## **FOREWORD**

The Proceedings of the CUCS Torino 2013 Congress are the result of the fruitful confrontation on development and cooperation activities which many Italian universities, as well as members of the international development cooperation system are engaged in. The organization of the CUCS Torino 2013 was possible thanks to collaboration between the Italian universities belonging to CUCS (Italian University Network for Development Cooperation), the General Directorate of Development Cooperation at the Ministry of Foreign Affairs and the Ministry of Education and Research.

The fact that the two Turin universities chose to promote and organize in synergy the Congress and the publication of the Proceedings is due to their desire to contribute to the consolidation of a local development cooperation system, in partnership with all those who made the event possible. Special thanks go to: the local institutions (the Piedmont Regional, the Province of Turin, the Municipality of Turin, the Network of local municipalities for peace - Co.Co.Pa., Gruppo Trasporti Torinesi-GTT), the Turin School of Development (ILO), the Chamber of Commerce (CCIAA), Compagnia di San Paolo, Fondazione CRT and the Piedmont NGOs Consortium.

The very title of the Congress - “Imagining cultures of cooperation. Universities networking to face the new development challenges ” - reflects multiple objectives. Here below are the main ones:

- the acknowledgement of the creative and innovative role which academic knowledge can produce and make available for the international development cooperation system;
- the joint commitment of the two Turin universities in the field of international development cooperation, as demonstrated by the 2013 Turin CUCS Congress. Their conviction is that cooperation is worthwhile and that it is necessary “to cooperate in order to cooperate better”;
- the active participation of the universities in the debate on the definition of the Post-2015 Development Agenda, by contributing with research, knowledge and the education of the future ruling classes, who will eventually be required to turn the objectives into policies and concrete results;
- a deep reflection on the relationship between development cooperation and the internationalization of university institutions and, more in general, of our territory.

In most cases academic mobility and university internationalization processes are first of all inspired by a competitive approach. The organization of the CUCS Torino 2013 Congress, its outcomes included within these Proceedings, and the projects that were born during the days of the Congress testify the richness, the effectiveness and ultimately the strong necessity for a cooperative approach in order to promote awareness in citizens who will be active and desirous of responding to the new global challenges.

### **THE CUCS UNIVERSITY NETWORK: COOPERATING TOWARDS A BETTER COOPERATION**

The Proceedings of the CUCS Torino 2013 Congress (19-21 September 2013) represent the final step of a scientific project and of an organisational and relational process that have proved challenging, engaging and ultimately rewording. At the same time the Proceedings testify the growing contribution by the Italian universities to the debate on international development and set a new beginning towards the next CUCS Congress to be held in 2015 in Brescia, as well as towards a more tight and effective cooperation between Politecnico di Torino, University of Turin and all the other actors involved in international development cooperation within the territory of Turin and Piedmont (international organisations, local institutions, NGOs, foundations, private companies...).

Founded in 2007, the Italian Universities Network for Development Cooperation (CUCS) encompasses today 28 universities<sup>i</sup>. CUCS represents nowadays the widest academic and scientific forum in Italy where universities can exchange and debate among themselves and with other international cooperation partners on development issues.

CUCS Torino 2013 came after the first CUCS Congress in Pavia (June 2009), focused on “Universities and Youth for Cooperation and Peace” and the second CUCS Congress in Padua (September 2011), on “Academic cooperation and the synergy with civil society and business community”<sup>ii</sup>.

The present Proceedings contribute to highlight the rapid pace at which CUCS is growing in terms of enthusiasm by its participants and in terms of quality of their scientific contribution to the current national and international debate on development, as acknowledged also by Caterina Bertolini (Coordinator of University Cooperation at the Minister of Foreign Affairs - General Directorate of Development Cooperation), in her introductory remarks to these Proceedings.

A detailed overview of CUCS objectives, institutional structure, historical evolution and future perspectives is offered by Emanuela Colombo (Polytechnic of Milan) on behalf of CUCS in the introductory session in these Proceedings. Gianni Vaggi's (University of Pavia) introductory remarks discusses the role that CUCS - and knowledge and training in broader terms - should play in the rapidly changing global scenarios of international development cooperation, while Eduardo Missoni (Bocconi University) focuses particularly on the contribution that universities might offer to the key area of global health.

### **THE CUCS TORINO 2013 CONGRESS: STRUCTURE AND GOALS**

The title of the CUCS Torino 2013 Congress – “Imagining cultures of cooperation. Universities networking to face the new development challenges” – echoes the very mission of the University: being a space for debate and for producing and sharing culture, it aims at promoting a broader innovative effort to critically assess previous experiences in order to enhance the effectiveness of cooperation within and between universities, as well as with other development partners.

Consequently, one of the main objectives of the Congress was to offer such a space, in front of the need of evaluating, raising awareness, and to know how to produce a Culture of Cooperation in all academic research fields. Therefore CUCSTorino2013 gave the opportunity to researchers working in/for development cooperation to take the stock of the current debate and start with new grip and ideas.

A second objective was to enhance relations within the CUCS network and between the network and other development cooperation actors, such as governmental and local authorities, civil society and NGOs, private companies and international organizations (in particular the UN and EU agencies based in Turin).

A third objective was to promote a deep reflection regarding the changes occurring at different levels on current development trends (theories, policies, and practices) and cooperation, and on the role of Universities as development cooperation actors, in terms of research, education and training, solutions implementation in the field, technology transfer and co-creation. Moreover the III CUCS Congress reflected on the achievements and perspectives of the Millennium Development Goals (MDGs), and on the contribution that universities should offer to the definition of the post 2015 development agenda.

The Congress has been organised in four plenary sessions, three parallel sessions and two poster sessions attended by more than 400 participants from 31 Italian universities and 10 foreign universities, international organisations, national ministries, local authorities, NGOs, and private companies. The three days of the Congress were hosted in three different venues, the University of Turin, the Politecnico di Torino and the International Training Centre of the International Labour Organisation (ITC-ILO), as a symbolic and spatial representation of the cooperation efforts between different institutions that has made the Congress possible and successful. On the evening of Friday the 20<sup>th</sup>, the

Municipality of Turin hosted a side-event to the Congress, with the projection of videos on development issues.

In the first day of the Congress, the opening session was held in the Aula Magna of the University of Turin, with the introductory remarks by the Rectors, and by representatives of the Piedmont Region, the Province of Turin, the Minister of Foreign Affairs - General Directorate of Development Cooperation (MAE-DGCS), the Italian NGOs Association (AOI) and the CUCS network. Following the openings, a first plenary session was devoted to a special event on food security in preparation of the World Food Day, jointly organised by the CUCS and the Ministry of Foreign Affairs, with speakers from FAO, IFAD, WFP, NGOs and universities. The second plenary session aimed at introducing the scientific debate of the Congress, with interventions by the CUCS delegates from University of Pavia, Bocconi University of Milan and by the Ministry of Education and Scientific Research.

On the second day of the Congress, three keynote lecturers addressed the plenary in the Aula Magna of the Politecnico di Torino: Francesco Biciato (UNDP), Mazen O. A. Hasna, (Qatar University) and Jean-Claude Bolay (Ecole Polytechnique Fédérale de Lausanne). During the third day of the Congress, the final plenary session was held at the International Training Center-ILO. This final session focused on the role of universities in the post 2015 development agenda, with representative from ILO-ITC, UNDP, UNESCO, European Commission DG Dev, OECD-DAC. The Italian Deputy Minister of Foreign Affairs, Mr. Lapo Pistelli, closed the session and the whole Congress by addressing in his concluding remarks the issues of the post 2015 development agenda and the process of reform of the Italian development cooperation.

Panels and posters sessions alternated the plenary sessions during the first two days of the Congress. The 33 thematic panels were selected through a call for panels, followed by a call for papers and posters; 155 papers and 93 posters were selected through a second call, with the scientific advice by the panels' coordinators. By involving both academicians and practitioners in the two rounds of selection, the Congress managed to enlarge the number of participants compared to the previous editions, and thus to enrich the quantity and the quality of the debate.

Being CUCS a multidisciplinary network, panel sessions have been defined considering a cross- and trans-disciplinary approach, identifying nine main thematic sections: Education, training and human resources; Global health; Security, risks, conflicts and vulnerability; Human settlements, territories and communities; Economic development: actors, networks and processes; Development cooperation methods and approaches; Rural development, natural resources and environment; Cultural cooperation; ICT and media for development. Each thematic session included different panels dealing with papers about theoretical and/or methodological approaches, while projects and experiences of research, education, technology co-creation and implementation in the field are included in poster format.

Paper presenters were invited to contribute to at least one of the following overarching questions:

- *Partnerships and frameworks to enhance cooperation*: which styles, practices, strategies, actors, approaches and instruments strengthen the culture and the effectiveness of cooperation? How and with which specificities do Universities cooperate with other actors within development programs and processes? How to enhance their contribution?
- *The link between knowledge, technology and power within the processes of local and global development*: knowledge and technology play a crucial role in upholding the processes of economic development, in shaping power relations and in promoting or hampering human rights and democracy; how do Universities participate to these processes? How do they balance the detachment proper of scientific research with the inclination to civic and moral engagement in the processes of social transformation?
- *Technology transfer and co-creation*: which methods and instruments are the most appropriate to guarantee the sustainability of the technology transfer and co-creation? How to analyse its impact on receiving societies? Which kind of academic contribution? Which is the relationship between general and theoretical knowledge, on one side, and local and contextualised knowledge on the other? From technology transfer from the North to the South to technology co-creation and knowledge sharing, mainly thanks to ICT: utopia or reality?

## **THE CUCS TORINO 2013 PROCEEDINGS AND THE WAY FORWARD**

The Proceedings of the CUCS Torino 2013 Congress collect most of the papers and of the posters presented during the Congress. The papers included in the Proceedings have been selected in close cooperation with panels' coordinators; they have been edited and revised following the Congress debate and an internal review by the panel coordinators in the aftermaths of the Congress. The Proceedings seek to contribute to the national and international debate on development cooperation activities carried out by the Italian Universities by sharing research-based analysis, stimulating debate and building common ground among key stakeholders.

The general picture offered by the whole of the papers and of the posters in the Proceedings is extremely rich and articulated, addressing the broader spectrum of the universities' field of intervention in international development cooperation. All the three university's missions are involved: research, training and the so called "third mission", that broadly covers the involvement of the university within the society, its engagement and outreach. In this respect, universities are contributing through training and research *for* development cooperation – i.e. producing general knowledge that might be used as a background for development cooperation initiatives -, *in* development cooperation –

getting directly involved within development cooperation activities by dint of applied training and research – and *on* development cooperation – approaching development cooperation and its social, political, cultural and technical dynamics as the privileged object of its study. These issues are explicitly addressed in the Proceedings section on “Education, Training and Human Resources”; they also represent a crosscutting theme to almost all the panels.

Beyond the specific contribution offered by each panel, paper and poster, we believe that the CUCS Torino 2013 Congress and its Proceedings represent a step forward towards a deeper and more effective engagement by the Italian universities within the rapidly evolving scenarios of international development cooperation. International development actors, theories, strategies, policies and practices are evolving both at the global and at the local scales. The Proceedings section on “Methods and approaches in development cooperation” specifically offers a glimpse of such dynamics, which again were addressed directly or indirectly in most of the panels. New donors such as China, Turkey and Brazil are emerging, redefining the traditional North-South equilibriums. They introduce new practices and devices in international cooperation, beside the conventional channels of official development assistance (ODA). The economic and political influence of these new donors often challenge more consolidated approaches within the international development forums, such as those affirming the link between development and the promotion of democracy and human rights. On the other side, new ways of understanding and measuring development and well-being are emerging from the bottom up, both in high and low income countries. The Proceedings section on “Economic development” specifically addresses the growing role of economic actors, the private sector, and migrants’ entrepreneurship in shaping these processes and orienting the definition of new development strategies in the context of the economic crisis affecting consolidated development models such as the European one, and resulting in the shrinking of public resources allocated to international development cooperation. Several other Proceedings sections and panels – ICT, media and development; ICT and Capacity building; Sustainability of environmental technologies in developing countries; Geomatics for emergency,... - address the role of technology, and in particular ICT as an instrument to empower new paths of development, denouncing at the same time the risk of reproducing asymmetric power relations linked to knowledge and technology.

Are the traditional actors of international development cooperation, such as Italy and specifically Italian universities, aware of the magnitude of these changes? Are they equipped to tackle them? We consider the approval of the long awaited reform of the Italian development cooperation in August 2014 as an encouraging step towards a positive answer to these questions. The reform process was discussed during the CUCS Congress too, confirming the Italian universities’ willingness to engage and cooperate with the Italian Ministry of Foreign Affairs and other development partners in the definition of national strategies and guidelines. In these respects, the Italian universities are looking forward further discussion and future implementation of the new Ministry’s “Principles, guidelines and priorities for development cooperation with Universities, Research and Training Centres”.

While these progresses are encouraging, we believe that there is still a long way ahead to sharpen the Italian universities’ contribution to international development. Therefore, on the basis of the CUCS experience and of the CUCS Torino 2013 Congress debate, we would like to conclude by sharing a set of questions developed in order to raise awareness, effectiveness and efficiency within universities’ development cooperation initiatives and towards a University policy on international development cooperation. These are the questions that will orient the future engagement of the Politecnico di Torino and the University of Turin, including their joint initiatives, on international development cooperation. We hope that they might also inspire other universities, within the CUCS network and beyond.

### *1. Universities, international cooperation and the post 2015 development agenda*

- Why universities should get involved in international development cooperation?
- How international development cooperation has been addressed within the different missions of the university (training, research and the “third mission” dealing with universities’ public engagement and outreach)?
- How universities understand the new global scenarios and the new geographies of development? How do they insert in these processes?
- How universities are contributing to the definition of the post 2015 development agenda? How this agenda will shape their future engagement on international development cooperation?

### *2. Universities’ internal organisation for development cooperation*

- How the engagement in international development cooperation initiatives fits within universities’ broader strategies on academic mobility and internationalisation? The competitive approach based on university benchmarking and inspiring universities’ internationalisation strategies is complementary or alternative to the spirit of international development cooperation?
- Do universities need to elaborate a specific agenda on international development cooperation? Or the issue should be rather tackled as cross-cutting theme in the ordinary planning and activities of the universities?
- Which are universities’ best practices in terms of internal organisation to manage development cooperation initiatives, information sharing on these projects within the university and outside, and promotion of trans-disciplinary working groups for development cooperation?

- Which are the most suitable modalities to organise and offer training on international development cooperation issues for universities' students and staff?
- Which are the most effective tools to promote the research on international development cooperation issues?
- Which are the most needed mechanisms to monitor and evaluate universities' development cooperation initiatives?

### *3. The partnership for international development cooperation*

- Which are the national and international academic networks more interesting and promising for international development studies?
- Which partnership should be established or reinforced with the other international development cooperation actors (governments, international organisations, NGOs, local authorities, private companies, foundations, religious actors,...)? Which are the most effective spaces and tools to foster such a partnership?
- Which academic partnership should be prioritised (top ranking international universities in high income countries or universities and other research/training centres in the countries of intervention)?

## **ACKNOWLEDGMENTS**

The Proceedings of the CUCS Torino 2013 Congress - edited by Politecnico di Torino and University of Turin – have been made possible thanks to the work of all the panels' convenors that have accepted to act as reviewers of the papers presented in their respective panels, as well as thanks to all the authors that have accepted to re-draft and submit for publication their papers and posters in the aftermath of the Congress. We wish to thank all of them for their valuable scientific contribution.

We are particularly grateful to Elena Giglia and Alessandro Leccese (University of Turin) for their guidance and support in publishing these Proceedings as a first issue of a new open access journal, JUNCO- Journal of universities and development cooperation. We hope that this will be the first of a long series of issues, allowing JUNCO to become a space where universities can share and debate the results of their researches among them and with other international development cooperation partners.

The publication of these Proceedings represents the last step of a long scientific and organisational process started in July 2012. Throughout this process we have met and we have been supported by the work of many people. In acknowledging all of them by name there is the risk to forget somebody, nevertheless we try.

A collective thanks to all the friends, colleagues, Rectors, Delegates of the CUCS network, particularly to Emanuela Colombo and Gianni Vaggi, tireless coordinators and spokespersons, and to Ferruccio Miglietta, CUCS' fundamental organising support.

A special thanks for their daily commitment on promoting international cooperation initiatives within the universities to: Marco Gilli, Rector of Politecnico, and Laura Montanaro, Deputy Rector for Internationalisation, and Silvia Vacca of the International Affairs Department of the Politecnico di Torino; Ezio Pelizzetti, former Rector of the University of Turin and Gianmaria Ajani, the current Rector; Sergio Roda, former Deputy Rector and Maria Lodovica Gullino former Vice Rector for International Relations of the University of Turin, as well as to the colleagues of the International Relations Offices of the University of Turin, (Claudio Borio, Rosa Tamburro, Fernanda Negro, Daniela Laurretta, Johan Fauriat, Valeria Sanchini, Maria Calabretta).

A big thank goes to the Politecnico IT Area, in particular to Mauro Innocenti and Cosimo Paladini for the development of the Congress website; to the Politecnico CORE (Comunicazione, Eventi e Relazioni con l'Esterno) Office, particularly to Salvatore Lombardi, Maria Antonietta Triumveri, Stefania Portaluri, Giorgia Nutini, Elena Foglia Franke and Anna Maria Perotto) for the Congress logo and graphics design and the Media coverage, and to Gianpiero Biscant and Michela Benedicenti of the Politecnico EDILOG (Edilizia e Logistica Unit) for their precious support in the logistical arrangements; to Costanzo Mercugliano (Eupolis-DIST) for the support in the financial request; to Susanna Bison and Elena Rabbia of the University of Turin Communication Office for their support, to the EDISU staff for their assistance in the accommodation of the Congress participants.

We would like to acknowledge all the partners that in their respective institutions and roles have supported the organisation of the Congress and in particular: Giulia Marcon, Giorgio Garelli, Angelica Domestico (Regione Piemonte), Marco D'Acri, Elena Apollonio (Provincia di Torino), Maurizio Baradello, Laura Fiermonte, Roberta Giaretto, Maurizio Toso (Comune di Torino), Roberto Montà, Edoardo Daneo, Michele Pizzino (CoCoPa), Andrea Micconi, Umberto Salvi (COP), Dario Arrigotti (Turin School of Development-ITC ILO), Marzia Sica e Mario Gioannini (Compagnia di San Paolo), Guido Bolatto e Giovanni Pischedda (Camera di Commercio), Massimo Lapucci, Luigi Somenzari, Francesca Rivoira (Fondazione CRT), and GTT (Gruppo Torinese Trasporti).

A particular thank to Lapo Pistelli, Deputy Minister of Foreign Affairs and his Head of cabinet Jean Leonard Touadi, as well as to Giampaolo Cantini, Caterina Bertolini and Massimo Caneva for the Ministry of Foreign Affairs (MAE-DGCS) support to the Congress and broadly to the Italian universities' development cooperation activities. We wish also to acknowledge all the participants to the special session on Food Security towards the World Food Day: Maria Lodovica Gullino (University of Turin), Leslie Amoroso (FAO), Annalisa Conte (WFP), Edward Heinemann,

(IFAD), Claudia Sorlini (University of Milan); Piero Sardo (Slow Food), Cristiana Peano (University of Turin), Federico Perotti (Focsiv – Volontari nel mondo). Equally we would like to acknowledge all the participants to the final plenary session of the Congress at the ITC-ILO Campus: George Jadoun (Turin School of Development-ITC ILO), Nicoletta Merlo (European Commission, DG-DEV), Michela Miletto (UNESCO-WWAP), Federico Bonaglia (OECD-DAC), Federico Biciato, (UNDP).

Finally a huge thank to all the University of Turin and Politecnico di Torino graduate and undergraduate students that have offered a tremendous support in the organisation of the Congress and in the editing of its Proceedings: Ilaria Ballari, Maddalena Bo, Giulia Gazzaniga, Davide Miceli, Carlotta Negri, Margherita Parrao, Erica Patta, Roberta Perna, Lisbeht Puente de la Vega, Riccardo Rossella, Anita Stankova and Lara Trabaneli.

---

<sup>i</sup> CUCS Partner Universities are: Istituto Universitario di Studi Superiori di Pavia, Politecnico di Milano, Politecnico di Torino, Università IULM di Milano, Università degli Studi di Bergamo, Università degli Studi di Bologna, Università degli Studi di Brescia, Università Cattolica del Sacro Cuore di Milano, Università Commerciale Luigi Bocconi, Università degli Studi di Ferrara, Università degli Studi di Firenze, Università degli Studi di Genova, Università dell'Insubria, Università degli Studi di Milano, Università degli Studi di Milano-Bicocca, Università degli Studi di Modena e Reggio Emilia, Università degli Studi di Padova, Università degli Studi del Piemonte Orientale "Amedeo Avogadro", Università degli Studi di Parma, Università degli Studi di Pavia, Università degli Studi di Siena, Università degli Studi di Trento, Università degli Studi di Torino, Università degli Studi di Trieste, Università degli Studi di Urbino, Università della Valle D'Aosta, Università Cà Foscari di Venezia.

## ITALY AND THE POST 2015 DEVELOPMENT AGENDA. THE ROLE OF UNIVERSITIES

Caterina Bertolini\*

\*Coordinator of University Cooperation  
Minister of Foreign Affairs - General Directorate of Development Cooperation

The production of knowledge, the sharing of know-how and the training of qualified human resources are all becoming more and more meaningful in sustainable development policies. Participants must increasingly have more specific capacities of analysis and interpretation, of pinpointing appropriate but flexible strategies and of dialogue with beneficiaries and with other cooperation actors, both at the level of single countries and at an international level.

The Italian academic world and the world of research have for some time been contributing to development cooperation by means that have been evolving in time. In recent years, while the cooperation paradigm was in the process of thorough transformation thanks to the IV High Level Forum on Aid Effectiveness of Busan (2011), universities and R&D bodies have seen their role as cooperation actors fully recognized.

This role, on the one hand, presupposes an evolved concept of capacity development in favor of partner countries and, on the other, the scientific and intellectual contribution of the academic world to the international debate as regards development issues. Training is leading – through support activities and the formation of partnerships – to the creation in partner countries of university centers and research. These have been enhanced by training courses and can support scientific research in areas which are of utmost importance for the development of those countries.

On the other hand, the contribution of the academic world to cooperation themes can be particularly meaningful, also thanks to the Italian position in international debates. In the 2014-15 period, Italy has been playing a principal negotiating role within the UN system in the definition of the new 2015-2030 development agenda. This was preceded by the first high level meeting of the “Global Partnership for Effective Development Cooperation” in Mexico in April 2014 and will be followed by the semester of the Italian Presidency of the European Union in the second half of the year. Another major cooperation opportunity will be offered by the 2015 Milan Universal Exposition, a unique venue for international debates which will be characterized by original contributions, the result of experience gained in the field of cooperation and of the intellectual contributions of the Italian academic and scientific world.

The CUCS Congress, held in Turin in September 2013, offered a prime example of the level and the breadth of the development themes which Italian universities are facing with competence and enthusiasm, both in Italy and abroad. High level papers were presented dealing with education and training, economic development, conflicts and vulnerability, to mention just a few of the topics found in the Congress proceedings. Moreover, university interest and research undoubtedly add meaningful elements to the practical methods used and to the evaluation of final outcomes. Contents and methodology are two aspects which the General Direction of Development Cooperation will continue to work on, relying on the collaboration of Italian universities, to achieve results in line with the principles of efficient aid.

## UNIVERSITY NETWORKS AS ACTORS OF SCIENTIFIC AND MULTIDISCIPLINARY PARTNERSHIPS: HISTORY AND DEVELOPMENT OF CUCS

Emanuela Colombo\*

\*Rector's Delegate Cooperation and Development - Politecnico di Milano  
UNESCO Chair in Energy for Sustainable Development

### History and Mission of the CUCS (Coordinamento Universitario per la Cooperazione allo Sviluppo - University Network for Development Cooperation)

In December 2004, the **Direzione Generale Cooperazione allo Sviluppo** (General Directorate for Development Cooperation) of the Minister of Foreign Affairs, promoted a wide project aiming to involve youths in the creation of **regional university networks**. The mission of this project, activated by the then Director General Deodato with the support of Prof. Caneva, was to foster the coordination between university and institutions. This coordination continued along the years thanks to the support of all succeeding Directors General, and in particular thanks to Director General Belloni and the current Director General Cantini, who reinforced the original scheme.

In this framework, some Universities, already part of one of the regional university networks in the northern region of Italy realized the importance and somehow the urgency of deepening the debate and keeping it at an academic level. Moreover, they gave birth to a University coordination which found its essence in the original characteristics and peculiarities of each University. This was the beginning of **Coordinamento Universitario per la Cooperazione allo Sviluppo (CUCS)** in 2007, that today includes 28 Universities. In the MoU signed by the Rectors and their reference delegates, the complex and multidisciplinary challenges of Human and Sustainable Development and Cooperation, as well as the necessity of strong partnerships, are recognized. Four are the fundamental elements:

- **Competences in Cooperation:** setting patterns of education, training, design and scientific communication in the sector, to give impulse to the creation of new generations of researchers, academicians and professionals (here and in Development Countries). Cooperation today needs to be seen in this professional frame. Voluntary attitude and inclination are positive engines, but they must be supported by consolidated experience and competence;
- **Cooperation models:** bringing innovation in the practice of cooperation using research for improving the efficacy. A research aiming at technologies and development models that are appropriate and participated, able to induce individual development and not dependence, and with the awareness that a unique optimum does not exist, but rather that each solution is strictly related to the specific context of action. Giving particular attention to genuine listening, reading and interpretation capacities and dialogue with local stakeholders lead to a positive approach of mutual learning;
- **Partnerships:** building Networks of competences (among Universities, NGOs, International Organizations, Non Profit, Enterprises, local and national institutions), since it is true that being alone allows you to run faster, but you can't go far when such themes assume the complexity typical of our society.

The CUCS was born as a voluntary organism and each partner accepted to define the internal roles, the commitments and all the necessary functions in a participatory manner. Within this approach and in cooperation with the General Directorate of Development Cooperation of the Ministry of Foreign Affairs, the CUCS organized three **national congresses**, one every two years starting from Pavia 2009, then Padova 2011 and today Torino 2013, and several dedicated days in the years in between, giving space to the description of experiences of cooperation but also giving the opportunity to analyze some fundamental topics: We remember in 2009 the role of cooperation in the University, in 2011 the partnerships between University and Civil Society and between University and Private Sector, and today the role of training and research in the post 2015 agenda.

### The relevance of Cooperation and Sustainable Development in the mission of University

Why do these themes have such relevance in the academia? What is the relation with the academic mission? Is only the domino of the so called third mission? In our opinion there is more, and there is a deep linkage with the first and the second mission of the University, that are education and research. We live in a further complex society, where we can't help recognizing the necessity to create solid bases of knowledge and specific competences as well as solid capacities of systemic analysis as well. This is requested by the current challenges of society. Thus, also from the University point of

view, it emerges the relevance **to enrich training curricula** of future citizens and professionals and the **role of scientific research in bringing innovation (that not always has to be conceived as invention)**.

Enriching training curricula: the original mission of University is training **graduates able to cover an active role in the transformation of the society**, both in the South and in the North of the World.

Time and challenges are changing: from the MDGs of today to the challenges of tomorrow post 2015 agenda, hence training methods and contents must adapt. Sustainable development must be somehow integrated in the curricula of the students (whatever disciplines they are studying), either from the theoretical knowledge either from the more practical point of view of the appropriate instruments. This is urgent not only for those who will operate in Cooperation, but also for all the individuals that will operate in global contexts, that are almost all our graduates. We all speak about internationalization. Also these capacities, beyond the personal skills of speaking one or more different idioms besides their mother tongue, may be considered as “internationalization”.

These considerations are open at the international level and include also the role of Universities in promoting principles of sustainable development and possible paths. The CUCS is involved at all levels in this frame, from European projects to specific experiences, and intends to give its own contribution to the discussion both from the theoretical and practical point of view, implementing practical experiences and seeking a coordination at institutional level with our reference Ministries to debate on these topics.

Scientific Research for Innovation: **scientific research becomes a tool for development**. Today challenges are linked and cross the traditional disciplines. To make some examples:

- Developing countries still express emergencies to face in a synergic manner: food security and safety, access to energy and water, to an acceptable health care system, to education, the problem of urban development and its sustainable planning.
- Emerging countries, together with developed countries, need to face global issues that are integrated by definition and concern the compatibility of the economic development with the environmental protection, land ownership, labor and employment, peace and international security. Nowadays there is great attention to the Water Energy and Food nexus, Climate change, Land Energy and Water, urban development, quality of life, decent work. In this vision, technology and innovation, together with those models implemented in human sectors that represent the results of research, are further seen as tools able to support society in overcoming cultural, economic, environmental frontiers of human development. Finally, technology and know-how transfer become a collective building for a real and mutual learning (a humankind that grows and gives value to strengths, mitigating weaknesses).

## Final considerations

The CUCS represented and represents a platform for debating all the issues pertaining the scientific and academic dimension of university cooperation.

We all know how it is really difficult to coordinate each other. And the few working example of network at the European level confirms the analysis. It is worth mentioning the presence in Europe of thematic networks as EADI or national as UNIPiD, very similar to CUCS even if more restricted (7-8 Finnish Universities). The Italian experience represents one of the very few example at European level. Its voluntary nature is certainly a big strength: it confirms, in every meeting and event, the real interest in the topic of Cooperation and the sincere sharing within the network, which is based primarily on mutual trust.

On the other hand, this voluntary nature expresses some limits in recognizing CUCS from a formal point of view, with a legal nature and able to apply to calls and refer in behalf of members. This topic is particularly important today. Indeed, in its future the CUCS needs to:

- become a more and more **representative speaker**, recognized and distinguished within the civil society and the institutions, in order to develop fruitful relationships from which the South of the World could gain benefit;
- widen the **design and intervention knowledge, skills and competences of University** in the Cooperation (by implementing joined projects and actions, as the Palestine case).

Therefore, the moment in which the CUCS should assume a more formal structure has arrived, though maintaining its voluntary nature and counting on the trust among partners.

**The coordination has still many steps to make and share in order to grow, but it is already a relevant speaker for every program of development, education, institutional building or rebuilding. It is relevant where a synergic action among Government, Civil Society, University and Enterprises is desirable** to have a real effect on the cultural, social and anthropologic change that is further requested by the global world.

For this change we must go on in doing our job, we must prepare the next generation of citizens and professionals; they need to be prepared and provided with adequate instruments to face the current and future challenges and to coop with them with deep ethics of responsibility.

We need this change for them, for us and for the future of our world.

## THE DEVELOPMENT SCENARIOS AND UNIVERSITY COOPERATION

Gianni Vaggi\*

### ABSTRACT

The notion of development has greatly changed during the last thirty years and it includes many more dimensions than income per capita. Health education, environment gender are now regarded as some of the many faces of development. Debate is now going on the post 2015 Goals. In parallel with the evolution in the notion of development policies too have changed from the purely economic conditionalities known as Washington Consensus to a broader view of partnership for development. However the last thirty years have also seen important changes in the economic scenarios. Many countries in Asia have experienced long sustained economic growth and the economy has also improved in many countries in Africa and Latin America. We have also seen the emergence of the so called new donors, which are extremely important players in the world economy. But the present economic crisis is also largely due to an excess of productive capacity and to the saturation of demand in many important sectors. Many countries try to overcome the economic difficulties by cutting domestic demand and fostering exports. This however leads to increasing competition and to neo-protectionist attitudes.

International cooperation must take into account the changed economic relations. At the same time it must work along the line indicated by the view of development as empowerment and ownership. Two concepts which highlight the changing relations among the actors of international cooperation. From the donors-beneficiaries relationship we are moving to a more equal partnership, which however will also bring to the different judgments and evaluation which can be expressed. The smoothing of these differences is a challenge in order to achieve mutual trust. University cooperation has a great role to play in this endeavour, also because in the case of university partnerships distances are much smaller than in other type of cooperation. Networking, academic mobility, joint research are part of the process which must lead to a better mutual knowledge among the people of the world.

### THE EVOLUTION OF THE NOTION OF DEVELOPMENT

In the beginning it was economic growth; in the fifties and sixties development was mainly regarded as economic growth: the increase in the Gross Domestic Product (GDP) per capita. Economic growth models focused on capital accumulation and on exogenous technical progress. According to the dominant views capital would flow to the countries in which it is scarce, typically developing countries and where labour was abundant; technology too would circulate more or less free of charge across countries, being a bonus for the poorest ones.

Today development is regarded as a multi-faced phenomenon, even better it is an ever evolving process. Let us briefly point out some of the major contributions to this new view. It all started with debates in the sixties and seventies, but it is only towards the end of the eighties which a general consensus began to emerge on a broader definition of development, more in [1].

In 1987 Bruntland Report by the United nations the idea of sustainable development receives a first definition, as the process which can satisfy the needs of present generations without compromising the possibilities of future generations, see [2]. Since this report the environment dimension and the idea of sustainability become essential aspects of the notion of development, recall the 1992 Rio Conference on sustainable development.

In 1990 we have the first Human Development report by UNDP with the Human Development Index, which includes not only income but also education and health.

In September 2000 the Millennium Declaration by the United Nations, the OECD, the World Bank and the IMF present the Millennium Development Goals, eight goals which provide the now most widely accepted definition of development, including health, education, environment and gender.

In 2012 at the conference Rio+20 the idea of the Sustainable Development Goals, SDGs, emerged; the sustainability dimension was receiving a broader definition not limited to the environmental aspect.

The MDGs were set for the year 2015 which is now quite close and on may 2013 the United Nations published a report which represents a first step in order to set new goals and a new time frame [3]. This is just a proposal for debate which now includes twelve goals and five 'transformative shifts', which focus on jobs and inclusive growth, leave no one behind, peace, sustainability and finally a global partnership, which is in fact a repetition of former MDG number eight.

This evolution has been strengthened in recent years thanks to the fact that the very notion of Gross Domestic

Product is being questioned has an appropriate indicator of the standard of living of people. The research work focuses on the definition of well-being, perhaps the most famous report is the so called Sarkozy Report of 2008 [4]. A lot of attention is also dedicated to the issue of environmental sustainability, see for instance the work of Dasgupta at Cambridge [5]. And in 2012 we have the first World Happiness Report which owes a lot the work of a team at Columbia University led by Jeffrey Sachs [6]. In 2013 in Italy we have the first report on the with an indicator for the BES - Benessere Equo e Sostenibile (Equitable and Sustainable Well-being).

Poverty too is no longer defined in terms of income only, but more in general as 'deprivation', or the lack of capabilities, in the sense of lack of the possibility to decide and to choose about one's life. Since 2010 we have the *Multidimensional poverty* by OPHI, the Oxford Poverty and Human Development Initiative [7].

All these approaches are quite recent ones and even if they show some relevant differences, nevertheless there are major similarities in respect to the view of development they support. Let us single out just two of these similarities. First is the idea that development corresponds to the enlargement of opportunities and possibilities of choice by the people. Second development it is a process which is valued and regarded as in a positive way by the people who are involved in it. The evolution of the notion of development and the emergence of that of 'human development' owes a lot to the work of Nobel laureate Amartya Sen [8].

## **DEVELOPMENT POLICIES AND INTERNATIONAL COOPERATION**

In the eighties and nineties we had the *Washington Consensus*; a set of economic reforms which was based on two main ideas. First, economic growth will derive thanks to reduction of the role of the state and to the opening of the economy; second, economic benefits will trickle down to the entire society. Therefore let the markets do their job in terms of allocation of resources and development will arrive.

In the late nineties different views emerged focusing more on the role of institutions and the so called 'second generation reforms', which were related much more to the social features of the economy, to the accountability of the governments and to an appropriate interaction between the state and the markets; the so called *post-Washington Consensus*. Less well-known but equally important is the approach to development policies proposed in 1999 by the then President of the World Bank James Wolfenshon: the *Comprehensive Development Framework*, which implied both an holistic view of development and a set of possible policies based on multiplicity of actors, from private firms, to local governments, to civil society and international organization.

Beginning in 2000 with the Monterrey conference on 'Finance for development' a series of High Level Forum has been held in order to define some sort of best practices in international cooperation. They go from Rome to 2003 to the Paris declaration of 2005 to the Accra Agenda for Action of September 2008 and to the 2011 Busan fourth forum on Aid Effectiveness, which has ended up with the *Busan Partnership for Effective Development Co-operation*.

The major topic of all these conferences has been aid effectiveness, which has however been examined from different points of view. Monterrey stressed the fact that if developing countries have to meet the MDGs by 2015 they must implement the appropriate policies and reforms, above all good governance, but the rich countries must commit to more and more predictable and stable aid flows. Up till now only five of countries reaches the *0.7% of GDP* which is the target set by the UN since the seventies. Monterrey also emphasizes the role of global public goods. The 2005 Paris declaration recommends the donor to have more accountable programs, to adopt coherent aid policies and to coordinate among themselves. In Accra the notion of *country ownership* is underlined. Finally Busan focuses on development effectiveness and not just aid effectiveness, which requires having a shared tools between all partners, including partners in the 'South', for the evaluation of programs and projects. The involvement of the civil society is another important issue and more attention is dedicated to the development outcomes of projects and policies rather than to input indicators only.

## **THE ECONOMY STRIKES BACK**

The debates of the last thirty years give a very useful view of development and they also indicate the procedures and the strategies which should be adopted in order to try to achieve it. We are therefore in a very convenient position to think about the way in which international cooperation should be approached and university cooperation in particular. However we must consider the overall scenario in which cooperation must operate in the coming decades and in some major changes in the world economy since the last decade of the twentieth century. This should help us to set international cooperation, and in particular European cooperation in a realistic context.

Let us point to some of the most important new elements in the world economy during the last generation. On the positive side, first.

One, at the world level goal one of the MDGs - halving the number of those living on less than 1.25 dollar a day - will be achieved largely thanks to economic growth in Asia and in China in particular. Most of the poor people now live in middle income countries (see [9], p. 1) and all the more so if we take the 2 dollars a day threshold (see [9], p. 6).

Two, the twenty first century will be the century of Asia. Luckily enough we have had the Asian Miracle, with

many countries in the continent upgrading from Low Income to Middle income. The notion of emerging markets did not exist twenty years ago, not we had the BRICS. This is of the utmost importance because it takes us away from the gloomy perspectives in which some regions have a destiny of economic stagnation; now there are success stories and not only in China.

Three, the 'lost decade' of the eighties and nineties of the last century, saw stagnating income per capita in three world regions: Middle East and North Africa, Latin America and Sub-Saharan Africa. Since the year 2000 even Sub-Saharan Africa, the poorest region, has been doing better than before growing on average around 5%; it is not China and let us see if these growth rates can be sustained over the years, but there are reasons for optimism. Something similar has taken place in Latin America, where there has also been some decrease in inequality.

Four, the so called South now presents some global power, China, perhaps India and some regional powers, Brazil, South Africa and Russia, therefore the old division rich-poor countries, north-south needs not be replaced by a more articulated geography. From G7 and G8 the world has moved to G20. This is good because it means that there are more players and potentially more opportunities for the poorest countries. This does not mean that trade relations of China with Africa are positive ones, but the emergence of the new economic powers, or new donors - not members of the OECD-DAC club - gives African countries an opportunity to deal with more countries, instead of being stuck into the traditional economic relations dating back either to the colonial period or to the post World War II economic setting. This fact also opens the possibility for the always advocated south-south cooperation.

Five, since 1998 Foreign Direct Investment and remittances have become the largest financial flows to developing countries, with around 600 and 450 billion dollars respectively. Remittances include only the officially registered ones, hundreds of billions are assumed to enter developing countries in an unofficial way. International aid is around 130 billion.

For many years we have advocated trade not aid, now we should all be happy about that. However... there is also the dark side.

One, the financial crisis of 2007-2008 is not yet over and it has drastically reduced employment opportunities in many high income economies, most notably in Europe. Financial markets whose size still overtakes the World Income by almost nine times, have proved to be extremely volatile and risky and is still not yet clear how they can help to produce wealth and job opportunities around the world. In modern finance there is an inherent element of systemic risk and of volatility.

Two, since the late eighties income distribution has worsened in all High Income economies reversing a pattern of increasing equality which had taken place since 1950, this is indeed extremely worrying because it means that all the social achievements of the last sixty years might be at danger. This includes the welfare system in western Europe, which by the guarantees decent minimal conditions and less unequal opportunities in education and health to everybody; notice that these are the two pillars of the notion of human development.

Three, even if growth rates are higher than before in many developing countries young people do not find appropriate employment. The situation is particularly severe in some Arab countries which should generate between 2.5 and 3 million of new jobs every year in order to absorb all those who are entering the labour market. Here there appears to be a kind of mismatch between the number of qualified people holding university degrees looking for a job and the ability of the economies to absorb them; quite often the result is migration.

Four, the present crisis has many features of a crisis of overproduction. For many years China has been investing 35-40% of GDP and other countries in Asia have followed similar path even if not with such exceptionally high investment ratios. This has led to a situation of overcapacity at the world level; the overall productive structure could produce more goods than those which can profitably be sold on international markets. This is clear in some productive sectors which appear to be saturated, the car industry being a case in point.

The world economy is now much more interconnected than it was forty years ago, but it is also going through a period of deep changes in what we can call the international division of labour. This is leading to huge imbalances which show both in the different growth rates among countries and above all in the deficits and surplus of the balances of payments. This happens among different countries and regions but also inside regional groups, the Euro area being an obvious example. In many countries this leads to budget constraints and to deflationary policies, with negative impact on resources for both knowledge and international cooperation. Even more dangerous are the tendencies towards isolation, the opposition to free movements of people and to neo-protectionist policies. Economic competition is now quite fierce and countries tend to protect their economies and to pursue both strict budgetary policies and to repress domestic demand in favour of exports. Remember that Asian economic growth is largely explained by a combination of export-led growth, industrial policies and huge accumulation of physical capital.

## **EMPOWERMENT AND OWNERSHIP**

If economic forces are so powerful and even dominant, what about all the nice ideas of development as a complex process, the importance of human rights, the new MDGs and cooperation as partnership? These are well established points and we need to debate and to progress from them. However, we must not underestimate the strength of economic forces, the opportunities they offer but also how ruthless they can be.

Empowerment and ownership are two words which very well describe the recent trends in the debates about

development and cooperation. Empowerment is the possibility to enlarge one's opportunities and her set of choices [10]. Ownership has the ability of developing countries and people to take the development process into their own ends. Both notions lead to a situation in which we will have to interpret cooperation as a dialogue among more equal partners. International cooperation will not immediately cease to be also partly donor-driven, but the role of traditional donors will become less relevant and more voices from the 'global south' will make themselves heard. It is a complicated process already under way and the economic facts we have examined in the previous section do reinforce it.

Cooperation as a partnership among actors who now feel they have the right to decide about their future. We are rapidly moving from *working for* to *working with*.

But the partners differ in terms of culture, tradition, social organization and conditions of life. How to decide the priorities: infrastructures or health? Economic growth or human rights? Traditional village authorities versus equal rights and voices.

## DISTANCE, DIALOGUE AND UNIVERSITY COOPERATION

In international cooperation we are used to *distance*, but that is mainly described in terms of different standard of living, which can be quantified thanks to economic, social, demographic indicators and so on. However there is another aspect of distance which has to do with the notion of *otherness*, and in particular with the fact that we may have different views on what is right or wrong, good or bad. People do differ in the way in which they formulate judgements. All these is of course particularly relevant in international politics, but it applies to a variety of situation and conditions, including judgment about what is an appropriate ethical conduct. Human beings all over the world continuously make judgments about simple and complex situations, which goes from how to organize family life to international politics. We also differ in terms of emotions and feelings, which are a very important element in the process of formulation of judgements. The perception of distance is also largely subjective; how poor do I feel I am? Does it depend on the indicators of international organizations? How much do I value income *vis-à-vis* culture, family bonds etc.?

International cooperation is about reducing these distances; the gap will never close completely and does not have to disappear because each of us is entitled to her identity; we must not end up all thinking in the same way. Nevertheless when distance is quite large there are problems in sharing initiatives and projects and in working together.

*Dialogue* is the process by which distances in judgements might be reduced; of course politics plays an extremely important role, but we must not underestimate all the opportunities of direct knowledge among different actors. A prerequisite for dialogue is mutual knowledge. International cooperation will more and more become a dialogue between equal partners who need to know each other better.

In this scenario *University cooperation* enjoys several advantages, I would say even privileges. We work with young people and we have to do with education and research, that is to say with *knowledge* in the sense of transferring and even producing it; knowledge is now regarded as new global public good (see [11], p. 35). We also have several tools to appreciate the differences and the same time to reduce distance: joint research programs, academic mobility, different networks, ranging from scientific societies to thematic networks, to regional networks and so on. All this networks provide also a sense of commonality, a sense of belonging, which is an important tool in reducing the distance.

In the case of university cooperation distance is not so large. How far are we from a poor villager in a remote part of Kenya? How far are we from a colleague of the university of Nairobi? In the latter case we have many common tools for communication, words easily have similar meanings, all the more so if we belong to the same academic field.

The ability to appreciate differences and to ask ourselves questions is a fundamental springboard for the improvement and enlargement of knowledge: otherness is also a way to learn. But when distance is quite large this may be difficult either because we are unable to communicate, or because our original positions are so far away that the whole process to re-approach them is painful and does not seem to produce positive outcomes.

In university cooperation it is much easier to have positive feedbacks: sharing a project is complicated but it is not so difficult to achieve a situation in which there is satisfaction by all partners. Thanks to the positive experience we can think of carrying on our collaboration. Dialogue needs to produce some positive outcome which strengthens trust and mutual feelings; empathy improves.

When distance is large it is more difficult to come to a common sense of satisfaction; dialogue requires more time and patience, and if some unpleasant event takes place the whole process of closing the gap might stop and even be reversed.

In his 2006 *Identity and violence* and in the 2009 *The idea of justice* Amartya Sen faces the issue of the different identities which characterize people around the world and how they might lead to conflicts and separation. To move from closed social groups to more open ones is a fundamental issue in today's debate on global justice. This is a crucial issue for the coming decades and we can do a lot to favour the process of opening up our identities. Indeed this is perhaps the most important challenge but also the most important opportunity of university cooperation.

## ROLE AND SOCIAL RESPONSIBILITY OF THE UNIVERSITY IN PROMOTING INTERNATIONAL COOPERATION FOR GLOBAL HEALTH

Eduardo Missoni \*

\*Università Bocconi, Milan, Italy - [eduardo.missoni@unibocconi.it](mailto:eduardo.missoni@unibocconi.it)

The acceleration of the process of globalization, understood as interconnectedness and economic interdependence, has pushed a process of cultural homogenization, along with the adoption of a Western, neoliberal development model, based on the dogma of economic growth and maximization of profit, which in turn requires indefinite and unsustainable consumption of resources and production of waste. Zygmunt Bauman's "I consume, thus I am" well synthesizes this contemporary way of recognizing the existence of the human being.

Social and environmental determinants embedded in our growth-society have dramatic consequences on health. On the one side, they are associated with substantial epidemiological changes in the profile of risk factors, with a growing double burden on poor countries and populations now facing both the challenge of "traditional" infectious diseases and the upsurge of chronic degenerative diseases of "modernity", once associated with wealthy life styles. On the other side unregulated growth societies go hand in hand with growing inequities in the distribution of health and access to health services.

In developing countries, impoverished National health systems face a growing shortage of health personnel for whose training significant domestic resources were invested. Active "pull" policies from rich societies and "push" factors associated with local living conditions favour brain drain from rural to urban areas, and from the South to the richer North of the world.

The loss of trust in multilateralism, the advent of global philanthro-capitalism and the push for a stronger role of the private sector in global health, gave rise to a mushrooming of public-private ventures, an increasing fragmentation of international aid to development, lack of coordination, exogenous models and procedures imposed on recipient countries, with ever increasing transaction and operational costs, in spite of the widely recognised and repeatedly reaffirmed principles of Aid effectiveness (ownership, alignment, harmonization, outcome based management and accountability).

These are only few examples of the increasing complexity of the world scenario and pose new challenges to education and research in the field of health.

Beyond the traditional approaches of "Tropical" medicine - an exotic legacy of colonial times erroneously attributing to geography the origin of diseases - and International Health - narrowly defining intergovernmental relations related to the health sector and medical practice abroad -, Global Health is an emerging area for interdisciplinary studies, research and practice that considers the effects of globalization on health -understood in the comprehensive meaning of a complete state of physical, mental and social well-being- and the achievement of equity in health for all people worldwide, emphasizing transnational health issues, determinants and solutions, and their interactions with national and local systems.

University plays a fundamental role in building new knowledge and competences for Global Health, which obviously links with international and transnational cooperation, starting from a wider reflection on, and rethinking of development. Thus, four areas of research appear to be relevant to the purpose: research on development (what should be really understood as human progress?); research for development (studies on: societal models and policies, methodologies, approaches, technologies, etc.); research on Development Cooperation (studies on: policies, governance, procedures, financing, practices of cooperation, etc.); and, in Development Cooperation (action research, north-south, and triangular collaborative research projects, etc.).

Regarding University's educational mission, higher education institutions dealing with the education of medical doctors and other health care professionals, including professionals trained in other disciplines (economic, social, political, etc.) that will operate in health-related or health-influencing fields, can no longer leave out a comprehensive understanding and consequences of the existing interrelationships between the local and global context. In today's globalized world, the promotion of the awareness of those interrelationships and appalling inequities, and the education of new generations of health professionals committed to social justice has become an ethical imperative. In that direction, the inclusion in the learning process of future professionals of an intercultural exposure and the direct experience of problems and life conditions in poorer societies, represent powerful educational tools.

There is a pressing need to reflect not only on "what is taught" (content) but on "how it is taught", inserting the training of future professionals in a values context that will prepare them to act as citizens of the world, for a world capable of future (in peace, sustainable and equitable). To that end, especially for Universities promoting international development cooperation, providing the students with the tools and the environments facilitating their "learning to be" and their "learning to do it together" should be at the centre of their social role and responsibility.

### ABSTRACT

This paper presents selected partnership experiences between technical universities and NGOs in Italy aimed at promoting Sustainable Human Development (SHD) through formal higher education initiatives. It stems from the GDEE project (Global Dimension in Engineering Education) as part of a series of actions aimed at assessing and reinforcing cooperation between NGOs and academia which is recognized as a key factor in reinforcing the presence of SHD in formal teaching programs at all levels of university education. Four higher education programs based in technical (science and engineering) university departments are presented, which reveal several common traits in their goals, approach and activities. The paper is co-authored by both academic and NGO staff. In all the examined initiatives, partnerships between academia and NGOs both at local and international level are seen as a fundamental element of the educational approach. Thanks to the adopted multi-perspective viewpoint, the paper critically discusses the main strengths, open challenges and future perspectives of the selected initiatives. This preliminary analysis can serve as a basis for programs aimed at systematically reinforcing NGO-University partnerships as a win-win strategy within both the higher education and international development cooperation systems.

### INTRODUCTION

Higher education has a great potential of promoting Sustainable Human Development (SHD), although such potential is often exploited only to a limited extent, particularly in technical studies such as those in science, technology, engineering and architecture, despite considerable progress has been made at international level especially in the past two decades [1]. Within the current international framework, actions that positively impact on the knowledge, skills and attitudinal values of future professionals in relation to SHD are increasingly needed.

There is an increasing demand of future professionals to be equipped with appropriate knowledge, skills and attitudinal values needed to interpret the dynamics that lie and emerge from completely different cultures, traditions, experiences, environments and economies. This need is not restricted to the actors of international cooperation for development but rather it is expressed by a much broader ensemble of private and public actors at both local and international level, as it emerges clearly from different sources, like a 2011 survey carried out by Politecnico di Milano in collaboration with Fondazione Politecnico di Milano and Assolombarda: engineering companies operating in the global context ask for highly specialized technical skills and also for a set of soft skills (interpersonal skills, teamwork, communication, etc.) which represent an added value in the modern context. For this reason, the promotion novel educational opportunities and approaches is increasingly being adopted by several universities at international and national level, often integrating academic curricula with “on the field” activities jointly developed with civil society organizations, thus improving the services offered by academia in terms of professional learning opportunities. The competencies the students can develop within such learning programmes are well recognized by a variety of stakeholders therefore also bringing a competitive advantage to the students in their future hiring process.

However, one of the main gaps that need coordinated action among networks of higher education institutions is a still significant shortage of academics actively involved and committed in fostering and directly introducing the SHD dimension, together with these related learning goals, in teaching activities, particularly in technical studies.

Global Dimension in Engineering Education (GDDE) is a 2-years (2013-2015) EuropeAid-funded project that aims (i) at improving the competences of academics to introduce SHD in the curricula and (ii) at facilitating the engagement of both staff and students in academic initiatives related to SHD. The foreseen activities to achieve such outcomes are i) to produce and spread teaching materials, ii) to train teachers in SHD integration, iii) to promote networking among them, and iv) to link academics with NGOs through formal and non-formal actions at universities. The main foreseen outcomes are the integration of SHD in regular subjects and to set up, in collaboration with civil society organizations (NGOs), other SHD-related activities.

The present paper has been conceived within the fourth project activity, namely the one oriented at reinforcing the linkages between academics and NGOs, and it has been co-authored by both academics and staff from NGOs, with the aim to achieve a critical, multi-perspective view on the subject. It performs a preliminary investigation of the partnerships between academia and NGOs in a series of selected technical university curricula in Italy, which have commonly recognized the added value of such cooperation within their educational approach. More specifically the paper aims to: (1) present together four SHD-related higher education programs in four different technical Italian universities; (2) highlight the role of NGOs in those experiences; (3) discuss the main strengths and challenges of NGO-university cooperation in those programs and (4) briefly summarize the strategic perspectives of this partnership.

## THE EXAMINED, SHD-ORIENTED, HIGHER EDUCATIONAL INITIATIVES

Four educational programs promoted by four different academic institution in Italy have been reviewed with a focus on the role of partnerships between academia and NGOs to promote the development of SHD relevant knowledge, skills and values for students of technical curricula. A summary of the main SHD-oriented experiences of these institutions in technical studies is reported in Table 1 and given below.

**Table 1** - Summary of the SHD-oriented higher education Italian programs examined within the present work.

	<b>CETAMB University of Brescia</b>	<b>Politecnico di Milano</b>	<b>Univ. of Milano Bicocca</b>	<b>University of Trento</b>
<b>Undergraduate level and lower</b>	<i>University seminars and other initiatives with high schools</i>	<i>University seminars and peer education (university and high school students)</i>	<i>Not examined within this study</i>	<i>CIVICAS – 1 ECTS open to all students</i>
<b>Graduate level (Master)</b>	<i>Final degree theses</i>	<i>Final degree theses  “Energy for Development” track of Energy Engineering program</i>	<i>MSc Water Resources Management in International Development Cooperation</i>	<i>“Environmental Management in International Cooperation” track of Environmental Engineering program  Final degree theses</i>
<b>Graduate level (PhD)</b>	<i>PhD in Appropriate Methodologies and Techniques for International Development Cooperation</i>	<i>Individual PhD projects Staff exchange – PhD student from DCs</i>	<i>Not examined within this study</i>	<i>Individual PhD projects</i>

### 1. CeTAmb – University of Brescia

CeTAmb (Research Centre on Appropriate Technologies for Environmental Management in Developing Countries), a research centre of the Department of Civil Engineering, Architecture, Land, Environment and Mathematics (DICATAM) of the University of Brescia since April 2000, deals with international cooperation regarding the technical-environmental aspects, trying to work as a meeting point among the academic world, the international cooperation sector and the young people, in particular PhD, university and high school students. This summary presents the methodological approach proposed and applied by CeTAmb in the implementation of its training and research activities, aimed at playing a role as a scientific technical support for NGOs working in developing countries and, at the same time, involving and training young people (from high-school to PhD students) in this sector.

CeTamb's main objective is the implementation of training and research activities to promote and share knowledge addressed to improve the quality of the environment and the promotion of the concept of sustainable development in developing countries (DCs) through the application of appropriate technologies. These technologies are designed, planned, implemented, managed according to criteria of simplicity, economy and sustainability, while respecting the peculiarities of the context of intervention. CeTamb's main intervention sectors are: drinking water supply and treatment, wastewater treatment and reuse, solid waste management and improved energy access from solid fuels.

The activity is carried out through direct participation in international cooperation projects and through the education programs. This allows to achieve the general objectives of the centre:

- to contribute to the international cooperation sector through the direct participation in projects that are useful and sustainable over time.
- to apply scientific and rigorous methods, promoting research and innovation in the field of appropriate technologies for environmental management in DCs,
- to educate and train young people to the issues of international cooperation.

In order to adopt a multidisciplinary approach in the implementation of these activities, in the years CeTamb has created a network of contacts, including research centres (Italian and international), Italian and local Non-Governmental Organizations (NGOs) and involving actively high-school and undergraduate students and professionals.

Moreover, since 2008, in collaboration with the Faculty of Medicine of Brescia, a PhD course in "Appropriate Methodologies and Techniques for International Development Cooperation" has been activated, aiming to strengthen research in the environmental and health sector.

## **2. UNESCO Chair in Energy for Sustainable Development – Politecnico di Milano (PoliMi)**

The challenge of supporting sustainable development and human promotion has become a mission at Politecnico di Milano in line with the international claim (Lozano et al., 2013), led through the collaboration with governmental, academic and international institutions. The issue has recently joined the specific activities of the Department of Energy, where initiatives like Sustainable Energy for All and the problem of access to energy are being faced, under the UNESCO Chair in Energy for Sustainable Development, which has been established in March 2012.

Activities have been tailored to combine the innovative and rigorous methodologies for the performance evaluation of energy conversion systems with a holistic and creative approach which aims at meeting the constraints of economic, environmental and social sustainability. Research and teaching are focused on strategies for improving energy access and for the impact evaluation of energy project. The activity also counts in the effective contribution of PhD students, coming from Developing Countries.

The general objective of Politecnico di Milano in this initiative is to enrich the new generation of professionals and citizens by promoting methodologies, contents and tools able to face current challenge with a multidisciplinary approach, merging technical aspects with social, economic, policy understanding.

The specific objectives are:

- *Broadening Knowledge and Promoting Research for development*
- Starting from this overall objective, courses and activities aim to prepare a professional figure with a broad knowledge in technical and scientific fields, able to operate in the energy sector at a multi-scale level, including the development of specific technologies and the energy analyses of different scenarios in different areas, by the choice of appropriate solutions and the attention to functionality and empowerment of people.
- *Curricula innovation*
- Courses link theory and practice and are implemented with several actors of cooperation to development, as the NGOs, with the presentation of real cases in which students are involved with a participative approach for their final project work. This gives the opportunity to students to face sustainable development with a comprehensive approach, analyzing international policies and legislation, understanding all interested actors in cooperation, highlighting the interrelation among economic, social and technical dimensions.
- *Enforcing networking and knowledge sharing*
- Staff exchanges and joint projects are implemented in line with the interest of Politecnico enforcing the SHD-oriented network especially with universities from developing countries. The staff exchange is tailored to knowledge sharing: incoming PhD students carry out part of their research activity at Politecnico in order to acquire the tools for effective development of cooperation projects, while outgoing PhD students develop such tools on the field, thus completing their formation.

To achieve those objectives, the main activities are structured as follows:

- *Broadening knowledge and research for development*
- Students are offered to work on MSc & PhD theses in joint cooperation with universities from Developing Countries. Contents are mainly related to: demand side planning in relation to the local framework, multi-

criteria, multi-objective and multi-stakeholders evaluation for selection of strategies in DCs, appropriate technologies and their integration in small scale grid based on RE sources, monitoring and evaluation of the impact for energy project and systems, result chain evaluation for project (from input to outcome), evaluation of the impact over the capitals of the local contest.

- *Curricula innovation*
- PoliMi has implemented a new track on Energy for Development within the MSc in Energy Engineering. It aims at combining engineering fundamentals with a multidisciplinary approach to address global problems by using the required methodology to assess impacts of technological solutions. Two courses within the track are specifically tailored towards these aspects: “Development Economy” and “Engineering and Cooperation for Development”. Students are introduced to the concepts of development, to the roles of the different stakeholders such as Academia and NGOs, and of Ethics and Human Rights. Staff from NGOs actively participate to the courses by presenting real cases where students are asked to solve and deliver a project work.
- *Enforcing networking and knowledge sharing*
- Partnership with universities in DCs has been enforcing through EC-funded projects proposals, aiming at upgrading higher education system on Sustainable Development, Sustainable Energy strategies and North-South cooperation and two lecturers (from Tanzania and Cameroon) are now developing their PhD research at the Department of Energy. Networking is also fostered through annual high level, multi-stakeholder international conferences on the necessary integrated approach to global resource management (water, energy, food), where technology, economic and policy aspects are faced together.

### 3. Water resources management in international development aid – University of Milano Bicocca

The origin of the MSc in “Water Resources Management in International Development Cooperation” is rooted in the cooperation among the University of Milan Bicocca and several national-level NGOs. Active participation of NGOs in the Master occurs both at the management and training levels: staff from the NGOs are part of the Management Board of the Master, together with academics, and are also strongly involved in teaching, where they facilitate tailoring the MSc topics to the evolving framework of international cooperation. Strategic choices related to the development and update of the Master contents have been promoted on the basis of indications and suggestions from practitioners who are active in the field, with the aim to increase the relevance of the taught modules for future employment of the participants. Overall, NGO staff and in general practitioners of international cooperation represent nearly 50% of the teaching staff of the Master.

Almost one third of the learning activities are part of a practical stage in the field with a project of one of the NGOs that is co-managing or externally supporting the Master. Each stage is jointly defined between academics and NGOs to reflect at best the interests of the NGO itself and the learning needs of each participant

### 4. UNESCO Chair in Engineering for Human and Sustainable Development – University of Trento

The strategic goal of the Chair is to contribute to the growth of a new generation of engineers able to make technological choices that promote development in its sustainable, human, social, environmental and economic dimensions. Within such broad scope, education and research topics of the Chair preferentially focus on environmental engineering in a interdisciplinary perspective, in close partnership with actors from the developing world.

The institutional activities of the Chair are part of the undergraduate and graduate programs in Environmental Engineering at the University of Trento. Their general objective is to contribute to the creation of a new generation of engineers, socially and culturally aware and responsible, able to work in interdisciplinary and intercultural contexts and to foresee and assess the overall impact of engineering project on the local communities and on the environment. The key educational activities of the Chair can be grouped as follows:

- *Undergraduate education:* the main activity is CIVICAS, a 1 ECTS short course opened to last-year undergraduate students enrolled at the University of Trento, aimed at introducing the issues of international development in the education of young future professionals, using the perspective of international cooperation for development as a preferential viewpoint. It is a joint project between the Chair, other Departments and the Training Center for International Cooperation (TCIC) and it represents an innovative experience at a national level.
- *Graduate education:* The graduate courses are part of the Track “Integrated Environment and Landscape design in the context of international cooperation”, within the MSc in Environmental Engineering. The specific objectives of this curriculum, a core activity of the Chair, are: (i) to integrate the traditional skills of environmental engineers with knowledge of notions about human and sustainable development, international cooperation, multi-stakeholder participation; (ii) to provide engineering students a first awareness of the international dimension of environmental engineering, also fostering practical experiences in international development projects and (iii) to develop the necessary knowledge and skills for making engineering choices appropriate to the local environmental and social context.

- This Track intends to develop professionals able to design, implement and coordinate environmental engineering projects and programs that fit with the specific social, environmental, economical and cultural context, both at an international and local level. This curricula therefore aims to equip students with the necessary technical knowledge, tools and critical skills needed to detect environmental problems, related causes and underlying processes and dynamics, to identify context-appropriate solution strategies able to integrate environmental protection with sustainable human development. The educational package comprises 6 courses of 6 ECTS each. The methodology integrates lectures with active learning approaches including group activities (Role plays, joint project development), field visits, practical fieldwork (including design and data post-processing). Two internship (short and long) can be part of the program on the basis of the student choice. The short internship is a group work [4], the long one is individual work on environmental issues within a development project.
- *Research and knowitransfer*: the broad thematic competence areas of the Chair are: river management, water supply and sanitation, urban and environmental planning and analysis, biodiversity conservation and forest management, biodiversity policies and development, solid waste management. Within its mission, the Chair promotes applied research activities on the above topics. Research is strongly linked with real-world contexts and the Chair is committed to share and disseminate the research outcomes for practical uses in the field.

## **THE ROLE OF NGOs IN TECHNICAL UNIVERSITY EDUCATION**

The partnerships between the examined SHD-oriented technical academic programs and the NGOs working in international cooperation for development show that the cooperation between these two entities can take different forms. At the educational level they can be grouped as follows:

- *Direct involvement of NGO staff in university teaching*: NGO staff give seminars, series of lectures, often drawing from their direct experience in real project to present case studies, to deepen theoretical concepts, to link together topics that are usually taught under different technical disciplines, or to promote the active learning of the course participants through techniques such as role plays. This mode of cooperation is common to all the examined experiences.
- *Participation of NGO staff in the management of academic programs*: in many of the examined cases staff from NGOs take part in the decision making process that governs the educational program. This promotes a stronger partnership, allows to examine in detail the different interests and needs of both academics and field practitioners. This is seen as a key requirement for a complete development of the educational potential of NGO-University cooperation.
- *Practical experiences of university students in the field*: a shared opinion among the authors is that in all the examined educational programs a key added value is provided by the practical experience of students in the field, in the framework of NGO-led development cooperation projects. This most often takes the form of individual internships aimed at preparing the final degree thesis, but in some cases [4] it can be the stage of a team of students supervised by tutors in the field. In all cases, this constitutes a unique opportunity to translate theoretical knowledge into practical actions, to become aware of the reality of a completely different cultural, social, legal and often also environmental context, and of its implications for working as an engineer or, in general, as a technician. Students learn the basis of planning and conducting technical fieldwork in these contexts and are often involved in post-internship follow up with the partner NGO. It is not infrequent that the outcomes of the internship produce a positive feedback on the NGO's activities in the project, either by promoting its development or by enabling the application of new methodologies for specific purposes.

These modes of cooperation have been developing along a period of time of roughly 10 years for almost all the examined programs. The collaboration often foresees other complementary ways of interaction concerning applied research, knowledge transfer and sharing, joint fund raising strategies, which are out of the scope of the present analysis and are not examined herein.

## **DISCUSSION**

The critical review of the university-NGO collaboration within the examined educational programs has allowed to point the main strengths and critical areas that require improvement and, in some cases, joint revision. The following items emerge as a preliminary interaction among the coauthors, and precedes a panel session at the *CUCSTorino2013* Conference, where it is be expected that further relevant elements will be added to provide a more comprehensive picture.

### Strengths of NGO-University cooperation

There is a clear mutual interest, which has been growing in recent years, to which the relative long duration and stability of many existing collaborations can be related.

NGOs increasingly need professional competencies, from the phases of needs analysis and project preparation to implementation, assessment and post-project monitoring. In all these phases the need emerges of continuously being up-to-date about relevant new theories and applications relevant to the evolving international framework, especially on key priority areas such as climate change, land use, food security, energy and water management. The size and organizational structure of most of the developmental NGOs in Italy does not allow the existence of a permanent, specialized technical staff within the organization able to fit these needs, and support from private technical consultants only is often useful in specific cases but cannot provide a systematic answer. On the contrary, partnership with universities has a strong potential to overcome such limitation.

On the other hand, many universities at the national level, coherently with a broader international academic wave in the past two decades, have been increasingly focusing on SHD in their educational and research activities. Academia can strongly benefit from the field experience of the civil society which can offer many chances to validate/revise their theoretical or modeling approaches based on real case studies. Within their educational domain, universities seek linkages with real-world applications and NGOs working in international cooperation for development represent the most suitable partners for this purpose, because they often have strong roots, established relationships and a privileged viewpoint both in the local and in the international contexts where they operate. The continuous interaction with the world of NGOs ensures the continuous relevance of the educational contents and approaches for the teaching activities themselves (i.e. for the field internships) and for the future students' employability.

The above two viewpoints can match almost perfectly when both parties commit themselves to develop a common language, to understand each others' needs and interests, with the ultimate aim of creating added values to their respective actions aimed at the promotion of sustainability, especially in relation to global priorities like poverty reduction and human development.

### Critical areas of NGO-University cooperation

The first critical element lies in the "strategic" dimension of the collaboration. A proper planning and follow-up of the collaboration among NGOs and Universities and of each student involved in field internships is a key success factor for a fruitful interaction, able to produce positive impacts on both the educational and applied research dimensions. On the contrary unstructured collaborations frequently result into frustrating experiences for both sides that can be exacerbated by the context of isolation which is an inherent part of individual internships.

Besides those related to unstructured collaborations, the main criticalities that have been pointed out within continued NGO-University educational partnerships can be grouped into the following three main categories.

- *Different basic priorities of academics and practitioners:* successful project implementation and ultimate achievement of development impact on the local context is often among the main priorities for NGOs, while Universities are characterized by increasing internal pressures to publish the research outcomes in indexed, peer reviewed scientific journals. While this is inherent in the nature of the two different types of institutions, the way it is managed by both sides can make a difference: in the worst cases it fosters divergences and hinders a successful cooperation, with adverse effects on the learning process of the student.
- *Different constraints in relation to time:* this is highlighted by both academics and practitioners and is often related to the difference in priorities. When NGO projects have a research component, which is partially delegated to supervised students, the timely and professional implementation of research is mandatory. If interests diverge and poor clarification has been made by both parties at the beginning of their cooperation, supervision from either the NGO or the academic side may not be as effective. Sometimes the students may be squeezed between the two constraints, with both positive and negative consequences on their learning process of learning. Theoretical studies might be partially discarded by the student in favor of the application to be completed, and also potentially relevant information cannot be included in the project.
- *Existing gaps in SHD competencies of academic staff:* While there is evidence of recent improvements on this side, still technical support often suffers from the limited knowledge and experience of academic experts about development issues, the local context thus making it hard to match the actual needs of the development programs. Addressing this gap is the key priority area of intervention of the GDEE project, which has motivated the present study.
- *Evolving international university context:* This has been highlighted by only one of the coauthoring institutions: the increasing know-how of local universities and of consultancy firms in southern countries has sometimes reduced the added value of a direct involvement of Northern Universities in technical assistance.

## CONCLUSIONS AND PERSPECTIVES

Albeit preliminary and incomplete, this paper has attempted a first step towards a more comprehensive assessment of the present state, the strengths and critical areas, and of the future perspectives in strategic partnerships between NGOs and universities in technical university curricula in Italy. It stems from the GDEE project (Global Dimension in Engineering Education) as part of a series of actions aimed at assessing and reinforcing cooperation between NGOs and academia which is recognized as a key factor in reinforcing the presence of SHD in formal teaching programs at all levels of university education. It has been coauthored by representatives of all the involved institutions thus allowing integrating and comparing different views and perspectives on the topic. The paper precedes a related panel session at the *CUCSTorino2013* Conference, where it is expected to achieve a more complete view of the relevant elements and actors.

The future perspectives of the cooperation between development NGOs and technical universities in Italy can be derived from an “appreciative enquiry” [5] perspective, through consideration of the positive elements that already allowed facing some of the described criticalities in past experience.

It is the opinion of several coauthors that the outlined challenges can find room for improvement when the cooperation becomes effective all throughout the project cycle, thus providing true educational and research opportunities for academics, who in turn commit themselves to create the necessary working conditions that fit the practitioners’ needs. Such enabling environment makes it possible to share the critical elements as they emerge, which can be better tackled together than separately. Also the inherent differences between the parties can be viewed as a continuous stimulus for a dynamical relationship that stimulates new questions with high potential for innovation.

There is a great, still largely unexploited potential for a broader sharing of practically relevant knowledge resulting from the large number of educational and applied research initiatives. University networks such as CUCS (the Italian University Network for Development Cooperation) can play an important role in increasing the dissemination and impact of new methodologies, theories and applications that are shown by NGO-University cooperation to be relevant in the field. Proper exploiting of this opportunity would positively feedback in the education systems for young professionals of the future.

## ACKNOWLEDGMENT

The contribution of the University of Trento and of TCIC for the work presented in this paper has been supported by the GDEE project, funded through EuropeAid/131141/C/ACT/MULTI 2-years grant (Coordinator: Polytechnic University of Catalonia, Spain) with title “Cross-cutting development education into technology studies”, under Lot 1: Global Learning in the formal education system. The contribution of the other co-authoring institutions has been supported through own grants. This paper does not correspond to one single abstract of the Conference “CUCSTorino2013”, but rather it stems from five abstracts separately submitted by the co-authoring institutions

## COOPERATION PROGRAMS ON EDUCATION AND TEACHERS TRAINING: THE ROLE OF UNIVERSITY AND EFFECTIVENESS EVALUATION

Cristina Coggi\*, Paola Ricchiardi°

\*Dipartimento di Filosofia e scienze dell' Educazione, Università di Torino, Italy, [cristina.coggi@unito.it](mailto:cristina.coggi@unito.it)

°Dipartimento di Filosofia e scienze dell' Educazione, Università di Torino, Italy, [paola.ricchiardi@unito.it](mailto:paola.ricchiardi@unito.it)

This panel outlines the analysis of international development cooperation projects on education and training, which involve the university both as a promoter and as a partner. The aim is to highlight the specific support by universities in developing multi level actions: some of the projects aim at promoting policies to grant everybody the right to schooling, others projects are focused on training professionals, and some others introduce direct tests, in scholastic or extra-scholastic environments characterized by generalized difficulties or by multiple risk factors. The panel collects experiences carried out in different countries, where converging issues can be found, both in the aims of the projects and their results, though on extremely different levels.

F. Zanetti's contribution shows the experience of the University of Bologna in Kosovo. The program, carried out by the Dipartimento di Scienze dell' Educazione, funded by Save the Children and by the Italian Development Cooperation, was aimed at promoting processes of local development and specifically the culture for integration of impaired students. The project was carried out in collaboration with the Minister of Education Science and Technologies of the Republic of Kosovo and with Prishtina University. The initiative led to the realization of a strategic program for the comprehensive education of children with special needs and a coherent project of university training for special needs teachers. The perspective adopted is characterized by three main topics: the empowerment of the participants aimed at avoiding the creation of inferiority and subjection conditions in the targeted groups; the long term sustainability of the actions to counterbalance welfare dependency; the active involvement of the beneficiaries. The proposed model of training, therefore, enhances the teachers' social competences, turning them into innovation carriers, as active protagonists within the projects as well as subjects able to detect different needs throughout the territory and to provide comprehensive and adapted answers.

The contribution of C. Coggi and P. Ricchiardi from the University of Torino, on a similar theme, proposes an appraisal and sustainable training model for educators and teachers, tested in Brazil and in some countries of Central America and Africa. These training modules are tightly connected to empirical tests, aimed at detecting learning difficulties in students who grew up in multiple risk factor conditions, the most suitable programs and the training needs of the professors. The survey carried out focused on the specificities of the role of the university in a fruitful cooperation with NGOs and scholastic institutions based in the analyzed territories. The University should first of all *make an in-depth analysis of special needs*, concerning the training requirement, which often comes out as the teachers and educators' difficulty in dealing with complex learning problems as well as significant delays in *school readiness*. Observational studies and targeted surveys shall be carried out, aimed at outlining any specific student weaknesses and the needs of the professionals. Thus the research groups shall *elaborate on the identified issues, aligning them within a written international framework*, in order to *define innovative action programs* to propose to local professionals, so that these can access them and adapt them to the needs within their specific contexts. Hence, the University can start pilot studies, with the support of local professionals, in order to study and select the most effective actions to meet the required needs, checking both on short and medium term results. Based on empirical evidence, the constituted group of international research, also involving local universities in a profitable synergy, can organize *training sessions* for the professionals acting in the analyzed territory. Such actions are necessary to encourage the sustainability of the actions proposed and must be performed in compliance with the modalities of actively involving the people they are targeting. Concerning this item, the research group has tested two different models. The first is the responsive model, constructing knowledge and offering methodological directions to the people involved in training, starting from their requests for learning support. The second is the *training-research model*, foreseeing an initial sharing of the principles of the proposed method, in order to offer an orientation based horizon to those that these actions are targeted towards; a phase of familiarization and re-alignment of the materials of the group; some lab simulations and finally pilot experiments in classrooms and with the support, remotely, of the research group of the University, and of local NGOs. The University validates the approach and summary *assessment of the effectiveness* of the proposed interventions and actions, involving all the players, and the *socialization of the results*, through publications in the several involved Countries.

A research group from the University of Torino verified the model in Central and South America and Africa. The team carried out special studies on learning difficulties, developing consistent training actions, in order to develop within local professionals, strategies of cognitive and motivational empowerment of pupils with special needs. The proposed training model is aimed at increasing the competences of teachers in cognitive and emotional-affective mediation, by using a recreational approach to learning, which uses play-materials for pupils aged between 3-6 years and free online teaching software for pupils aged between 6-11. Teachers and trainers are offered an intuitive knowledge-based teaching structure, in small groups, through an involvement experience, focused on essential core

disciplines, in languages, mathematics and logic. The programs started in the countries where this cooperation is happening foresee, at least for the primary school, the use of computers, also improving digital awareness. Technology transfer though, creates several sustainability issues, mainly linked to the need to keep the hardware working, to update software and to access the web. Further difficulties the group of research had to deal with, in carrying out the programs of cooperation, concern above all, the selection of local skilled professionals ready to manage the coordination and to support the activities, once the training and pilot experimentations have been concluded. Institutions have not always been able to be in charge of the program. Where this happened (ex. Minas Gerais) it was clear that the teachers trained in several schools had accepted the principles of the method, substantially modifying their approach to the teaching criteria in their classes. This result was acknowledged and appreciated also by local authorities.

The panel illustrated the two formative models in an analytical way. T. Bonasso presented the training research-action presentation carried out Teofilo Otoni, in Minas Gerais. R. Trincherro presented the responsive model performed at Kigali in Rwanda.

Formative experiences have covered the themes of cognitive enhancement which exploited games on calculators. The intervention in Africa was divided into the following steps: 1) tracking of the expectations and preliminary knowledge of the participants; 2) software based re-aligning; 3) exposure of the basic concepts of cognitive enhancement; 4) comprehension test and feedback of participants-trainer and trainer-participants; 5) tracking of the problems met on the field by teachers, based on the acquired theoretical knowledge, with case studies; 6) isolation of paradigm problems and exposure of possible techniques and action strategies; 7) planning of class interventions and first preliminary experimentations; 8) final test with the request to participants to describe possible actions they would like to undertake in class, based on what they learnt during the course. In both situations, Rwanda and Minas Gerais, the activities are continuing thanks to the collaboration of NGOs and the involvement of local authorities.

## **FROM A DISCIPLINARY APPROACH TO THE CULTURE OF INCLUSION: THE ROLE OF THE DEPARTMENT OF EDUCATION STUDIES OF THE UNIVERSITY OF BOLOGNA IN THE PROJECT “INCLUSIVE EDUCATION FOR CHILDREN WITH DISABILITIES IN KOSOVO”**

Federica Zanetti\*

\*Department of Education Studies “Giovanni Maria Bertin”, University of Bologna, Italy, [f.zanetti@unibo.it](mailto:f.zanetti@unibo.it)

### **ABSTRACT**

Particularly over the past decade, the Department of Education Studies of the University of Bologna has consolidated its role in education and consulting in the field of socio-educational interventions in international cooperation. In different contexts and with different social stakeholders, the common purpose has always been to foster the development of autonomy and construction of aware identities by the inhabitants and communities in the project territories. In the latest project, funded by Save The Children Italia Onlus and the Italian Development Cooperation, from 30/11/2012-30/04/2013, generally aimed to contribute to the inclusion of more vulnerable groups in the economic and social life of Kosovo, starting from school. With 50% of the population aged under 25, the implementation of quality inclusive education starting from pre-school age for all citizens, whatever their ethnic, social belonging, their disability/ies, represents a priority for the Government for the development and democratisation of the country. A specific objective is to guarantee access to quality preschool and primary education for children with disabilities in 8 municipalities of the 7 regions of Kosovo. The operational plan of the project was based on the cooperation between Save the Children, the MEST “Minister of Education, Science and Technology” of the Republic of Kosovo, the Faculty of Education of the University of Prishtina and the Department of Education Studies of the University of Bologna with the aim of: - implementing the “Strategic plan for organizing inclusive education for children with special educational needs in pre-university education in Kosovo”, drafted by the MEST; - providing technical support to the MEST and the University of Prishtina for drafting a teacher training plan for teachers and support teachers, based on inclusive education (establishment of a Master Course of Inclusive Education; renewal of the Preschool Programme and Primary Education Programme with a view to social inclusion); - viewing and knowledge of the Bologna degree programme for support teachers; - activating and supporting a process of renewal in teacher training, recalling the social function of school and professionalism which may be a factor for innovation in the quality of course contents in new training courses and social policies.

### **CONCEPTUAL ORIENTATION FOR DEVELOPMENT COOPERATION AND THE NEW ROLE OF UNIVERSITY COOPERATION**

Socio-educational and learning interventions in the context of development cooperation cannot be removed from an in-depth reflection on the very concept of cooperation and development, in relation to social transformations and new global scenarios, which demand models and practices that take account of sustainability, governance and an educational dimension that is increasingly linked to autonomy, participation and inclusion.

The aim is to analyse new potential conceptual orientations, through models, instruments, thoughts on good practices that offer ideas for adjusting the aim of intervention policies. This means starting from changes in the complex concept of development in order to be able to define new cooperation instruments and models.

The concept of development dates back to the post-war period, defining the process through which, thanks to the support of more industrialised countries, "backward" countries would have reached the same level of so-called progress, in the name of modernisation and economic growth, in a western, post-colonial perspective. According to this meaning, antinomies are created that are still very difficult to overcome, despite their inadequacy: developed/developing, rich/poor, industrialised/non industrialised.

Around fifty years later, during which time economic growth has not managed to achieve the illusory objective of putting an end to poverty, we examine the profound contradictions that mark the activities undertaken with a view to development, which is still very often perceived as more in terms of damage than of opportunity. The attempt to create a fairer world has failed, the global socio-economic divide has taken a stronghold, the difficulties caused by development have increased where the poverty of certain groups or countries has been used as a pretext to promote investments with positive effects mainly in the richer countries.

In the 1990s a new concept of development took hold, with a different meaning: “human”, combining the criteria of

social progress with those of economic progress; “sustainable”, implying a focus on the conservation of natural resources and respect for the environment; “participatory”, considering the process of democratisation and the protection of human rights. A new concept of poverty and social exclusion took hold, the prelude to a vision of intervention no longer oriented to a compensatory action but rather to participated development blending solidarity and entrepreneurship, aiming to foster processes to strengthen social networks and cultural change following logics of empowerment [1].

This therefore led progressively to an approach to development marked by: a new awareness of the multidimensionality of development (and the consequent loss of centrality of economic growth); from a vision of development as an equality of opportunities to realise one's own skills (and therefore the possibility to choose); from the establishment of the global dimension of development processes, making the north and south of the world of common interest; from the recognition of the plurality of parties to development and the consequent need to ensure complementarity between the actions of different parties with different, public and private natures.

In continuing to investigate the complex idea of development of both society and individual, and on the nature of the poverty that can be eliminated by development, the educational dimension holds a broader social function: on one hand, it becomes strategic and transversal to all types of interventions focusing on human development, and on the other, the complex weave of elements described above have made the processes of negotiation and construction of joint meaning, which must be tackled by operators in the field, more difficult and complex; in order to work effectively the problem of competencies and training becomes fundamental and strategic.

Precisely in the light of the analysis of this scenario and the new role played by the educational dimension, since 2000 the Department of Education Studies has set a priority twofold objective. The first is to develop competences suited to the complexity of these new humanitarian aid and development cooperation contexts that are able to promote relations between cultures and the capacity for social and cultural change through the empowerment of human resources in local communities. In the field of socio-educational intervention, in particular, the lack of skills leads to methods of action in which the undoubted inspiration of solidarity risks being accompanied by choices of an exclusively assistential nature or even to more or less aware introduction of burdensome elements of cultural colonisation which do not foster the development of growth processes for the autonomy and construction of aware identities among the inhabitants of the territories involved.

The second is that of overcoming the dominant logics of emergency among cooperation stakeholders. Projects work mainly in a perspective of immediate intervention, aiming to guarantee the survival of populations and the structural recovery of services: consequently, cooperation workers and project volunteers often have more sense of commitment and human solidarity than the skills required for long-term support interventions that are functional to accompanying the slow process of requalification of the realities affected by conflict from the inside. There is a clear difficulty in connecting humanitarian emergency interventions with organic choices and assistance in development: substantially, the ability to promote development "from the inside" which would constitute the most qualified professional heritage of international cooperation.

The participation of university experts (working in the design, management and assessment of interventions in the socio-educational field) in international cooperation agencies (the United Nations, national and international NGOs, the Italian Development Cooperation office of the Ministry of Foreign Affairs), has covered and continues to cover various sectors, from basic education (for children and adults), social services also in emergency situations, the prevention of children's distress, the fight against the sexual exploitation of minors and child labour, up to processes of teaching innovation and social and school inclusion, again in the field of medium and long-term interventions, able to contribute to the local implementation of experiences that accompany the perspectives of education with those of the promotion of peace and socio-economic development and always pursuing the purpose of human development and support for vulnerable groups and those at risk of social exclusion.

## **THE PROJECT “INCLUSIVE EDUCATION FOR CHILDREN WITH DISABILITIES IN KOSOVO”: THE REFERENCE FRAMEWORK**

In the latest project, funded by Save The Children Italia Onlus and the Italian Development Cooperation, from 30/11/2012-30/04/2013, generally aimed to contribute to the inclusion of more vulnerable groups in the economic and social life of Kosovo, starting from school. With 50% of the population aged under 25, the implementation of quality inclusive education starting from pre-school age for all citizens, whatever their ethnic, social belonging, their disability/ies, represents a priority for the Government for the development and democratisation of the country. A specific objective is to guarantee access to quality preschool and primary education for children with disabilities in 8 municipalities of the 7 regions of Kosovo. The operational plan of the project was based on the cooperation between Save the Children, the MEST “Minister of Education, Science and Technology” of the Republic of Kosovo, the Faculty of Education of the University of Prishtina and the Department of Education Studies of the University of Bologna with the aim of:

- implementing the “Strategic plan for organizing inclusive education for children with special educational need in pre-university education in Kosovo”, drafted by the MEST;

- providing technical support to the MEST and the University of Prishtina to develop a teacher training plan for teachers and support teachers, based on inclusive education (establishment of a Master Course of Inclusive Education; renewal of the Preschool Programme and Primary Education Programme with a view to social inclusion);
- understanding the degree programme for support teachers (specialisation programme for teaching support activities envisaged under MIUR decree of 30 September 2011);
- activating and supporting a process of renewal in teacher training, recalling the social function of school and professionalism which may be a factor for innovation in the quality of course contents in new training courses and social policies.

Specifically the teaching staff of the Department of Education Studies of the University of Bologna (composed by Roberta Caldin, Roberto Dainese, Elena Malaguti, Elena Pacetti, Federica Zanetti) coordinated the work of the group consisting of professors of the Faculty of Education of the University of Prishtina, the representatives of the MEST and the staff from Save the Children, agreeing on some aspects that characterise the approach to inclusive education.

The project is set within a context marked by social and educational change in which the Ministry of Education, Science and Technology and the Faculty of Education, University of Prishtina play an active and strategic role for the development of Kosovar society, as demonstrated in a number of reference documents:

- *Strategic plan for organizing inclusive education for children with special educational needs in pre-university education in Kosovo 2010-2015*, Ministry of Education, Science and Technology, 2010;
- *Administrative instruction. Professional assessment of children with special instructive-educational needs*, Cabinet of the Minister, Ministry of Education, Science and Technology, 2012;
- *Personnel qualifications working with students of special education needs*, Cabinet of the Minister, Ministry of Education, Science and Technology, 2012;
- *Criteria for election of assistants and instructors for inclusive education and their obligations*, Ministry of Education, Science and Technology, 2012;
- *Current Status and the Future*, Faculty of Education, University of Prishtina, 2012.

Since the 1950s the education system in Kosovo has run special schools, differentiated according to different types of disability; only since 2000 have the first steps been taken towards the integration of children with special needs in the mainstream school system. However, it was not until 2007 that educational policies began to move towards inclusive education. As underlined in the document “Strategic plan for organizing inclusive education for children with special needs in pre-university education in Kosovo 2010-2015”: *“This strategy reflects the close cooperation and consensus of many partners who contribute to the development of this process in central level, local level, civil society, professional organizations etc. Strategic document has summarized all the concerns and challenges that accompany this process by defining its purpose and vision and strategic objectives such as: early identification and intervention and increase the inclusion of children with special educational needs; provide and strengthen support mechanisms for inclusive schools; professional development of educational personnel; improvement of physical infrastructure for inclusive schools and increase awareness on inclusive education. A the same time it provides ideas and concrete activities for the realization of these objectives. Establishing an inclusive educational community is the duty of each member of society, therefore it remains the responsibility of each of us to give the maximum contribution to the implementation of planned activities being convinced that it is the society the one who benefits the most”* [2].

The process initiated by Save the Children, with the involvement of the MEST and the Faculty of Education, University of Prishtina is innovative and complex, and goes beyond mere school; it is a cultural transformation which changes the relationship between school, family and society, among the teachers in the schools; it changes the university context and the approach to knowledge by both students and teachers.

OVERVIEW INCLUSIVE EDUCATION

- By end of 2012, Inclusive Education program has reached **10,162** children, including children with disability, Roma, Ashkali and Egyptian children, IDP communities.
- All gaining access to & benefiting from quality pre-school, pre-primary and primary education and non-formal education.
- Working in in 9 pre-primary & 12 primary schools, in 8 project locations (one new municipality in 2013)
- Supported training of teachers for IE methodologies
- Established 8 regional resource centres.
- Directly working with MEST, MED, CSO, kindergartens, pre-primary and primary schools, parents and children.

**Fig. 1 - Final Workshop: Perspective of Inclusive Education in Kosovo, Prishtina, 18 April '13. From the presentation “SAVE THE CHILDREN IN KOSOVA/O Implementing Inclusive Education Model in Kosova/o” by Ahmet Kryeziu, Country Director, Save the Children in Kosova/o.**

Talking of inclusive education in the training of teachers and specialist support figures means first of all rediscovering and promoting the social function of school. Priority tasks of schools of all levels are both the learning and socialisation of students. School sets out to remove or overcome the obstacles which prevent or hinder the full individual and social realisation of the individual and the community they operate in.

Inclusive education requires the profound modification of traditional teaching methods. It demands teaching that is able to blend the right to equality with the right to diversity. In other words, it requires teaching which, on one hand, is able to pursue strategies of individualisation, adopting tools that as far as possible put students in a condition to achieve the same objectives, and which on the other hand, allows individual students and groups of students to develop personalised competences according to their own specific motivations and resources.

The framework of rights establishes the passage from a model of primary exclusion, insertion and integration, to the current model of inclusive pedagogy and education, focusing on the prospects of inclusion and specifically of educational processes. In 2011, aiming to develop policies and projects targeting people with disabilities, the World Health Organisation and the World Bank produced the *The World Report on Disability*[3], which includes a specific section on education and childhood. Recognising the greater risk of exclusion and emargination from society lying in the condition of disability compared to the population without disability, it aims to provide useful indications for steering innovative policies. The document clearly highlights how the presence of conditions of disability “today” still suffers from forms of discrimination and the undermining of human rights, even more so for women and children with disabilities. From this point of view, the Convention on the Rights of Persons with Disabilities promoted by the United Nations in May 2008 offers strong support. The report marks and epoch-making change in the protection and support policies targeting people living in conditions of disability. Among the innovative elements it brings is the passage from a vision of incapacity as an individual problem to the possibilities that the context can offer in order to eliminate all obstacles, barriers and prejudices. Disability is therefore a relationship between a person's characteristics and the way in which society considers and faces them.

It therefore introduces a solution for tackling the issue of diversity based not so much on health care but rather on social inclusion policies. The reflections emerging from recent international legislation (UNESCO [4], WHO [5], UN [6]) on inclusive education revolutionise the way of conceiving the approach to disability and vulnerability and through the assumption of responsibility force us to revise the referred cultural models and implicit theories which guide day to day educational practices.

In international legislative documents, the concept of inclusion is closely related to the concept of right, non-exclusion, equal opportunities, which requires schools to take on board all children, with all their differences. Inclusive education is linked to the right to life [7], understood as the right to “quality of life”, which depends on social participation and the sense of common belonging. Inclusion in social life passes through inclusion in school; as a new educational model, the inclusive perspective recalls our responsibilities as educators, trainers of future teachers, and demands a change of paradigm towards the cultural reference models respecting the greater interests of children and their rights and duties [8].

## **FROM THE DISCIPLINARY APPROACH TO THE CULTURE OF INCLUSION**

In the Republic of Kosovo the school system and the university training system have begun a process of innovation which moves from the right to access to school for children with disabilities to their full inclusion in school and social contexts (community-based approach, informal education...). This process also demands renewal in the field of teacher training, which lacks specific competence in this area; in the quality of the contents of the new learning paths and in social policies.

As Lulavere Behluli, from the Ministry of Education, Science and Technology, stated in the report “Inclusive education in Kosovo: vision, plans and challenges for the future”, during the final workshop “Perspective of Inclusive Education in Kosovo” - Prishtina, 18 April 13 – the inclusive approach does not remain limited to the disciplinary contents of special pedagogy, but opens up to new needs and new challenges:

- it must be part of all the faculties providing training for teachers and other educational figures;
- it must be a characterising element of the training of teachers of all levels;
- it must be included in senior school curricula focusing on inclusive education;
- it must be further studied through field research.

The work carried out by the teachers of the Department of Education Studies aimed to respond to these learning and cultural needs by tackling two particularly important aspects.

The innovation of Preschool Programmes and Primary Education Programmes in an inclusive perspective is possible only if the social professionalism of the teacher is recognised. The traditional professional dimensions of the teacher, focusing on the possession of specific disciplinary and teaching skills depending on the specific role covered, must be accompanied by dimensions of social competences which aim to support the general role of the school. Social professionalism of teachers mainly concerns the following competences [9]:

- competences concerning the reading and critical analysis of the complex social, cultural and economic context in which the school lies;
- competences concerning the measurement and interpretation of the specific social conditions of every pupil and the class groups with which they work directly;
- competences in the field of collaboration with all staff working in the school;
- interpersonal competences for communication with the pupils' families;
- competences to collaborate with the services and operators who support students with certified deficits or in any case with disabilities deriving from individual psycho-physical conditions or situations of social disadvantage;
- competences in planning and local cooperation;
- competences in the documentation of individual and group learning paths for pupils, as well as their families and the local community.

The second aspect concerns an analysis and comparison of what it means to adapt course contents to an inclusive approach in university programmes.

Building the foundations for design in inclusive schooling means starting from the consideration of the educational group as a resource, a potential for learning and socialisation, a possibility for the school to represent the place where inclusion practices are implemented in order to foster participation in the social, cultural, economic and political life of the community.

For the teacher, this implies transforming one's own vision of the class from linear to systemic-circular, from considering separate individuals to enhancing their network of relationships. The “bureaucratic” class becomes the class-group through the intersection of three different levels: the personal level, through which the teacher deals with the emotional plane, experiences and lives of every student; the interpersonal level, in which the teacher focuses on the way of communicating, the methods through which the students build their own relations; and the systemic level, through which the group is considered as a subject of construction and transformation both in terms of learning and socialisation [10].

There are three fundamental strengths in the reference framework of inclusive schools, in which inclusive education becomes a driver of the process of promoting social inclusion:

1. children learn more and better in an environment where they feel appreciated and in which their abilities are enhanced.
2. An effective teaching style must link teaching experiences with the personal experiences of the pupils, for the learning to acquire meaning. In this perspective, in heterogeneous groups, collaborative learning, the main characteristics of which include positive interdependence, individual and group responsibility, constructive and direct interaction of co-construction processes and sharing of knowledge and group assessment, becomes an added value.
3. Upturning the paradigm, focusing attention not longer only on the missing elements and deficits but also on a global vision and an approach to multi-factoral and multi-perspective health. This approach does not in any way exclude the biological dimension (the knowledge of limits and deficits) and specific enabling, rehabilitating and education interventions, but recognises the individual as historical and historicised within a true reality (and therefore inclusive as it also includes disabled persons, those with special education needs, vulnerable people or those who live in conditions of marginality, poverty and exclusion); it also contemplates the philosophical, cultural, historical, mental, social and educational dimension, and the relationships which are built with the territory as a whole.

These elements, shared and discussed during the work carried out during the various missions, were included in training the teachers involved by Save the Children, and are included in the documents of the Ministry, which outline the future direction of educational policies and which were accepted as new challenges for the processes of change in progress in the University, particularly the Faculty of Education.

The innovative path taken represents a long-term challenge, a new allegiance with the territory and society as a place of differences, not only linked to disability, but also to cultures, genders, identities, a transformation that implies a passage from the “special” disciplinary approach to the culture of inclusion, from the theory to the practice of inclusive education, from the inclusion of “one” to the inclusion of all, from sensitivity to professionalism based on training and competences.

These aspects of the educational dimension of international cooperation underline new sensitivities and visions of international aid, including human development and the promotion and protection of human rights, with specific attention on the child, recalling the need to use specific methods and competences in social and educational work.

These cannot be removed from three fundamental dimensions:

1. empowerment: the process through which a person generally excluded from power and decision-making becomes able to exercise his own powers, and make his own choices. In education, the concept of empowerment refers to educational interventions which aim to place their interlocutors (and no longer mere recipients of the intervention) in a condition to be able to become or re-become stakeholders responsible for

their own life and choices, in the present and the future. Empowerment is therefore the opposite of any educational intervention which creates dependence and subjection in the persons or groups it targets.

2. Sustainability of the projects we implement and the processes we activate, we must consider the capacity of the project to be sustainable for the community, which has to organise resources in order to be able to take care of common goods and protect its own rights. It is the opposite of assistentialism.
3. Inclusion: there can be neither development nor well-being without allowing the populations involved to take a leading role and be beneficiaries of the interventions carried out in their territories and their relative changes.

The promotion and enhancement of organic collaboration of university staff with the academic and non-academic world of development cooperation can strengthen innovation and experimentation, like a generative action which proceeds through processes of action-knowledge-action for subsequent experimentation and the formulation of new hypotheses and new projects. Among these, for example, the promotion of exchanges coordinated by university staff; the coordination and participation in international interdisciplinary research and collaboration in order to promote, through training and support to research and experimentation, pedagogical and social innovation, the development of skills in the persons and institutions with responsibility for education, care and aid in situations of suffering, distress, exploitation, disadvantage and difficulty; the promotion and experimentation of educational and learning methods and activities to foster equal opportunities and the enhancement of individual and group differences; the promotion of ideas and practices of “community education”, which underline the need to build an education system into which all educational resources flow with a view to collaboration and avoiding phenomena of the total delegation of education to individuals, which identifies the educational dimension as a fundamental factor of living together, participation and the democratic development of the community.

### ABSTRACT<sup>1</sup>

The aim of the present paper is to illustrate a model for implementing cooperation and research actions, focusing on developing education interventions in contexts that exhibit multiple risk factors. It involves an articulated model, one that has been tested through years of study and interventions in the field, and which comprises: 1) an adequate identification of education needs in the cooperation context; 2) structuring and elaboration of interventions, instruments and methods that are appropriate for local specificities; 3) implementation of training-research actions with teachers and educators in the cooperation country; 4) pilot implementation of interventions in schools, with the support of NGOs and Italian university students (appropriately trained via workshops and stages in Italy); 5) implementation of systematic experimentation and results evaluation. Such a model has the advantage of encouraging the active involvement of all subjects, the progressive acquisition of a method on the part of local professionals and the construction of an international research group. Critical features for the most part concern willingness/possibility of involvement on the part of various subjects and the difficulty of sustaining education interventions that are additional relative to scholastic programmes and which require local resources that are not always available.

### INTRODUCTION

Planning and implementing interventions in support of the rights to education for children who live in risk contexts is a complex challenge, which can be tackled effectively only by means of a significant commitment of research on the part of the University, with the active involvement of international cooperation organisms and the synergic commitment of a variety of actors. This makes it possible to create networks that facilitate relationships and the willingness to get involved on the part of the scholastic institutions that constitute the addressees of the training actions.

In this triangulation the role of universities consists mainly in elaborating innovative interventions, based on international literature, and in the implementation of controlled experimental verifications. In this way it is possible to construct a patrimony of reliable knowledge that can then be shared with the various partners involved in the cooperation, constituting transnational research groups. In this interaction the role of university students (or persons who have just acquired their degrees) can also be significant as a vector of innovation in countries in the Global South. Involvement in such projects is also extremely beneficial for university students who can thereby acquire research skills, flexible didactic strategies that are attentive to contexts, cooperation values and intercultural dialogue abilities.

### A COOPERATION MODEL

The present paper illustrates a research and cooperation model, elaborated by a workgroup at the Department of Philosophy and Sciences of Education in the University of Turin, to implement cognitive and motivational reinforcement interventions in contexts involving deprivation or socio-environmental risks. Such interventions involve the activation of workshops to encourage literacy skills and the scholastic success of pupils experiencing learning difficulties in countries in South and Central America and Africa. These interventions aim not so much to recover scholastic knowledge, but to activate cognitive processes in children who are often significantly behind in their development and to stimulate learning motivation, something that is lacking in socio-cultural deprivation contexts. In those contexts, exhibiting serious risk factors (natural catastrophes, wars...) there is provision for a specific supplementary intervention on creativity, to reinforce children's resilience (i.e. the ability to successfully deal with and overcome traumas).

The intervention model, progressively developed through analysis and various experiences, involves collaboration between universities and NGOs, based in the territories under consideration, and those scholastic-education institutions involved in improving the quality of didactics and pupil success.

The cooperation and research plan is structured in various phases, considered essential in integrating the education

proposals in the local culture, in order to increase their persistence and hence their “sustainability”, and encourage the acquisition of skills and maturity in global citizenship behaviour in the various protagonists involved.

### 1. Identification of context requirements

The model, inspired by an action-research approach, involves an initial needs analysis phase performed in the context in which the intervention is required. The difficulties are first conceptualized, with exploration of the international literature, in order to identify their etiological factors and to focus possible interventions. The analysis of problems is also implemented using direct methods, including interviews with privileged witnesses and the adoption of in-field observation techniques (diagnostic tests, questionnaires and discussions with local teachers and managers...). University students are often involved in carrying out such observations in loco, in systematically gathering documentation and in transmitting it to the research group.

We set out below some significant elements taken from input diagnoses, executed in two contexts in which we carried out cooperation projects: Minas Gerais (Brazil) and Santa Marta (El Salvador).

In the first case (example 1) the observations were carried out by university students and by local teachers with the collaboration of an NGO.

---

#### *Example 1 - Minas Gerais - Brazil – Identification of learning difficulties in children*

The following is a summary table of the main problems observed in linguistic and mathematic contexts at Teofilo Otoni in infant and primary schools, obtained via the distribution of questionnaires to teachers.

**Tab. 1** – Difficulties identified by teachers

<u>Language difficulties</u>	<u>School level</u>	<u>Mathematics difficulties</u>	<u>School level</u>
Colour recognition. Lateralization problems. Spatial perception problems.	4-5 years	Association of numbers and quantities.	Infant sch. (4-5 year olds) Primary sch. (all classes)
Oral comprehension of instructions. Distinction between lower and upper cases.	Primary sch. (2nd class)	Problems in graphically distinguishing one number from another.	Infant sch. (4-5 year olds) Primary sch. (all classes)
Letter recognition.	Primary sch. (2nd, 3rd classes)	Recognition of numbers up to 10.	Primary sch. (2nd, 3rd classes)
Syllable recognition. Autonomous writing of one's name.	Primary sch. (2nd, 3rd, 4th classes)	Recognition of numbers beyond 15.	Primary sch. (3rd, 4th, 5 <sup>th</sup> classes)
Separation between various words. Autonomous writing of simple words.	All classes	Execution of simple additions and subtractions up to 15.	Primary sch. (3rd, 4th, 5 <sup>th</sup> classes)

The survey carried out with teachers highlights the serious deficiencies of pupils in terms of readiness prerequisites and basic skills relative to reading and writing. To extend the analysis individual tests were also administered, relative to infant schools, together with structured language, mathematics and cognitive processes tests in the primary schools. The results were discussed with teachers to motivate them and involve them in recovery activities. Below we provide a graphic that sets out, in the form of a cognitive abilities profile, the results of a sample of children aged 5 at Teofilo Otoni. This profile was compared with that of Italian children in order to more clearly highlight the specific difficulties experienced by the Brazilian group. The same indicates systematic delayed development in the Teofilo Otoni children in disadvantaged communities in almost all cognitive abilities when compared with the standards for their Italian peers experiencing similar poverty and migration contexts (fig. 1).

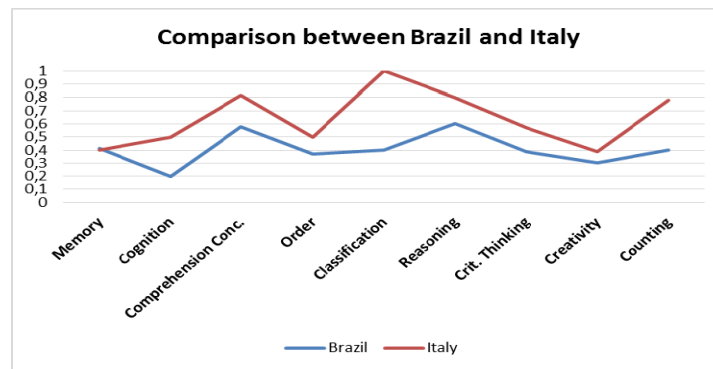

Fig. 1 – Comparison between Brazil and Italy

In the following example (e.g. 2) the observations, carried out at Santa Marta in El Salvador, were the work of NGO professionals (psychologists). The data has been further explored thanks to the systematic observations of an Italian university student.

**Example 2 - Santa Marta – Observation carried out with the collaboration of an NGO (Psychologists)**

We set out in descriptive form some results of an analysis similar to the previous one, carried out relative to children in primary school at Santa Marta in El Salvador. In this context, scholastic delay can be attributed mainly to the effects on the second generation of the civil war (1981-1992), which generated significant traumas in adults (teachers and parents) and indirectly in the children. Given the difficulties experienced by teachers in getting involved, the first analysis, which we report, was carried out directly on pupils in a primary school, via the administration of entrance tests regarding reading-writing skills, mathematics and cognitive processes. The sample comprises two 4<sup>th</sup> year classes, relative to which a realignment intervention was requested.

Among the main results, it can be seen that 20.97% of the children in the two classes were illiterate; 33.87% can read a few words, but do not know how to write. In mathematics, on average, the students answer less than a quarter of the test questions, which involve the solution of two simple problems and the performance of calculations, with four operations, for the most part with one or two figures. Success in logic questions is on average greater when the questions are cultural free: in this case, on average, pupils correctly answer 59% of the items. This indicates that difficulties are largely due to socio-cultural deprivation. In this regard it is significant that it is not possible to forecast the cognitive level of the pupils relative to their success in language ( $r=0.19$ ), while there is a significant correlation between the results of questions regarding cognitive processes and results in mathematics ( $r=0.57$  with  $p<0.01$ ). The results in reading and writing therefore seem to underestimate the cognitive potentiality of the children, who exhibit serious difficulties in their cognitive processes in only 3% of cases, but considerable delays in their reading and writing processes.

**2. Planning interventions relative to specific contexts**

Based on the needs emerged in the initial analysis, education interventions were elaborated to reinforce deficient abilities and the motivational resources of pupils with more difficulty. The first interventions in this line were elaborated by us and introduced in Brazil, with the involvement of UNEB (University of Bahia). The first pilot experiments for the method were realised by a Brazilian psychologist-pedagogue, in a school constructed and supported by Italo-Brazilian cooperation. The project was named Phoenix, referring to the mythological bird that recreates itself from its own ashes, symbolizing the hope that all children can enjoy success in their lives. The logo for the project (fig. 2), which formed the basis of a collective identity, was designed and elaborated by a Brazilian UNEB Design student, born in a shantytown, and selected from among various competitors by the international research group. The symbol embodies the essence of the project and the type of cooperation involved, integrating the colours of the Italian flag with those of the Brazilian flag.

Fig. 2 – Phoenix Logo

The success of the method in Salvador de Bahia led to the extension and adaptation of the same to other Brazilian contexts (Minas Gerais and Pernambuco) and to disadvantaged Italian environments. Experimentation in Italy allowed the method to grow and develop further, given the opportunity for continually monitoring the experiment and the possibility of differentiating between infant, primary and first year secondary schools. Parallel to these developments in the project were carried forward in French, the appropriate language for contexts like Rwanda, Madagascar and Haiti, together with an experiment in Spanish, which was launched in El Salvador.

The programme, precisely because it was the fruit of the efforts of workers from various countries, stands as a transcultural didactic model, which is effective relative to common risk factors in very different contexts, with appropriate adaptations. Training in the various countries focuses on the main objectives of the project i.e. the stimulation of specific cognitive and motivational processes, and general theoretical references. The materials relative to which the action is applicable, and the privileged ludic forms are, on the other hand, the subject of re-elaboration in the various cultures, carried out by Italian researchers in partnership with local experts, teachers and educators. In each country, referents are identified who provide the required indications for rethinking the activities and the modalities for realising the project, in forms that are appropriate for the context. Relative to infant schools, where the approach is entirely ludic, the symbolic game is the one that requires the most transformations, since play objects, narrative traditions and the social roles that have to be learned as well as the known contexts are different in different countries. In addition, space and the importance attributed to symbolic play seem to be remarkably deficient in some cultures, with long-term effects on creativity and the capacity for abstraction in children. It is therefore necessary to regulate their introduction, in line with the features of each context.

In the same way, given the frequent experiential poverty of children in those contexts in which the project is implemented, interventions are usually planned such that they gradually integrate pupil knowledge and skills, in order to progressively satisfy the requirements of a globalized world and to stimulate those cognitive processes that appear to be most compromised. This approach also comprises the decision to use didactic software, especially in training aimed at the primary school. Interaction with computers, while introducing some difficulties in experimentation (e.g. problematic use of networks, hardware that is often obsolete...), is an important condition in reducing the *digital divide* and in opening up new possibilities for access to the international culture and communication.

In general, therefore, in re-adapting education interventions it is vital to take into account, on the one hand, features in the local didactic tradition (importance attached to writing rather than speaking, memorization rather than critical and creative activities), and on the other, the need for a more complete development and appropriate reading and writing levels. It is therefore not simply a question of translating the activities but of elaborating new materials relative to cultural contents, programmes and educational habits specific to the context, while at the same time encouraging the complete development of children.

### 3. Involvement and training of university students

Involving Italian university students in the cooperation interventions described above comprises, in addition to an adequate knowledge of the host country language (particularly important when it is necessary to take part in teaching interventions), participation in training. This consists in an articulated course, since it involves above all a workshop (20-30 hours), with a theoretical section, relative to risk factors and the scholastic problems of disadvantaged children in countries in the southern hemisphere. The academic activities therefore involve an analysis of the survey instruments to be used in carrying out the diagnoses and a presentation of the most effective interventions in order to encourage the cognitive and motivational reinforcement of the addressees. These are followed by simulation activities in the lecture hall to encourage the acquisition of didactic-operational skills.

The training ends with an apprenticeship phase in Italy, in which students are asked to implement the project in infant and primary schools, for at least 45 hours, to acquire familiarity with the method. University students are then involved in adapting the materials relative to the foreign country where the experimentation will be carried out. Finally, the students are provided with the materials that have been elaborated together with innovative aids which can then be presented to the local teachers.

### 4. Teachers training in cooperating countries

To stabilize innovation abroad systematic training is also realised relative to teachers in the cooperating countries.

The training interventions focus on the theoretic outlines, didactic strategies and organisation and verification modalities as set out in the Phoenix Project. This is a training-research approach in which addressees progressively master those principles at the heart of the method and the criteria adopted to structure the intervention. The teachers are therefore involved in adapting the programme and in the production of new aids, in line with the said action-research approach. Teachers are subsequently called upon to re-elaborate the theoretical stimuli they have received; to observe an expert in the field who activates the innovative practices; to then introduce them in pilot form in their appropriate context; to collaborate in a subsequent collective revision and to evaluate the courses realised relative to their systematic introduction. One of the greatest priorities at the core of the training model for teaching personnel concerns the actual effects of the innovations and the updating of education practice. Involvement in the research has proved to be an effective response to this need. Indeed by activating research courses which are integrated with training, teachers are stimulated to appropriate what they have learned and to become more reflective and metacognitive, and hence to change their practices through intelligent innovation.

## 5. Implementation of interventions and experiments

Among the teachers trained in the cooperating countries, some referents are identified that are interested in implementing the innovative intervention. The same are involved in pilot experiments and in the documentation and verification of results, with monitoring by the Torino University research group.

The aim of the experiments is therefore to encourage progressive acquisition of the method by local psychological-pedagogical operators, with periodic meetings, if possible, and with the support of a local coordinator.

## 6. Involvement of local universities

Collaboration with university professors in the universities of the countries involved in the cooperation is useful in supporting the training seminars, to improve the actions involved and to **create a network able to provide continuity for the interventions**. Local universities can also involve their students (future teachers or educators) in the training, to enable them to use the method and to encourage a capillary introduction of new didactic strategies.

## 7. Evaluation

Evaluation at the start or during the project can pursue decision-making aims, focusing on the emergence of empirical criteria, which justify the choice of launching or sustaining the programme in a given context. In this regard the entity of the emerging requirements, the authenticity of the motivations for innovating the contexts in question, the stability of the education figures involved, the possibility of monitoring *in itinere*, the quality of NGO involvement and the possibility of registering the results obtained can all prove to be highly significant. Evaluation also seeks to encourage improvement, since it is focused on perfecting the actions and transferring them to other contexts.

A complex process is therefore initiated in this regard, one that includes the university but also operators in the countries involved. The following phases can be distinguished.

- 1) *A priori evaluation*: there is a priori verification of the level of effective knowledge of requirements on the part of the addressees and the coherence of any solutions designed with the latter.
- 2) *Initial evaluation*: a formal evaluation of the project is implemented, centring on the organisation, programming and materials. The adequacy of the interventions is evaluated (realistic, verifiable objectives...) together with timescale (correspondence between the scholastic calendar and the availability of volunteers...) and context resources (teacher skills, willingness to be involved, presence of adequate informatics instrumentation, Internet...).
- 3) *Evaluation in itinere*: this is aimed at monitoring the actions. It involves interactions of the research group with NGOs and local operators in gathering documentation *in itinere* on organisational aspects, actions effectively undertaken, difficulties encountered and solutions adopted... The feedback permits fine-tuning *in itinere* of the interventions: transmission of new materials, teacher-training actions. As regards these aspects university student availability proved to be extremely useful.
- 4) *Evaluation of results*. This focuses on the overall estimate of the efficacy of the project relative to the objectives which one seeks to achieve and the changes caused by the implemented actions.

Evaluation of the efficacy of Phoenix interventions realised in cooperating countries is carried out using a multiplicity of instruments and involves various actors in the project (the pupils, addressees of the method, local teachers who have received training and have taken part in the experimentation, university students, who have realised the didactic activities abroad, entities or actors in the territory in question, universities and NGOs).

### A) Evaluation of pupil results

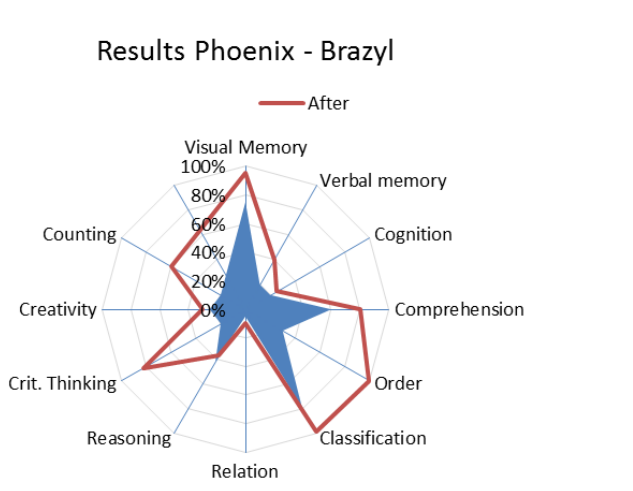

Experimental verification of the results of the Phoenix programme is carried out using an experiment plan with two

equivalent groups, one experimental and another as control, in order to compare the children’s progress with traditional didactics and that of pupils who have been exposed to innovative didactics. The plan makes it possible, as is well known, to keep the maturation effect under control. The results of applying the method with children in the cooperating countries are measured by administering structured tests (translated and revised for the local context). We will report, by way of example, the presentation of some results obtained in Minas Gerais and in the state of Bahia, using standardized instruments, aimed at the pupils. The results are illustrated to teachers on a local level, and, when possible, discussed publically - including with citizens - and disseminated to an international scientific audience.

**Example 1 – Results of 5 year old children (Minas Gerais)**

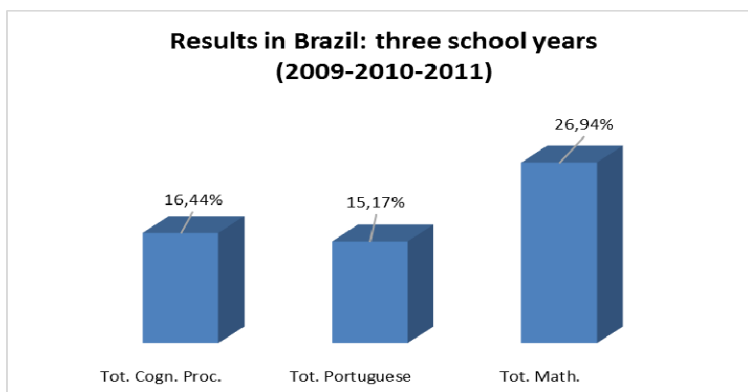

At the end of the Phoenix experimentation realised at Teofilo Otoni with 5-year-old children in the infant school, the following results were obtained using a readiness test, administered before and after the intervention. The actions focusing on cognitive and motivational reinforcement realised with the experimental group, by means of a sequence of targeted ludic proposals, made it possible to progressively harmonise the cognitive profile of the sample subjects, a profile which was initially significantly deficient (as indicated in fig. 3). The initial lowest levels concern the creation of relationships, verbal memory, knowledge and creativity. At the end of the course, progress is noted in almost all areas, with significant gains in sequencing and in critical development.

**Fig. 3 – Comparison of test results before and after the Phoenix project (5 year olds) – Minas Gerais**

**Example 1 – Primary school children results in three years of project work (Bahia)**

The following is an example of the results for the primary school. They constitute the results of three years of work in Salvador de Bahia and make it possible to appreciate the constant improvements achieved in the skills of experimental group subjects, through the administration of structured tests. In Brazil too, as in other contexts, mathematics is the disciplinary sector exhibiting the greatest gains, followed by cognitive development and language progress, in this case Portuguese (fig. 4). Linguistic skills therefore appear to be the most difficult to improve.

**Fig. 4 – Results in Brazil**

The results achieved by pupils are evaluated indirectly by noting the perceptions of teachers relative to the efficacy of the project.

### Example – Teacher perceptions

We set out the *improvements* that teachers have noted in their pupils following participation in the Phoenix project.

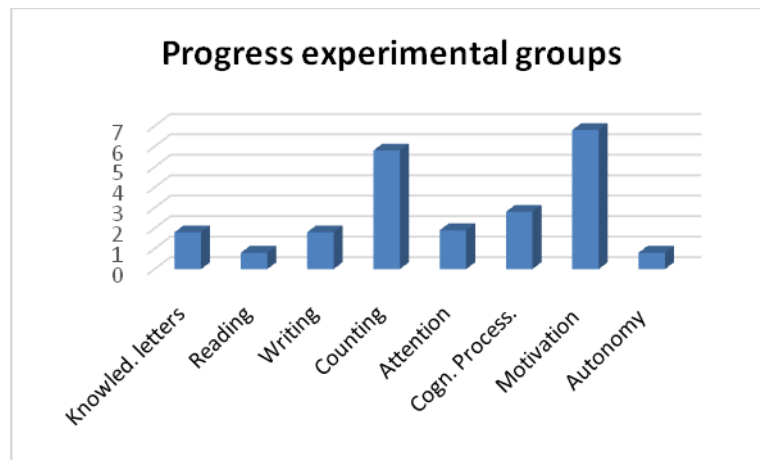

Fig. 5 – Improvements perceived by teachers

### B) Method evaluation

The didactic quality of the proposed programmes is also evaluated indirectly through the perceptions of teachers regarding the adequacy of materials and the proposed intervention.

#### Example – Evaluation of the method by teachers

We set out below, in a schematic manner, the main advantages of the Phoenix methodology as emerging from the questionnaires handed out to teachers involved in training and experimentation at Teofilo Otoni:

- Attractive easy-to-use games
- Teaching that is flexible and adapted to a wide variety of needs
- Possibility of using computers to acquire basic familiarity with informatics
- Stimulation of curiosity and interest in knowledge
- Development of learning ability.

### C) Evaluation of effects on teachers

Training interventions focusing on teachers are accompanied by monitoring aimed at evaluating the professional growth of the same. We set out, by way of example, the training results relative to 40 education professionals in Minas Gerais.

#### Example – Training results

##### a) Increase in knowledge, change of attitudes and acquisition of specific skills

Using semi-structured questionnaires (administered in input and in output of the training course), the following changes were noted. According to primary school teachers, the training has made it possible to **structure and share** in a group context **innovative didactic practices** (84.21%) and to plan interventions in various schools. The activities contributed to *reducing the digital divide*, familiarising teachers with the use of technologies. Teachers also confirm that they have acquired **more in-depth knowledge of the difficulties** experienced by their pupils. Relative to an initially more superficial description of the said difficulties, at the end of the course one notes a greater analytic and diagnostic ability. At the end of the training we also noted that *teachers had learned to carefully document cases exhibiting articulated anamnesis and in-depth input diagnosis, with attention devoted to specific and deficient cognitive processes.*

As regards *infant school* teachers at the end of the course, the same confirm that they have learned to finalise ludic activities relative to the cognitive difficulties of children experiencing most difficulty. More specifically, teachers confirm that they have learned to work in a manner that counters the difficulties of children as regards concentration and attention levels, as well as those of reasoning, which are particularly common among their pupils.

### **b) Appreciation of the training proposal**

**Relative to levels of enjoyment regarding the training proposal, evaluated on a 4 level scale, one notes appreciation indices** that are very close to maximum values (between 3.5 and 3.8). The highest level was achieved in meetings that involved workshop experimentations and the general presentation of the project, followed by illustration of software for primary school teachers and concrete games for those teaching in infant schools.

### **D) Evaluation of effects on university students**

The involvement of university students in the cooperation projects was aimed - in addition to contributing to support for the rights of children and the development of research - at increasing their skills as future education professionals. Cooperation experience can also encourage greater awareness of global citizenship values and international solidarity.

Student empowerment therefore involves cognitive, affective and behavioural aspects. The *cognitive aspects* include creativity in the didactic sector, critical ability in selecting adequate materials, specificity and ability to identify with others in order to establish a deeper level of dialogue with another culture. The *affective aspects*, on the other hand, included the development of a realistic level of esteem for oneself, as a subject able to realise the values in which one believes; a good level of empathy, required in order to be able to perceive the feelings and difficulties experienced by others; a good level of control over emotions, both positive and negative. Some of the above results can be observed using self-evaluation instruments.

### **E) Evaluation of effects on the territory**

The effects on the territory are evaluated through data relative to the diffusion of the experimentation. Specifically the following indicators are assessed: the number of teachers and children involved, the nature of the involvement of adults (production of materials, documentation, innovation...), the number of entities implicated and the activation modalities (inspector reports, manager videos, interviews with political figures and budgeting of local resources to support the project).

We also carried out an evaluation of the effects on current didactics: in some contexts, teachers state that they have moved from transmissible didactics to heuristic-inductive didactics, with a ludic learning approach that makes learning more motivating and meaningful.

## **CONCLUSIONS: ADVANTAGES AND CRITICAL FEATURES**

The cooperation model adopted displays numerous advantages, as can be seen from the examples referred. At the same time, it requires a number of conditions if it is to achieve optimal implementation. Indeed, it assumes a stable presence in the cooperation territory of those NGOs that collaborate and the presence in the territory of a motivated and competent referent who maintains contact between the research group and the experimentation group. The model assumes also a willingness to get actively involved on the part of a variety of actors, local tenacity, including when project launch financing ends, and a willingness on the part of all actors to continue to commit personal time and energy to actions for the collective good. The latter aspect is complicated in those contexts where teachers often have "two job" commitments or are still taking part in university training.

As regards Italian university students, cooperation interventions of an educational-didactic character require good skills in terms of language ability and a willingness to commit oneself, respecting local needs and requirements. Such criteria are not always easy to satisfy.

## **THE PROJECT "FENIX" IN TEOFILO OTONI -BRAZIL-MINAS GERAIS. TRAINING TEACHERS ON COGNITIVE ENHANCEMENT FOR CHILDREN LIVING IN DILAPIDATED CONTAINERS**

Tiziana Bonasso\*

\*Supervisor U.S.CO.T., University of Turin, Italy, [t.bonasso@yahoo.it](mailto:t.bonasso@yahoo.it)

### **ABSTRACT**

I want to dedicate my speech to those, who are put their soul in this project to Teofilo Otoni, of which were not even talked about today. Those children that I have just met 20 years ago in Teofilo Otoni: children, who I met under the bridge, near the bus station, along the roads, recovered in police stations or hospitals: hungry children, wounded, alone, humiliated, abandoned...

Children who have learned about the subject to be poor, but certainly directly these children are rich of enthusiasm, joy and love of life, what they shout to the world. And just today we should think about these children. Now I take the chance to start the project Fenix from Cristina and Paola in another city, and that was not Salvador, so thanks to the decentralized cooperation project approved and funded by the Piedmont region, in September 2010, along with Alessia Rosa and Edicleide psychologist in Salvador de Bahia, we started our adventure in Teofilo Otoni.

My role was, along with the Edicleide, to start with an initial training teachers on the implementation of the project Fenix.

### **THE PEOPLE I'VE MET DURING THE DEVELOPMENT IN TEOFILO OTONI**

The training started in November 2010 and there were more people involved from Italy than from Brazil:

**Prof. Cristina Coggi and Prof. Paola Ricchiardi, University of Turin**, who conceived the project, have studied and prepared aptitude tests for settings and finally, they placed instructional materials for nursery school and selected computer software for the realization of the project Fenix in primary school.

The teacher and educator **Bonasso Tiziana, Edicleide do Nascimento**, has dealt with training teachers to Teofilo Otoni and adaptation of games and software.

**Dr. Alessia Rosa**, who was responsible for the documentation of the course by creating a video.

**Sonia Rodrigues Lemes**, project manager Fenix in Teofilo Otoni, who was responsible for coordinating the activities in the schools who involved in the project.

In September 2010 for the training in Teofilo Otoni there were involved:

- 25 primary school teachers and 18 teachers of nursery schools;
- 6 psycho education experts of schools in the municipal network;
- 8 teachers and 6 students at the University Federal of Teofilo Otoni.

### **THE COURSE**

- The course lasted a week and it was done in the municipality of Teofilo, at the Federal University of Teofilo Otoni. Coordinated by Prof. Tula Rocha and speaker of the University for the project FENIX.
- The whole course was held in the morning and in the afternoon for a total time of 45 hours and the involved teachers in the study related to the theoretical framework of the project Fenix.

### **THE DIDACTIC SUMMARY OF THE ACTIVITIES INCLUDED:**

- Theoretical training of teaching models useful to counteract the difficulties of learning contexts at risk;
- Teachers have analyzed the characteristics of the entrance tests and final proposals to detect the levels of pupils;
- They learned to administer the tests, even with simulation activities and group work and to deepen the diagnosis in order to better personalize interventions.
- Then they examined the programs of the Fenix, educational software and games of concrete "case Fenix".
- They finally made brief experiments with children with educational materials proposed.

The experiment was carried out in four schools, two municipal schools and two state schools and all four have involved children in nursery school and primary school.

State schools were involved:

**SCHOOL FREI ANTELMO KOPMAN**  
**SCHOOL IRMA ARCANGELA**

State schools were involved:

**ISTITUTE DORALICE ARRUDA**  
**ISTITUTE TEODOLINDO PEREIRA**

All four schools are in a very poor neighborhood of the city and the children who attend are not followed by families, are often left to themselves: the school was for them the unique learning environment

## **THE SEMINAR**

After 9 months of testing, as required by the Memorandum of Understanding between the partner of the project, was organized a seminar in the city of TeofiloOtoni, open for all teachers of the schools who were involved in the project and teachers of other educational institutions interested in deepening methodology Fenix. During the seminar were presented data of the results of the experiments and space was given for the teachers who have experienced the project and who told the audience their experience.

## **EDUCATING TOGETHER THREE - A NEW OPPORTUNITY**

In November of 2011, thanks of a new loan from the PIEDMONT REGION, there started a new one-week training in TeofiloOtoni for teachers of nursery school.

The teacher Bonasso Tiziana organizes a new course that involves new teachers from municipal and state schools, who had already experienced the methodology Fenix in the role of "tutor" to new teachers. At this course are also participating officials super stewardship of the City of TeofiloOtoni and joins on as a new partner "the university 'private Unipac" with 4 teachers and 8 students.

This new insertion allows school teachers to have a support in the classroom during the trial, that the students of Pedagogy in their syllabus will carry out the hours of their internship in support of the project Fenix in state schools.

In March of 2012 there started a new training for primary school teachers with the Brazilian pedagogy of Salvador de Bahia Edicleide.

Thanks of this intervention evaluating it gives the possibility of adding new schools for the experiment and review planning the FENIX project and activities in the laboratory to achieve with the software. The installation program installs new games in the Portuguese language in the computer labs and form teachers to use them.

Definitively in this period identify the referents of the new and old schools who are participating in the project, constitute a working group coordinated by Fenix and at the municipal level is responsible for brazil Sonia Rodrigues Lemes.

## COGNITIVE ENHANCEMENT FOR CHILDREN IN DEVELOPING COUNTRIES. A TEACHER TRAINING EXPERIENCE IN A KIGALI PRIMARY SCHOOL.

Roberto Trinchero\*

\*Department of Philosophy and Education, University of Turin, Italy, [roberto.trinchero@unito.it](mailto:roberto.trinchero@unito.it)

### ABSTRACT

This contribution describes an intervention of teacher training about using didactic software and classroom strategies to enhance core capacities of children in primary schools. The intervention is part of the wider project named Phoenix ([www.edurete.org/fenix](http://www.edurete.org/fenix)) and took place in the days between 4 and 15 September 2012 at the school Saint Ignace de Kibagabaga (Kigali – Rwanda). The experience was divided into the following phases: 1) constitution of the training group, detection of expectations and prior knowledge of the participants; 2) informatics ability realignment; 3) exposition of basic concepts and feedback “participants to trainer” and “trainer to participants”; 4) recognition and collection of the problematic situations encountered by participants in their current experience; 5) isolation of paradigmatic problems and exposure of related theories and possible strategies of action; 6) planning and testing of cognitive enhancement strategies in the classroom, with feedback of the trainer; 7) final test in which the participants have to design a plan of intervention to improve several cognitive ability of their pupils. Final planning describes strategies that teachers have learned in the course and are going to use in the next months. The training was conducted by the author of this article. Experience has highlighted the typical problems encountered in the school situation under review. It was conducted with the strategy of *responsive training*, that is training which aims to respond specifically to the needs arising from the participants. This strategy aims to make participants aware of their needs and to aid them to construct field activities appropriate to their context and pupils. Protocols of the intervention are available at [www.edurete.org](http://www.edurete.org).

### INTRODUCTION

The term “cognition” can be defined as the ensemble of the processes that an organism uses to organize information. Cognitive enhancement may be defined as the amplification or extension of core capacities of the mind through improvement or augmentation of internal or external information processing systems [1]. The focus is not on specific knowledge or skills, but on the core capacities of the subject, that include processes devoted to the acquisition (*perception*), the selection (*attention*), the representation (*understanding*), and the retention (*memory*) of information, and the use of this to guide behavior (*reasoning* and *coordination of motor outputs*). Interventions to improve cognitive function may be directed at any one of these core faculties. The related expression “cognitive empowerment” indicates interventions that aim to help the subject in the acquisition of a personal sense of “power” in order to feel responsible for his/her learning, for example to know how to self-motivate after a failure, to develop self-monitoring and self-regulation strategies for comprehension, to develop appropriate beliefs and self-representations useful to recover quickly from personal failure (*resilience*). In this sense, cognition, metacognition and motivation of the subject constitute a “synergic alliance” for his/her scholastic achievement.

The progress in information technology has produced the most dramatic advances in our ability to process information. External hardware and software can support in many ways the human cognitive abilities. Computer help us not only by offloading mental tasks but also by proposing training exercises (and immediate feedback) that increase the ability to approach complex situations, to gain comprehension in order to suit specific needs and to derive appropriate solutions to various problems. The aim of computer-based training in cognitive enhancement is to promote a better and more rapid comprehension and problem solving, even with simple and complex problems. Increasing rapidity in comprehension of the problem and application of solving strategies can dramatically improve performance within a particular domain of knowledge.

The present article describes an experience of teacher training about using software and classroom strategies to enhance core capacities of children in primary schools. The intervention took place in the days between 4 and 15 September 2012 at the school Saint Ignace de Kibagabaga (Kigali – Rwanda). The intervention is part of the wider project named Phoenix ([www.edurete.org/fenix](http://www.edurete.org/fenix)) [2]. The aim of the Phoenix project is to promote the cognitive and motivational enhancement of subject at risk in order to foster scholastic achievement. The project is based on different strategies, with an important role of the use of educational software. It involves the structuring and testing of innovative educational setting, which mainly use the technology (software, online learning environments, video games) in order to: increase resilience, realign the cognitive disadvantages, develop the motivation to learn, consolidate concepts and

strategies relevant to the basics in mother tongue and in mathematics.

## CONTEXT OF INTERVENTION AND PARTICIPANTS

Kibagabaga is the name of a hill and district in the east of the city of Kigali, Rwanda, in central Africa. On this hill, the Jesuits began in 2003 to develop a school project of a certain size. The school owes its name to Saint Ignatius of Loyola (École Primaire Saint Ignace, EPSI, see <http://kibagabaga.com>), founder of the Society of Jesuits, present in Rwanda since the early fifties. The overall plan includes the creation of an institution comprising grades of school primary, secondary and higher education. The first year of the primary school was 2008, and has seen 7 teachers working on 5 classes: two classes for the first year, two classes for second year and one class for the third year, for a total of 130 students. The progress of the project has led to a noticeable increase. In 2009 started 5 new classes, including also the fourth year, with a total of 15 teachers and 282 students. In 2010, with the opening of the fifth year, the school has come to count 13 classes, 19 teachers and 426 students. In 2011 was opened the sixth year, the last of primary education, for a total of 15 classes and 25 teachers. The intent was to follow the first group of students in their school career, gradually opening new years of course, and expanding consequently the number of classes. Kibagabaga is a populated area, recently urbanized, with its administration, places of worship and an hospital, all grown from just ten years. The Jesuit school project is one of the achievements of urban development that characterizes Kibagabaga today.

The EPSI is a private school, nationally recognized, and follows the curricular plans proposed by the government. It is managed by the Order Jesuit, and funded partly by a socio-cultural foundation, partly through the contribution of the families of the students. The costs borne by households are divided into installments on a quarterly basis and, in relation to the costs of others private schools subsidized, are of low/moderate entity. The parents are strong believers in education as element that can provide a better future for the new generations, and are willing to great sacrifices and hardships to ensure their children's attendance at a good school. The public schools has up to 60 students per class, while private schools involve costs too high for the vast majority of Rwandans families. The EPSI is a good compromise between these conflicting situations, and some children can afford to attend it only thanks to social assistance funding they receive. Other children are forced to live away from their parents to get the right of entry to the residence, in cases where the family lives in areas where there are only lower-level schools. The pedagogical foundations adopted refer to the Ignatian model, with particular attention to the training of communitarian sentiments, the development of individual attitudes, and respect for Christian values. In this vision, school is "a living cell of society", and Saint Ignatius school is a "living cell" of the whole school project of Jesuits in Rwanda. The educational aim is to encourage reflection on the knowledge and direct experimentation, in an environment in constant relationship with the external reality. The EPSI is especially open to collaborations with the local community, and in particular with the other schools.

The school activities includes activities carried out in the afternoon, defined *club*, managed by teachers, sometimes with the assistance of external experts. These activities aim to develop personal skills of each student, in terms of theater, dance, sports, environmental protection, journalism, religious reflection. In addition to these commitments, teachers are required to take the refresher courses for students in difficulty, or lags behind the average level of the class. These courses are recommended to families and require an extra fee. The opportunity to get some additional income is important for teachers: on average, their wages do not allow meeting the needs monthly, and it is common for teachers to need to carry out a second job.

Two key points concerning languages of teaching and computer equipment of the school. The EPSI has chosen for teaching an international language, French, with the aim of making it a tool for reflection and structuring of thought. The willingness to train multilingual citizens was realized by choosing to use favored the French in school, alternating with English as language of instruction in some courses, primarily in the scientific-mathematical areas, from the third class. The EPSI considers very important the use of new technologies. A new computer lab with 20 computers of the latest generation was set up in 2011, but it has had only a little impact on teaching because many teachers do not have sufficient computer knowledge to use computers in currently teaching. In addition, the high costs of Internet connection do not make it sustainable annual subscriptions. For these reasons, teachers need to add to their many tasks the training about language and computer, and this creates a serious extra work in a condition where life is not always easy. Comes to their aid the steely determination that characterizes the people of Rwanda, and the willingness to do whatever is in their power to promote the scholastic success of the children, who represent the future of the nation.

Participants at the course of computer-assisted cognitive enhancement was 15 teachers of Saint Ignace School (9 males e 6 females) and 3 educators of Fidesco ([www.fidescousa.org](http://www.fidescousa.org)), who work in assistance and prevention of school failure of the street children. To get better knowledge of the context, the trainer also held a workshop in the morning in which the pupils can try the games for cognitive enhancement.

## TRAINING ACTIVITIES

The teacher training activities have started on September 4, 2012 and have ended on September, 14, 2013. Training

took place every afternoon from Monday to Friday from 2:30 p.m. to 5:30 p.m. The goals was to make teachers independents in the application of Phoenix protocols and to collect specific needs and problems from teachers, in order to give them appropriate techniques and instruments for work in classroom.

The first activity was the self-presentation of the participants where they introduced themselves and talked about their past experiences with cognitive enhancement software. This activity was followed by the statement of expectations that they placed in these training. In this presentation has emerged that many participants had insufficient computer skills to use any software for student's cognitive enhancement. The lack of informatics knowledge has necessitated the perform of a realignment activity, which consisted in the creation of couples in which one of the members had a good knowledge of the computers fundamentals (called "the expert") and the other was instead a beginner (called precisely "the beginner"). The couples were asked to choose a name (e.g. Tigers, Lions, etc.) to strengthen the identity of the group and then took part in a role-playing game, in which the expert of the couple had to drive the beginner to write a letter to a friend with a word processor. In this task, the expert could only talk about giving instructions to the beginner and did not have to touch the computer in any way. The beginner had to carry out the instructions of the expert. The expert was and would have been, at all stages of the course, the responsible of the beginner's learning. This activity has been supplemented by the use of software to enhance the ability to use the mouse and typing letters on the keyboard. It was explained that this same strategy could be used with the pupils in the activities performed in computer lab. Teachers had a lot of fun performing this activity and have especially appreciated the chance to carry this peer education strategy in their practice with students. The realignment activity lasted two days and led to ensure that everyone was able to: a) turn on the computer, b) locate the necessary software, c) start and use them, d) save files and retrieve saved files.

The next activity was a brainstorming about the conception that the participant had of terms "cognition", "metacognition", "motivation", "cognitive enhancement", "resilience". Subsequently, the trainer provided the fundamentals of cognitive enhancement theory, starting from the conceptions and misconceptions emerged in the previous brainstorming. The lessons have insisted on the concepts mentioned above and on the thinking of scholars J. P. Guilford, R. Feuerstein, L. W. Anderson & D. R. Krathwohl, J. Anderson, J. Hattie.

Theory lessons were followed by ongoing test to control understanding (see Figure 1). In this test, participants had to contextualize the above concepts in specific game situations experienced in their previous computer training (item 1, 2, 3). At the end of the test (item 4) was requested to formulate an *incident*, that is a case of a particularly problematic student present in their class, that they thought could be inherent to the concepts seen. The next task consisted in the discussion of the answers given by teachers and isolation of their "good answers". This feedback had the function of "knowledge alignment" of all in relation to the key-concepts treated in the intervention. Test questions and "good answers" are summarized in Figure 1.

**Fig. 1** – Ongoing test and "good answers"

*Item 1.* Describe, in your opinion, the cognitive processes involved in this task [...], in terms of:

- Acquiring information,
- Selecting information,
- Representing information,
- Retaining information and
- Using information

Good answers, *Acquiring* information:

«You see the new word coming and observe the letters that compose it»

«Seeing the words falling down»

Good answers, *Selecting* information:

«Choice the appropriate key (in the set of all keys) to type the word acquired»

«Reading the words falling down and choice one word to type»

Good answers, *Representing* information:

«You recognize the word that you are typing and you don't need to 'see and type' letter by letter, but type an entire word» (You have a mental representation of the word).

Good answers, *Retaining* information:

«I remember the letters that compose the word and I type them»

Good answers, *Using* information:

«I type the characters that I remember compose the word that I have perceived, recognized, chosen»

*Item 2.* Describe, in your opinion, the metacognitive processes involved in this task [...] (it's easier if you reflect on how you did learn to do the task).

Good answers:

«I try to press Shift keys at the same time and I fail. I must pose a question to myself: 'What I am doing wrong?'. In relation to the answer that I give to question I must to change my behavior, until I reach the success».

*Item 3.* John is a pupil that have resilience. John has played once to this game [...] and is little bit discouraged because

he doesn't know the color proposed. In your opinion, what will do John now?

Good answers:

«John doesn't lack motivation. He tries to click on ever block to find the right answer (the computer says when is right and when is wrong). Then he memorizes color and after a certain numbers of session, he will learn color names».

*Item 4.* Describe a typical problem that you have encountered in your class and for which you would like to have more knowledge and tools from the lessons of Phoenix training.

---

From the item 4 of the test, a rich set of specific instances was emerged, that have originated a sequence of training modules (with many software examples, see protocols at [www.edurete.org/conv/difficulties080912.zip](http://www.edurete.org/conv/difficulties080912.zip)) that focus on possible solutions to the problems reported by participants:

P1) *Memorization Problems* («When I teach the kids something, another day when I ask those thing they forget it», «Problem of memorization of multiplication table»). To improve memory for concepts was showed to teachers how to: a) aid children to create associations between texts, images, sounds, actions; b) stimulate children to find personal images for the concepts that the teacher explain (also as strategy to improve creativity); c) choice an image from the images proposed from children and use systematically this image in association to the relevant concept. In particular, was explained to teachers how to use in proficient manner two types of memory cognitive functions [3]: *Recognizing* (find out an object among a set of objects) and *Recalling* (bring out from memory an information). The trainer showed to teachers how to construct little songs and doggerels in order to memorize sequences of mathematical operation and how to use them with the pupils. Last tip was the recommendation to use frequently sessions of formative assessment (with nominal or anonymous tests) to verify systematically remembering and understanding of the pupils. At the end of the module, a task was given to teachers. The request was to design an activity to improve memorization of concepts by the pupils, in relation to the contents they are currently teaching, to apply it into the classroom and to write down a short report (maximum 8 lines of text) describing the activity and the obtained effects.

P2) *Comprehension problems* («Students who appear to be attentive in class but can neither answer any questions about the lesson nor solve any exercise»). Comprehension difficulties are directly related to weaknesses in lexical, syntactic, conceptual, inferential and organizational language processes. Students with poor comprehension are poor at making inferences and integrating text information. Consequently, poor comprehenders do not strive for coherence and they tend to use less story content and use less sophisticated story structures. Poor comprehenders tend to read quiet superficially. They are less likely to engage in constructive processes when reading. It would appear that they are not deficient in general knowledge but fail to use gap filling inferences and are not sure when and how to apply their prior knowledge [4][5]. Hence, an important prerequisite for understanding is the ability to assign meaning to important words in the text. If the pupil has a poor vocabulary, it is very difficult for him/her to assign the right meaning to entire text. Interventions aimed at improving the vocabulary of the students are very important, and equally important is to know the purpose of the text and how it is possible to connect the concepts vehiculated by the text to the prior knowledge of the pupil. A possible strategy is the use of *advanced organizers* [6], provided before explanation to pupils, to facilitate pupil's understanding. In this training module, several examples were presented with refer to the seven cognitive processes related to understanding identified by Anderson & Krathwohl [3]: *Interpreting* (clarifying, paraphrasing, representing, translating information from a formalism to another), *Exemplifying* (illustrating, instantiating, given a concept find an example), *Classifying* (categorizing, subsuming, given an example find the related concept), *Summarizing* (abstracting, generalizing, find a concept that summarize a text), *Inferring* (concluding, extrapolating, interpolating, predicting, find a conclusion or extrapolate a rule from instances), *Comparing* (contrasting, mapping, matching, find similarities and differences between instances), *Explaining* (constructing models, find causal paths in a sequence of events). The task given at the end of the module has required to teachers to design an activity to improve the comprehension of concepts by the pupils, to apply it in classroom and to write down a short report (maximum 8 lines of text) describing the activity and the obtained effects.

P3) *Handwriting problems* («Students who have a problem to write well», «The pupils write slowly, they have no speed in writing», «The children have difficulty in taking notes»). The strategy proposed by trainer refer to the practice of handwriting, that can improve the coordination between visual, verbal and motor capacities. Computer driven practice, by means of animations that illustrate step by step how to draw letter, can improve handwriting.

P4) *Orthographic problems* («Children that don't write the words properly: 'govenment', or 'govnment', or 'government' instead of 'government' »). The strategy proposed by trainer to improve writing abilities requires that the student *reads more*, to acquire models of words and text structures, *writes more* to practice these models, *reads back what he has written and search for errors*, to acquire metacognitive ability of self-correction. The feedback of someone (teacher, mates or computer) is important to help the pupil to find his/her errors and the feedback is more effective if it is immediate. For this reason the *visual* feedback obtainable from computer (e.g. by an orthographic corrector built in a

word processor) is very effective and also very effective is the *verbal* feedback obtainable by screen reader programs (in the training was presented the DSpeech free software). Developing of self-assessment and general evaluation capability is related to two cognitive processes [3]: *Checking* (check the internal coherence of a product or an object, coordinating, detecting, monitoring, testing) and *Critiquing* (give a judgment about a product or an object using a set of external criteria).

P5) *Dyslexia problems* («When I tell to a kid to write for example 25 he writes 52, or when I ask him to compare  $10 < 20$ , he writes  $10 > 20$ », «There are children who can't recopy words from the board as they are, e. g.: 'on' they write 'no', 'in' they write 'ni', 'an' they write 'na'»). Dyslexia is not disability, but only a different mode of functioning of the mind [7]. From Dyslexia is impossible to completely get out, but it is possible to get better with apposite training (that foresee progressive steps). Examples of computer training to deal with Dyslexia include: a) practice to recognize letters on the screen of the computer and on the keyboard; b) practice to associate sound and letter symbol (the computer program says a letter and the pupil have to click it on the screen); c) practice to recognize words (oral and written) and reproduce it on the keyboard (before without maximum time and then with); d) practice to find the missing letter (the program shows a picture and an incomplete name and the pupil have to complete); e) practice to associate symbols and real word objects; f) practice of orthography by means of corrector built in word processor; g) practice of orthography and association between oral and written words by means of screen reader programs. For each of these strategies were presented examples of software and free educational game. The task given at the end of the module has required to teachers to design an activity to improve the writing ability of the pupils, to apply it in classroom and to write down a short report (maximum 8 lines of text) describing the activity and the obtained effects.

P6) *Problems in mental calculation/Automaticity problems* («Some pupils don't know how to calculate mentally»). The strategies proposed by trainer refer to the importance of the practice finalized to improve the automaticity of cognitive operations. Novices take a significant amount of cognitive resources in interpreting and dealing with the problems, using conscious and explicit processing. With practice, accompanied by reflection on “what works” and “what does not work”, the cognitive operations become more automatic and implicit. Strategies that not lead to tangible results are gradually forgotten, and the effective ones are progressively automated. This frees cognitive resources for new learning: it is not necessary to think about a thing to do it (e.g. riding a bike or driving a car). It is important to give pupils opportunities to repeat their problem solving in different circumstances, so that they can automate problem solving process. Computer games offer to the pupils the opportunity to “practice without judgment of the adult” and this fosters the process of “learning from own error”: the pupil feel himself free to do errors and to take the time for reflect on them, with an aid that is not perceived as a judgment. Various computer games and educational software designed to develop automaticity in calculation was presented in this module (see protocols). Training emphasized the importance of progression. The decomposition of complex problems and instructional sequences in simpler sub-problems makes educational interventions more effective. In order to promote learning success, it is important to ensure that the pupil really masters concepts, principles and key strategies present in the current learning content before moving on to new content. The same principle is valid for ability: it is important to ensure that the student really masters an ability (e.g. doing sum with objects) before moving on to another more complex (e.g. doing sum with symbols).

P7) *Problems in the transfer of learning* («There are pupils who do well in class, are very talented, but do not get satisfactory result for the exams», «Slow learning»). Better performance in solving a problem does not automatically translate into better performance in solving a different problem (lack of learning transfer). Empirical evidence demonstrates the role of analogy [8]: the learning obtained in solving a problem would benefit over those obtained in another, if certain topics of this are similar (e.g. in content, logical structure, strategies for the interpretation and troubleshooting, etc.) to those already learned. To improve learning transfer in solving a new problem, it is possible to propose specific training to the pupils that requests to find what in the new problem is similar to what they already faced in the past and what is different. For what is similar it is possible to use known strategies, for what is different it is possible to search into the set of known strategies those have analogy with the structure of the problem. This means to do specific trainings to learn to *analyze* problems, in order to determine: problem typology and structure (recognizing what was already faced), what the problem requests (understanding what is necessary to do), unknowns (recognize what is missing and/or needed), available data (recognize what you have). Three cognitive processes are related to analysis [3]: *Differentiating* (discriminating, distinguishing, focusing, selecting, find and separate the main components of an object, split a whole into constituent parts), *Organizing* (rearrange main components in another structure, finding coherence, integrating, outlining, parsing, structuring, compose parts in a whole), *Attributing* (find the point of view of authors, deconstructing text). To improve analysis ability several strategies are available: a) propose session of self-evaluation before examinations (develop the ability to face new problems and to discover the logic that stands behind the problem); b) provide feedback on problem solving strategies used by the pupils (explain “what works” and why, and “what doesn't work” and why); c) simulate examinations in session of formative assessment (teach to face “anxiety related to examinations”). In addition to these strategies, various computer games were presented by the trainer to improve analysis processes. The task given at the end of the module has required to teachers to design an activity to improve the analysis ability of the pupils, to apply it in classroom and write down a short report (maximum 8 lines of text) describing the activity and the obtained effects.

P8) *Creativity problems* («Some pupils repeat only what have seen and heard from the teacher. They are not able to give personal contribution», «In the examinations, some pupils repeat only what the teacher said, they are not able to do autonomous study on books»). Three cognitive processes are related to creativity [3]: *Generating* (construct new ideas, hypothesizing), *Planning* (formulate a project to do something, designing), *Producing* (constructing something, implementing the project). Various strategies and computer activities were presented to improve these three processes (see protocols). The task given at the end of the module has required to teachers to design an activity to improve the creativity of the pupils, to apply it in classroom and write down a short report (maximum 8 lines of text) describing the activity and the obtained effects.

P9) *Attention problems and hyperactivity* («Some children are much distracted (only their bodies are present)», «Pupils who lack of observation, concentration, does not stand up», «Students lack of concentration», «The problem of a student who does not want to sit still, he will not write or take it what teachers say. He just wants to disturb, dance, make displacements in class. It loses its class materials (pencil, eraser), it tears the books. He wants to imitate what he saw on television»). The ADHD Syndrome was synthetically presented by trainer, as characterized by developmentally maladaptive and inconsistent levels of inattention, impulsivity, and hyperactivity. The trainer pointed out that ADHD is not a disorder that is possible to face only with cognitive strategies, but cognitive strategies may contribute to reduce effects in less serious cases. Proposed cognitive treatment refers to: a) find an activity (computer game, practical activity, etc.) that entertain and promote implication in the pupil with disorder; b) aid the pupil to remain on the activity until he/she reach the aim of the game/practical activity; c) individuate and correct impulsive behavior providing “good” models of behavior. Various games to increase attention were proposed (Put the ball into the hole, Launch the Penguin from airplane to the boat with parachute, Find the differences, Say if the word has been displayed on the screen, Copy the pattern, Create a symmetry, Play Force 4, checkers and chess against the computer).

P10) *Problems of motivation* («Some children do not have interest in new things», «Children who do not want to write», «Students who want to play and do not to study», «Students who do not want to take notes», «Students who do not revise contents at home», «Students that do not want to follow the lesson, student that want to play in the class», «Some pupils are lazy in multiplication or reading», «Pupils disturb others in the class and do not follow the lessons», «Pupils do not do that their homework»). The trainer pointed out that individuals choose whether to invest their cognitive resources in the study or other activities. The learner does not invest his cognitive resources in the study if he/she is not motivated or if he/she perceives that his efforts do not lead to visible progress. In this case, student can choose to invest their resources in other activities (games, sports, entertainment, social activities, etc.) that he perceive as more useful and source of minor frustration. Several strategies were presented to deal with demotivation: a) using active approaches to didactics (some pupils need to do practical activities in order to reach comprehension of something); b) using game based strategies (computer games, songs, recitation, cooperative learning with pair or workgroup and championship between groups) to improve intrinsic motivation; c) involve the parents in the homework activities, explain the importance of homework and the opportunities that offer the scholastic achievement for the life of their children; d) organize peer tutoring sessions (students of the secondary school that do tutorship for students of the primary school).

At the end of the training, a final test was given to participants. Teachers had to: 1) Describe a strategy to improve memorization ability of the children that they are going to use in the next months; 2) Describe a strategy to improve comprehension ability of the children that they are going to use in the next months; 3) Describe a strategy to improve analysis ability of the children that they are going to use in the next months; 4) Describe a strategy to improve creativity of the children that they are going to use in the next months. The last question of final test request to the participants if they have already used the games and the strategies of Phoenix project, and if they do, to shortly describe what they have done and the results that they have observed.

The final test has shown that teachers have learned many techniques of action and that, already during the training, have begun to use them with students. Answers to proposed questions were articulated and reflect a good level of understanding of basic concepts and principles illustrated in the training intervention. This is a good sign that hints that teachers have acquired the cognitive tools necessary to start working effectively with the class. In order to support the implementation of learned strategies in current activities with the class, course materials (slides with theories and examples of work) have been made available on the site [www.edurete.org/conv/difficulties080912.zip](http://www.edurete.org/conv/difficulties080912.zip). Presentation of the intervention and photographic documentation are available at the address [www.edurete.org/conv/kigali2012.zip](http://www.edurete.org/conv/kigali2012.zip).

## FINAL CONSIDERATIONS

Taking into account the difficulties described in paragraph 2, the participation and commitment of teachers in the course has been remarkable. Feedback from participants to trainer was highly positive, mainly because it was perceived that the course has been specially cut to their needs, without following a lineup of default arguments but with content that could change from time to time in relation to the specific needs that arose from the participants. This form of shared construction of the ladder of training, is typical of the training strategy defined *responsive training*, that is precisely training which aims to respond specifically to the needs arising from the participants. Generally, this task is not easy because the participants themselves are often not fully aware of what are their training needs. They should be helped to

make them emerge and to define them in a conceptually correct way.

As pointed out by Thomas [9], in order to effectively build responsive training systems, first it is essential to build effective feedback mechanisms between an organisation's real operational needs and their training systems design. To be effective, these feedback mechanisms must employ data collection and analysis techniques which: 1) identify weaknesses in normal operations which require the development of training interventions; and 2) identify the weaknesses in training which give rise to resident pathogens within normal operations. The training carried out have aimed to develop metacognitive reflexivity of the participants, in order to make them able to recognize what of their current actions in classroom are most effective and which are not, in relation to their own objectives. To promote cognitive empowerment for the pupils, the first cognitive enhancement should be referred to their teachers.

## ACKNOWLEDGEMENTS

Thanks to Cristina Coggi for the opportunity that was given to me to do this experience in Rwanda. Thanks to Sara Fiore, Alberto Parola and Melinda Varga for valuable suggestions and information about the context of intervention. Thanks to the Jesuits Jean Claude Michel, Charles Niyigena and to all the confreres of Centre Christus de Remera (Kigali) for the welcome, the hospitality and the invaluable support provided during the training. Thanks to Marie Mukabayiro, director of the primary school, and to all the teachers and educators involved in the training, for their engagement and gratuitous work. Finally, last but not least, thanks to all the pupils of the school Saint Ignace de Kibagabaga who attended the morning workshops. By observing their behavior, they give us several suggestions about the attractiveness and effectiveness of games used. These suggestions have allowed us to develop new and more effective games (see [www.edurete.org](http://www.edurete.org)).

## ICT AND CAPACITY BUILDING: THE CONTRIBUTION OF INTERUNIVERSITY COOPERATION TO THE TRAINING OF GLOBAL AND LOCAL ENTREPRENEURSHIP IN CULTURAL, ECONOMIC AND SOCIAL SECTORS

Inzoli Angelo\*

\*Independent Researcher in Political and Social Sciences, [angelo\\_inzoli@hotmail.com](mailto:angelo_inzoli@hotmail.com)

The choice to once again dedicate some time to the theme of E-Learning as a possible strategic aspect in inter-university cooperation has root in the consideration of a nature generally relative to the theme of relations between North and South. It concerns the importance of the fact, “knowledge”, as precondition of every project of development that could be supported and maintained. Acknowledging the fact of knowledge is strategic in every action of development. It means that every action of development must be concerned with “teaching to do”. In this sense the strength of forms of transmission of knowledge must be taken advantage of, from more informal levels to auto or self-learning up to those levels that are more institutional and related to university education. It is typically the elevated level - the university education - that has been the object of reflection in the Panel under consideration. Through the four expositions, quite different in approaches and in the speakers’ backgrounds, questions are raised on the actuality and the possibility that the development of the African continent could consider.

The exposition of SPREAFICO presents the networks of possible project of E-learning in Africa. It is a reflection developed from one internal department of the Catholic University of Milan (CREMIT) dedicated to the education in Media and Information Technologies. There are two areas of research and of intervention by the Centre. The first is the Media Education (education to the, with the and for the media, in school and outside-school, from contexts of formal education, to family, to informal education); while the second is Education Technology (with particular emphasis on the themes of integration of technologies in the didactics, to the design and evaluation of processes of formation in E-learning, to moderation of communication on line and to E-tutoring). CREMIT has among its goals that of maintaining an international opening. For instance the partnership with the Shalom College of Father Kizito in Nairobi; the collaboration with different Brazilian Universities; the participation on line MENTOR, etc.. Its hope is to be able to insert in international network research and funding interests. Despite various attempts, CREMIT has until now not succeeded in commencing effective experiences of inter-university cooperation in Africa, conserving still a sure hope to succeed one day. SPREAFICO’s proposal seeks to present a possible realizable operative modality in an African context.

The exposition of INZOLI AND ZOUYA has instead sought to put to light the sense today and in the African university context the promotion of E-learning forms. It is clear that today the elaboration of knowledge and of its transmission is strictly connected with development of ICT (Information and Communication Technologies). The new instruments of information and communication have the power, on one hand, to reduce the threshold of accessing knowledge (operating in a direction of democratization of knowing) and, on the other, to accelerate enormously the possibility of exchanging (surpassing, at least virtually, a good series of borders). These two novelties can still have a strong impact on the world of African universities in which often times a vertical and hierarchical model in the pedagogic structuring of formation predominates. The fore lesson in this model is comparable to the logic more like that of a seminary where the corpus of knowledge acquired by a student is evaluated heavily on the grounds of a professor’s lesson. The introduction of the ICT can put in question this model through a new pedagogy of learning based on a student’s active role and on a professors’ more orientative than directive role. In line with a slogan coming out of the discussion, the ICT cannot be reduced to a process of alphabetization of information. It asks for rethinking of the didactic methodology.

It is only in the exposition of ELLERANI AND MENDOZA that the prospective more operative on the E-learning has been brought to the fore. ELLERANI AND MENDOZA have added a voice to a complete experience that has involved the network of the Selasian University of Latin America. On practical objective the Edulife foundation has been able to put the proper platform of the E-learning at the disposition in order to stimulate comparison and debate among the universities which have otherwise collaborated less among themselves. A remarkable motivation of the teaching staff and the grip of knowledge of intellectual capital of notable calibre are among the results that can be realized.

The exposition of YASSIN AND SESANA poses a question on how Information and Technologies of Communication (ITC) can be factors in promoting political participation, particularly in unstructured contexts of large zones of instability and war that involve the contemporary Africa wars.

At the end of the panels two views came out quite strongly.

- a) The first regards the importance of giving adequate attention to teachers and professors, who constitute the true strategic target for the operation of the entire African university population. In fact in the course of the discussion, the true and primary beneficiaries of all inter-university cooperation have alluded to. A real

modernization of the African university system and a concrete proposal of E-learning will be an illusion without direct and pivotal involvement of the teaching staff. Such involvement must however take into consideration the real danger that the professor statute has gradually suffered beginning from the 90s.

- b) We are living in a transition that is profoundly modifying the operative modalities and the same sense of the E-learning, and today it is difficult to tell which form it will take in future. Rivoltella reminds us that if it is true that we are confronted by normalization of the E-learning in the sense that no one questions it and puts it into discussion because of its integration in the processes of formation, it is important to speak of it in terms of its evolution. In fact *“one season has finished and it happens that another has began. Those who give information of this transition are already catching a glimpse and are closely tied not only to the social affirmation of the instruments of the Web 2.0, but also to the awareness (that begins to emerge) of the fact that typically these applications offer concrete possibility of application to the same processes that are interested today in the normal E-learning. By this way, we are thinking of the diffusion of the scholastic blogs, the adoption of wiki technology as substitute to the Intranet company in the small- media enterprises (by this way the software open source T-Wiki is becoming a true and proper case - cfr. in Internet, URL: <http://twiki.org>), but also in the adoption of Google Apps as platform of Web services on the part of many Italian universities among which are the University of Messina, Ferrara and Camerino, as it is already happening in the USA at the Arizona State University or in Europe at the University of Linkoping in Sweden”*<sup>1</sup>.

To an Africa, extraordinarily receptive to the new ITC but structurally still weak to enjoy fully the positive impact on entire the organisation of society and economy, the E-learning has still more to give. The African condition would not afford to be isolated by such projects. Projects, like forms of technological assistance, should not cut off, but seen as an opportunity for new cultural sociality in which partners involved.

## POSSIBLE AREAS AND CRITICAL ELEMENTS FOR BUILDING DEVELOPMENT COOPERATION INITIATIVES IN EDUCATION AND BLENDED LEARNING METHODOLOGIES

Gerolamo Spreafico\*

\*CREMIT, Università Cattolica del Sacro Cuore di Milano, Italy, [gerolamo.spreafico@unicatt.it](mailto:gerolamo.spreafico@unicatt.it)

### ABSTRACT

Training sessions for teachers in the entire school system (primary, secondary, school and university) are the basis for a long lasting development in the emerging countries and it is of high interest both for Private and Public authorities that work in the (abovementioned) emerging countries.

There are different and many approaches to tackle this kind of topic. CREMIT wants to provide a contribution through the ELIA project in order to provide support to this fascinating and complex issue. In this scenario CREMIT has developed since long time its own project called ELIA (E-Learning in Africa) that integrates many results of research in the field of innovative teaching methods and the use of social media.

The topic to be developed on this occasion is not so much a description of the contents of the project ELIA play as an analysis of the feasibility conditions and the difficulties encountered in the chain of logic design and implementation of projects of this nature. In other words, we intend to present a series of internal and external elements to the system of development cooperation on which you can act in our view for a positive evolution of the theme.

Finally, a note on methodology and culture of fundamental importance for the understanding of the project: those who work in the field of the development of ICTs and especially the new media and social networks have learned that you can only approach a "descriptive" and "not-normative" as the cultural and technological changes are rapid and fluctuating. Even our project ELIA is the son of this approach and its continuous progression and transformation we are concerned and passionate about.

**KEY WORDS:** *Digital literacy, education, digital divide, ICT for development, discovery learning, didactics, Blended Learning*

### PREMISES

Training sessions for teachers in the entire school system (primary, secondary, school and university) are the basis for a long last development in the emerging countries and it is of high interest both for Private and Public authorities that work in the abovementioned countries.

There are different and many approaches to this kind of topic. CREMIT wants to provide a contribution through the ELIA project in order to provide support to this fascinating and complex issue. We decided to focus our attention on three main words to clarify the project and to introduce our operational proposal.

#### - ***E-Learning***

We believe that the systems of training production (modules and paths) through the ICT have reached a good level of ripen (even if still growing). Through the e- Learning we mean both the existing technologies to transfer knowledge and the teaching itself (pedagogical knowledge transfer) that can create the learning environment (teaching). In particular, it is important to underline the tendency to use web 2.0 instruments both for formal and informal education activities and in general for knowledge transfer.<sup>1</sup>

#### - ***Emerging countries***

In the present geopolitical frame, the target for countries considered emerging (steady development grades) is very flexible. For sure we can consider among them countries in the Middle East and North Africa as well as some Far East or Latin American countries (BRICS countries).

#### - ***Developing countries***

Despite the indicators to measure the human development are under constant review and the Millenium objectives<sup>2</sup> are very far from being achieved (*primary needs satisfaction and defense of basic human rights*), it is

<sup>1</sup><http://elearninfo247.com/>

<sup>2</sup><http://www.endpoverty2015.org/>

possible to affirm that the number of developing countries where the use of information technology is high and that the awareness of the importance of investing in human capital is increasing year after year.

For each of the three words-concepts used it is interesting for us and useful to our goal to gather the data that link the increase of economics and social parameters and the ICT use. These data are constantly monitored by National and International Research Centers.

For each of the three words-concepts used it is clear the dynamic development that convince us about the real possibility to realize projects that can make use of different parties aimed to the education development. Western society are invaded by the cultural transformation caused by the explosion of internet and its applications, consequently the educational field is highly stimulated towards them. Emerging countries are also (as already explained) very much influenced by the new ICT ways of communication, which implies the fact that there are highly potential consumers – ICT and communication industry user. Within the above scenario our considerations developed into the production of some draft projects. We won't detail in this document the exact sources mentioned above nor we will define a pilot case to be used as potential standard to be replicated. Nevertheless, there are some interesting hints that can be analyzed thoroughly.

## 1. THE PRESENT STATUS OF ICT IN AFRICA AND THE POTENTIALITIES OF AN INNOVATIVE PROJECT

After a rough analysis of Distance learning training projects implemented for the International Development Cooperation, it is clear that some ongoing projects and some to be started are instable or not sufficient for the needs<sup>3</sup>.

The most evident limits can be traced back to the following elements:

- Difficulty in the co-management of the projects where different international partners are involved.
- Working out of learning objects inadequate in matter of contents, of multicultural and transcultural values and ineffective communication ways<sup>4</sup>.
- Difficulty in starting e-learning systems in pre-defined or not clarified educational paths.
- Lack of economic sustainability in the project in a middle-long term.

The above-mentioned remarks show us an interesting scenario to set an innovative and efficient project:

- A. **Clear purchaser.** To identify a partner at governmental level that can support the e-learning methodology experiment in one or more educational systems. This partner would be the first sponsor of the New project.
- B. **Project completeness.** To define a project that contains
  - a. A concept defined among the main partner, the expert purchaser and a meaningful group of stakeholder
  - b. A pilot phase
  - c. A roll-out phase
  - d. A performance phase
- C. **Competent** and multidisciplinary group of work.
- D. **Flexibility** in the technology use and maximized use of products which are the results of industrial research and commercial proposals.

## 2. THE CONCEPT

The ELIA Project started from CREMIT and from some experts of International Cooperation experience. It is based on three main elements:

- Vertical elements
- Horizontal elements
- Transversal feasibility elements

### 2.1. Vertical elements

#### Technologies

The choice of solutions and of instruments to use for this project is important for the impact the ICT themselves will

<sup>3</sup><http://www.avu.org/e> ; <http://www.auf.org>.

<sup>4</sup>References: <http://www.itu.int> ; <http://www.close-the-gap.org/discover-us/united-nations/un-gaid/> ; <http://www.unctad.org/cstd>.

have in the project itself. Our choice is to use light (that can be used also with not last generation hardware and software) and open solutions (free from costs of rigid contracts of private software). The reason for our choice is both for strategic reasons and economical aspects.

In fact, on one side our choice guarantees the independency from rigid and expensive licenses and from the limits that a hardware or software not of last generation may have. It is important for us to take always into consideration that the contests we work in may have deep lacks in infrastructures and resources.

On the other side, our strategy aims to have a positive impact in the future sustainability and feasibility of the project itself. Open solutions are rapidly growing also in the e-learning field in schools, universities, public offices and companies as valid alternatives to the commercial LMS and LCMS.

Nowadays there are valid alternative open solutions to create contents to be implemented in platform. The continuous improvement of new applications in this field may lead to a complete autonomy from proprietary solutions, in parallel with the open and free content.

In particular the following solutions will be used:

- LAMO solutions (Linux Apache MySQL PHP) server side.
- Moodle as LMS platform for contents implementation and trainee activity management.
- Open source application software for content realization to be implemented in platform.

### **Coordination**

Coordination should be entrusted to a group of work that depends on MOU ( Memorandum Of Understanding ) among three main parts:

- *School*. It can be both Private or Public (Education Ministry, Private Schools or Colleges).
- *Research Center*. It can be CREMIT itself or a cooperation pool created ad hoc together with another Research Center of Education Department or Local University.
- *A Financial board*. It can be a private sponsor or a Temporary Business Association (TBA ) among a Private or Philanthropic Sponsor, a NGO and an International Financial Board (UE, WB, UNICEF, ADF).

### **Counterparts**

The ELIA project can be conceived on different levels. For example, the targets of the projects can be the following:

- *Institutional Education*
  - ✓ Teachers' training for primary school and Teaching diploma certificate
  - ✓ Teachers' training for secondary school. General and specific training to make use of ICT
  - ✓ Trainers' training for Vocational Training Center. Basic level and high level training
- *Adult education and high education*
  - ✓ Basic training for training worker that operate in rural areas or in difficult situations (refugee camps)
  - ✓ Training in new methods of journalism ( new media, social network, etc)
  - ✓ Training in the field of health care and highly specialized

Of course, the ELIA project can be conceived depending on the identified target and on available resources.

### **Training receivers**

They can be adults that have an educational and training role. They are subjects who are getting trained in an adult phase.

## **2.2. Horizontal elements**

The ELIA project has a direct effect (education) and an indirect one (ICT development). Single people involved in the project will have different and well defined roles. Team sessions will be ensured in order each person has the chance to share information, proposals, lessons learnt and possible correction actions to be undertaken. This horizontal element has to be considered as the cultural basis of the project and the key element of the long lasting success and sustainability.

The weakest parts in most of the international cooperation projects in a long last perspective are: fragmented competences and shared out communication. In order to fight against these mistakes learnt from other projects, it is possible to think of a blog, information campaign, radio or video broadcasts very specific and focused.

The horizontal approach fosters a common learning even within the coordination team that can learn from the experience itself, improve step by step and replicate the experience also in other contexts supported and reinforced by the ICTs.

### 2.3. Feasibility transversal elements

The vertical practical dimension crosses with the cultural horizontal dimension reinforcing some common elements that grant the efficiency:

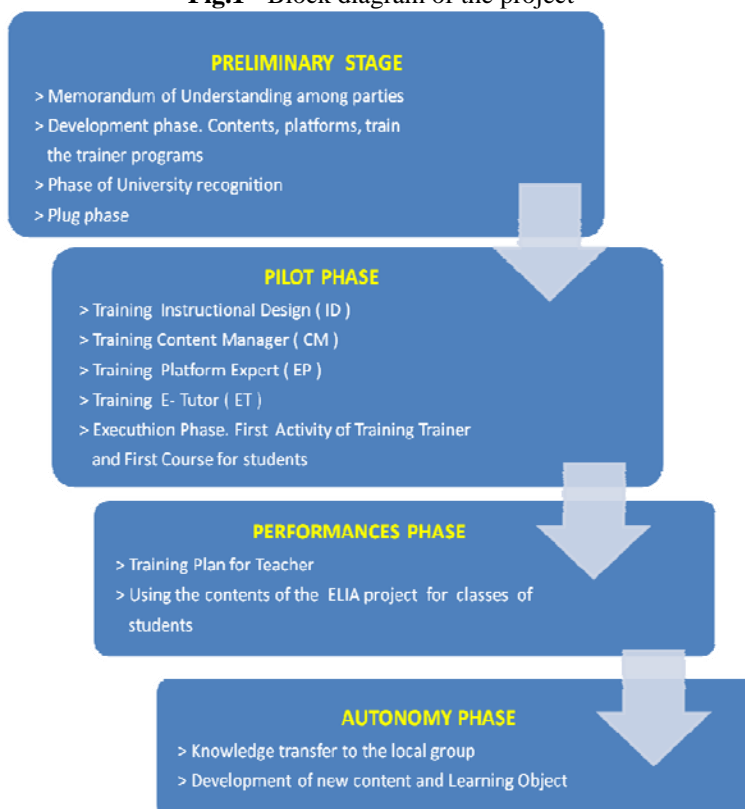

- Accurate survey of the place where the project will be started
- Setting up of an international technical staff ( both sides)
- Setting up of an international Didactical-Pedagogical staff ( both sides)
- Identification of a Project Manager in Staff to the TBA Direction (Temporary Business Association)
- Strong and easy to maintain technologies acquisition (also remote)
- Business plan with a solid Financial investment for all project phases

### 3. PROJECT PHASES DEVELOPMENT

In the next chapter the stages of development of the project are summarized.

- Memorandum of Understanding among parties
- Development phase. Contents, platforms, train the trainer programs
- Phase of University recognition
- Plug phase
- Pilot phase
- Execution phase (1 year)
- Performance phase ( 1 year )
- Autonomy phase ( 1 year )

**Fig.1** - Block diagram of the project

## THE INTERCULTURAL PERSPECTIVE OF E-LEARNING PROGRAMS AND THE USE OF NEW TECHNOLOGIES IN AFRICA

Inzoli Angelo\*, Zouya Mimbang Lucie°

\*CREMIT, Università Cattolica, Milan, Italy, [angelo\\_inzoli@hotmail.com](mailto:angelo_inzoli@hotmail.com)

### ABSTRACT

Based on the socio-anthropological approach, this article explores the intercultural implications of the development of North-South cooperation projects regarding E-Learning in the African countries. In Africa, E-Learning is widely spread in the Anglophone area and not well known in francophone counterpart. Various methods and strategies have been adopted by each group to develop E-Learning (which is not the focus of this article). The development of E-Learning points out a series of questions that we can define as “intercultural” and that touches the three main stakeholders of any cooperation project including Teachers, Students and Educational Institutions. Analyzing the first stakeholder raises the issue of the value and the management of the teaching practices of E-Learning which are fully different from the traditional pedagogy linked with the ‘authority’ and the ‘book’ leading to an erosion of the intellectual status in the society. On the other hand, students face new practices learned through E-learning from its compatibility with the professional environment capable to render them more flexible and productive compared to the face-to-face teaching. The approach of E-Learning becomes more complex in the African educational institutions that desire to pick up new intellectual resources coming from the North hemisphere but that still need to be more adapted, proactive and creative regarding the cultural and socio-economic differences. The introduction of new Information and communication technologies must therefore be seen as an opportunity to improve the African educational system and by the same time increase the socio-economic status of a continent that has been historically marginalized.

**KEY WORDS:** *E-Learning, University, ICT, interculturality, cooperation, development.*

The present contribution intends to emphasize and to analyze in much summarized terms development through cooperation: the promotion of E-Learning in Africa, and intends to do so using the socio-anthropology method of development backed by J.P. Olivier de Sardan, one of its main authors. This method requires the structural analysis of every social fact of cooperation. This complex analysis takes into consideration the concerns of various actors and institutions of the North and South in an interconnected and globalized world.

### INTRODUCTION

The French author reminds us that “development” refers to a social phenomenon than can be defined as “*all social processes led by voluntary operations of transformation of a social milieu, enterprises through institutions or external actors to this milieu but fetching to mobilize this milieu, and relying on an attempt of grafting of resources and/or of techniques and/or of skills*” [1]. The transformation of the demographic, economic and social structures – relative in this case either to the structural aspects (industrialization, urbanization, professionalization, institutionalization...) or the qualitative ones (change of mindsets and behaviors...) - is analyzed through empirical and multidimensional studies that focus on the evolution of interactions among diverse social actors, their practices and their respective representations. Applying it especially to the study of the diffusion of E-Learning in Africa, we can affirm that it may represent one of these voluntary actions in a specific context – that at the end of the 90s - when African countries integrated the dynamics of a multi-polar globalization. This latter was characterized by an increased mobility of population, ideas and images that have their true enabler in the development and in the capillary diffusion of the new Information and Communication Technologies.

Speaking of E-Learning as a mean of cooperation also remind us that it has a concern either on the possibility of exchange of material goods or the construction of big infrastructures, but also on some immaterial goods like “knowledge” and pedagogic infrastructures for its production and diffusion. As far as E-learning is concerned as one of these pedagogic infrastructures, we use the definition given by Elliot Maise which means a modality of utilization of the technologies in network to protect, to distribute, to choose, to manage and to widen knowledge. This definition “*suggests to us four key notes: with the e-learning the way of thinking and protecting the formative contents changes; the way of organizing them and filing them changes; the modalities of benefiting and of choice on the part of the user*

*change; the modality of allocation of contents and of management of the process changes*" [2]. The E-Learning industry encompasses diverse operative modalities linked to different actors: it helps the capacity building of professionals in the sphere of a continuous formation, in diversifying or studying effectively the formative offer of a university. It involves the process of a specific knowledge that integrates technological and pedagogical competences.

We are developing these ideas in the light of a category called "interculturality" because - as the word etymologically indicates - every action of development is also a story of meeting/colliding among cultures that coexist and interact. By its nature, the concept of interculturality goes beyond a dynamic and proactive way: those of multiculturalism and pluralism. Still, we are not getting into the debate that the use of this notion deserves; the use of the concept of interculturality helps to put in light or how being cancelled from the Information and Communication Technologies may not constitute the cultural differences (that is the differences among the groups and persons that do not share the same universe of meanings and the same expressive forms of these meanings but only those gaps that in an unglobalized world constitute the inaccessible frontiers if lacking points of entry. Today these gaps are no longer a wall, but they become a bridge that renders possible their own overcoming towards a new culture that has the inevitable form of the "metissage" (bowling pot).

## THE TWO VERSIONS OF E-LEARNING IN AFRICA

We do not possess a complete phenomenology of the experience of E-Learning in Africa; nevertheless we are in a position to identify two geographical and cultural trajectories, identifiable through the two major linguistic areas: the Anglophone zone (with real and more influence on international level) and the Francophone one (often not well known). In short, the way we went through was not dissimilar from the one of the E-learning in our country as we shall see at the end; we find ourselves today in a situation of rethinking the modalities and reviewing the priority objectives<sup>1</sup>. C. Depover and F. Orivel (2012) carried out a comparative analysis of E-Learning between the two parts (Anglophone and Francophone), emphasizing the diversity of strategic and methodological options that differentiate them [4]. We limit ourselves to a few hints.

- As far as the Francophone world is concerned, an interesting point of view is constructed by the action of the Francophone University Agency (AUF: Agence Universitaire Francophone) [5], taken from the beginning by its activity to promote the diffusion of E-Learning and to make it the "case of resonance" of good practices. The French distant formation (FOAD : Formation Ouverte à Distance) is defined by Depover and Orivel as "handmade" in opposition to the projects of Anglo-Saxon mega universities to which the term "industrial" well suits. According to the authors in the francophone world, the main purpose of FOAD concerns Masters Programs in which the follow up of the students is more individualized. From the beginning, the choice has been to link the FOAD to the didactic activities of the university and to anchor them to the internal of their organized structures and of the respective academic curriculum. We are not in front of a project of vast proportions from a work of deep study, rather of a proposal born from diverse experimental episodes<sup>2</sup>.
- In the Anglo-Saxon world the tendency is more of the Massive Open Online Courses (MOOC) and of the virtual universities intended for a large audience of youth. They propose the idea to create some new channels, alternatives and self-regulating formation. From the francophone point of view, the judgment on this system is ambivalent. According to J. Wallet, the MOOC "*are the windows of a large warehouse, with big and*

---

<sup>1</sup> P.C. Rivoltella reassumes it in three stages or "generations": The first is constituted by the experience of Distant Formation (FAD) developed in the Italy of the period after the Second World War with the scope to provide the country with new technical competencies. In this period we find two experience of success: la Scuola Radio Eletra di Torino (from 1951) that promotes the courses by correspondence and the Telescuola of the RAI to which the program follows is Never too late aimed at supplying a television formation to adults who cannot read nor write. The second generation searches to go past the non personalized set up and strongly transmissive of the first. E-Learning came up between the years 1990 and 2000. It developed in two directions: first of all in the formation of the teaching and administrative staff of the public administration. In this context emerges the value of the figure of the Tutor, like a figure of reference and factors of personalization. Successfully the E-Learning was also developed by the universities that had the willing to extend the formation offer and to provide themselves with a new instrument. Academic structures come up and ad hoc delegate to the methodological, technological and didactic research depending both on new degree courses and on improving the didactic competency of the teachers less accustomed to the use of the new technologies. The true and proper telemetric universities also came up, regulated in 2003 and these today are over 120. In this period, some professional categories, like that of doctors, have adopted the instruments of distant formation like the instruments of on-going updating. The third generation is that called 2.0. It's a product of normalization of E-learning, in the sense of its assimilation on the part of a cultural context that has constituted a recognized instrument used at all levels and in many contexts. The future seems characterized by a second thought blended in the sense of TELE (Technology Enhanced Learning Environment), learning environments not necessarily supported, equipped and strengthened telemetrically by the technology in which the technologies developed from a distance become grouped technologies, instruments that favour the social dimension of learning [3].

<sup>2</sup> The AUF has been active from the end of 90s with the objective to support the network of the francophone universities in the world. As association it plays the role to promote union and network among universities on geographic base, themes and others, but never in concurrence with them. It collaborates with other European institutes dedicated to the distant formation (the CIFFAD of Quebec, the ACCT of Bordeaux that became the OIF in 1995). Among first projects there were those to install in the academic headquarters of countries of the South, the technological structures capable to facilitate the research works of the teachers and or the researches and students at the end of a cycle of studies. At the beginning all the strategy is based on the organisation of SYFED (Système Francophone d'Édition et de Diffusion), to put at the disposition of university world an actualized scientific documentation. From Sénégal the center extends to all the francophone countries in Africa.

*prestigious signs for advertisement. Like in big commercial malls of Paris, these windows are immense, wonderful and many people come to admire them, especially during the Christmas period. But this does not mean that later they would buy it*" [6]. We are in front of the commercial version of the instruction, not anymore among the objectives of a monopoly of the state, but rather inside the logic of marketing. D. Oillo, as Stanford mention that, Haward and other international universities can afford to don't have an interest of the zones in which the digital infrastructures are still weak, but confident on a mass of students that other universities do not have, they compensate a large number of leavers with significant success.

- A further difference of perspective can be found on the point of view of actors in favor of the E-Learning. While in the Francophone world, there are likely control by public institutions; in the Anglophone world we have the dominance of the private sector. And the public institutions, as J. Wallet mentions in the document already cited of AUF, have some modes of funding, functioning, and reasoning, and a know-how which are common to those of the face-to-face teaching and which will integrate with difficulty the distant teaching. The wish of the AUF engaging itself in distant learning in relation with cooperation North-South is to respond to the needs of formation but also to structure the offer, to avoid the creation of a bazaar of education in which the fake universities in Africa flourish and at the same time where pressure of globalization expose public institutes to competition with international offer without having the same facilities<sup>3</sup>.

## NUMEROUS ACTORS IN THE FIELD

We have chosen three different actors to analyze some problems linked to putting in place programs of E-Learning in African context:

- the institutional actors, the African universities in partnership with institutions of the North with more experience of E-Learning;
- The teachers called to run this innovation;
- The students always more attracted by more effective "market of formation".

### The point of view of the institutional actors

To understand the value and the perception of E-Learning in Africa, it may be useful to put forward big lines of the evolution of the universities in Africa. From the colonial period and the following days of independence (60-80) and those of structural adjustment (90-2010), the relation between policy of exploitation / economic growth and the development of educational infrastructures (the creation of a scholar system and a university network) has always been direct and problematic. Today Africa has many scholar systems reflecting the colonial powers who occupied the countries: these have given form to a scholastic system composed of various levels (basic literacy, technical formation, university) to which management, at least at the beginning, has been always entrusted to the religious force that the colonial administrators were co-opting in their countries of origin<sup>4</sup>. Still the university formation has known only in the postcolonial period a real expansion. It appeared like the leading instrument for the training of the leaders of the new states. A decisive turning point was however in 90s, when following the plans to tie up national budget, universities found themselves downsized. The consequences of some plan to recover from national debt on the university systems have been diversified. The reduction of state finances for school has led to a quantitative and qualitative reduction of the structures of support to the research and teaching (university libraries and laboratories) and a decrease of teacher's salaries reflecting loss of motivation and social status.

Moreover the academic staff is obliged to search for part time jobs of including consultancy for the international NGOs or even migrating to educational institutions of the North. To go about those systemic failures, networks have been developed. The first are the networks of NGOs specialized in applied researches like the "Council for the Development of Social Science Research in Africa" (CODESIRA) of Dakar or the "International Institute for Insect physiology and Ecology" (ICIPE) in Nairobi. These organizations have been able to mitigate the crisis of the university sector putting forward necessary resources to the applied research for the sector of the Graduates and post graduates training. The second phenomenon, more importantly, is the rapid growth private colleges (in some countries, around the year 2000, they arrive at collecting more students than public institutions) distinguishable by their status (non lucrative and lucrative) by their identity (secular or religious), by their thematic options (Business school) and by the quality of

<sup>3</sup> Even here one moves from the proposition of distant teaching concerned with the teaching staff to the creation of a virtual university (the UNISAT) in 1992-23. In 1995 it was decided to create a model of E-Learning more participative and that permits to unite distant moments to face to face moments with the presences of the tutor. The proposal of a Virtual Francophone University that is placed side by side to the similar project of the World Bank of a Université Virtuelle Africaine (UVA) was launched, but without success. In 2000 the project (UFV) was abandoned and it was decided to move to the organization of Campus Numerique Francophone (CNF). A little later the centers SYFED became CNF and the first was activated in Yaounde in Cameroon. In twelve years 43 CNF in the world were prepared to which 23 were added in partnership. In 2012, 40 among courses of licentiate and masters were proposed in Burkina F., Cameroon, Egypt, Lebanon, Madagascar, Morocco, Sénégal, Tunisia and Vietnam.

<sup>4</sup> One chapter in part is represented by Islamic universities. A general figure even if very limited of the story of the African university is constructed on the text of P. Zeleza [8].

their structures.

In these final years the institutional actor (the African universities) seems confined to two difficult modular factors: the demand to adapt to a globalization strongly normative and the weakness of local governance. For the first factor it is necessary to mention that if the university in the postcolonial phase was having as objective to train the leaders and necessary workers to implement African national politics in a context of growing globalization. This factor has been also impacted by the new objective to prepare elite to the demands of the global market and the necessary requirements to update technologically and culturally the private training. The second factor requires that the adaptation of the demand must be realized in a milieu of immense weakness of the systems or of the local institutions among which are the universities. In Africa these are symbolized today by some structural errors that various actors have summarized like the absence of a qualified training, the absence of diversification, the problem of frequent strikes, the increase of university population, the difficult to access the scientific and technical information. The consideration of this double factor (global pressure and local weakness) – must not be under evaluated in the analysis of concrete experiences of E-Learning that by their nature are based on collaboration among institutions of the North and the South. – That to only have a “fair weight”.

In this picture, the choice to propose different forms of E-Learning is dictated often by an opportunistic strategy tending to retrieve the maximum educational productivity but unfortunately difficult to find. This is still a factor that can hamper the positive outcome of the experience. To this proposal the testimony of the EBAD (Ecole des bibliothécaires, archivistes et documentalistes) of Dakar which has decided to switch to the E-Learning is interesting<sup>5</sup>. This international school that in the 90s was having half of its students who were coming from other African countries found itself running for 10 years to see this percent reduced to zero, after the drastic reduction of the state scholarships and of the unemployment in public office. From there, the necessity to think again about the school adopting the principle: “if the students do not come to us, we shall go to them”. An observer of the EBAD project comments like this: “*We are underlining that the swerving of the project to the e-learning is carried out in full dot.com period when one believed that the Internet could have changed educational system and the fact to earn a lot of money. In the middle way between the opportunism and the strategic reflection, in a period during which the development of E-learning was still a dream*” [9]. In this case the opportunism is transformed into an innovative capacity throughout the long-sighted leadership of its director that from the immediate benefits it will succeed to catch a glimpse and realize a new model of teaching giving back a hope to a training that seemed a little waned.

### The point of view of the teachers

In the proposals of E-Learning through the investment and the implication of institutions, the most crucial is still adequate teachers. From them – the main stakeholder of teaching – the opportunities linked to the use of the new technologies are often perceived as a problem. Problems that seem to prevent an implication of teacher’s board are multifaceted. Before anything the difficulty to acquire the necessary competencies on the new technologies is a problem that is gradually simplified with the lowering of the costs of the new technologies. Second difficulty is to enter in a new didactic logic. The professors often live on the facility of the students to adopt the scientific computer instruments and to enter in the logic of digital information like a threatening to their authority. The facility to access to the digital scientific information seems to most teachers like a mortal body exhausted by the students’ learning. What frightens is also the loss of authority linked to the end of the face-to-face way to do teaching in which the lesson of the teacher remains the principal form of scientific information at the disposition of the student. This difficulty sends us back to the character that still pyramidal and little participative in the university training in Africa. Lastly the difficulty linked to the effort to integrate new operative modalities that necessitate a gross personal investment in acquisition of instruments, in time to dedicate, in intellectual resource to use, the absence of recognition of the scientific comity and of a consequent economic compensation that makes it possible is to be mentioned.

In short from the point of view of the teachers two elements result essentially for an adequate realization of the projects of E-Learning: the economic realization and the restoration of the status of the tutor. To a proposal of retribution the comment of a director of school on this subject is effective: “*when they pay the teachers, this works*”. And speaking of the investment in the E-Learning reminds that in every case exists a second motivation. Less material but more scientific order: “*to earn ourselves is also the quality and the structure of their courses. Still this second motivation though important in a teacher’s career, it does not surpass the first*” [10]. The second factor of success is the social status of the tutor. This figure is linked from the beginning to the role that extends from the “technological facilitator” to the pedagogic mediator”, it is by many indicated as a “bridge” between teachers and students, capable to help renewal of the method of teaching [11]. In the case in fact of distant teaching the figure of the Tutor constitutes a professional status distinct from that of the teacher and his competencies regarding whether the pedagogic mediation or those relative to the organization, to the social and motivational aspects up to those technique and administrative.

Still, it is not forgotten that the bigger problem regarding the world of teachers and the E-learning is that of helping them to seize the pedagogic potentialities of the new technologies related to the two classic elements of the figure of the teacher: the choice of the methods of the research and the proposal of contents. In the experience of E-learning, the

<sup>5</sup> The story about this center can be found at: [www.ebad.ucad.sn/Archives/forciiir](http://www.ebad.ucad.sn/Archives/forciiir).

interaction between the teachers and the students – basic in every formative relation – instead of being substituted or replaced by a student-computer relation it is pushed to intensify itself and the role of the professor in the learning of a method is evident. The same is valid for the same modalities of construction and digital diffusion of the contents of teaching: far from becoming secondary, the E-Learning asks for new modalities of organization and of presentation where positive relapses become an advantage of the entire sector.

### The point of view of the students

Lastly we come to the students in their capacity of usability and clients of the proposals of E-Learning. On recent investigation on the profile of the candidates that enter the experience of distant teaching, women are only the 20% of the total of the young one in professional activity, and living in urban areas. This profile reveals already how many are highlighted above: the local elite that in the postcolonial season were seeing in public office a possibility of social ascension, they now apply to international institutions and organizations and to multinational and local businesses. We find them among these candidates of young students (in search of academic titles more marketable in a global context) and many state civil servants who, forced by the precariousness of their status, want to invest a new supplement training capable to upgrade them professionally.

For some observers the world of the young in the countries of the South shows a growth of individualism in the way to devise the training and the instruction: this is not seen as a possibility to construct competencies to be active in one's country, but like an individual investment on one's future. As far as this could be only partly true, it must not be forgotten that for many young ones the digital modernity appears to them like a virtual and real possibility to over cross borders and to break the rigidity in which their societies seem degraded.

The point of view of the young in front of the potentiality linked to the proposal of the E-Learning have been well explained in an article of the magazine *Liberation* of 18/02/2006 dedicated to the Numeric Campus of Libreville in Gabon. The article presents the motivations for which the young are attracted to the forms of E-learning. It seems to offer them the access to a quality teaching in a time in which the direct access to the European training seems impossible due to financial and document motives. Besides the participative modalities that the access to distant formation seems to respond to a question of participation "tout court" (all short). One of them says: "*in Africa the word is not easily given to the young. But in the Numeric Campus (and in the programs of distant education) we take it without difficulty*".

## CONCLUSION

We have been interrogating ourselves on the promotion of the E-learning in Africa with an evident practical intent: that of learning from the analysis of the past the better practices and a vision more realistic of the difficulties and of the opportunities that it could bring. We summarize what has been said in a synthetic way.

- In view of the diversity of technical and methodological aspects that are suggested in different programs of E-learning in African Universities, it is necessary, above all, to acknowledge the existence of a double interpretation in connection to its usefulness : the E-learning as a different didactical way applied to university programs (the francophone vision) and the E-learning as being a new methodological approach compared to the traditional one known in the universities. The two visions respond to divergent political objectives bound to the role of the university in a globalized world and to its status (public or private).
- Still the choice to promote the modalities of distant teaching totally or partially are today strategic for a university that must elaborate the proper training offer in a context that has become always more competitive and marketable. Besides, these modalities – as far as they could be developed and renovated and as far as they could be experimented by a very small number of students – they still know to transmit the image of modernity capable to attract more youth.
- The E-Learning understood as realization in a local context of a specific pedagogic structure has in itself an ability of innovation that is still long from exhausting its potentialities in the African context [12]. The fact that it seems to have exhausted its magical fascination more than discouraging us must lead us to great realism. Such minor fascination however can be accused by the fact that in Africa, partly rare exceptions and despite the rapid improvements, it brought technical problems and intensive use of the opportunities of the network (frequent and extended suspensions of the distribution of the electric power, dislocation of internet shops only in more important urban areas, costs still too high than the supporting material).
- We have affirmed that, although pilot projects exist that we should define as "experience of success" in the environment of the E-Learning, they turn to become reproducers on a vast scale. Among the reasons we have highlighted like the point of view of the African academic authority, the E-Learning may not be actually a priority. Faced to a boundless growth of students and the toll of integrating them adequately, from the pedagogic point of view, the African universities fall into the risk of under evaluating such an opportunity.
- The E-Learning is an educational infrastructure that demands, in order to be realised, an articulated series of competences to new educational and social techniques. Above all it acts to promote the adoption and the

mastery of ICT. On this point of view the generations after the years 2000 seem to have an advantage to those who completed their academic formation before this period.

- Several observers and researchers have put to light the exceptional impact of ICT on the methodology of teaching. The new technologies of communication, far from rendering the role of a teacher unnecessary, demand a radical change in favour of greater communication creativity, a clear methodological rigidity and a stronger interaction with students. The role of tutoring is therefore strategic especially in launching projects and in accompanying the persons involved (professors and students) so as to render this stride functional.
- The capacity to create networks among universities, economic, social and religious subjects remain today a choice of strategic intelligence that asks to be reevaluated. In this sense the investment is essential in professional figures of "creators of networks", capable to transform the affinities and the cultural compatibilities into structured and shared resources for long term perspectives.
- The point of view of the teachers is fundamental because it is commonly accepted that the pedagogic innovation passes and remains with them. It is also known that a temporally and physiological space exists between experimentation of new technologies and organized integration in a system of instruction. What is important is to maintain permeability between research and pedagogic innovation then, E-learning as instrument can contribute to this.

The social anthropologist J. Tonda in his book "Le souverain moderne" speaks of the invasive and violent modernity and of its symbols, capable to impose its domination unconditionally, from there and over every consent, and to mold images, meanings and gestures. According to Tonda the Sovereign owes its effectiveness to the aggressive consent and to the paradoxical connivance of the bodies and of their capacity of imagination. Speaking of aggressive consent (in French «consentements révoltés») Tonda refers to the living and painful feeling – that accompanies the consent of the persons to the modernity and its logic – of the inequities and the injustices that structure the African social and economic space [13]. The modernity in fact is characterized for this capacity to produce classes less utopist ("internet for all!") that conceals deep and structural disparities.

The dramatic perception of Tonda is perhaps well that it may accompany also us, today, while we interrogate ourselves on the capacity of the ICT to favor a less imbalanced development of Africa. The risk is in fact still strong once more to go beyond it rhetorically in an ingenuous optimism. The optimism is useful to the cooperation with Africa and they try also the fact that official documents might look for toning down excessively enthusiastic on this theme<sup>6</sup>. That which rescues – gives vigor to every enterprise – is always the lucidity of the analysis and the humility in action: they can do from foundation more solid to better hopes to which we wish to continue to entrust our confidence in life.

The challenge to deal with is in fact properly that of succeeding to do in a way the introduction of the new Information and Communication Technologies remains a historical opportunity – not to reduce the simple technological alphabetization – for redesigning the profile of the African society and of which also social or group actors historically more marginal will be able to take an advantage in the course of time.

## NOMENCLATURE

## PARTICIPATORY PROCESSES AND TOOLS FOR IMPROVING TEACHERS' PROFESSIONALISM: THE IUS CASE<sup>1</sup>

Piergiuseppe Ellerani\*, Ma. José Gil Mendoza<sup>o</sup>

\*Università di Lecce/Fondazione Edulife, Italy, [piergiuseppe.ellerani@gmail.com](mailto:piergiuseppe.ellerani@gmail.com)

<sup>o</sup>Fondazione Edulife, Italy, [m.mendoza@edulife.it](mailto:m.mendoza@edulife.it)

### ABSTRACT

This paper presents the experience carried out by a confederation of Higher Education Institution (IUS) active in six Latin American countries.. To achieve the goal of a new teaching and learning model based on the "learning process" and shift the paradigm of learning to "centred teaching", the Higher Education Institutions have defined a new profile for university teachers. This action expresses three features presented in this paper: the first refers to the profile as the "product" of a Community of Thought; the second refers to a "participated process", a working model that allowed the co-construction of the profile with the teachers, the administrative and the human resources staff of the universities; the third presents the tools and technologies used in an integrated way (Virtual Collaborative Learning Environment based on Web 2.0, Human Resource Management, video-research, e-portfolio).

The project - developed through action-research - has defined a shared idea of teaching quality, which is research-based and supported by tools enabling self-assessment of every single teacher, university quality monitoring, and the implementation of continuous improvement plans to build a community of learning.

**KEYWORDS:** *Higher Education Teacher profile, Teaching and Learning in Higher Education, Competencies evaluation, Tuning America-Latina, Web2.0, E-Portfolio.*

### 1. THEORETICAL FRAMEWORK

International research emphasizes that quality teaching is necessarily student-centred and that its aim is to provide effective learning opportunities for all students [Henard, Ringuet, 2008]. In addition, the changes in competencies requirements occurred with the establishment of the learning society deeply influence students' lifestyles [Benavides et al., 2010]. In order to achieve their full potential as adults, youths need to develop a range of competencies and knowledge able to help them master and implement concepts learnt outside school or academic contexts [NAP, 2012]. Development potential and potentially successful students - in both higher education and vocational careers - must be backed by mastery of at least four key areas: critical thinking and problem solving, communication, collaboration and creativity and innovation [Partnership for 21st Century Skills, 2010, p.2]. In higher education, each student must be seen as an individual able to learn continuously by applying critical thinking, performing team work, solving problems and making effective decisions [Tuning Project, 2008].

The demand for new competencies for young people consequently implies updated teacher profiles ready to deal with the new student profiles [Guasch, Alvarez, Espasa, 2010]. Teachers should hold classes and manage classrooms by implementing more effective and innovative teaching methods [Schleicher, 2012; Benavides et al, 2010], thus rapidly conveying the outcome of research on the learning process. Such higher education trends have increased quality awareness of the learning opportunities for students [Henard and Ringuet, 2008, p.10]. Furthermore, as observed by Zabalza [2003], it is necessary that professors alter their point of view, enabling the transition from teacher-centred teaching to a style aiming at quality learning. In effect, research proves how university teaching methods influence students' involvement both in the classroom and when studying, [Altbach et al., 2009, p.11] and shows how deeply they are correlated with the teacher's idea of teaching and of learning [Kember and Kwan, 2000]. Higher education teachers generally privilege a mainly content-centred educational approach, yet the learning-centred approach serves the purposes of effective teaching methods much better. The Talis-Ocse [2009] survey seems to back Kember and Kwan's research, as it has shown how teachers' beliefs influence teaching styles and methods [Zhang, 2009]. It is deemed important that teachers move "off stage" and adopt teaching methods that allow students to play the lead role in their learning process [Tuning Project, 2008]. Doing so, students could be educated in a teaching context leading them to active, democratic and responsible citizenship. As stressed by Europa2020 [EU, 2010], the higher education experience should provide all young people with the tools needed for positive interaction with peers from different contexts,

<sup>1</sup> The paper is a summary of the volume, *Il ciclo del valore. Un modello partecipativo per il miglioramento continuo della professionalità docente*, by Piergiuseppe Ellerani (Franco Angeli Editore, forthcoming).

promoting intercultural competencies, democratic values and respect for fundamental rights and the environment, while fighting any form of discrimination.

## 2. TEACHER QUALITY

Latin American universities have taken the opportunity to address, in an innovative way, the challenges posed by areas of expansion and of internationalization in the knowledge society [UNESCO, 2009]. Higher education in Latin America is engaged in the process of improving compatibility, comparability and quality of the service it provides [Tuning Project, 2008], supported by a range of actions involving teachers and aimed at the enhancement of teaching and learning quality. As a matter of fact, higher teaching quality implies the opportunity to increase teachers competencies also self-evaluation wise, to enhance students' motivation and diligence [Butler, 2007], to organise and manage participatory and inclusion contexts able to develop lifelong competencies and creative thinking.

Teaching quality and the quality level of higher education organisations are bound to the awareness of personal and social responsibility and to the development of the participatory process in order to identify and represent the dimensions involved in institutional "quality vision". As pointed out by Rabinowitz [2013], it is important to bear in mind the term "participatory" - which does not only entail asking for advice but rather implies every single participant becomes an essential element in the planning process. You can describe a participatory approach as a method that takes everybody's point of view into account and allows everybody to participate in the planning process with some degree of decision-making power [Rabinowitz, 2013].

Specialised literature constantly describes how teachers learn to work with their colleagues within the Professional Learning Community, engaging in ongoing exchange and by reviewing their practices, analysing students' performances and developing and creating more effective education techniques [Darling-Hammond, 2009].

The positive effects of the professional communities - regardless of school type - are now widely documented by a remarkable number of studies. The relevant feature is that teacher communities are often part of networks in which members can discuss the practice focus or shared educational concerns [Darling-Hammond, 2009; Fullan, 1991].

Even though each professional learning community is unique, the main features lie in collaboration and peer-influenced decision-making, as well as in democratic behaviour and in the way each member participates in vision-building: beliefs, values and shared vision. Other features include: supporting and distributed leadership; adult cooperative learning; positive attitude: trust, peer support, shared practices; sustainable development; continuous self-evaluation process [Hord and Sommers, 2008; Zepeda, 2008; Fullan, 2005]. PLCs therefore evolve into special contexts - physical, social, emotional and cognitive space - where relationships and learning perform a "transformative" action influencing individual and social perspectives and habits of mind [Mezirow, 2003; Costa, 2008].

## 3. DIGITAL ENVIRONMENTS FOR CONTINUING EDUCATION

In today's world building and developing professional teacher communities, organizing and proposing continuing education, and enhancing Institution quality, implies coping with the extraordinary evolution process involving information and communication technology and, more in detail, web 2.0.

McManus [2005] asserts that web expansion and easy access to the same have radically modified its very nature. Interactive and dynamic elements have emerged in the use of web 2.0 [O'Reilly, 2006]. Participatory, collaborative and distributed practices are now simpler and enhanced, providing informal and non-formal learning opportunities in everyday life [Lankshear, Knobel, 2006].

Web 2.0 relational nature is boosted by the interactive comments and considerations posted by the participants. The overall concept seems to identify "knowledge" as a "collective agreement" and the groups as "speaker communities" - a concept able to combine facts with other dimensions of the human experience, like opinions, values and beliefs [Dede, 2008, p. 80].

Taken as a whole, web 2.0 interconnection, creative competence and interactive features support the so-called "participatory culture": clear from barriers, both in building stage and in knowledge update, and supported by civic engagement, it constitutes a great incentive and is highly supportive for creating and sharing personal digital productions and finding out what other people think about them [Jenkins, 2006]. Thus higher education has to face interesting challenges and evolve towards a more than radical and fresh change in order to progress and educate new generations in a profoundly transformed world. Its role can contribute to educating students so that society, currently undergoing a significant crisis of values, may be able to overcome mere financial and functional considerations, achieving new, sustainable integration.

## 4. RESEARCH CONTEXT

This is the approach we have chosen for introducing the project selected for outlining the teachers', administrative staff's and executive staff's profiles at IUS confederate Universities: considered as a whole, they are concurrently

human resources able to enhance academic life quality and, specifically, to create the conditions for student-centred learning.

The assumption is that teachers perform best by organising learning and student-centred activities. For this to happen, the same teachers must be given the opportunity to work according to the paradigms required by the competence-oriented and student-centred perspective. As a consequence, it is essential that the human resources in charge of university administration are in the position to create a profile able to integrate into the student-centred paradigm perspective. Nevertheless, human resources managers must update their profiles to be able to assess and organize adequate teacher and administrative staff improvement paths in order to maintain, or enhance, the level of quality of learning-centred education.

The building of the participatory profile was the last stage of a long-term improvement process involving higher education institutions.

The goal of the first stage of such process was to provide the universities involved in the project with the so-called *Marco de Referencia* [Framework of reference], a set of documents outlining the elements to characterize the Institution Identity and stating the essential conditions - defined Policies - for implementing such identity model.

The second stage was dedicated to the implementation of the *Marco de Referencia*, through the so-called “Mutual programs”, whose goal was to secure common development bases. They consisted in action programs (average duration three years) for setting goals, methodologies and tools according to a process logic.

The first of these programs involved the drafting of the Carta di Navigazione [Navigation Chart] which provided a clear institutional project for each institution, the adoption of multi-year strategic plans and of annual operational plans, the implementation of a system and practice of auto-evaluation and hetero-evaluation, the pursuit of state accreditation in countries whose laws provided such status.

The second program was dedicated to the *Integrated Human Resources management* process introduced at the Conference held in Porto Alegre (Brazil) in June 2009, virtually an extension of the strategic plan outlined in the *Navigation Chart*. To keep up with the deep ongoing global change involving the education paradigm, it was essential - in order to enhance quality - to draft university teacher Competence Profiles as if they were the main “value generator” in an institution. In addition, other two correlated competence profiles had to be defined, namely those for the Executive and Administrative Staff.

Once profiles had been outlined, a Training course on human resources management named “Integrated Management for competencies” would have started. Course content sequence - grouped into eight main themes, developed April to November 2011 within a virtual environment built for cooperative learning - coincide with the human resources Value Cycle, which accompanies individuals throughout their professional career.

Human resources enhancement *generates value* for the institution and for the end users (the students), as well as for all the external stakeholders (value chain). The value generated by this chain has repercussions on the same human resources, involving them in the generated benefits, through professional development schemes, opportunities for competence consolidation and development, and further personal and team investment. The outcome is a virtuous circle widely involving the whole value cycle.

**Table 1** - Value cycle.

	Step	Description	Framework questions
1	Purpose of the organization	Training students to “learn to learn”, helping each student to outline personal, future-oriented, life projects.	What essential aim do the Institution’s actions focus on?
2	Pragmatic view	Promoting competent relationship networks for creating a permanent learning system able to involve students and all individuals through their interests, schedule and location, based on a person-focused approach.	Which participants and processes are involved to achieve the essential purpose of the organization?
3	Value chain	The teachers act as value generators, outlining the competencies - identity, systemic, professional – able to generate value, in order to be able to promote/accept/support each student.	Which competencies, peculiar to human resources, can generate value?
4	Value chain	The institutions, as an organisation, define the competencies that help teachers act as value generators.	Which competencies, peculiar to the institution/s can generate value?
5	Professional Learning Community	The institution is structured as a professional learning community for promoting continuous goal and competence improvement and evaluation through processes involving the core [self-peer evaluation] and the exterior [hetero-evaluation and	Which processes and products contribute to Institution continuous improvement?

		accountability].	
6	Competence profiles as the outcome of the work carried out by the learning community	Human resources profiles quality - representing the professional learning community - is continuously assessed and reported within the professional community in order to update and improve the level of quality of the profile competencies and of the institution.	Where are we heading? Is our work consistent with the purpose?
7	Continuous assessment and orientation of individual and group -focused education aimed at improvement	The human resources generating value within the institution constantly verify the purposes and new emerging visions redefine the value chain and enhance the level of quality of the learning-centred organization.	Is the purpose up-to-date?

## 5. RESEARCH METHODOLOGY, TOOLS AND VALUE CYCLE

The implemented research-action project was lead by two key elements: a) the “value cycle”, which represents a methodology - integrated by processes and products - able to support the organizations in outlining competence profiles for continuous improvement; b) the web.2.0-based cooperative digital learning environment (AVAC) in which the value cycle developed. The teachers’, administrative staff’s and human resources’ managerial profiles were finalised over the three years. The research-action was based on the legitimate peripheral [Engström, 1996] social-constructivist theoretical model [Vygotskji, 1967] of adult learning, as per Kolb’s cycle [1984], adopted by learning communities [Hord, 1997; Wenger, 1998].

Videos were used in some of the project stages to provide content and methodology support. Further videos were produced by the universities involved in the project to review the processes implemented in profile-definition stage.

Participants are represented as follows (table2):

**Table 2 - Parties involved in action-research**

Participants	Stage	No.	University No.
Teachers	Participatory profile co-building	386	13
Teachers	Profile experimentation	371	14
Referee tutors	Experimentation support and focus group lead	66	14
Administrative staff	Participatory profile co-building	64	7
Administrative staff	Profile experimentation	184	7
Executive staff	Profile experimentation	126	7
Tutors	Experimentation support and focus group lead	30	7

Source: self-sourced.

Profile definition was broken down into four stages.

In the first stage, carried out face-to-face, a set of possible competencies, classified by area, were presented to the university deans, to the human resources management teams and to the teachers' representatives. The initial submission was based on some university teacher competence models, previously proposed by a few authors [Zabalza, 2003; Euridyce, 2007; Bozu y Canto Carrera, 2009]. The competence areas provided a basic structure which, through face-to-face introductory cooperative work, represented a starting-point for discussion and an opportunity for perspective sharing.

In the second stage the work teams adjusted within the purposely set web2.0 digital environment. In this stage, the inter-university teams used previously defined competence models and a further model based on dynamic and authentic assessment [Wiggins, McTighe, 1998] for defining the profile content (competence areas), the dimensions involved in the competent action, the explicitation criteria of what should be tackled while carrying out the competent action and the competence development indicators - broken up into four levels and providing feedback if the criterion is met. The process was carried out adopting web 2.0 technology, which simplifies and enhances participatory, collaborative and distributive practices (wiki) and proposes informal and non-formal learning opportunities during the activities. Opportunities for increasing interaction and social relations created by the narrative tools (forums and blogs) are boosted. Blogs take on the nature of narrative practices applied to experience, quality evaluation, space for learning different writing styles; wikis allow for the co-building of constantly updated content, significant to research, study and insight.

In the third stage each team thus integrated the process by making changes, if necessary. Wiki tool features (statistical data, accept and refuse changes, text integration) allowed for the achievement of the profile end product through co-built procedures [Vigotskij, 1967]. The profile content was validated and legitimated by the learning community through the co-building process [Engström, 1996]. It thus becomes a “value generator” for the whole learning community.

In the fourth stage, the profile was uploaded onto the Human Resource Management (HRM) tool and underwent the experimentation stage with teachers not involved in the shared building process.

The HRM tool is integrated into the cooperative digital environment (AVAC) developed on databases containing the final human resources profiles, visualized as text descriptors in the chosen competence dimensions, in the quality indicators and in the level ranges. The HRM makes different assessment levels possible: each single teacher can self-evaluate his/her own competence levels; each colleague can be deemed a “peer” able to provide feedback; each department manager can have access to the evaluations and obtain an analytical and global framework of the department competencies; external assessors (hetero-evaluation) can evaluate the competence levels of the single teachers and departments. HRM is based on the authentic assessment theoretical model, which considers assessment rubrics, quality indicators and quality or competence evidence evaluation tools.

Summarizing, the teachers' profile as end product of the professional community including the thirteen institutions – achieved through cooperative work carried out by the teachers and inspired by continuous assessment – was developed through:

- competence definition. The teachers selected the competence listed in the final profile through forum interaction, supported by theoretical contributions and research;
- creation of competence quality indicators and levels. Competencies were later transformed into wiki articles. Competencies were described in terms of descriptors, indicators and evidence. Wikis – cooperative writing and composition wise - were fed by the teachers who corrected, rewrote and co-built the final profile;
- metacognition. The teachers who participated in the experimentation used the blog for narrating their own experience, applying metacognitive synthesis to the implemented processes. The teachers involved in the research process increased their awareness level, transforming practice into “reflection” able to inspire the next step.

Throughout cooperative work the teachers integrated the experience as a recursive change process, carrying out effective actions for building up positive interdependence and trust among the community members:

- enhancing learning through action;
- taking on a leadership distribution model;
- allowing the individuals involved in the process to take responsibility for their own development.

The evaluation concept – whose aim is to appreciate what is important and meaningful – has become a trend for continuous improvement as it is correlated to the use of tools and processes that must be able to constantly appreciate what counts. The continuing learning paradigm, throughout life and its locations, outlines a new requirement, which is also connected to the essence of evaluation: it becomes – as a process – a learning opportunity [Wiggins, 1998; OECD, 2010] and provides a clue on what should be improved and in which way (table 3).

**Table 3 - Interrelation involving teachers' and executive and administrative staff's profiles**

IDENTITARY	SYSTEMIC	PROFESSIONAL
<b>TEACHER PROFILE</b>		
Knowing how to promote human and professional development	Being connected	Designing and developing contents

		Developing a systemic mindset
--	--	-------------------------------

Source: self-sourced.

Each profile is broken up into competence areas, which are divided into competence fields including different groups. Each group is made up of several criteria, each of them is matched with a scale of indicators (four levels ranging from 1 to 4), of descriptive nature (evidence), indicating the level of competence mastery.

Mastery numerical rating outlines:

- the level of mastery of each single teacher/administration staff member/executive staff member compared to the expected rating of the single IUS;
- the level of sectoral mastery of teachers/administrative staff/executive staff;
- the overall level of the single IUSs compared to the expected rating.

The evidence constitutes a basis for comparison against the indicators and allows teachers to outline the development level of their own profile. Evidence is collected and selected by the teachers through the e-portfolio and represents a guide for both self and hetero-evaluation of the profile development level.

Profile dimensions created inextricable interdependence among the same, as all of the three profiles focus on the same competence areas, which are deemed strategic for a learning paradigm-oriented change and are aimed at achieving the learning to learn-centred education goal specifically pursued by Higher education institutions. In detail, we present the competence areas and the correlated evidence in teacher profile (table 4).

**Table 4 - Final teacher profile and evidence per achieved quality levels.**

<b>HE Teacher Profile</b>		
<b>Areas</b>	<b>Competencies</b>	<b>Quality Level [EQL] [E-Portfolio] evidence</b>
Professional	Designing and developing topics	Course program Designing topics, tools and learning material Teaching performances Learning evaluation tools
	Designing and leading learning environments	Designing learning activities focused on students' individual differences Using active learning and interaction with students and teachers Innovating and creating tools, tasks and resources according to the students' features
	Evaluate of and for learning	Documents and activities prepared for the course final examination Documents and activities prepared and available on-line
	Social relationships	Leading learning environments Team work with colleagues to design projects and activities Promoting and leading meeting sand work groups with internal and external staff and stakeholders Presenter at meetings, workshops and conferences inside/outside Presenter and/or University delegate at project presentation
Organization	Research development	Drafting papers and books[individually and/or in cooperation with] PHD or Degree Tutors Referee of research projects Reports for internal and external information on university research Leading classes as research based communities and reporting results
	Working in an Organization as in a Professional Learning Community	Performance of the daily activities of the organization and responding to requests. Participation and peer work. Working with external people/stakeholders Updating the e-portfolio and self-evaluation
Institutional Identity	Promoting students' human and professional development	Helping students to define study plans [curriculum studiorum and Cv] Helping students to define Professional Projects [with reflections on ethical principles] Coaching students and enhancing their specific competencies Being available to meet students outside the classroom with face to face meetings and communication within digital environments. Pedagogical attention with students, recognized by students and colleagues.

## 6. A NEW ORGANIZATIONAL MODEL AS A PROSPECT FOR CONTINUOUS IMPROVEMENT

Research-action confirmed the importance of identifying a competence-based teacher profile (Zabalza, 2009), also as an opportunity for carrying out continuous development and improvement plans (Unesco, 2009). The process proved web2.0 and HRM effectiveness in building up-to-date higher education teacher profiles. Furthermore, it was possible, through on-going assessment-based HRM, to evaluate the quality of teacher competencies. Such self-assessment actions carried out by the teachers are also subject to hetero-assessment that can potentially be carried out by tutors, colleagues, external experts or students. To make this possible, digital portfolios (e-portfolio) or personal learning environments (PLE) should be implemented, to create places where teachers can support their profiles and path, share their experiences and receive feedback which is significant to the continuous improvement process. Such tools trigger processes that reinforce the identity of the university institution, which should support the enhancement process involving its own teachers and its own quality level through the actions carried out by the executive and administrative staff. According to Sergiovanni (2000), this aspect generates intellectual capital or the ability of an organization, and of its staff, to learn, learn again, carry out research and improve the ability of identifying issues in order to improve teaching and learning: another remarkably significant element for identifying the level of quality of an organization.

Future research may focus on how Personal and Social Digital Learning Environments help teachers to effectively transform and enhance their practices. In addition, Personal and Social Digital Learning Environments are part of a social network that teachers can use for inviting – and for getting connected with - colleagues, external supervisors and external experts and assessors in order to evaluate their progress. Research could concentrate on how the social network contribution may become a peer-evaluation and feedback tool for improvement. It might be interesting to verify if the Personal and Social Digital Learning Environments are contexts in which metacognition processes able to influence teachers' beliefs and practices transformation are encouraged.

In this sense, the main focus is on the enhancement of teachers and of their history which - supported over time by their personal profile and path, narrating their own experiences and receiving feedback significant to continuous improvement - expresses the cultural and intellectual capital generated by university institutions.

### ABSTRACT

Community Media as Alternative Media Strengthening and Support Mechanisms in African Protracted Crises and conflict-affected Territories is an imperative necessity for the African reality. In today's world and with special emphasis on Africa, there is enough knowledge but little courage to address chronic and complex challenges especially in the Media fronts. Therefore, Paradigm shifts from Elite Knowledge sharing to Community Knowledge and Experience Sharing at large, and furthermore, from State-monopolized Media to Community-managed Media become likely a basic need and necessity for the African numbed communities. The tyrannical regimes prevailing in the African Continent are erecting every possible constraining barriers and denying the access of media houses to that territories targeted by their discriminative, sophisticated modern local apartheid, scorched earth policies and at the same time practicing horrible numbing on its population. These regimes have the complete State-owned or para-statal Media monopoly and they absolutely do not allow any transmission of whatsoever informative news unless it undergo through rigorous control, often done through dedicated security apparatus. Logically, this gloomy situation necessitates rapid and concrete actions and interventions, in particular additional and alternative media to silence-break and inform a wider public about that inhuman circumstances. Therefore, *ad hoc* concrete, consistent, constructive and coordinated Media Strengthening and Supportive Mechanisms should be put in place to scale-up the existing fragmented and scattered local African traditional and innovative media agencies serving the local communities. New media supportive and strengthening services can be realized through web-based media tools such as web-radio, web-based TV, as well as Media Networking Smart Mechanisms. This is also possible and obtainable following innovative partnering modalities. Shared visionary projects and programs can be identified, implemented, maintained and sustained with minimum financial and economic costs and maximum social and cultural benefits for the potential partnering stakeholders. For these motivations a multi-player projects, programs can be suggested in a shifting and evolving vision of knowledge and experience-sharing. Thus, participated media support projects and programs should prioritise to be SMART, simple, miserable, actionable, result-based, and time-bounded. The principal requirements for the success and sustainability of relative and relevant proposals can be identified in hard and soft infrastructures frameworks in addition to the voluntary human resource and political will. The inter-university international cooperation and community solidarity for development, among other actors can play major and proactive role in the African continent transformational shifts and beyond.

**KEYWORDS AND CONCEPTS:** *Smart and Alternative Media, Community Web-based Media, Knowledge and Experience Sharing, Pro-Conflict-Affected Communities, Information Communication Technologies, Cultural Exposures and Capability expression, Inter-University Solidarity for Development Cooperation, Transformational and Paradigm shifts.*

### INTRODUCTION

As already known, for decades and decades in the African continent and even till today people have been living in dire humanitarian situations. The armed conflicts and successive civil wars have reduced African communities to the limits. The combined marginalization and oppression witnessed are aggravating factors especially in situation of absent, silent or silenced media. Currently, many African territories are hardly accessible and completely isolated from the media world for diversity of reasons and constraints.

Even the humanitarian organizations are not allowed to denounce and voice out the deteriorating and dire situations in terms of food and nutrition insecurity, absence of reliable education structures and systems, complete lack of sanitary and health infrastructure, resource grabbing, money laundering, green-washing, social and environmental injustice and exclusion, poor governance mechanisms, not to talk about the tragic daily aerial bombardment causing massive displacements towards all the domestic and neighbouring countries, continental and intercontinental mass migration and

exodus.

Especially, in the marginalized and impoverished territories, in urban slums, rural dwells, peripheral rural outskirts, refugees camps as well as reaching the populations under siege in the caves, wondering in the bush, forests, mountains and valleys. An impelling media hard and soft infrastructures are needed to be a base for just peace, social justice and cohesion, rule of law, respect of universal human rights, democratic transformation and smooth transition, and above all human dignity restitution. The innovative social digital media and ICT can assist in that prospective and would play a proactive role in the service of the African communities within the continent and around the globe. To address this challenging reality, there is a need to suggest and implement practical solutions to this problematic scenario, considering the context specificity.

Alternative media have historically been a central force in social change. However, they do not uniformly subvert the hierarchies of access that have always been fundamental to mainstream media. In fact, their journalistic norms and routines have always drawn on the professional standards of the mainstream. The perception of 'mainstream' and 'alternative' as a misconception arguing that they have always existed on the same continuum and continue to converge [1]. In conflict-borne realities, alternative activist and community-managed media can play the role of the mainstream conventional media.

Media is related to different communication typologies, for instance, in scientific communications, communicating to the public involve three main groups of actors (scientist, journalist and the public) [2]. Likewise, in isolated conflict-affected areas, the communication mainly involves politicians (militarized or civil), ITC professionals and the dynamic public (communities).

Fig. 1 - Map of Africa

Communities exposed to cultural transient and transformational environments can be included in enabling and empowering information technology and communication projects and programs, which will allow and enhance their capability expressions for full economical, social, political and cultural inclusion and participation in non deprivable developmental arena.

## METHODOLOGY

The methodology followed to extend this article is threefold:

- i) direct experience and observations of the Authors;
- ii) Simple open ended *ad hoc* questionnaire;
- iii) Semi-structured interviews with privileged informants.

Briefly:

1. Storytelling
2. Self-administered Questionnaire which are online web-based and with assisted respondents and
3. Web-based online Interview with privileged informants supplemented by photos and video from Journalist.

The direct experience is reported in a sort of story telling done by the others, being from and living in protracted crises and conflict-affected territory in Sudan and neighbouring countries. Worth to mention that the protracted crises and conflict-affected territories are characterized by the longevity and succession of crises, prevalence of aid flow and fragile economic and food and nutrition security status.

The questionnaire is composed of five core compulsory questions and 2 optional enquiries. The core questions asked are the following:

1. Do you agree that the Alternative Media is playing major roles than the conventional Media? If yes, please explain.
2. How can the Alternative Media be strengthened and supported?
3. How can the International Inter-university Cooperation and Solidarity assist in supporting the ICT and e-learning in protracted-crises and conflict-affected realities?
4. Do you agree that Knowledge and Experience sharing are effective in pushing towards major Mediatization and Educational Scaling-up? If yes, please explain
5. Do you know any sort of innovative e-learning, social Media, capacity building, ITC instrument applicable in protracted-crises and conflict-affected realities?

While the optional enquiries were:

6. What sort of improvement and/or inquiry can be added to the abstract provided?
7. Do you have any additional inquiry to add? If yes, what is it?

The questionnaire was sent to about 50 stakeholders, and posted in the personal social media and web page of the principal author and blogs of the authors. Respondent to the questionnaire have had 2 weeks time to formulate their answers and sent it back. Their response were satisfactory enough, in particular those who are active in the Alternative and Activist Media. Alternative and Activist New Media [3] could be a suitable outlet in protracted crises and conflict affected African realities.

While the semi-structured interview was done via Skype (teleconference program) with expert journalists in the Diaspora and was not possible to carry it with another journalist in the war-affected areas due to security constraint.

The wider public in the social media (Facebook personal pages of the authors) reacted to the questions with likes, shares and comments.

The time has been major constraint to collect many answers and revert backs. However, the told stories, returned questionnaires, and conducted interviews were sufficient to address the themes put on the table for this e-consultation.

One of the oral respondents mentioned that the questionnaire formulated in English language is difficult for many potential respondents, and if possible to translate that in local languages, however, the author does not have sufficient time and means to carry that task.

Internet links to the event and author website has been reported in the questionnaire [4].

## **RESULTS**

### **1. Story**

My strongest experiences in the communication field have been in Kenya at the time of the post-electoral violence, (January-March 2008) and in Sudan, both before and after the independence of South Sudan (2011), particularly in the Nuba Mountains area.

When I started visiting the Nuba Mountains in 1995, the area was ravaged by civil war in a context of complete isolation. There was no communication by land, only by air, and if was very dangerous. The only information reaching the people from the outside was the government radio broadcasting. No telephone or any other communication apart from the extremely expensive satellite phone. The government propaganda was focusing in promoting religious and ethnic division. The liberation movement on its side insisted on the military aspect of the war, in the press releases coming out to the Nairobi office, that could not be seen and understood by the majority of the population. Therefore in an area as big as Northern Italy the only communication was oral. No printed or electronic communication whatsoever reached the people. No chances for the civilians to have their concerns and their problems heard and taken into consideration. From both sides the communication was basically top-down. Recently, while the civil war is still going on in a different political context, the modern means of communication are having a notable impact. On the rebels side there are two radio stations in the area, though their range is very limited due to the mountainous nature of the area, and

there is a small but committed team of journalists armed with tape-recorders, cameras, video-recorders and with enough skills to edit and publish news related to the war, and on the government side there is a cellular telephone network, and a better organized communication and information collecting system, that sometime offer chances even to the opposition to make their opinions known. It is clear that the social and political awareness of the actors of this war has become more sophisticated and the participation of the civilian in the debated has become more important and there is the emergence of a public opinion. People are not ready any more to simply absorb pure propaganda, they are more and more responsible.

In the very different and much more sophisticated Kenyan context and the experience of almost three months of post-electoral violence in 2008 has proved to me that, in a society deeply divided along ethnic line like the Kenyan one, people are ready to believe the propaganda of their own side, in spite evidence to the contrary. In such situation the ability to collect, document, and disseminate accurate facts and to promote a healthy debate is absolutely essential to put people in control of their own life. In that context a few media owned by independent faith-based institution have played a key role to tone down the animosity and to promote the acceptance of the different political positions.

## 2. Questionnaire

### Respondent A

1. *Do you agree that the Alternative Media is playing major roles than the conventional Media? If yes, please explain.*

“Yes, Alternative media has proven to challenge existing powers, to represent marginalized groups, and to foster horizontal linkages among communities of interest. Its dimensions in this case we talk of its content, aesthetic, modes of production, modes of distribution, and audience relations has given the reality on the ground unlike what we consume from the mainstream media. The conventional media has been playing to the gallery of its commercial interest or the government manipulation without key interest of championing for the human rights.

Communication scholar Robert W. McChesney [5], inspired in part by the work of Chomsky [6] and Herman [7], has linked the failures of the mainstream press primarily to corporate ownership, pro-corporate public policy, and the myth of "professional journalism." He has published extensively on the failures of the mainstream press, and advocates scholarship in the study of the political economy of the media, the growth of alternative media, and comprehensive media policy reforms.”

2. *How can the Alternative Media be strengthened and supported?*

- a) Empowering the community to learn the skill of story-telling to increase the content of the alternative media.
- b) Replacing the current libertarian media model with one that operates democratically, rather than for profit
- c) Strengthening public service broadcasting
- d) Incorporating the use of alternative media into a larger discourse
- e) Increasing the role of citizen journalism
- f) Turning a passive audience into active participants
- g) Using mass media to promote democratic ideals

3. *How can the International Inter-university Cooperation and Solidarity assist in supporting the ICT and e-learning in protracted-crises and conflict-affected realities?*

“Talking with governments, the leadership and the donor community, to put emphasis in training of ICT from the early stages of development of the child in the affected arrears. i.e. Making the subject mandatory in primary, secondary and college level. Setting the infrastructure for ICT in the areas to aid learning.”

4. *Do you agree that Knowledge and Experience sharing are effective in pushing towards major Mediatization and Educational Scaling-up? If yes, please explain*

“Yes, I agreed. It helps to inform and empower all members of society, and enhances democratic values. It is a liberal-democratic approach to our studies that advocates the reformation of the mass media with an emphasis on public service broadcasting and audience participation, through the use of citizen journalism and alternative media channels.

The internet and in particular Web 2.0, is seen as a powerful medium for facilitating the growth of a media democracy as it offers participants, a potential voice, a platform, and access to the means of production. Because the web allows each and every person to share information instantly with few barriers to entry across a common infrastructure, it is often held up as an example of the potential power of a media democracy.”

5. *Do you know any sort of innovative e-learning, social Media, capacity building, ITC instrument applicable in protracted-crises and conflict-affected realities?*

“It is apparent that in the widespread protests in the Middle East and North Africa known as the Arab Spring were orchestrated by social media sites like Facebook, Twitter, and YouTube. The Citizens had the chance to quickly connect with one another, exchange information, and organize protests against their governments. While social media cannot solely be credited with the success of these protests, technologies played an important role in instilling change in Tunisia, Egypt, and Libya. These acts show a population can be informed through alternative media channels, and can

adjust its behaviour accordingly.”

*6. What sort of improvement can be added to the abstract provided?*

“In countries with a high illiteracy rate, for example, it is difficult for average citizens to take part and fully engage with media, and adjust their behaviour accordingly in society. Instead of promoting democratic ideals, this would in turn fracture society into an upper-class that actively participates in creating the media, and a lower-class that only consumes it, leaving individuals open to the manipulation of information or media bias. It is therefore important to empower common citizens on the importance of media and involve them in all activities to make them be active participants.”

**Respondent B**

*1. Do you agree that the Alternative Media is playing major roles than the conventional Media? If yes, please explain.*

“Alternative media are important because they can reach everybody and can be used by everybody with minimal training, and in certain difficult conditions they can gather and disseminate information that the institutional media cannot or do not want to access.”

*2. How can the Alternative Media be strengthened and supported?*

“Training. Popular education. Formation of small clubs and information points with a minimal technical support that with a minimal cost can be sources of knowledge and information.”

*3. How can the International Inter-university Cooperation and Solidarity assist in supporting the ICT and e-learning in protracted-crises and conflict-affected realities?*

“Teams able to intervene and adapt to the local situation and provide training and simple, essential equipment.”

*4. Do you agree that Knowledge and Experience sharing are effective in pushing towards major Mediatization and Educational Scaling-up? If yes, please explain.*

“I agree. We have seen the Nuba report Team do miracles with in spite of the low departure point, with journalists barely able to communicate in English but becoming able to provide extremely effective coverage.”

*5. Do you know any sort of innovative e-learning, social Media, capacity building, ITC instrument applicable in protracted-crises and conflict-affected realities?*

“I believe the most effective social media during conflict in Africa is community radio and human rights monitoring with use of portable small video-cameras.”

**3. Interview with a journalist**

The interview was conducted stemming from the main questionnaire in a free way of answering [8].

*1. Do you agree that the Alternative Media is playing major roles than the conventional Media? If yes, please explain.*

Actually, the alternative media has played great and influential role in transforming the society in North Africa and specially in contexts where there are oppressive regimes denying freedom of expression and basic and fundamental rights, access to media and gagging and harassing journalists. In realities such as Sudan, the number of Social Media users is very limited, but it is efficient and effective and used by activists inside and outside the country. Through the Social media and personal websites, the information become available even for users in very remote areas and villages, through the phones connected to satellite internet, digital remote webcams, and the world has become ever connected with that remote areas not like in the past. So any change or notable event become widely disseminated and diffused within no time and transmitted consequently.

In Egypt, Tunis, and other aggressive and oppressive regimes, the youth gained and took advantage of the available social media and achieved and developed great communication capacities and led the wide public through that innovative instruments of the social media, so the social media constituted alternative media counter opposing the regimes mainstream conventional media. Despite of the close surveillance and controls by that regimes, some external institutional arrangements assisted those youth and activists and through certain systems of codifications and creation of alternative nicknames and fantasy modalities, they managed to communicate effectively and timely.

So, substantially, the alternative media is becoming popular and playing a role of the mainstream conventional areas and continue to do so.

*2. How can the Alternative Media be strengthened and supported?*

The alternative media can be strengthened and supported through many options, to mention but a few:

- That can be done through direct donations
- Building websites

- Facilitate accessibility to the web
- Upload ready contributions
- Enhance and encourage data and information collection and correspondence
- Protect the activist by obscuring the physical locations
- Diffuse songs, short stories, novels, news, photos
- Train in the main journalistic capacities such as interviewing capacities, public opinion collection, news gathering, journalistic investigation
- Offering jobs in media houses and encourage popular journalism
- Build capacities in photo and video journalism, Event organisation coverage
- Research for original and historic cultural master pieces of song, poetry and heritage
- Provision of useful electronic links
- Moral support
- Constructive criticism

*3. How can the International Inter-university Cooperation and Solidarity assist in supporting the ICT and e-learning in protracted-crises and conflict-affected realities?*

That can be and cannot be. Essentially it depends on the financial availability and support and willingness to build the capacities of the needy. For example, in Sudan there are no means and instruments such as cameras, laboratories, training materials, to prepare capable medial professionals. and Recently the universities have lost their spirit of conducting genuine preparations of their students, and limited the freedom of research and journalistic investigation, and by that the universities become only universities in names without much substances, eluding the students and wasting precious time and resources of the students. In the past the students used to prepare concrete projects and participate in the public awareness and social enlightening, combat the socially destructive habits such as the FGM, conducting scientific and practical tours to the remote areas in Gedarif, Dungula, Nuba Mountains, and even to Europe, but the students are mobilized for ideological and religious governmental interests. Ad to that the teachers are increasing leaving the country and migrating to the Arab grabbing countries, and those who remain are not sufficiently dedicated and less qualified to carry their mission. Therefore, the International Inter University cooperation can play a supportive and assisting role, if it put in consideration that terrible reality and act consequently. And that need political will and money.

*4. Do you agree that Knowledge and Experience sharing are effective in pushing towards major Mediatisation and Educational Scaling-up? If yes, please explain*

Definitely yes, but before that, certain conditions should prevail. For example, if we consider the KSA. And, in particular, in Libya during the era of Gaddafi, people are living in certain degree of welfare, economically citizens were in excellent conditions, however they were culturally and socially deprived. For example, in the universities, there were no teaching of philosophy nor sociology, and there was no freedom of press, and the syllabus forbid teaching Ibn Khaldon because his philosophy considered against the modernity and against the bedews and accordingly for any rule, there are exceptions, good universities, ideal income, Mediatisation gagging and cultural oppression. So Knowledge sharing and education does not necessary travel hand in hand with the major Media Freedom.

*5. Do you know any sort of innovative e-learning, social Media, capacity building, ITC instrument applicable in protracted-crises and conflict-affected realities?*

Yes, that is achievable through training of trainers, in absence of pollicised governments, oppressive security and intelligence apparatus, examples:

- Film making by the suitable available and normal mobiles is one of the options accessible to many users
- Mobile digital Cinema, which is easy to erect in remote settings.
- Web-streamed courses and exams by e-correspondence

*6. What sort of improvement can be added to the abstract provided? When can the Media be used as positive instrument and mean to upgrade the welfare and living conditions in conflict and crises areas?*

The abstract is fine in this format. Always, the Media can be more instrumental in the coming transformational stance to play its core mission.

*7. Do you have any additional inquiry to add? If yes, what is it?*

- What are the requirements to create effective and efficient functional alternative media?
- What are the potentials of the alternative media?
- What type of professionalism is needed to create and support the alternative media?
- What are the major missions of the writing, web-broadcasting, photo and video journalist?
- Why are journalists frequently in marathon behind the authorities and reporting what they deem suitable, instead of adopting professionalism and non-biasness?

- What are the reasons behind the under and misreporting?
- Why do some journalists use their media power to shine or gloom rivals?
- How to isolate the useless Media operators, and place the suitable person in the right positions?
- Why does governments avail all the state Media apparatus only to the journalist expressing their mainstream lines?

The interview is concluded by a request to call for professional symposium which invites experts and stakeholders to come with papers and contributions that can support the spirit of this paper and documentary [9].

From this quick formulated paper emerged eight addressable challenges and Needs which can be enumerated as:

- Need 1. SMART Alternative Media – Imperative Necessity
- Need 2. Community Web-based Media – Up-and-out Scaling
- Need 3. Knowledge and Experience Sharing – Media Capacity Gaps Reduction
- Need 4. Pro-Conflict-Affected Communities – Solidarity for Sustainable Cooperation and Peace Building
- Need 5. Information Communication Technologies – Innovative, Adaptable and Adoptable, and Resilient Tools
- Need 6. Cultural Exposures and Capability Expression – Respect and Acceptance of Diversity
- Need 7. Inter-University Cooperation in Solidarity for Development Cooperation – Understanding Complex and Enabling pathways.
- Need 8. Participatory Workshops and Symposium, constitution of permanent and permeable panel of experts and stakeholders.

## SUMMARY

From this brief participatory action research, emerged that the Alternative Media is becoming more popular in protracted crises and conflict-affected territories, such as the current South Sudan. There are plenty and blended strengthening and supporting mechanism, and the International Inter-university cooperation and solidarity can play a proactive role in boosting such enabling pathways. the participants recommend organization of workshops and symposium and constitution of panel of experts and stakeholders to deeply address that challenging and imperative domain.

## ACKNOWLEDGEMENTS

The Authors would love to acknowledge the helpful support provided by the Universities of Udine and Padua, Girolamo Spreafico of the Catholic University Research Centre CERMIT, Angelo Inzoli, Nigrizia, Foundation, Koininia Community, NewsfromAfrica, Enzo Nucci, Eric Sande, Faisal Saad, Omer Osman, Mubarak Abdelrahman Ardol, Hussein Saad, Amar Awad, Arnu Lodi and A. Wahab Himmat, the anonymous respondents and referees for their invaluable collaboration, comments and advice. And to Dr. A. Babiker for read prove. The Authors also appreciate the late received apologies by friends and colleagues involved in time-consuming missions and lack of access to the internet which hindered their active participation.

## HEI COOPERATION FOR CAPACITY BUILDING IN BIODIVERSITY CONSERVATION, FOOD SECURITY AND SUSTAINABLE DEVELOPMENT

Cristina Giacoma\*

\*Life Sciences and Systems Biology, University of Turin, Italy, [cristina.giacoma@unito.it](mailto:cristina.giacoma@unito.it)

The University of Torino plays an important role in coordinating higher education programs for development in Africa, Asia and South America. The themes of this panel span over various aspects of cooperation projects focused on biodiversity conservation, food security and sustainable development in developing countries, including educational activities, rural development, and technological transfer. One of the major shared points will be the analysis of the link between knowledge, technological transfer and empowerment within the processes of local and global development. This virtuous cycle plays a crucial role in shaping the processes of economic, social and political development, redefines needs and affects the perspectives and health of individuals and communities.

The discussion highlighted the methods and practices leading to success stories between University consortia, and between Universities and local NGOs or public entities. Furthermore, a key strategy to improve sustainability of cooperation actions was the identification of common goals that will be pursued after the end of the project, thanks to the establishment of a long term consortium agreement. Students' involvement in cooperation projects deeply increases the achievement of results foreseen by Dublin descriptors, such as the capacity to apply acquired knowledge, capability of communication, etc. A direct consequence is to open the door to improved capability to find a job both abroad and in Italy, when students finish their formal training.

We finally discuss how capacity building may help rationalising resource management and ensure innovative changes and how previous experiences may generate useful insights into a revision of our global agenda. Discussion started by the presentation of 3 "best lessons learned" during cooperation projects carried out by the University of Torino in Africa, Asia and South America. Prof. Giancarlo Bounous, together with Prof. Paola Bonfante, Prof. Silvia Perotto and Dr. Gabriele Beccaro summarized the activities run by many agreements of the University of Torino with South America Higher Education Institutions. Many different activities in the academic field, such as exchanging students, have been carried on during these last years in Brazil, Argentina, Bolivia, Uruguay, Chile and in many other South America Countries. The topics of the cooperation regard biodiversity exploitation and its active preservation, dissemination of rural innovation, especially oriented to the vocation to generate new incomes, use and valorisation of local agro-biodiversity, innovative agronomic techniques. Rural development and environmental and social sustainability, by providing staple food as well as promoting economic growth of the local communities, strictly linked with the tourism resources.

Carlo Semita discussed on behalf of Elena Ferrero, Gabriella Trucchi, Angela Calvo, Chantal Yvette Zoungrana Kaboré, Aboubacar Toguyeni, Balla Abdouramane, Alhassane Yenikoye, Yacoub Idriss Halawlaw and Issa Youssouf how CISAO will promote environmental care in a sustainable development perspective, improving life conditions of the population and reducing the gender gaps in employment access and in sharing knowledge by enhancing higher education systems through Master courses to give technical, scientific and methodological bases to the students, allowing them to manage natural resources and improve agriculture and food security.

Cristina Giacoma on behalf of all other co-authors (Marco Gamba, Valeria Torti, Daniela Antonacci, Maria Chiara Paire, Ahmed Ouledi, Kamaliddine Afraitane, Hantanirina Rasamimanana, Julien Randrianodiasana, Nicole Andriaholinirina, Eustache MIASA, Gabriele Beccaro and Giancarlo Bounous, stressed how multidisciplinary played a fundamental role in the collaborative efforts with HEIs in Madagascar and Comoros Islands to conserve and protect biodiversity in this priority hotspot of the Indian Ocean. The actions involving the University of Torino and its partners aimed to: i) implement academic education curricula devoted to the study of biodiversity and sustainable development; ii) foster cooperative attitudes and cooperation activities of the HEIs; iii) support endogenous sustainable development processes for food security in the projects target countries; iv) build a field station in order to facilitate student and researchers mobility; v) promote community based sustainable development; vi) increase the diversity in the partnership involving international and local ONG, local and national associations, professional organizations. The participation of partners with different profiles was also a key point for making these collaborations a success story.

Marco Gamba on behalf of the other co-authors (Chia L. Tan, Yeqin Yang, Kefeng Niu, Lei Shi, Weiyong Zhang, Isidoro Riondato, Cristina Giacoma, Emilio Balletto and John A. Phillips) how important is to foster positive attitudes and behaviour toward wildlife in rural children. He discussed different modalities to run a creative education program for children and the role that researchers and Universities can play. He features the collaborative effort in China as a model which can be adopted in other geographic regions where species and habitat conservation must become a top priority. Universities can have an important role in critical assessment of previous experiences in order to enhance the effectiveness of cooperation with other development stakeholders (e.g. governmental and local authorities, civil society and NGOs, foundations and private companies, and local associations).

Finally, cooperation within each institution, among institutions and opening to as many stakeholders as possible when implementing educational programs, have been identified as key points to reach sustainable results.

### ABSTRACT

As underscored by the United Nations, which designated 2011-2020 as the UN Decade on Biodiversity, biological diversity is not only a very important heritage to transmit to future generations, but supplies vital ecological services to all local communities. Together with global changes, overexploitation is the main threat to the communities' sustainable development based on locally available natural resources. Acting in a collaborative effort with higher education Institutions in Madagascar and the Comoros Islands, the University of Torino has partnered to conserve and protect local biodiversity in this priority hotspot of the Indian Ocean, by carrying out and promoting research, training and capacity building activities. Actions involving the University of Torino and its partners aimed at: i) implementing academic education curricula devoted to the study of biodiversity and sustainable development; ii) fostering cooperative attitudes and the cooperation activities of both the HEIs North-South and South-South programmes; iii) supporting endogenous sustainable development processes for food security in the projects' target countries; iv) building a field station, in order to facilitate students' training and mobility; v) promoting community based sustainable development; vi) fostering the partnerships' level of representation, by involving international and local NGOs, local and national associations, professional organizations, as well as private companies. During the process of evaluating the effectiveness of UNITO actions we found that the academic curricula implemented are effective in capacity building of specialists in biodiversity and agricultural management, and that the HEI network is successful in attracting partners from various social categories. The newly built research field station and multipurpose centre in the forest proved very useful not only for the academic training of young researchers but also for local capacity building in both biodiversity and agricultural techniques. It also worked as a keystone for improving local governance.

### RELEVANCE OF UNITO ACTIONS

Current biodiversity is the result of over 4 billion years of evolution resulting in a bewildering verity of forms, functions and processes. IUCN listed Madagascar and the Comoros among the Earth's major biodiversity hotspots [1]. These areas, however, suffer from extremely high levels of poverty, so that fostering a sustainable co-evolution between society and ecosystems is going to be crucial. In fact, due to the on-going loss of forest cover, biodiversity is dramatically declining in these countries. Since local economies are mainly based on the exploitation of natural resources, preserving forests and biodiversity is essential for a sustainable economic and human development of Madagascar and Comoros. Preserving natural resources is central for preventing soil-erosion and for protecting water supplies, two focal issues having strong positive impact on household food security. Maintaining a high degree of biodiversity is also crucial for ecotourism development and for other income-generating opportunities. Despite that the Malagasy and Comoran governments have implemented numerous environmental protection measures, such efforts have not yet been enough for achieving the goal of conserving biodiversity in these Countries. Low efficacy was mainly due to the limited knowledge of the islands biodiversity and distribution patterns, very limited number of local experts in conservation projects, poor involvement of local workforce, and low levels of awareness of the local communities as concerns conservation issues and inadequate management and governance abilities. The situation requires more research on biodiversity, more training and more effective cooperation actions.

Starting in 2002, the University of Turin (hereinafter UNITO) promoted research projects on biodiversity and capacity building in Madagascar and Comoros, at the individual, institutional and social levels (see <http://www.mad.unito.it>). UNITO activities of community capacity building at individual level started in Madagascar thanks to private funds of Zoological Parks (*Parco Natura Viva: Verona*) which supported cooperation with the most

important Zoological Park in Madagascar, the research centre of *Enseignement Supérieur et de la Recherche Scientifique*, Parc Botanique et Zoologique Tsimbazaza (PBZT).

Community capacity building started shortly afterwards at the institutional level with the Malagasy Universities for developing bidirectional North to South transfer of training abilities in the field of Sustainable Biodiversity Management and Conservation. The activity was supported by MIUR project "*Promozione di attività formative inerenti la "Conservazione della biodiversità" presso l'Università di Mahajanga (Madagascar)"* under *Programmi per l'incentivazione del processo di internazionalizzazione del sistema universitario (d.m. 8 maggio 2001 n. 115 art. 10) - collaborazioni interuniversitarie internazionali del Ministero dell'università e della ricerca*. The implementation of an international joint master (or "*laurea magistrale*") degree also supporting South to South cooperation between Malagasy and Comoran Universities was finalized by the project SCORE (Supporting Cooperation for Research and Education), financed and implemented in the framework of the EDULINK Program (9<sup>th</sup> European Development Fund, Reference: EuropeAid/126851/D/ACT/Multi).

A second EU project B.I.R.D. "BIODIVERSITY INTEGRATION AND RURAL DEVELOPMENT" (Reference: FED/2009/217077) further enhanced the professional training of the master degree students, but also promoted community capacity building at the societal level, by involving the local authorities of villages and Fokontany authorities near the Maromizaha forest. The project supported the implementation of local action plans and fostered the socioeconomic development of local communities. The key strategy was to start a research field station capable to act as a multipurpose centre, where researchers could be hosted, where training and dissemination events took place and organizational meetings with the local communities were held.

## APPROACHES AND INSTRUMENTS STRENGTHENING THE EFFECTIVENESS OF PROGRAMS

Education and training have a significantly positive impact on health, social and political participation, equal opportunities, economic growth rates, income and productivity, as well as benefits distribution. To achieve these results UNITO cooperation activities fostered local capacity building by:

- following a bottom-up approach to formulate development policies, which, starting from individuals have to involve institutional and research bodies, as well as the civil society, i.e. in particular, universities, biodiversity and agricultural research associations, forest management institutions and local farmers' associations;
- establishing long-term cooperation agreements between UNITO and ACP partners. Partnerships is expected to contribute to the improvement of higher education quality levels in fields relevant for the partner countries and consistent with local poverty alleviation policies, thereby contributing to the achievement of the Millennium Development Goal of poverty alleviation and sustainable development;
- promoting higher education and interdisciplinary approached, to make available skilled local human resources in the field of Sustainable Biodiversity Management and Biodiversity Conservation;
- integrating biodiversity valorisation and rural development, in order to develop and disseminate innovative biodiversity conservation policies;
- relying on locally available materials and labour.

## SUSTAINABILITY

Environmental sustainability is among the most suitable means to ensure the long term conservation of local biodiversity. The environmental sustainability of UNITO activities was assured in many ways: i) by choosing indigenous species for agricultural practices, ii) by using sustainable agro techniques, iii) by protecting the local fauna and vegetation, iv) by providing renewable energies equipments, v) by showing to local communities the forest and wildlife as a development and income opportunity.

Social sustainability is assured by strongly involving in the projects' activities the local villagers, who are living close to the forest, and by insuring the appropriate attention to gender issues. Concerning environmental education, we successfully involved the teachers of local schools in the permanent training and exchange of newly acquired information. Children were sensitized on appropriate nutrition and environmental benefits. Moreover, the adoption of a bottom up approach through the involvement of local partners facilitated their ownership of the project.

Finally, the long term sustainability of the projects has been assured by capacity building activity carried on with local partners and addressed to local populations and communities. The initial network was made up by HEIs (the lead partner DBIOS - Dept. of Life science and System Biology of University of Turin, DISAFA - Dept. of Colture arboree of University of Turin, GRENE - Gestion des Ressources Naturelles et de l'Environnement de l'Université de Toamasina, ESSA - Ecole Supérieure des Sciences Agronomiques, Dép. d'Agriculture de l'Université d'Antananarivo, and FST - Faculté des Sciences et Techniques de l'Université des Comores.

A key point in order to ensure sustainability of the actions is the enforcement of research and tourism services to promote the Maromizaha Forest and the Comoro islands as a competitive destination for researchers, thus assuring a

financial support. The involvement of as many stakeholders as possible is another crucial aspect. Among the focal objectives of the BIRD project was to foster the generation of a network of protected areas. To achieve this goal we promoted the involvement of local research associations such as GERP (Groupe d'Etude et de Recherche sur les Primates de Madagascar), of NGOs such as Ulanga and Fanamby, as well as private companies such as PNV and the Ambatovy Mining Enterprise. At institutional level we obtained to involve the Malagasy Ministry of Enseignement Supérieur et de la Recherche Scientifique, as well as the Ministry of the Environment.

## **INSTRUMENTS**

The instrument that was determinant in assuring the effectiveness of UNITO projects was the establishment of two multipurpose centres, respectively in Madagascar (the Maromizaha Multipurpose Centre) and in the Comoros (the Karthala Multipurpose Centre). The centres function, among other things, as training centres for research and tourist guides. This proved a key issue for the projects' success consisted in the training of skilled naturalistic research guides, after an intense three-month training in Maromizaha. Specific field examinations were run in Madagascar to select the candidates. One of the aims of the project is to make those professional figures able to come abreast of international researchers, so it was fundamental to make themselves independent in data collecting. In that way research guides will assure continuous monitoring of the biodiversity of the Maromizaha forest, helping GERP in managing the site and promote conservation programs. Guides dedicated their attention to the reproductive biology of several species, including lemurs, on the social life of sympatric species, and on the vegetative cycle of plants living at different altitudes. During the evenings they also started a specific training on the use of computers and on database management, a crucial step to empower these professional in manage and share the data they collect. They were also taking care of the finalization of the information area at the multipurpose centre in Maromizaha. As a result, the number of effective researchers coming to the "Nouvelle Aire Protégé" (NAP) of Maromizaha started with 8 persons in 2009 and reached the highest peak in 2011, with 208 visitors coming to study the animal and botanical biodiversity of Maromizaha.

Centres work also as training centres for promoting local communities' awareness activities and dissemination of innovative and transferable cultivation models, identifying, applying and spreading the potential of both native and new species and varieties suited to generate new incomes, actively conserving the local genetic resources and contributing to the dissemination of the knowledge and sustainable use of the natural resources, to diversify and improve local food production. Around 15,500 m<sup>2</sup> of surface have been cultivated with vegetables and fruits and trusted to local farmers trained and provided with materials, equipment and technical support.

The centre promotes also the introduction and use of renewable energies at the community level, reducing forest exploitation. Implemented activities consisted in:

- training courses for 17 technicians in the building and maintenance of solar energy equipments (solar ovens, solar fruit-driers, solar panels);
- dissemination activities on renewable energies and equipments directed to local communities;
- setting and delivery of 130 solar oven;
- setting and delivery of 7 solar driers, one of which assigned to a cooperative for the processing of the fruit produced in the experimental parcels;
- setting and delivery of 10 higher efficiency stoves;
- we produced a guide for the construction of the ICARO edit and delivered it to ACAMECA enterprise as well as to 20 participants to the course;
- sensitisation of 200 local people on renewable energies use.

Moreover, centres are essential for promoting ecotourism by publicising and valorising natural resources, thereby generating new income for local communities. Both centres were quipped with facilities for teaching, biodiversity survey and biological research (power generators, reflex cameras, microphones, GPS, digital cameras, radio-transmitters, animal sound recorders; meteorological tools, entomological materials, notebooks and PCs); in Madagascar a solar energy system was installed to electrify the centre, thereby allowing autonomous lighting and powering of the scientific equipment (laptops, scientific instruments, field instruments, GPS).

## **TECHNOLOGY TRANSFER AND CO-CREATION**

To come to technological transfer, UNITO cooperated with all the local partners to disseminate competence in scientific training both in the field of biodiversity and of agriculture, by:

- Training local technicians in agricultural models. We successfully applied the mixed-parcels model of vegetables and fruit trees. The mixed parcels already generated income during the first year, thereby supporting economically the project during the 3 years necessary to obtain crop. We now can rely on 30 peasant leaders able to spread the know-how to other villagers.

- Organising and implementing “energy training” and setting of renewable energy equipment. We especially designed ICARO solar dryers. ICAROs delivered last year gave important results and generated favourable impact. They were used to produce dry fruit which was sold on the market in small packages. The Centre also arranged a weekly delivery of dried fruit to local bakeries. Villagers showed a great interest in the ICARO drier and demonstrated to be able to exploit it at its best.
- Introduction of new cultivated species and cultivars by 1) spreading improved cultivars of traditionally cultivated vegetables, 2) introducing new temperate fruit-tree cultivars, 3) promoting the cultivation of under-utilized and indigenous fruit species. The Anevoka site, for its location on the border of a primary forest, was particularly suitable to experiment with endemic species. Since these originate in the forest, they would be in similar conditions to those of their habitat of origin. Among these Styger et al. (1999) have identified various species and determined the foremost ones. In addition to native species, some exotic species were adapted and distributed throughout the island. In most cases these species, such as Spanish tamarind (*Vangueria madagascariensis*, Rubiaceae), the Salehy (*Omphalea biglandulosa*, Euphorbiaceae), the Sefontsohy (*Colea fusca*, Bignoniaceae) were previously underutilized.

## KNOWLEDGE SHARING

In a context where natural resources may potentially generate strong economic and rural development, most of the population of Madagascar and the Comoros does not have access to any suitable education, also because of the enormous difficulty of movement within the two countries, which hampers all innovation processes in rural areas. Projects in Madagascar and the Comoros has shown that an appropriate combination of measures in agricultural, forestry and renewable energy domains could contribute, if efficiently spread, to improve the livelihoods of small farmers. This was achieved by disseminating information necessary for planning the sustainable use of land and of natural resources. Focusing actions on a local scale by an interdisciplinary, bottom-up approach, we formulated developmental policies integrating biodiversity valorisation and rural development. By relying on locally available resources, long- term cooperation agreements, as well as by establishing research field stations acting as multipurpose centres, we promoted effective capacity building actions, at the individual, institutional and social levels.

Our next challenge will be in the development of information and communication technologies for development or ITC4D for increasing dissemination of knowledge, methods and instruments of successful cooperation interventions.

### ABSTRACT

San Diego Zoo Global (USA), Fanjingshan National Nature Reserve Administration (China), and the University of Torino (Italy) have partnered in a collaborative effort to promote environmental sustainability and biodiversity conservation in Guizhou, China. The objectives of the partnership are twofold: (i) train researchers and wildlife professionals using a multidisciplinary program that employs the latest methods and tools in order to deepen their understanding of wildlife and the environment, and (ii) foster positive attitudes and behaviour toward wildlife in rural children through a creative education program called the Little Green Guards. A recent development of the education program is the Little Green Guards Club for children whose houses border nature reserves. During club meetings, staff of the three cooperating institutions and volunteers participated in teaching English and natural history lessons. Club activities included animal themed art projects, games, movies, and field trips designed to cultivate empathy for animals and appreciation for nature in these children. Evaluations conducted before and after implementation of the education program showed a significant increase in children’s knowledge of and affection for wildlife, and sometimes coincided with positive behavioural changes toward native species. Here we feature our collaborative effort in China as a model which can be adopted in other geographic regions where species and habitat conservation must become a top priority. We will discuss the role of Universities in critical assessment of previous experiences in order to enhance the effectiveness of cooperation with other development stakeholders (e.g. governmental and local authorities, civil society and NGOs, foundations and private companies, and local associations).

### INTRODUCTION

China is most notable for being the world’s most populous country with over 1.3 billion people [1]. As a result of recent economic expansion, China now leads the world in consumption of natural resources and their pollution by products [2,3]. While the country’s thriving economy makes daily international headlines, little attention has been paid to China’s rapidly disappearing wildlife species and the natural places where they occur. For much of the western world, wildlife conservation in China does not appear to be a critical issue as the international symbol of all Chinese wildlife, the giant panda (*Ailuropoda melanoleuca*), shows signs that its population number is either stable or, in the case of the captive population, on the rise. On the other hand, to most Chinese, wildlife conservation is a non-issue because wildlife and wild places, unless exploitable, possess no tangible benefits [4]. According to the latest IUCN Red List assessment, China ranks in the top ten countries having the most number of threatened species [5]. These diametric opinions highlight the large disconnect that exists between the lay and the scientific communities. How do we bridge this gap to ameliorate the current wildlife situation in China? This paper focuses on this key question, the question that provided the impetus for creating the *Little Green Guards* program.

### THE BASIS FOR THE *LITTLE GREEN GUARDS* PROGRAM

Founded in 2011, the *Little Green Guards* is a conservation education and outreach program for children living in remote communities bordering Fanjingshan and Mayanghe nature reserves in Tongren City Prefecture, Guizhou Province, China. Fanjingshan and Mayanghe nature reserves each hosts a unique assemblage of flora and fauna, and are part of the United Nations Educational Scientific and Culture Organization’s (UNESCO’s) World Network of Biosphere Reserves of the Man and the Biosphere (MAB) Programme. Specifically, Fanjingshan is home to over 6,000 animal and plant species; many are rare and relict, the most prominent being the Guizhou snub-nosed monkey (*Rhinopithecus brelichi*) that only occurs here as a single global population of about 700 animals [6]. Mayanghe, dominated by

limestone hills, also harbors a rich diversity of over 2,000 animal and plant species. The main target species for protection in Mayanghe is the Francois' langur (*Trachypithecus francoisi*), estimated at about 730 individuals, or roughly 70% of the total global population [7]. Due to small population size and limited range, these two Endangered monkeys [8] are far more vulnerable to extinction than the giant panda (Figure 1).

**Fig. 1** - Threatened primate species in Guizhou, China: Guizhou snub-nosed monkey *Rhinopithecus brelichi* (large, right photo), Francois' langur *Trachypithecus francoisi* (small top, left photo) and Tibetan macaque *Macaca thibetana* (small bottom, left photo). Credits: San Diego Zoo Global/Fanjingshan National Nature Reserve Administration.

## RURAL COMMUNITIES AND EDUCATION IN GUIZHOU

The rural communities immediately adjacent to Fanjingshan and Mayanghe nature reserves are densely populated by ethnic minorities such as the Miao, Tujia and Dong groups. These communities are considered to be at or below the poverty level [9]. All families we surveyed here have multiple children, generally 3-4, but some have as many as 9. Moreover, in many households the children are largely under the care of illiterate grandparents or other adult relatives while their better educated, albeit absent parents, labour in large cities (C. Tan et al. unpubl. data). As with past generations, the current youth have extremely limited economic and educational opportunities. Due to financial hardships at home and the state of education system in these rural areas, most young people stop their schooling after the nine-year compulsory education (K. Niu et al. unpubl. data).

The state-run education system in China has a number of shortcomings, most notably those that can be attributed to an unequal distribution of funding and human resources, and a rigid national examination metric for admission to high schools and universities. These inequities create a vicious cycle whereby rural inhabitants continuously remain an underprivileged class because of a lack of social advancement primarily due to poor education. It has been our experience that the quality of education decreases the farther the school is located from an urban center. By virtue of their remoteness, rural schools are extremely under-funded and under-resourced. The poor standard of living in villages coupled with the lack of any financial incentives from the central government pose an insurmountable challenge for rural schools to recruit and retain quality educators.

The nationally set curriculum for the nine-year compulsory education is meant to prepare students for the highly competitive high school and university entrance examinations. At the primary school level, the subject emphasis is on reading, writing and arithmetic. In the case of Tongren rural schools, the curriculum is heavily weighted toward Chinese and Mathematics. For example, a weekly lesson plan for the second-grade at one of the local schools contains 30 class periods, of which 13 are devoted to Chinese and 7 to Mathematics. Subjects such as Physical Education, Moral Principles and Daily Conduct, and Local Course (with topics related to culture, history, and geography of this area) are scheduled during 6 other periods. Even though there may be a class period separately allocated to Music and Drawing, the school usually has no funding for purchasing equipment or supplies for the students, and in general, these class periods are taken up by additional Chinese or Mathematics lessons. As part of China's education reform [10], English is taught in urban primary schools starting at about the third grade. However, rural primary schools do not include a foreign language in their curriculum because they lack educators capable of teaching the subject.

Since biology is not part of the primary school curriculum, the concept of biodiversity conservation is unknown to

the rural children. The *Little Green Guards* program, therefore, is an endeavour aimed at enriching the standard curriculum. Benefits to local residents, especially the education of children, frequently accrue when conservation efforts attain international recognition. As such, the *Little Green Guards* program may help rural children gain upward mobility by offering them extracurricular learning opportunities and allow them to escape from poverty in the future.

## **THE BASIS FOR INTERNATIONAL PARTNERSHIPS**

The growing complexity of global social and economic problems, especially in developing countries in Asia and Africa, has dramatically hindered biodiversity education efforts intending to fundamentally change traditional attitudes and behaviours toward over consumption of natural resources. This situation has created an urgent need for formal cooperation among private institutions, local governmental agencies and universities to work in synergy thus creating conservation programs that generate broader impacts. In the case of the *Little Green Guards* the synergy is dynamic. San Diego Zoo Global and LDVI International spearheaded the creation of educational materials and provided support for school activities, as well as recommending capable professionals and allocating financial aid. The governmental partners, Fanjingshan National Nature Reserve and Mayanghe National Nature Reserve, provided local knowledge and the human resources necessary to transform the program content into locally appropriate messages resulting in effective conveyance to the intended audience. University personnel, who have an expertise in providing capacity building and professional training, have further contributed to the effort by distilling complex biodiversity topics into an easily understood format.

Given the economic and educational deficiencies in rural Guizhou, we face many challenges when conducting our *Little Green Guards* program. The expertise of our international team helps us solve these problems at different levels. Specifically, San Diego Zoo Global and LDVI International work closely to create an overall education framework that includes tailored lessons in combination with thematically related activities aimed at increasing schoolchildren's knowledge of and affection toward local wildlife species. Fanjingshan National Nature Reserve Administration plays a pivotal role in coordinating in-country program activities and providing liaison support among local and international partners. To help build the capacity of reserve personnel, the University of Torino is a key partner for providing scientific input and training to ensure the program's sustainability. All partners actively fundraise to support program objectives and publicize our work through different channels.

## **IMPLEMENTATION**

In 2011 the *Little Green Guards* program founders, Chia Tan and Kefeng Niu, worked with Lei Shi and two volunteers from Guiyang universities, Bing Yang and Tianyou Yang, in developing and implementing the inaugural activities. An emphasis was placed on raising awareness of endangered species at Fanjingshan and Mayanghe nature reserves, particularly the two flagship species: the Guizhou snub-nosed monkey and the François' langur. The program was implemented at two schools. Since the students (and teachers) had not been introduced to conservation education topics, it was important that they gained positive experiences from this first exposure. In the classroom, we used simple narratives and slides to describe the basic biology of charismatic local fauna and flora. We also incorporated animal-themed games, songs, and drawings to cultivate an interest in wildlife in these children. To begin connecting them with wildlife found in their "backyard", the older students (fifth and sixth graders) participated in guided field trips to see the local monkey species (Figure 2). Identical pre- and post-program questionnaires were used to evaluate the impact of this outreach and education effort. Students were asked whether or not they have heard about the local nature reserve. They were also asked whether or not there are any monkeys in the forest, and if so, describe what kind. Additionally, we used this opportunity to evaluate third- and sixth-graders' general knowledge of and attitudes toward a variety of animal species, both domesticated and wild. This information helped us design appropriate and effective conservation education modules for subsequent program activities. We deemed our first school event a success because all of the children were sad to see us leave when the four-day program ended.

**Fig. 2** - Connecting Guizhou rural schoolchildren with monkeys found in their “backyard” through guided field trips. Credits: San Diego Zoo Global/Fanjingshan National Nature Reserve Administration/ Mayanghe National Nature Reserve Administration.

We learned from our pilot program that knowledge of wildlife was lacking in these rural children. We also discovered major deficiencies in China’s education system in these rural settings. When we returned to the local schools the following year, we had developed a complete module, called “My Habitat”, to teach children the relationship between wildlife species and their required habitats (Figure 3). This module (3 versions based on grade levels) contained the lesson, associated exercises, and thematically related activities such as songs, art projects, and the student evaluation. At one of three local schools where we administered the program, we organized a schoolyard concert for the local community that was attended by over 400 residents and government officials. Students performed ethnic dances choreographed by their teachers, as well as singing a chorus pledging to conserve wildlife. We also showcased students’ artwork produced during our program period to inform family members about the local wildlife species (Figure 4). Our efforts attracted the attention of local television stations, television documentary film production companies, and online media companies. Also, our volunteers, partners, and sponsors multiplied at this time, and we were able to enlist support from Chinese corporate sponsors to help defray program costs.

## FUTURE PLANS

The *Little Green Guards* program has been proven successful in terms of effectiveness in the overall design and execution of its education and outreach components. Aimed to maximize the program's sustainability and lasting impact, we propose to:

- 1) develop set curriculum (six lesson modules) that concentrates on the biology and protection of native species and their habitats for eight target schools (approximately 1,100 students) near Fanjingshan and Mayanghe nature reserves. We will work with conservation educators to create biologically - sound, age – appropriate modules following the guidelines of Tongren Unified School District for Local Course (or “Di Fang Ke”). The main purposes of Local Course are to increase students' awareness and understanding of native wildlife, and to instill a sense of pride about their natural heritage and a responsibility for its stewardship. Similar to the module developed for “My Habitat”, each new module will contain teacher’s instructions, the topic lesson, related activities to enhance learning, and student evaluation.
- 2) conduct workshops to train educators (approximately 75 teachers) from the program target schools on how to implement modules and integrate them into existing Local Course. As conservation biology training for teachers in rural schools is nonexistent, the goal of the workshops is to introduce teachers basic conservation education techniques, discuss the module contents, and assist module implementation in class. Besides providing a “how-to” guide, the workshops will empower teachers to be role models and conservation advocates.
- 3) establish Biodiversity Conservation Learning Centers to further communicate the purpose and value of protecting local wildlife species to the community. We will select three schools closest to reserves’ core protected areas and help each school transform a classroom into a Biodiversity Conservation Learning Center. The room will be furnished with audiovisual equipment, books, visual displays and students’ artwork. Also at the school entrance, we will create a biodiversity mural and install an interpretative panel to disseminate information regarding the endangered wildlife species in the area. The mural and interpretive panel will educate not only the students and teachers but also community members and visitors.
- 4) recruit and train student volunteers from universities in Guizhou to conduct outreach events in rural and urban settings. To reach a wide audience and create locally relevant messages to promote pro-conservation attitudes and behaviours, we will recruit volunteers, especially students from Guizhou teacher’s colleges. We will develop a volunteer program coordinated by nature reserve staff. We will speak at recruitment events and provide volunteers with the techniques and tools needed to be affective and effective wildlife conservation ambassadors. Trained volunteers will assist with outreach efforts at target schools and other venues. The experience may inspire some recruits to teach in rural schools where access to quality education is lacking.

The Little Green Guards is the first program in China to recognize that conservation education initiatives, in order to be successful, need to be uniquely tailored to citizenry of different socioeconomic levels, with the most need being in

the indigenous communities that rely heavily on the natural resources of protected areas. Through the proposed activities and continued cooperation among local and international partners, and the Tongren Unified School District educators, we can ensure that rural schools neighbouring nature reserves play a pivotal role in educating a new generation of responsible citizens who can become guardians of their native wildlife treasures. Additionally, through their children we can begin to transform the feelings, motivation and commitment of other family members toward native species and habitat conservation. Thus, we believe the Little Green Guards can be a model which can be adopted in other geographic regions where species and habitat conservation must become a top priority.

## ACKNOWLEDGMENTS

Our program would not be possible without the support and assistance of the following people and organizations: B. Yang, T. Yang, R. Feng, N. Yang, G. Zhang, D. Cui, D. Sun, Mr. Jin, Y. Qiu, Y. Zeng, X. Dong, X. Zhi, V. Hale, A. Ang, teachers of Dabaoçun, Taohuayuan, Kaiwen, and Banpotai Primary Schools, C. Ishee and Family, Anonymous Donor, Margot Marsh Biodiversity Foundation, the Offield Family Foundation, San Diego Zoo Global, San Diego Zoo Volunteers, the Ocelots, V. and H. Bord, J. Opdycke, B. and T. Durler, Fanjingshan National Nature Reserve Administration, Mayanghe National Nature Reserve Administration, the Forestry Department of Guizhou Province, Guizhou Environmental Protection Bureau, Guizhou Foreign Experts Bureau, the State Administration of Foreign Experts Affairs, International Primatological Society, Wuhan Sante Cableway, Shenzhen Sea Sky Land Technologies, LVDI International, and the University of Turin.

### ABSTRACT

The CISAQ, an Interdepartmental Centre of the University of Turin, in partnership with three Sahelian Institutions of the Higher Education, has submitted the project “Réseau des Universités Sahéliennes pour la Sécurité Alimentaire et la Durabilité Environnementale (RUSSADE)” to the EuropeAid-ACP-EU Cooperation Programme in higher education (EDULINK II).

The overall objective of the project is to mobilize knowledge and know-how to fight hunger and poverty and to increase environmental care in a sustainable development perspective, improving life conditions of the population and reducing the gender gaps in employment access and in sharing knowledge. The specific objective is to enhance higher education systems through Master courses to give technical, scientific and methodological bases to the students, allowing them to manage natural resources and to improve agriculture and food security.

Programs are multidisciplinary and treat both challenges and difficulties of the agricultural development in Sahel with the purpose to enhance abilities in different strategic fields: livestock productions, food security and safety, environmental protection, sustainable and fair development. For these reasons the high level Master is planned with innovative multidisciplinary integrations, structured in a common early training followed by specialized education courses chosen among three options (animal and vegetal productions and environmental protection), to give to young people work opportunities in key sectors of their countries.

To ensure mutual exchange and harmonization of expertise, it is necessary to establish an active network between the four involved universities, integrating theoretical, practical and experimental knowledge with special focus on local and regional issues.

The target groups are the students of the Master: graduates in agronomy, biology, veterinary medicine, geography, geology, environmental sciences (or equivalent degree), local teachers, researchers and professionals.

### INTRODUCTION

The beneficiary (partner leader) of the project “Sahelian Universities Network for Food Security and Environmental Sustainability (RUSSADE)” is the University of Turin (Italy), supported by the Piedmont Region, International Affairs Section, and the Italian NGO Terre Solidali Onlus.

The involved African partners are CRESA of the University of Niamey (Niger), the Polytechnic University of Bobo Dioulasso (Burkina Faso), the University Institute of Science and Technology of Abéché (Chad).

The choice of these HEIs as project partners comes from a long cooperation in several scientific areas between the University of Turin and African institutions, such as Universities of Niger and Burkina Faso (Abdou Moumouni University of Niamey and Polytechnic University of Bobo Dioulasso). Moreover, the University of Turin recently established new relationships with the University Institute of Science and Technology of Abéché, in Chad.

The project was presented by CISAQ, an organization that integrates multidisciplinary skills and knowledge, whose institutional task is to promote and coordinate scientific and educational exchanges with the countries of West Africa and particularly of Sahel [1].

The International Affairs Section of the Piedmont Region participates to the Project as a stakeholder and as a donor. Terre Solidali Onlus (an Italian non-profit organization of social utility) involves its experts in special activities and features (such as orientation activities, support in the field work, demonstrative practices and training sessions).

## REASONS OF THE INTERVENTION

The strategy of the European Union has recently included financial support also in the educational field and strengthening the systems of higher education of African countries. Likewise, the guidelines for EDULINK II call for proposals indicate “energy facilities, agriculture and food security” as instruments to eradicate poverty. For these reasons, CISAO and its African HEIs partners are developing a project whose general objective is to use knowledge to fight hunger and poverty and to promote environmental protection in a sustainable development perspective [2]. To achieve this goal the following requirements are considered as crucial factors:

- a) a stronger synergy between Sahelian HEIs and with the University of Turin will enhance capacity, excellence and regional integration and will allow the creation of a permanent network;
- b) the quality of higher education in the field of agriculture and management of natural resources will improve food security and living conditions of Sahelian people [3].

In general terms, to improve the impact of education on the quality of life of local population means to think about the present situation and to act for a better future so that the target people could receive scientific and methodological instruments to manage natural resources with an eye on environmental sustainability and equity.

A holistic approach to improving agriculture and food security should not neglect the social-economic aspects related to these themes, including the gender gap reduction in terms of access to employment and knowledge sharing (1, 7, 8 Millennium development Goals) [4].

The attention of the project, concerted between all partners, was focused on several inter-related and inter-dependent critical issues such as environmental challenges, social-economic and structural difficulties to be overcome, measures to be consequently adopted, identification of target beneficiary groups, organization of actions implementation, mechanisms for monitoring, evaluation and control of the activities.

The **target groups** are identified among:

- graduates in agronomy, biology, veterinary medicine, geography, geology, environmental sciences or equivalent degree. Sometimes, the knowledge of these students is too theoretical or not properly orientated to the local challenges;
- the academic staff of the HEIs partners, in order to update and improve their teaching skills, thanks to a more integrated methodology. In fact, these teachers often experience cultural isolation, sometimes consequent to a landlocked location, and need to exchange opinions on teaching-learning processes, in order to become conscious of their teachers role and of the effect of their actions on their students (success rate, for example).

The **final beneficiaries** of the project will be:

- a) academic institutions of the Sahelian region and their students;
- b) public services, such as local or regional institutions, NGOs, agribusiness and agro-food enterprises: these institutions have often difficulties finding qualified employees, sufficiently trained in relation to their tasks;
- c) the final medium/long term beneficiaries are the most vulnerable or disadvantaged sections of the population, such as rural populations, children and women. These groups are obviously in major risks of poverty and malnutrition, in addition to health fragility and social exclusion. The requirements of these groups will be obviously taken into account by the trainers as well as by the newly trained students. Moreover, these requirements should become pressing needs in future professional actions and should also receive the attention of civil society with a long-term perspective of equitable sharing of resources.

## LOCAL ISSUES AND ENVIRONMENTAL CHALLENGES

Poverty rate in Sahel is very high, especially in the countries involved in the project (56,5% in Burkina Faso, 61,9% in Chad and 43,1% in Niger) [5] [6] [7] [8].

These high poverty rates are strongly linked to malnutrition, which is a challenge in maintaining social peace and stability and prevents the development of human resources.

Food insecurity, that is the result of a widespread and severe scarcity of productive resources, plagues most of these countries and primarily affects the most vulnerable part of the population. It is difficult to realize agricultural improvement because soils are overworked and depleted, as well as animal productions improvement that is hampered by low biological performances of animals, by scarce availability of food resources and by a poor livestock management. Furthermore, aridity, together with overpopulation, generates a process of environmental degradation of local and regional extension and consequently determines people migration to the humid tropics [9] [10] [11].

The fast urbanization in Sahel countries creates many problems: environmental degradation, instable public health, excessive energy consumption, in a context of lack of human resources qualified for solving these problems [12] [13].

To attain a collective and sustainable food security the local governments have adopted, over the last decade, some

Strategies for Poverty Reduction, which assign to the rural sector the role of principal motor of economic growth in these countries until 2015 [14] [15].

Since the droughts of the 70s and 80s, the Sahel is undergoing a continuous process of environment degradation (Fig. 1). The desertification process has a significant impact also on several river flows and river ecosystems, damaging human activities.

**Fig. 1** – Intensive erosion effects on soil and rocks in Tillabéri region (Niger). (Photo E. Ferrero)

Environmental damage exacerbates inequality by exerting a negative impact on the already poor people and, in the meantime, the inequalities of human development also amplify the environmental damage [16] [17].

In this regard, the role of universities as engines of development is undeniable. However, African HEIs are facing enormous financial and social problems: a low schooling rate at all levels, outdated infrastructures, inadequate financial, political and logistical support by governments and enterprises [18]. A limited involvement of the private sector is still persistent due to inconsistent and occasional relationships between universities, industry, government, social and productive sectors of the economy.

At the same time, unstable political climate, restriction of freedom expression and culture of corruption are some reasons that contribute to the brain drain, to disrupt academic work and to provide constraints on the production of knowledge, hindering socio-economic development. In the field of information technology and communication (ICT) and in activities related to research and development, the gap between Africa and the industrialized countries continues to widen. The disparities are even greater in the case of the transfer of knowledge to industry and society. The link between science and development is not quite considered as a decisive strategy by policy makers of the Sahelian countries, consequently the research has a low impact on improving people life conditions.

Development strategies in Sahelian countries require the implementation of projects and programs that take into account the close relationship among **research** (emergence of new scientific knowledge), **training** (enhancing professional capacities and infrastructures in the field of science and technology) and **innovation**, (transfer of basic knowledge to the application), through the creation or the involvement of enterprises. This is the concept called “**Triangle of knowledge**”.

## AIMS AND GOALS

This project aims to organize a specialized Master to prepare a skilled staff for strategic positions in the technical structures of ministries, training and research institutions, enterprises, NGOs, all working in the field of rural development.

Educational multidisciplinary programs should face challenges and difficulties of agricultural development in Sahel region with the purpose of enhancing capacities in various strategic fields: livestock productions, food security and safety, environmental protection, enhancing knowledge for sustainable and fair development.

A multidisciplinary and interdisciplinary approach should be used in planning curricula for technicians involved in development activities.

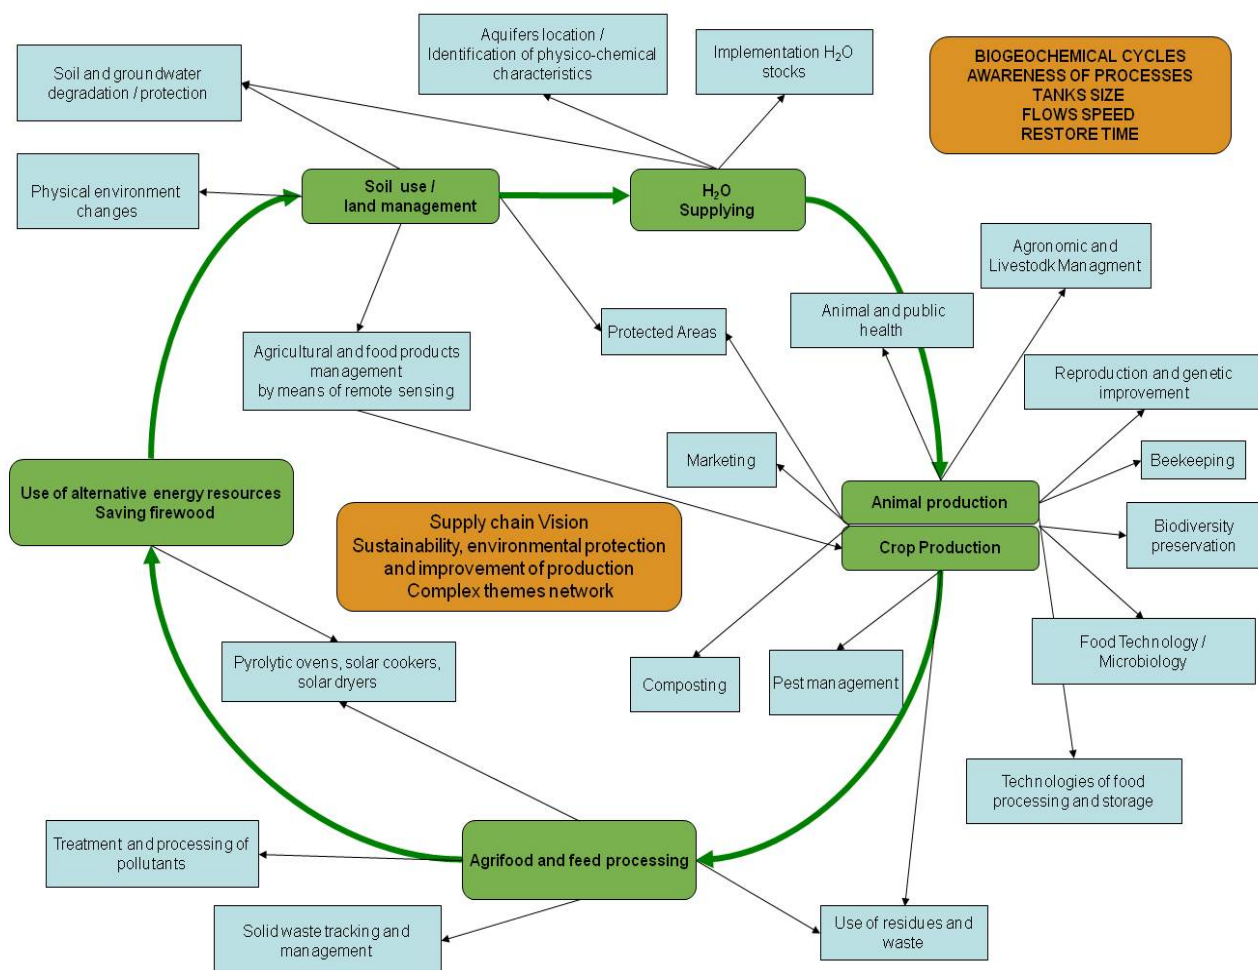

Focus of the master is the awareness of links between the different areas involved to cope and develop coordinated and tailored programs.

The courses and training activities will take place in an innovative way, offering an integrated and interdisciplinary handling of themes concerning sustainable rural development in cyclical vision and “supply chain” structure. The

diagram and the list of skills were previously discussed and shared by the partners (Fig. 2).

Thanks to the innovative procedures of this kind of training, the project recommends measures designed to strengthen the capacity and effectiveness of higher education, to promote basic and applied scientific research, to improve educational quality through updated teaching methodologies and to progress administrative management of the universities, which will involve a growing number of students.

**Fig. 2** – Supply chain and cyclical vision map, including and connecting the Master’s topics (from [3], mod.).

An important aspect will be the strengthening of links between HEIs and a wider cooperation between them in the areas of training and research: this network, encouraging the exchange of academic staff and students, will create a more favourable environment for debate and innovative research, will promote a greater awareness of the complex connections between human choices and natural processes and will also accelerate the process of democratization.

## STRUCTURE OF THE MASTER

The Master’s structure includes different topics (land management, environmental restoration, agro-pastoral production chain, farmer organizations and strategies, local development). Disciplinary integrations will be offered by Niger, Burkina Faso, Chad teachers and CISAO members in an institutional framework for shared and collective vision. The integration fits into an innovative higher education vision and, at the same time, offers as opportunities for young people, allowing them to work in key sectors of the region.

The timetable for the three years project includes three main steps.

- a) **First period:** consulting actions on the organization of the Master and the strengthening of relations between academic institutions and other stakeholders. Some workshops will be organized to facilitate these cultural exchanges, to discuss and select students’ curricula and to facilitate their integration into the working world. Delegations from all the involved HEIs will participate in the planned workshops. These meetings will also provide a special session with the participation of local authorities, enterprises, NGOs, etc. During this period, collaborations will be activated with institutions that could host the Master’s students for internships or for their employability.

- b) **Second period:** realization of the Master teaching steps, according to the programme of training modules. The teaching material will be available on the project web site for teachers and students.
- c) **Third period:** diffusion of results and impact on the region, production of educational materials also designed for primary and secondary school teachers, for a better dissemination of the integrated vision of development problems. This third period will also include the evaluation of the actions carried out during the project and a feed back on the structure of the Master with a consequent effect of improvement.

The Master provides theoretical courses taught by academic staff of different nationalities and seminars held by non-academic professionals (e.g. officials of the Piedmont Region or operators of the associated partner Terre Solidali Onlus) or by local officials of local associations or NGOs, etc., whose involvement has been considered relevant. These actions will be integrated with practical activities (laboratory activities, field trips, etc) (Fig. 3).

**Fig. 3** – The laboratory facilities at the Faculty of Agronomy of the Abdou Moumouni University of Niamey give the possibility to integrate practical work with lectures and field trips. (Photo C. Semita)

Distance education is also recommended to increase the impact of any action capacity building, even if the HEIs partners still need a technological improvement. Therefore, at the moment, only the establishment of a database can be forecasted, with the creation of a website and a newsletter (Fig. 4).

**Fig. 4** – Enhancing structures and digital equipment of the Abdou Moumouni University of Niamey will support the integrated distance education and improve relations between the partners. (Photo C. Semita)

## METHODOLOGICAL APPROACH

The approach is systemic and will involve multidisciplinary knowledge. The themes of improving livestock production, preservation of local animal and vegetal biodiversity and the use of biotechnology in animal reproduction and genetic improvement will be connected to the modernization of agriculture, the use of technologies for preservation and processing of animal and vegetal food products and the implementation of systems using solar energy (solar cookers and photovoltaic systems). Innovative teaching strategies will be prepared and proposed in order to connect these items to other key themes, like land management (transformation of the physical environment and degradation)

and land use, supply and protection of water resources, management of solid wastes and pollutants.

This list is not exhaustive: all these issues will be thoroughly discussed between the partners during the first phase of the project as well as the network between them and between the teachers' skills.

A main methodological concern will be the spreading of sustainable appropriate technologies, easy to be used by local not qualified staffs, with a low impact to the environment, applicable in the Sahelian context.

The goal is to bring more changes in the educational field to help teachers to be open-minded, prepared for the exchange of ideas, so that students can benefit of a more practical and multidisciplinary approach and acquire a greater awareness and understanding of these complex problems.

The main result of such training is the acquisition not only of technical skills, but also of a deep awareness of local issues, taking into account that a local intervention affects the entire region: what happens in a limited area can affect the entire country.

Teachers and researchers will be stimulated to master the latest scientific and methodological knowledge in their own fields and to the other side to create a positive interdependence with students, developing a sense of personal responsibility, encouraging the acquisition of cognitive and social skills and developing the motivation to learn and solve complex problems by promoting teamwork. Understanding the links between learning, theory, research and professional practice develops the capacity to face problems in a systemic way, in different contexts and to acquire professional skills to work respectfully on different environmental components.

## EXPECTED RESULTS

For the success of the project as a whole, it is crucial that innovative actions do not remain only confined to the academic world; the key problem is to find strategies in order to spread them to a larger scale, starting from the trained technicians. To achieve this goal the policymakers of the Sahelian countries should be aware of the role of education in general and universities in particular as engines for development.

It is therefore necessary that universities get out of their circle of elites opening to the outside world, so that knowledge can be a real contribution to national and regional development policies. The qualified and trained professionals should also understand that the acquired skills are not only a personal asset, but also a resource to be spent for development actions.

In this context, the project's educational task is to strengthen individual motivations and to employ knowledge at service of socio-economic development and poverty reduction in the region.

To obtain a wider effect, it is necessary to disseminate and share the principles and results of the project with social and productive sectors of the economy and civil society (Fig. 5).

The three-year length of the project could be a period of time long enough to create a critical mass able to interact with policy-makers dealing with the serious problems of development. This will happen if some crucial topics, like the effects of climate change, the problem of environmental degradation at all levels (including the challenge of waste and recycling), the issue of modernization of the rural sector, are brought to the attention of a wide audience in an effective and compelling way.

An action of this nature may cause a change in mentality: for example, awareness of the links between development, environmental degradation and poverty should lead to changes in individual behaviour for the maintenance and respect of natural resources.

## ACKNOWLEDGMENT

The RUSSADE project gratefully acknowledges the collaborators of CISAO and of the HEIs Sahelian partners, who shared together their skills for the characterization of the activities.

The RUSSADE project was submitted and approved by the European Union in to the EuropeAid-ACP-EU Cooperation Programme in higher education (EDULINK II). The completion of the bureaucratic procedures prior to the signature of the grant agreement and the activation of the project are still in progress.

### TEACHING ITALIAN AND ARABIC: AN INTERCHANGE BETWEEN ITALY AND LIBYA

Barbara Airò - Silvio Beretta - Antonio M. Morone

Pavia University - Centre for the Study of Extra-European Peoples/Department of Political  
and Social Sciences **May 2012 – June 2013**

“Teaching Italian and Arabic: an interchange between Italy and Libya” was an **Academic Project** intended to realize a specific and intensive training activity in both Italian/Arabic language and Italian/Arabic culture for a selected group of Italian and Libyan students and teachers.

The Project was jointly staffed by the **Pavia University Centre for the Study of Extra-European Peoples** and **Tripoli University’s Department of Italian Language**. The Italian Ministry of Education, University and Research (MIUR) founded the Project within the framework of **Cooperlink** (international interuniversity cooperation).

The Project was composed in **two main stages**:

- 1) Students’ selection in Tripoli and in Pavia by means of a standard placement test on language skills;
- 2) Performance of joint seminars in Pavia (September 2012) and Tripoli (June 2013) for 8 Italian and 8 Libyan students, plus the academic staff of both universities.

The teaching program coupled lectures in language and translation with other lectures in history, economics, and literature for a total of 20 hours each seminar.

The main **achieved results** during and beyond the time period of the Project were:

- 1) Deep and reliable improvement in language skills as well as in knowledge of their reciprocal cultures and histories for both groups of students;
- 2) Social and cultural interaction as well as reciprocal interplay among both students and teachers, who got the chance to experience a firsthand intercultural dialogue which favored also the consolidation of friendship and human understanding;
- 3) The opportunity for the academic staff to practice and improve their teaching skills by interacting with a mixed students’ class;
- 4) The strengthening of inter-university cooperation between Pavia and Tripoli, setting the stage for further exchanges and joint research.

The main **objective** of the Project was to encourage, promote, and foster dialogue and exchange between two countries, Italy and Libya, bound by a painful and at the same time rich common history. To plan and realize the Project, the applicant (Pavia University) adopted the **methodology** of sheering cultural endeavor and included the partner in all the Project steps.

**In conclusion as spinoff of the Project** we are proud to report that Pavia staff collaborated in the (re)opening of the **Tripoli Department of Italian language** and to the formation of the teaching program for a four year designed academic course.

## «Insieme per Makamba»

Anael Bianucci ([anael23@tiscali.it](mailto:anael23@tiscali.it)) e Chiara Ghislieri

Università degli Studi di Torino – Dipartimento di Psicologia

### Abstract

The project "Together for Makamba" is involved in international cooperation projects designed and conducted by Enaip in the African territory. It became part of the second Uni.Coo of the University of Turin. The work of action-research was carried out within the "Centre des handicapés - St. Bernard" Makamba born in 1977 with the aim to improve the functioning of rehabilitation structure and re-education of subjects, with particular attention to children with physical disabilities. It cover a huge area and it being the only center for disabled people across the south of the country.

### Resumé

Le projet "Ensemble pour Makamba" s'inscrit dans les projets de coopération internationale créés et menés par Enaip sur le territoire africain. Il est devenu une partie du deuxième appel Uni.Coo de l'Université de Turin. La recherche-action a été réalisée dans le "Centre des handicapés - St. Bernard" Makamba né en 1977 dans le but d'améliorer le fonctionnement de la structure pour la réhabilitation et la rééducation des sujets, avec une attention particulière aux enfants ayant un handicap physique. Il a une très grande zone desservie étant le seul centre pour les personnes handicapées dans le sud du pays.

### Riassunto

Il progetto "Insieme per Makamba" si inserisce nei progetti di cooperazione internazionale ideati e condotti da Enaip nel territorio africano. Esso è entrato a far parte del II bando Uni.Coo dell'Università di Torino. Il lavoro di ricerca-azione si è realizzato all'interno del "Centre des handicapés - St. Bernard" di Makamba nato nel 1977 con l'intento di migliorare il funzionamento della struttura destinata alla riabilitazione e alla rieducazione di soggetti, con particolare attenzione ai bambini affetti da handicap fisici. Esso accoglie un bacino di utenza molto ampio essendo l'unico centro per disabili in tutto il sud del paese.

### Achieved Results

La possibilità di tradurre concretamente gli apprendimenti, così come quella di partire dall'esperienza per apprendere, è stato un elemento indispensabile per generare vissuti di **efficacia personale e collettiva** sia per il personale del centro (circa 15 persone) sia per gli utenti del centro (circa 100 bambini e adolescenti), vissuti che si legano al raggiungimento di risultati quali:

- ✓ innovazione delle metodologie utilizzate con gli utenti per facilitare la **partecipazione**, con particolare riferimento all'uso del **gioco**;
- ✓ maggiori **competenze** del personale in tema di **confronto con la diversità**;
- ✓ migliore gestione degli **aspetti legati alla cura** e, in specifico, all'igiene.

### Objectives

Il progetto era teso al **miglioramento del servizio** attraverso un intervento caratterizzato da una forte componente formativa al fine di ottimizzare l'organizzazione. In specifico, il progetto mirava a:

- ✓ promuovere lo sviluppo delle abilità manuali e porre le basi per la creazione di un gruppo produttivo capace di contribuire all'autofinanziamento del centro stesso, attraverso attività laboratoriali;
- ✓ formare e informare su temi quali igiene personale, degli spazi e alimentare attraverso attività educative, sia con il personale del centro sia con gli utenti;
- ✓ contribuire all'informatizzazione della gestione amministrativa del centro e formare il personale all'utilizzo delle prassi introdotte.

La partecipazione e il coinvolgimento in attività manuali hanno avuto come riscontro tangibile un **miglioramento dello spazio di lavoro e di vita** divenuto, grazie all'impegno di tutti i soggetti coinvolti, più adatto a ospitare momenti ludico-ricreativi, ma anche piacevolmente educativi.

**GIOCARE CON LO SPAZIO  
PER COSTRUIRE UNO SPAZIO DI GIOCO  
E APPRENDERE INSIEME**

Il centro al momento dell'arrivo della borsista

Il centro a seguito dei lavori svolti  
quali la creazione di un'area gioco e la decorazione  
dello spazio interno

### Methodological approach

Le attività sono state guidate da **due approcci metodologici principali**:

- ✓ *l'action learning* (Marquardt & Ceriani, 2009) con cui si è favorito l'apprendimento individuale attraverso la realizzazione di attività di gruppo che hanno permesso una continua circolarità tra pensiero e azione;
- ✓ il *cooperative learning* (Comoglio, 2000; Johnson & Johnson, 2005) attraverso il quale sono stati creati dei veri e propri ambienti di apprendimento in cui i partecipanti, in un clima relazionale positivo, hanno lavorato all'interno di un processo di problem solving di gruppo.

Sono stati realizzati specifici cicli di incontri formativi (ciascuno di breve durata) relativi alle diverse aree prese in considerazione, alternando momenti a carattere prevalentemente teorico con attività pratiche.

### Conclusion

A seguito di questa esperienza, è possibile ipotizzare sviluppi futuri realizzabili attraverso la progettazione e realizzazione di interventi formativi a carattere partecipativo. Ciò dovrebbe essere pensato attraverso il coinvolgimento del personale e dell'utenza presente in struttura partendo da un'attenta analisi dei bisogni, al fine di migliorare il servizio offerto agli utenti, promuovendo al contempo una crescente percezione di efficacia nel personale, nella direzione di un maggiore benessere.

# Imagining cultures of cooperation: Universities networking to face the new development challenges

III CUCS Congress  
Turin, 19-21 September 2013

## M.Sc. TRACK IN INTEGRATED ENVIRONMENT AND LANDSCAPE DESIGN IN THE CONTEXT OF INTERNATIONAL COOPERATION

Field work internship as opportunity for engineering students to approach developing context

Bezzi Marco, Zolezzi Guido, Ferrai Martina, Geneletti Davide, Ortigara Cordeiro A. R.  
UNESCO Chair in Engineering for Human and Sustainable Development – University of Trento

### abstract

Since 2006 the M.Sc. In Environmental Engineering at the University of Trento has developed an innovative Track in *"Integrated Environment and Landscape design in the context of international cooperation"*, which has the general objective to contribute to the creation of a new generation of engineers, socially and culturally aware and responsible, able to work in interdisciplinary and intercultural contexts and to foresee and assess the overall impact of engineering project on the local communities and on the environment. The Track is composed by an educational package that comprises 6 courses at M.Sc. level offering 6 ECTS each. The courses methodology integrates traditional lectures with active learning approaches including group activities (Role plays, joint project development), field visits, practical fieldwork (including design and data post-processing).

### the innovative aspect

The innovative concept of the M.Sc. is the *field work internship as a group work experience* aiming to equip students with skills for making engineering choices appropriate to the local environmental and social context.

### activities

Students are directly involved in field data analysis survey and in the proposal elaboration. All the activities are carried out in partnership with governmental institution and civil society organizations and variable focuses which can include river management, water supply and sanitation, watershed management, solid waste management, geo-morphological processes analysis, soil erosion. The results of these project stages are environmental engineering projects that are shared with the partners and often become part of their future development plans.

2006 – 2008 – 2010  
Caia – MOZAMBIQUE

- Analysis of water uses, water supply and of well contamination risk
- MADZI-ATHU Project: community based water management
- In collaboration with Consorzio Associazioni per il Mozambico (Trento)

2007 Peja/Pec – KOSOVO

- River Quality Analysis by means of different biological indicators.
- In collaboration with Tavolo Trentino per il Kosovo (Trento) and the Pristina University.

2012 Koboko – UGANDA

- Gully erosion analysis and mitigation project proposal
- in collaboration with: NGO ACAV - Trento

2011 Pemba – TANZANIA

- Urban and rural solid waste management analysis
- in collaboration with: Onlus Fondazione Ivo de Carneri – Milano

2009 Rudno – SERBIA

- Rural solid waste management analysis
- in collaboration with: Tavolo Trentino per la Serbia (Trento) and the University of Kraljevo.

2013 Vermosh – ALBANIA

- Hydro-geomorphological analysis of destructive debris-flows and flood events in Vermosh for risk-mitigation intervention.
- In collaboration with: VIS and University of Tirana.

### conclusion

1. The participants are provided with a **first practical experience** related to environmental issues in developing international contexts and their critical skills in the application of their engineering knowledge to apply sustainable solutions are enhanced.
2. The participants are equipped with **cross skills** (intercultural approach, gender issues, ...) that can be tested directly during the group work experience.
3. The participants can get in contact with the operative aspects of NGOs in international cooperation and have the opportunity to contribute in the developing of engineering projects.

# Immaginare culture della cooperazione: le Università in rete per le nuove sfide dello sviluppo

III Congresso scientifico CUCS  
Torino, 19-21 Settembre 2013

## PREPARARE I BAMBINI ALL'ADOZIONE INTERNAZIONALE

### ideazione di nuove prassi con gli operatori burkinabè

Marta CASONATO \*°, Paola MOLINA \*, Gisèle THIOMBIANO °

\* Università di Torino, Dipartimento di Psicologia, marta.casonato@unito.it  
° ARAI – Regione Piemonte, referente Burkina Faso

#### Il contesto

Nel rispetto della Convenzione dell'Aja, firmata già nel 1994, i minori burkinabè che non trovano una famiglia nel loro Paese sono proposti in adozione all'estero. In accordo con la legge italiana sull'adozione, l'Ente proponente il presente progetto, l'ARAI – Regione Piemonte, collabora con l'Autorità Centrale burkinabè sia per offrire ai a questi bambini una famiglia, sia per svolgere progetti di cooperazione (fra i molti condotti, citiamo la costruzione dell'Hotel Maternel, una delle strutture coinvolte nel presente progetto).

Il lavoro è nato dalla necessità di creare una continuità tra pre- e post-adozione, nel rispetto delle origini dei bambini, evitando di creare spaccature nel senso di identità già minato dagli eventi. E' necessario preparare i bambini all'adozione e alla futura altra appartenenza culturale già nel Paese di origine: questo lavoro accompagna a comprendere il nuovo progetto di vita, limita lo shock derivante dal radicale cambiamento, getta le basi per la costruzione di un rapporto con i nuovi genitori e infine mantiene viva la speranza durante la lunga attesa.

Nonostante sia stata svolta su piccoli numeri, questa ricerca ha aperto il confronto con tutti gli attori dell'adozione, dal Ministero ai singoli bambini, aprendo interessanti prospettive.

#### Risultati ottenuti

In accordo con gli obiettivi del progetto, i risultati sono stati raggiunti su due piani differenti: il primo conoscitivo, l'altro applicativo. Nel primo caso, l'indagine svolta ha permesso di comprendere meglio cosa pensano gli operatori dell'adozione (istituti di accoglienza ed enti autorizzati) a proposito della preparazione dei bambini (se e come vanno informati della loro adozione). Nel secondo caso, riferito al piano applicativo, le attività volte ad aiutare il bambino a comprendere il suo progetto di vita, hanno permesso di comprendere quali fra le possibili azioni potrebbero essere utili ed applicabili nel contesto specifico.

#### Obiettivi

Il progetto, basato sull'evidente necessità di sostenere ed accompagnare i bambini burkinabè in stato di adottabilità nella comprensione del loro nuovo progetto di vita, si proponeva di sperimentare un possibile protocollo di buone pratiche per la preparazione dei bambini all'adozione internazionale, tenendo in considerazione la cultura locale e attraverso una condivisione del processo di ricerca con gli operatori sociali.

#### Approccio metodologico

Il progetto si è composto di due metodi differenti: un'indagine ed un intervento. A monte, sono stati presi accordi con il Ministero ed i CAEDs, gli istituti di accoglienza dei minori. Ottenuti i consensi ed instaurate le collaborazioni, il primo approccio utilizzato è stato quello dell'**indagine**: agli operatori che si occupano di adozione (enti stranieri presenti in Burkina Faso e CAEDs che ospitano i minori in stato di abbandono), è stato trasmesso un questionario per indagare i limiti e le potenzialità della preparazione all'adozione e per comprendere meglio quali azioni venivano già messe in atto. Sono stati inviati n° 25 questionari, ma le risposte sono arrivate solo da 7 CAEDs e da 5 enti autorizzati all'adozione, dato che evidenzia il basso tasso di partecipazione, specie fra gli enti.

Parallelamente sono state sperimentate delle **attività psico-educative** in due differenti CAEDs della capitale, pensate e proposte in collaborazione con gli operatori delle strutture e rivolte ai bambini di età compresa fra i **3 e i 5 anni, già abbinati** ad una famiglia. Le attività sono state condotte attraverso laboratori di gruppo (narrazione di una storia che spiega l'adozione, attività di bricolage, ecc.) e incontri individuali (volti a presentare più nel dettaglio, ad ogni singolo bambino, la sua futura condizione di vita).

#### Conclusioni

Pur essendo stata condotta su un numero molto piccolo di soggetti, la ricerca ha permesso numerose riflessioni.

La preparazione dei bambini all'adozione internazionale è in alcuni contesti ancora un tabù, e questo specie fra gli enti che di adozione si occupano. Gli operatori degli istituti, al contrario, sembrano ben consapevoli dell'importanza di un accompagnamento in questa delicata fase di passaggio nella vita dei minori adottabili, ma spesso incontrano difficoltà logistiche dovute alla scarsità di risorse.

L'esperienza diretta con i bambini e gli operatori ha inoltre permesso una riflessione condivisa, sia attraverso le risposte al questionario, sia più direttamente con il personale che ha collaborato nella conduzione delle attività psico-educative.

In ultimo, questa esperienza sul campo ha permesso di acquisire una più profonda conoscenza delle condizioni di vita dei minori adottabili, permettendo un miglioramento della formazione che ARAI – Regione Piemonte rivolge alle coppie in attesa di adottare un minore burkinabè.

# Imagining cultures of cooperation: Universities networking to face the new development challenges

III CUCS Congress  
Turin, 19-21 September 2013

## Capacity Building in ICT: the Experience of Maputo Living Lab's Summer Schools

Aaron Ciaghi, Pietro Molini, Adolfo Villafiorita  
ICT4g Research Unit - Fondazione Bruno Kessler

### Objectives

Build groups of motivated people that work on ICT4D projects at MLL addressing national issues.

Create agile developers teams, find potential for reverse innovation, stimulate EU-Moz coop.

A reference practical ICT course to quickly develop internationally competitive and recognized skills.

### Approach

- Four weeks course (half day)
- Participation free of charge
- Instructors from Italy and Mozambique

- Learn-by-doing
- Scrum
- Self-assessment
- Guest lectures on creativity

- Backbone Projects:
- 2011: Vaccination Reminder
  - 2012: Agricultural Market Info
  - 2013: Weather Advisory & Disaster Risk Assessment

### Some Numbers

- ~ 100 students from 8 different universities
- 7 companies
- 3 public entities
- 1 NGO

- 10 instructors from 3 research centers
- 3 universities
- 1 private company
- 4 countries

### Curricula at a Glance

#### Summer School of ICTs (2011-2013)

- Agile Software Development
- Practical Programming
- Web Programming
- Mobile (Android) Programming

#### Summer School of Ruby on Rails (2013)

- A modern framework for Web Applications
- Highly competitive skills
- Agile on everything

### Lessons Learned

- **Learn-by-doing:** high participation, high motivation, development of actual skills
- Effectiveness of working on **real projects** and involving the **stakeholders**
- **Instructors:** two is better than one
- **Daily logs**
- **Problems:** low and uneven average skills (even graduates), connectivity issues

### Follow Up

- **MLL:** SAMo and eUniPro projects
- **Mobility:** 6 months grant from the University of Trento for 5 students

### Maputo Living Lab

Funded by Provincia Autonoma di Trento (2011-2014)

#### Goals:

- Build local capacity
- Address the needs of the local community
- Promote entrepreneurship
- Promote innovation
- Implement a replicable model

#### Staff

- 2 directors
- Mixed steering committee
- Geographically distributed teams

#### Projects

- SAMo: Social Accountability for Mozambique
- eUniPro: curriculum management system for UEM

## Immaginare culture della cooperazione: le Università in rete per le nuove sfide dello sviluppo

III Congresso scientifico CUCS  
Torino, 19-21 Settembre 2013

### 1st level Master in “Oral Health in Disadvantaged Communities and Low Income Countries”

*Vecchiati Giancarlo, Bassi Francesco, Di Caccamo Patrizia, Atkinson Jennifer, Cavallo Luca, Preti Giulio*

Università degli Studi di Torino – Dipartimento di Scienze Chirurgiche; CIR Dental School; ECITOH – European Centre for Intercultural Training in Oral Health; COI – Cooperazione Odontoiatrica Internazionale

#### Abstract

The cooperation between the University of Turin and the Ngo COI – Cooperazione Odontoiatrica Internazionale started in 2000. In the same year they established the European Center for Intercultural Training in Oral Health (ECITOH), a training and research centre for oral care, oriented principally towards the needs of disadvantaged communities and low income countries. Courses are based on promoting intercultural values and exchange of knowledge and experiences in international cooperation.

In 2006 the COI and ECITOH headquarter was opened at Lingotto Building in the Dental School of Turin.

In 2006 COI, ECITOH and University of Turin started the 1st level University Master on: “*Oral Health in Disadvantaged Communities and Low Income Countries*”, for professionals in health and dental field, who want to participate in work or volunteer activities in international cooperation and solidarity.

#### Achieved Results

The cooperation between the University of Turin and COI through ECITOH has allowed **the implementation of 4 Master editions.**

- 74 health professionals attended the Master
- 57 students achieved the Master degree in four editions

COI has developed oral health programmes in Bosnia Herzegovina, Burkina Faso, Ethiopia, Kenya and Lebanon involving Master participants.

Most of them, delivered their degree thesis in a COI programme.

Many participants are currently COI volunteers.

#### Objectives

The Master trains the health professionals to:

- acquire specific skills to understand and know the health and the oral health conditions in low income Countries and in the disadvantaged communities in Italy;
- get the needed expertise in the organization and management of health and oral health programmes, with a public health approach;
- achieve the skills necessary to develop inter disciplinary health programmes in network with several partners.

#### Methodological approach

The didactic approach is based on frontal lessons, but introduce new validated teaching techniques based on participatory methodology like focus groups, class exercises and role plays.

The **main topics** are:

- Health systems and oral health in high and low income countries.
- Basic principles of management of human, physical and financial resources.
- Health and oral health international guidelines.
- Strategic planning of health service.
- Primary Health Care (PHC) and Primary Oral Health Care (POHC).
- Techniques of prevention and cure in low income countries and disadvantaged communities.

#### Conclusion

This Master, the only one in Europe in this field, connect COI practice and skills with academic knowledge in oral health to promote human development, following international validated guidelines.

The Turin Dental School has enlarged its didactic offer. Thanks to an international network of scientists and partners it has the opportunity to research and test on the field the Master theoretical assumptions and topics.

1° edition: Examination board at Thesis presentation

1° edition: Participants at lesson

**November 2013:** start of the university Master in “Oral Health in Disadvantaged Communities and Low Income Countries” - 5<sup>th</sup> edition.

**Registration open until 30<sup>th</sup> September** (h 12.00) on [www.unito.it](http://www.unito.it)

Theoretical and practical lessons.

**Duration:** 1 year - 7 sessions on Friday and Saturday, between November 2013 and June 2014. **Location:** COI and ECITOH headquarter at Lingotto Building in the Dental School of Turin. **Number of participants:** 10 – 20. **Language:** Italian, English and French.

**Information:** 011 6708185 - [coingo@cooperazioneodontoiatrica.eu](mailto:coingo@cooperazioneodontoiatrica.eu) - [www.cooperazioneodontoiatrica.eu](http://www.cooperazioneodontoiatrica.eu)

III Congresso scientifico CUCS  
Torino, 19-21 Settembre 2013

## PROMUOVERE LA SALUTE ORALE IN COOPERAZIONE INTERNAZIONALE: UNA SFIDA DI SALUTE GLOBALE NELLE ESPERIENZE DI PROGETTI INTEGRATI IN LIBANO E IN ETIOPIA

A Rinaldi <sup>1,6</sup>, P Di Caccamo <sup>2</sup>, G Benedetti <sup>3</sup>, B Giordani <sup>4</sup>, C Resti <sup>5,6</sup>

1) Sapienza Università di Roma – Dip. di Sanità Pubblica e Malattie Infettive, 2) COI Cooperazione Odontoiatrica Internazionale ong, 3) OISG Osservatorio Italiano sulla Salute Globale, 4) Laziosanità - Agenzia di Sanità Pubblica della Regione Lazio, 5) A.O. San Camillo Forlanini Roma, 6) RIISG Rete Italiana Insegnamento Salute Globale.

*Dedichiamo questo lavoro alla memoria di Erica Giuliani, una giovane dentista che ha dedicato la sua vita professionale alla odontoiatria pubblica e alla prevenzione per diminuire le sofferenze e le conseguenze delle malattie orali nei bambini.*

### ABSTRACT

L'analisi e la valutazione di numerose esperienze pregresse di aiuto allo sviluppo nel campo odontoiatrico hanno messo in evidenza che la mera replicazione del modello esclusivamente curativo, il più diffuso nei paesi ad alto reddito, non è efficace nel produrre miglioramenti stabili della salute orale dei beneficiari. Partendo da queste considerazioni, COI (Cooperazione Odontoiatrica Internazionale) ha scelto di intervenire seguendo un approccio di salute di comunità focalizzato soprattutto sulla prevenzione: l'unico, secondo The Lancet, che risulta sostenibile e realizzabile ovunque.

La collaborazione con centri di studio qualificati come le Università, dapprima con la Dental School dell'Università degli Studi di Torino e, recentemente, con il Dipartimento di Sanità Pubblica e Malattie Infettive della Sapienza di Roma, ha permesso di affrontare con un adeguato approccio scientifico i contenuti e le modalità di realizzazione di programmi di salute orale adatte ai diversi contesti.

La carie dentale e la malattia parodontale sono le patologie orali più diffuse al mondo: soltanto la carie colpisce dal **60 al 90% dei bambini** in età scolare e **quasi tutti gli adulti**. A fronte di questo enorme carico di malattia è impossibile e irrealistico pensare di poter raggiungere e assistere tutti gli individui. La carie dentale presenta una stretta correlazione con reddito ed istruzione ed è presente quasi sempre in contesti deprivati, va perciò posta la massima attenzione a non rafforzare le differenze sociali già esistenti attraverso interventi impropri. Infatti le cure comportano costi elevati ed è forte il rischio di generare meccanismi di accesso iniquo producendo disuguaglianze. Punto di forza invece è il dato che le patologie orali sono largamente prevenibili agendo sui relativi fattori di rischio e i determinanti sociali di malattia, per altro comuni ad altre patologie croniche, attraverso strategie preventive di comunità che si sono dimostrate essere molto efficaci.

Si descrivono qui due esperienze recenti realizzate in Libano e in Etiopia e tutt'ora in corso. Entrambi gli interventi seguono l'approccio di *Primary Oral Health Care* e la filosofia *Health Promoting Schools* per intercettare la permuta dei denti ed iniziare il più precocemente possibile ad affrontare il problema in chiave preventiva.

### INTRODUZIONE

In Libano, la prevalenza della carie dentale risulta tra le più elevate del mondo. Dati rilevati nel 2000 indicano una prevalenza dell'88% nei bambini di 6-8 anni e del 75% nei dodicenni. In Etiopia non si hanno dati ufficiali in merito, ma i livelli di povertà, strettamente associati alla presenza di carie dentale nella maggior parte delle aree rurali del Paese correlano bene con la presenza e la diffusione della carie nei bambini in età scolare e, nello specifico, le premesse per l'intervento in Etiopia nell'area di Wolisso, oggetto dell'intervento, si basano su un'indagine realizzata sulla popolazione scolastica della zona dall'Associazione Pediatri di Famiglia per i Bambini del Mondo - CCWW ONLUS.

Nel 2011 in Libano è stato avviato un programma di promozione della salute orale (*School-based Oral Health Programme*), cofinanziato da UNDP ART GOLD Lebanon e dalla Regione Lazio. Dal 2013 è in corso l'estensione del progetto pilota a livello nazionale, in partnership con il *Ministry of Education and Higher Education (MEHE)* e l'*Università Libanese Faculté de médecine dentaire*.

Dal 2012 in Etiopia su progetto di COI, finanziato dalla Tavola Valdese con i fondi otto per mille, in appoggio all'ospedale Cattolico di St. Luke di Wolisso (supportato dalla ong Medici con l'Africa CUAMM), si stanno realizzando azioni di promozione della salute orale a livello scolastico (2 scuole elementari, una governativa e una privata) e di diagnosi e cura ospedaliera integrata nella *Head Clinic* nel tentativo di raccordare promozione, prevenzione e trattamento delle patologie orali in un sistema di riferimento valido nel distretto sanitario.

### MATERIALI E METODI

In entrambi i paesi sono state effettuate diverse missioni formative realizzate con metodologia partecipativa e didattica interattiva, esperienziale ed autogestita con *focus group*, gruppi di lavoro, *role play*, che hanno coinvolto gli operatori sanitari e i **maestri delle scuole** elementari in Etiopia e **tutti i livelli del sistema scolastico in Libano**. In Etiopia, il Dipartimento di Sanità Pubblica e Malattie Infettive della Sapienza di Roma, ha partecipato alle missioni formative inviando i propri specializzandi esperti nelle metodologie didattiche più innovative.

### RISULTATI

In Libano, il progetto pilota ha coinvolto **9 scuole primarie pubbliche** e previsto la formazione di team multidisciplinari che hanno contribuito alla produzione di **un manuale pratico per insegnanti** sull'educazione alla salute orale e all'igiene personale dei bambini. Il manuale, in arabo e in inglese (*Basic Oral Health Knowledge, A Practical Manual for Teachers*), è il risultato di un processo integrato fra municipalità, scuole e centri di salute di base e fornisce suggerimenti pratici e nozioni di insegnamento sulla prevenzione della carie dentale in ambiente scolastico.

In Etiopia, a Wolisso, il progetto è tutt'ora in corso, e sono stati formati finora **20 operatori sanitari**, **90 studenti del corso infermieri**, e **80 insegnanti**. I bambini che hanno iniziato a beneficiare delle attività di educazione alla salute generale e orale sono **circa 1500**. Dall'analisi di gradimento è emersa sia dal personale sanitario sia dai maestri la necessità di aumentare le conoscenze negli ambiti proposti attraverso altre occasioni formative, inoltre è stato richiesto di arruolare un'altra scuola pubblica per il prossimo anno.

### DISCUSSIONE E CONCLUSIONI

Al fine di accompagnare e sostenere forme contestualizzate di sviluppo locale, risulta preferibile un approccio integrato basato sulla prevenzione e l'attivazione delle risorse disponibili nella comunità per la promozione della salute. Ciò permetterebbe allo stesso tempo di non trascurare le fasce di popolazione più vulnerabili e il funzionamento corretto del sistema di riferimento delle patologie ai differenti livelli della *Primary Health Care*. Intersettorialità (collaborazione tra figure professionali della sanità e dell'istruzione), coinvolgimento di *leadership* locali (MEHE, *Ministry of Public Health*, *Université Libanaise Faculté de médecine dentaire*, municipi), integrazione di *health policy* nelle strategie locali e sviluppo comunitario sono i criteri alla base degli interventi realizzati in Libano e in Etiopia.

Infine, la collaborazione concreta tra ong e università ha permesso un ricco intreccio di saperi e di pratiche a inequivocabile mutuo beneficio: il COI ha compiuto un importante salto di qualità sia nella preparazione dei volontari sia nell'attenta pianificazione, realizzazione e monitoraggio dei progetti realizzati; l'ambito accademico ha avuto l'opportunità di testare in contesti diversi i modelli studiati e teorizzati.

## ESTABLISHING A NEW MASTER DEGREE IN SUSTAINABLE CROP PROTECTION IN EGYPT: A PROJECT FUNDED BY EU TEMPUS PROGRAMME

Paola Colla<sup>1</sup>, Davide Spadaro<sup>1,2</sup> and Maria Lodovica Gullino<sup>1,2</sup>

<sup>1</sup>Center of Competence for the Innovation in the agro-environmental sector (AGROINNOVA), University of Torino, Via Leonardo da Vinci 44, 10095 Grugliasco (To), Italy.

<sup>1,2</sup>DISAFA, University of Torino, Via Leonardo da Vinci 44, 10095 Grugliasco (To), Italy.

**Education**, training and life-long learning programmes have to face the **challenges** that **agriculture** is confronting today:

### Elements of Sustainability

- 1 Integrated pest management
- 2 Management intensive grazing
- 3 Soil conservation
- 4 Water quality
- 5 Cover crops
- 6 Crop/landscape diversity
- 7 Nutrient management
- 8 Agroforestry
- 9 Marketing

The Project "**Establishing a Master degree in Sustainable Crop Protection**", funded by the EU TEMPUS Programme, supported the modernization of *curricula* in the field of **crop protection** in Egypt to respond to societal and job market demands with the goal of produce a **new generation of young professionals** able to analyze options, define strategies and manage solutions for securing healthy and safe food and feed supply

### MAIN PROJECT ACTIVITIES

- Review of *curricula*
- Training of universities staff
- Development of teaching material
- Master accreditation
- Networking among teaching institutions and private sector
- 7 Master Degrees launched on 2012/2013**

A **network of Master's degree in Sustainable Crop Protection** was developed among seven Egyptian universities (Ain Shams, Assiut, Kafr El Sheick, Mansoura, South Valley, Suez Canal, Zagazig) with the support of four European institutions (University of Torino and National Research Council in Italy, University of Lleida in Spain and Mediterranean Agronomic Institute of Chania in Greece). Tempus MSCP Project was coordinated by Agroinnova, University of Torino, from January 2010 to July 2013.

## “Tutori di resilienza. Modello di formazione di insegnanti e social workers nell’ambito del programma MOSAIC del Ministero degli Affari Sociali Libanese con il supporto della cooperazione italiana”

Hurtubia V., Giordano F., Castelli C.,  
Università Cattolica del Sacro Cuore, Milano - Dipartimento di Psicologia

### Introduzione:

A fronte del grande esodo di profughi dalla Siria in territorio Libanese, il Ministero degli Affari Sociali Libanese (MoSA) e la cooperazione italiana hanno promosso il programma nazionale MOSAIC per la protezione dei minori siriani. Le esperienze di guerra, violenza e migrazione forzata subite e la condizione di precarietà e marginalità in cui si trovano a vivere in territorio libanese hanno reso prioritaria l’attenzione ai bisogni psico-sociali. La cooperazione italiana ha richiesto l’intervento dell’Unità di ricerca sulla resilienza dell’Università Cattolica del Sacro Cuore, con il modello di intervento “Tutori di resilienza”, ideato e impiegato in contesti traumatici di guerra, violenza e catastrofi naturali in Italia, Gaza, Pakistan, Haiti, Sri Lanka, Cile e Mozambico.

### Obiettivo:

Consentire alle figure educative deputate alla presa in carico di famiglie siriane vittime di guerra e spostamento forzato, nell’ambito del programma MOSAIC del Ministero degli Affari Sociali Libanese in partnership con la cooperazione italiana, di assumere il ruolo di tutori di resilienza nei confronti dei minori.

### Risultati Attesi:

Trasmissione a insegnanti e social worker conoscenze teoriche e competenze pratiche su:

- osservazione e comprensione di bisogni e problematiche dei minori
- interazione e dialogo mediante linguaggi verbali e non verbali.
- Rafforzamento delle risorse interne ed esterne dei minori.

### Approccio Metodologico:

Training suddiviso in 2 fasi:

- modulo social worker (4gg) => formazione teorica dei social worker ed esercitazioni.
- modulo minori (6gg) => applicazione guidata degli strumenti con i minori siriani

### Destinatari

20 insegnanti, social workers e altro personale volontario, reclutati dal Ministero degli Affari Sociali Libanesi per interventi con minori e famiglie profughe siriane.

### Strumenti

- Manuale di intervento: "Tutori di resilienza. Guida orientativa per interventi psico-educativi"
- Laboratorio narrativo: "Memory work Program"
- Laboratorio fotografico: "Vite d'(')istanti"

### Conclusioni:

Scheda di valutazione somministrata 3 mesi dopo la formazione (N11; M 5 F; 7 libanesi e 4 siriani)

1. Perpetuamento del lavoro volontario con minori siriani

2. Perseguimento dei risultati attesi

### Limiti e proposte per il futuro

- Bisogno di monitoraggio costante => follow up a 6 – 12– 18 mesi di distanza
- Necessario approfondimenti di alcune tematiche => formazioni successive su tematiche proposte dai volontari

III CUCS Congress  
Turin, 19-21 September 2013

## University-NGOs partnership in formal education: the experience of CIVIC.A.S.

Francesco Mongera, Michela Bortoli: Training Centre for International Cooperation  
Guido Zolezzi, Marco Bezzi: University of Trento - Department of Civil, Environmental and Mechanical Engineering

### abstract

CIVIC.A.S. –Contesti Internazionali in eVoluzione e Cooperazione allo Sviluppo- is a 1 ECTS elective course jointly organized by the Unesco Chair at the University of Trento and the Training Centre for International Cooperation (TCIC). It represents a unique and innovative experience of collaboration between the academic and the NGO sector at national level. It aims at introducing the issues of international development in the first level of higher education, using the perspective of development cooperation. This is achieved through the integration of lectures on the social, economical and management dimensions of international development with practical seminars held by NGO practitioners and academics who directly share their experience with the students.

CIVIC.A.S. is open to all undergraduate students of the University of Trento. After the 2010 pilot course, it has been offered once a year in two parallel tracks, separately offered by the Departments of Engineering and Social Sciences, in order to reach the highest number of interested students and to have the opportunity to deal with issues of specific interest for different academic curricula. The course's design is yearly updated thanks to an adaptive process managed by a joint UNITN-TCIC working group.

### objectives

- To introduce development cooperation and promote a critical understanding of the interdependence which link North and South of the globe;
- To raise awareness among students on the connection between their personal and professional life and the development cooperation contexts.

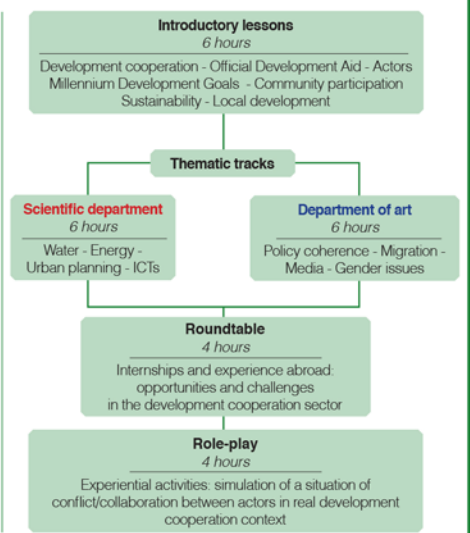

### achieved results

### methodological approach

The presence of academics and practitioners allows an effective integration of theoretical contents with practical experience in development cooperation projects. The course integrates lectures with active learning methods, including classroom discussions, round tables and a role play:

- The role play is designed and implemented with a local NGO on the basis of a real project in the field
- The round table aims to inform students about requirements and opportunities to undertake practical experience in the development sector.

### conclusion

CIVIC.A.S. represents a pilot experience of NGO-University cooperation in the formal higher educational system in Italy. During its four consecutive editions it has been developed substantially. Its main outcomes so far are:

- Differences in learning styles and interests between students from technical and social curricula need to be taken into consideration for an effective course design;
- Active methods and field experiences presentations prove to be the most effective learning tools with students from technical studies;
- The academic commitment to offer the course on an elective basis has actually opened the way to permanently establish a 1-ECTS opportunity in relation to topics such as sustainability, human development, discipline ethics;
- NGOs reach a not yet explored target in raising awareness and disseminating their practices in sustainable human development;
- A continuous joint work based on mutual interests between university and NGOs is a key requirement for the sustainability of this type of initiatives.

**Training Centre for International Cooperation** TCIC - Training Centre for International Cooperation - is an association whose mission is to enhance knowledge and skills of those involved in international development. Our main goal is to provide high quality training on international cooperation issues. Besides training, we are also engaged in research, information and awareness raising.

This project is financed by the European Union

A wood in the San Salvario neighbourhood: A Photovoice Project  
Valentina Noya  
University of Turin; Department of Cultures, Politics and Society

## This Photovoice project involved:

- ✓ telling a story through photos taken by each woman separately
- ✓ the photos being taken within the San Salvario neighbourhood
- ✓ each woman personally selecting 5 images
- ✓ collectively commenting on the chosen material (40 photos)
- ✓ holding an exhibition based on themes that emerged during the project

**Abstract:** The aim of this project is to present the evolving perceptions a group of female immigrants have of their neighbourhood, using Photovoice (PV) as a visual research tool. Madri di Quartiere ('Neighbourhood Mothers'), the first Italian project of its kind, involved 8 women from 7 countries who live in Turin's San Salvario neighbourhood.

The neighbourhood is now facing the challenges of gentrification as a result of a transformation brought about by an urban renewal programme. The neighbourhood is a metaphor. Its spatial boundaries are open doors: the Valentino park, the river Po and Porta Nuova railway station.

San Salvario's residents – artists, young people and immigrants – are symbols of a change that continues undeterred in a country that is static. Immigrants and women are precious resources which remain untapped. They settle, put down roots and leave their mark on the areas in which they live. Whether they intend to be or not, they are active citizens and are often better at spotting potential than Italians.

**Methodological approach** The pre-PV phase involved participant observation, interviews, the collection of written autobiographies, mental maps of the San Salvario neighbourhood prepared by the 8 women taking part in the PV project and evaluation and monitoring of Madri di Quartiere project. PV is a visual research method which uses a participatory action strategy. What's different about it is that it offers a means to tell a personal and at the same time a collective story. I personally chose to give this PV project a strong narrative slant. The method makes use of the stillness and tangibility of an image to connect time and space, allowing careful observation through the links formed.

**Achieved Results:** The PV project showed that there is change going on in the San Salvario neighbourhood. The project expanded the women's sphere of participation and allowed an inner transformation, partly thanks to the knowledge the women gained as Neighbourhood Mothers – services, transport, community hubs. The photos show how the women have blended memories of their homelands into a life in Italy that is not always easy and yet is seen through the lens of hope and faith – places of worship, memories from Italy, the market, games, the childhood dimension, nature. The process of transformation is often depicted through images that show movement. The photos also show the importance of therapeutic landscapes like the welcoming, democratic and "natural" Valentino park.

**Conclusion:** The initial aim of my work with the women was simply to search together for something that existed 'elsewhere' and to find meaningful links between the images they each chose independently. Individual deconstruction and collective reconstruction led to the creation of new meanings which emerged as a result of the innate maieutical approach to the methodological process. I followed. One of the major achievements of this project has definitely been the strengthening of bonds between the women in the group. This acted as a catalyst and many of the women involved confirmed that our Photovoice project contributed greatly to the success of the Madri di Quartiere project.

UNIVERSITÀ  
DEGLI STUDI DI TRIESTE

## Indo-Italian International School on "Use of e-infrastructures for advanced seismic hazard assessment in Indian Subcontinent"

Antonella Peresan, Giuliano F. Panza & Giampiero Vezzoli  
Università degli Studi di Trieste - Dipartimento di Matematica e Geoscienze

### Abstract

Probabilistic methodologies for seismic hazard assessment, currently in use in several countries worldwide, turned out fatally inadequate for the most destructive recent events worldwide, like the earthquakes that struck Bhuj (Gujarat, India) in 2001 and, more recently, Bam (Iran, 2003), Boumerdes (Algeria, 2003), Wenchuan (China, 2008), Port-au-Prince (Haiti 2010) and Tohoku (Japan, 2011).

To address this problem, the International School on the "Use of e-infrastructures for advanced seismic hazard assessment in Indian subcontinent" has been organized at the Institute of Seismological Research (ISR) in Gujarat (India) in February 2013. The School aimed at training Indian geophysicist and engineers on the application of an innovative methodology that permits to evaluate the hazard from earthquakes and tsunamis, based on the physical modeling of ground shaking from a wide set of possible earthquakes. This neo-deterministic approach to seismic hazard assessment (NDSHA) has been developed by the Seismology group at DMG - University of Trieste and by the ICTP - SAND Group, in the framework of a number of fruitful international collaborations, where visiting scientists actively contributed to develop and test this advanced methodology.

The School, attended by more than 40 participants and with an Indo-Italian faculty composed by experts in the fields of seismic hazard assessment and advanced computation, benefited from the financial support in the framework of the **Cooperation Agreement between the University of Trieste and ISR**, signed in 2011. The Agreement also provided the basis for an International **Cooperation Project, funded by the Friuli Venezia Giulia Region (Italy)**, aimed at developing an integrated system, with high scientific and technological content, that will provide advanced information for seismic and tsunami risk mitigation in the Gujarat region.

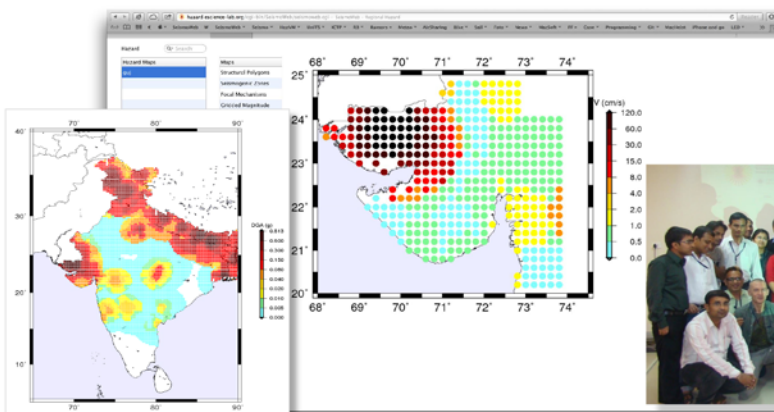

The International School represents a success story, where the University Cooperation Agreements provided the starting spark for a larger scale activity, eventually attracting external funds and allowing for the dissemination of researches developed at Trieste University.

### The School

The School trained Indian geophysicists and engineers on the theoretical aspects of the neo-deterministic method for seismic hazard assessment, as well as on the web-based interface enabling participants the efficient computation of realistic synthetic seismograms, which may permit to deal with variety and complexity of the potential earthquake sources, and the implementation of parametric studies to characterize the related uncertainties. A brief review of the different seismological methodologies and of the e-infrastructures currently available to solve the seismological problems has been provided, discussing advantages and drawbacks for each of them. Besides theoretical lectures, the School had a major hands-on component, including computational exercises, Linux experience and training on the use of Grid and Cloud e-infrastructures for running the NDSHA codes, mainly developed at Trieste University.

### Capacity building and societal relevance

The Cooperation Agreement between the University of Trieste and ISR, provided the basis for a wider indo-italian collaboration in seismic hazard assessment and significantly contributed to the international dissemination of the methodologies developed at DMG -Trieste University. The relevance of the cooperation, however, is not limited to the scientific community. Nowadays, in fact, it is well recognized by the engineering community that standard hazard indicator estimates (i.e. the peak seismic ground acceleration) alone are not sufficient for the adequate design, primarily for special infrastructures. NDSHA approach, on the other side, naturally supplies realistic time series of ground motion, which represent reliable estimates of seismic input readily applicable to seismic design. Thus, the overall goal of the collaboration activities is developing an integrated system, with high scientific and technological content, for a scenario based definition of ground shaking that will provide local authorities and engineers **advanced information for seismic risk mitigation, particularly effective for the protection of cultural heritage and the design of critical infrastructures**, also with the most advanced engineering tools, like seismic isolation.

Web interface developed for training activities on the computation of synthetic seismograms on HPC infrastructures, along with some examples of NDSHA hazard maps and a picture of the participants to the Indo-Italian School

# Immaginare culture della cooperazione: le Università in rete per le nuove sfide dello sviluppo

III Congresso scientifico CUCS  
Torino, 19-21 Settembre 2013

## L'osservazione: uno strumento di lavoro per gli educatori della prima infanzia.

Maria Nives Sala, Paola Molina

Università di Torino, Dipartimento di Psicologia

il progetto è stato realizzato grazie all'Agenzia Regionale per le Adozioni Internazionali  
si ringrazia tutto il personale dell'Hôtel Maternel che ha collaborato per la realizzazione de progetto

### Abstract

Nella città di Ouagadougou, in Burkina Faso, l'Hôtel Maternel accoglie bambini e giovani madri in situazioni di abbandono e di difficoltà; all'interno della struttura è organizzata una sezione per i bambini dalla nascita ai tre anni. In questa sezione le persone che si occupano dei bambini sono principalmente le assistantes maternelles che, organizzate su turni, trascorrono 24 ore su 24 con i bambini e l'educatore della sezione che trascorre alcune ore durante la giornata.

Si è ritenuto importante fornire all'equipe di lavoro della sezione degli strumenti di osservazione in grado di supportare la capacità di osservare lo sviluppo dei bambini nella prima infanzia. Infatti, tale capacità è ampiamente riconosciuta come una delle competenze di base della professionalità degli educatori, e rappresenta un primo passo nella costruzione di un progetto educativo che tenga conto delle differenze individuali di ogni bambino e che stimoli la comunicazione fra operatori rispetto al lavoro educativo con ogni singolo bambino.

### Obiettivi

L'obiettivo del progetto è stato fornire un supporto all'attività dell'educatore ed alle assistantes maternelles le competenze osservative utili ad un'approfondita comprensione lo sviluppo cognitivo affettivo e sociale dei bambini di età compresa fra 0 e 3 anni presenti all'Hôtel Maternel.

Ciò è stato realizzato con l'intento di favorire lo sviluppo di progetti educativi individualizzati e la comunicazione fra operatori sia appartenenti alla stessa sezione sia di sezioni diverse, nonché la definizione di interventi di sostegno mirati nelle situazioni in cui si presenteranno indici di rischio.

L'obiettivo generale è stato raggiunto attraverso i seguenti obiettivi specifici:

- Acquisizione dello strumento QCSP per la comprensione dello sviluppo e per il monitoraggio del benessere emotivo del bambino.
- Adattamento dello strumento QCSP nel contesto culturale specifico, grazie alla collaborazione dell'equipe presente nella struttura.
- Sensibilizzazione degli operatori a riconoscere i primi segnali comunicativi dei bambini e a coglierne le evoluzioni durante lo sviluppo.

### Approccio Metodologico

Il progetto si è svolto nelle seguenti fasi:

sono state condotte delle osservazioni nella sezione per conoscere le prassi e per raccogliere le proposte e le richieste delle assistantes maternelles ;

è stato proposto l'utilizzo di una griglia di supporto all'osservazione dello sviluppo nella prima infanzia, il QCSP, in quanto adatto al raggiungimento dell'obiettivo. Sono state valutate e discusse con le assistantes maternelles alcune parti della griglia da adattare al contesto di utilizzo;

l'equipe di lavoro ha condotto diverse osservazioni, una per ogni bambino della sezione;

i dati sono stati sintetizzati e restituiti all'equipe. In questa fase ha partecipato e contribuito anche un membro dell'equipe, che ha potuto così acquisire le competenze tecniche per poter continuare ad utilizzare la griglia osservativa

### Risultati

L'equipe è stata coinvolta nelle osservazioni e ha contribuito attivamente nella realizzazione del progetto talvolta avanzando proposte o curiosità personali. La scala QCSP è stata adattata al contesto specifico di riferimento. Successivamente sono stati compilati dall'equipe di lavoro 18 questionari, di cui 17 sono risultati validi che si riferiscono alla quasi totalità dei bambini ospitati nella sezione. L'età dei bambini osservati risulta compresa fra 4 e 50 mesi (media=21,38; ds=12,47) nel gruppo vi sono 10 maschi e 7 femmine.

I risultati presentati nel grafico e nella tabella, come previsto dallo strumento utilizzato, rivelano che con l'aumentare dell'età, crescono i punteggi ottenuti.

Il QCSP è stato pensato per rilevare le competenze comunicative che si sviluppano tipicamente nei bambini nella prima infanzia. Lo strumento rileva le principali modalità comunicative non verbali e l'emergere delle prime parole, proponendo una serie di comportamenti che il bambino può mettere in atto mentre interagisce con l'adulto, durante situazioni che il bambino vive quotidianamente.

Il QCSP valuta tre dimensioni cruciali della competenza comunicativa:

- **l'interazione sociale**: relativa a tutti quegli scambi interattivi in cui il focus di interesse non è tanto l'oggetto, quanto il fare qualcosa con un'altra persona (canzoncine, solletico, cucù, gioco di scambio, gioco simbolico, ecc.);

- **l'attenzione congiunta**, relativa a tutti gli scambi che hanno come scopo condividere un focus di attenzione su un evento o un oggetto con qualcun altro (indicare immagini, seguire lo sguardo dell'altro, ecc.);

- **la regolazione del comportamento**, relativa a tutti i comportamenti che hanno lo scopo di far fare qualcosa all'altro e ai comportamenti che il bambino mette in atto per rispondere alle richieste dell'adulto.

Inoltre, il QCSP permette di rilevare i diversi ruoli che il bambino ricopre nella comunicazione: il bambino può, infatti, **iniziare** una comunicazione ("usa un gesto per chiedere di far uscire un oggetto da una scatola"), **rispondere** alla comunicazione dell'adulto ("La guarda e fa segno di sì o di no con la testa se lei chiede se vuol continuare") o **mantenere** la comunicazione per più turni ("Se lei mostra col dito più immagini, guarda più immagini successivamente"). Infine, il QCSP valuta il **livello di complessità cognitiva**, da 1 a 5, che il bambino raggiunge nelle sue comunicazioni (Molina & Bulgarelli 2012).

età	Interazione Sociale M(ds)	Attenzione Congiunta M(ds)	Regolazione Comportament o M(ds)	Media M(ds)
1,00 n=7	2,47 (0,66)	1,71 (0,87)	2,64 (0,75)	2,21 (0,70)
2,00 n=4	3,83 (0,58)	3,00 (0,72)	4,00 (0,82)	3,56 (0,68)
3,00 n=6	4,06 (0,43)	2,93 (0,83)	3,80 (1,04)	3,57 (0,63)
Tot n=17	3,33 (0,91)	2,49 (1,01)	3,38 (1,01)	3,02 (0,93)

### Conclusioni

Il progetto di ricerca ha permesso di costruire una buona alleanza di lavoro con l'equipe della sezione 0-3 dell'Hôtel Maternel. Il progetto, coinvolgendo in prima persona le nourrices ha permesso di valorizzare il loro lavoro. Durante la fase osservativa e nella compilazione delle griglie QCSP le assistantes maternelles si sono mostrate interessate e hanno mostrato interesse nel verificare quegli elementi della comunicazione con il bambino che venivano indicati nella griglia osservativa. Quest'ultimo elemento, insieme all'interesse dell'educatore che ha collaborato nello scoring e nella lettura dei risultati, rappresenta un incoraggiamento per il futuro utilizzo dello strumento come prassi valutativa della struttura.

## TRAINING ABROAD FOR RESIDENTS

Luisa Mondo<sup>°</sup>, Giuseppe Costa\*

<sup>°</sup>Epidemiologia Regione Piemonte, Italy, [luisa.mondo@epi.piemonte.it](mailto:luisa.mondo@epi.piemonte.it)

\*Director ScaDU Epidemiologia ASL TO3, Italy, [giuseppe.costa@epi.piemonte.it](mailto:giuseppe.costa@epi.piemonte.it)

The Legislative Decree of 17 August 1999 no. 368 “Implementation of Directive 93/16/EEC relating to the free movement of doctors and mutual recognition of their diplomas, certificates and other documents and directives 97/50/EC, 98/21/EC, 98/63/EC and amending Directive 93/16/EEC, 99/46/CE” published in Official Gazette n. 250 of 23 October 1999 - Ordinary Supplement no. 187 Corrigendum OJ. 44 of 23 February 2000 at the article 46 comma 6 says that “As part of the collaboration between Italian universities and universities of foreign countries university teaching and integrated research and specialist training may also take place in health facilities of the aforementioned countries, in conformity to training program and medical staff on the recommendation of the school board, except as provided Article 12 of the Decree of the President of the Republic 10 March 1982 162”<sup>1</sup>.

Clearly some schools are more suitable than others to training in least developed countries, namely those that do not require advanced technologies. Some experiences confirm that specialized training in international development is not only possible but fulfills the educational goals and favors professional growth coming from working in difficult conditions and with vulnerable patients.

Despite the presence of several projects proposed by health organizations and institutions working in low-income countries and responding to the requirements of specialized training abroad, students meet strong resistance by the school directors who should authorize the training. In the last few years the Board of Physicians of the province of Turin has agreed to promote this training activities both in the academic setting and in the development NGOs, because the period spent abroad is part of the educational course and does not interrupt its continuity.

CCM, Comitato Collaborazione Medica (Non Governmental Organization founded in 1968 by a group of doctors in order to promote the right to health) carries on development projects in Burundi, Ethiopia, Kenya, Mali, South Sudan and Somalia. All the projects include training of local professionals and of the community. CCM organizes information and awareness activities through courses of education in schools, campaigns focused on health topics, teaching courses for volunteers, aid workers and medical professionals. CCM underscores that the collaboration between NGOs and the University/Schools of Specialization has to be practical, use multiple competences, evaluate the feasibility of new projects and promote the cooperation of homologous subjects. The resident has the opportunity to know different realities, he may study a topic agreed upon by NGO and School of Specialization, teach the local staff specific subjects, perform medical activities related to his specialization and eventually communicate his experience to colleagues and teachers through his final dissertation.

CUAMM, the first health NGO recognized in Italy has conceived the Junior Project for residents. CUAMM works for the respect of the fundamental right to health and to make the access to health facilities available to all, including the populations living in isolated and far away areas. The agency offers the possibility of theoretical and practical trainings within a project of international development, where residents can increase their notions related to their specialization and may get ready to become involved and face the problems of international development and of global health in Italy. The project is open to residents in General Surgery, Obstetrics and Gynecology, Infectious Diseases, Internal Medicine, Pediatrics, Hygiene and Public Health.

COI (Cooperazione Odontoiatrica Internazionale) has been working for years to grant to right to oral health and to global health, and to reduce inequalities through interventions of sustainable international development. Presently it has projects in Africa, Asia and Europe and it has attained qualified experience to intervene in professional training and continuing education of local staff, prevention and education on general and oral health, creation of dental clinics and transfer of technologies suitable for humanitarian and conflict emergencies, restoration of health centers after conflicts or emergencies, provision of aid workers and volunteers for medical activities.

---

<sup>1</sup> Article 12 - Establishment of graduate schools. The establishment of graduate schools is arranged in the statutes of the university. Universities and Colleges may establish graduate schools responding to requirements of professional specificity, within the limits of availability of teaching and non-teaching staff, as well as adequate facilities and equipment, acquired partly as a result of agreements entered into with in university compliance order, necessary for the smooth conduct of the courses. The statutes of the university shall, in accordance with the provisions in article 3 above for each graduate school, the duration of the course of study, the list of compulsory subjects teaching, their distribution and the number of years in the introductory course, any indication of optional subjects, practical activities to be performed, the frequency mode of the at educational activities and practices, establishing as often as necessary to support the annual examinations and fine them, the determination of the degree required for admission, how to conduct examinations. For the purposes of the frequency and useful practical activities should be recognized on the basis of appropriate documentation, the activities carried out by the service facilities specializing in social and health-related specialization, or even abroad to the extent permitted by law February 9, 1979, n. 38, in cooperation with the countries of Italy in the developing world.

## TRAINING ABROAD FOR RESIDENTS

*Author:* Giuseppe Costa, Direttore SCaDU Epidemiologia ASL TO3

*Co-authors:* Marilena Bertini (MD, president CCM Italia), Guido Giustetto (MD, vicepresidente Board of Physicians and Dentists, Torino)

As part of the teaching and research integrated collaboration between Italian universities and Universities of foreign countries or of projects of international development, all the residents of the Faculty of Medicine are entitled to spend a maximum of 6 months in accredited or accreditable health facilities in least developed countries. Specialized training may also take place in health facilities of the aforementioned countries, without interrupting the educational program.

The resident has the opportunity to know different realities, perform medical activities related to his specialization, get ready to become involved and face the problems of international development and of global health in Italy, teach the local staff specific subjects, and eventually communicate his experience to colleagues and teachers through his final dissertation.

Usually these projects are born from the sensitivity and the initiative of single students or single schools of specialization. In Piedmont the institutions are trying to create a plan shared with the University and with agencies and associations dealing with international development and supervised by the Board of Physicians, that promotes all the medical activities in the field of international development through a Commission of Solidarity. The main hurdles are represented by the schools of specialization which often need the work of doctors in training and sometimes do not know how to recognize the minimal requirements of a development project to be accredited in the educational training of the school.

The lecture will illustrate the characteristics and the results of some such projects, will try to identify the critical elements for the success of the initiative and will discuss their meaning in the university policy.

## MASTER IN TROPICAL SURGERY AND HUMANITARIAN EMERGENCY IN PARTNERSHIP WITH MSF: SURGICAL TRAINING IN LOW-INCOME COUNTRIES

*Authors:* E. Baggio, M. Lorenzini, A. Momoli, F. Mazzarella, M. Pains, T. Cappellari, A. Pea - Università degli Studi di Verona

The Master in tropical surgery and humanitarian emergency was activated in Verona in the academic year 2010/2011 in order to provide surgeons who want to work in developing countries or during humanitarian emergencies with the necessary theoretical and practical skills and organizational ability. Under the aforementioned circumstances a surgeon must be able to face a broad spectrum of emergencies, including not only general surgery but also obstetrical surgery, orthopedics, plastic surgery, pediatric surgery and urology.

The program of the Master has been developed by the coordinator of Doctors without Borders and its points are: safe surgery and safe anesthesia (WHO guidelines); basic radiologic and echographic diagnosis (ECHO fast-track); medical and surgical semeiotic elements; management of multiple traumas, open and closed chest and abdominal traumas, cranial traumas in the absence of imaging; management of obstetric and gynecologic emergencies with the indications to caesarean section, hysterectomy and related surgery; emergency catheterization and drainage; emergency orthopedics in children and adults; management of bone fractures (casts, traction, bone fixation nails, intramedullary); amputation; airways and tracheotomy; war surgery; blood transfusions and blood salvage; management of burns, plastic and reconstructive surgery; prophylaxis and treatment of sepsis and septic shock; antibiotics in tropical setting; nutrition before surgery; management of stress; informed consent; ethnic, cultural and religious aspects in the doctor-patient relationship; ALS (Advanced Life Support) e PALS (Pediatric Advanced Life Support) for the control and support of vital functions in adults and children in critical conditions.

The Master includes attendance of one of the three hospitals in Burundi for one month: the hospital of Mutoyi run by VISPE, Milano; the hospital of Kiremba, run by ASCOM, Legnago; the governmental hospital of Ngozi already hosting a nursery teaching program issued from the cooperation of the University of Verona with the small University of Ngozi.

Up to date we had 24 students in 3 years. Almost all already had a specialization. Of course most are general surgeons (16), then there are others specialized in obstetrics and gynecology (2), plastic surgery (2), urology (2), pediatric surgery (1), and neurosurgery (1).

The evaluating questionnaire distributed over the years allowed to modify some points of the program and to evaluate the degree of satisfaction which was good to excellent in 90% cases (insufficient - sufficient - average - good - excellent).

## **LOW-INCOME COUNTRIES DURING SURGICAL TRAINING: THE EXPERIENCE OF THE SCHOOLS OF SPECIALIZATION OF GENERAL SURGERY AND VASCULAR SURGERY OF VERONA**

*Authors:* E. Baggio, G. Armatura, M. Moro, F. Panzeri, P. Criscenti, M. Tamburrino, C. Bassi - Università degli Studi di Verona

The schools of specialization in Italy, especially in surgical disciplines, have many problems: on one side the lack of educational standards required by European laws, on the other the poverty of experiences outside the school. Therefore often the idea of a “larger vision” is lost even if the law gives the possibility of an educational period of 18 months abroad. This possibility is understood by the Schools Councils as attendance of highly specialized structures in technologically advanced countries. Actually a part of the 18 months could be spent in low-income countries provided some requirements are met:

1. Safe environment
2. Presence of an expert surgeon tutoring the resident
3. Residency at third year or more

The experience of the School of specialization in General Surgery and Vascular Surgery of Verona began following a project of cooperation between the University of Verona and the one of Ngozi (Burundi) aimed at training nurses. The university of Ngozi was born from the will of the two ethnic groups after the civil war. Many professors from Verona contributed to the academic programs and later to practical training which was held in the regional public hospital and focused on surgery with the further scope to train the local surgeons. A network was created which included two more Italian hospitals: the hospital of Mutoyi run by VISPE, Milano, the hospital of Kiremba, run by ASCOM, Legnago. Unlike the hospital in Ngozi, in the other two hospitals the presence of a tutoring surgeon was granted. Most internships took place after 2008, when the country was safe and peace among the different groups had been reached.

To date the residents who took advantage of a stay in Burundi are 11: 7 women (63%) and 4 men (36%). Most were residents in their third year for both specializations. Results are twofold: first, the resident increases the spectrum of his/her expertise because surgery in low-income countries has a wider meaning and includes obstetrics, orthopedics, plastic surgery, pediatric surgery and urology; second, he/she experiences the value of solidarity and the reality of international development. In a globalized world the experience in a developing country helps the resident to become a different person and a different doctor.

## **HUMANITARIAN MEDICINE: A NOVEL EDUCATIONAL PROGRAM FOR HUMANITARIAN WORKERS IN ANESTHESIOLOGY AND INTENSIVE CARE**

*Author:* Luca Ragazzoni, Education Manager, Program Disaster SISM

In the last few years the international attention for a more professional approach of humanitarian care has increased. Independently of specific competence, health professionals have to acquire a global understanding of the humanitarian sector. The involvement in international conventions in low-income countries is considered by the literature as a novel strategy to create projects in poor settings. Yet, in order to meet both the requirements of academic education and humanitarian needs, international internships have to be properly designed and integrated into the residency. The Centre of Research in Emergency and Disaster Medicine (CRIMEDIM) of Università del Piemonte Orientale wants to develop an educational program for residents in anesthesiology and intensive care focused on humanitarian and disaster situations. The program implies the collaboration with different Italian NGOs and the active participation of internationally recognized academic and non academic organizations. The program has the scope to create health professionals adequate to participate in humanitarian international programs requiring advanced skills in anesthesiology and intensive care and a basic knowledge of tropical medicine, mothers and children health, public health during emergencies and catastrophes.

The method is based on self-learning, distance learning, virtual simulation, internships, training and field education.

The program lasts 7 months subdivided into 9 weeks of distance learning, 2 weeks of internship in pediatric emergencies, 1 week residential workshop and 4 months of field training.

## GLOBAL HEALTH GOVERNANCE, HEALTHY SYSTEMS AND DEVELOPMENT COOPERATION

Eduardo Missoni<sup>a</sup>, Angelo Stefanini<sup>b</sup>, Paola Brusa<sup>c,d</sup>

Universities, as key institutions aiming at social change and development, serve not only as centres of production, reproduction and implementation of scientific knowledge. They are also integral part of the society in which they work and with which they entertain, more or less explicitly, a 'social contract' governing their mutual relations [1].

In recent years, universities have taken on an increasingly important role in international development cooperation leading to the proliferation of different social actors who offer international assistance ostensibly towards a fairer world through a process of human and sustainable development. In the health field we have gone from a situation where only a few specialized organizations such as the World Health Organization, selected international NGOs and few other UN agencies were devoted to the task, to one in which many other institutions, including private foundations, “philanthro-capitalists”, corporations as well as social groups have begun to implement or support development cooperation programs and projects in various health and health-related fields in different countries. This has given rise to a great diversity in cooperative as well as divisive efforts, working methods, and also among the specific objectives of the various projects and programs. In this context, it is not surprising that contradictions and problems have arisen in the way development cooperation, in general and particularly in health, is understood and applied into practice.

University's international cooperation for health development consists of all the activities of the university community that are aimed at social transformation particularly in the most disadvantaged countries, transformation in which institutional and academic growth has an important role. It is implemented through partnerships and agreements (teaching / research / capacity building-institutional strengthening) with academic or other institutions from countries in the developing / low and middle income countries. Global Health is an emerging area for interdisciplinary studies, research and practice that considers the effects of globalization on health, and the achievement of equity in health for all people worldwide, emphasizing transnational health issues, determinants and solutions, and their interactions with national and local systems [2]. Clearly the field of global health extends beyond development cooperation, understood as policies and programmes aiming at improving life conditions in poor resource settings and countries through international and transnational (i.e. involving actors beyond nation-states) collaboration. Global health is, indeed, totally embedded in the wider horizon of cooperation among all countries to further peace, full respect of human rights and quality of life on a planetary scale.

In this sense, international cooperation plays a fundamental role in the worldwide promotion of the right to health and to ensure an adequate control of social determinants of health. International cooperation is undoubtedly an essential factor for both global governance “of” and “for” health agenda. Whereby “for” health refers to the need of including health priorities and concerns in negotiations and policy-making in arenas traditionally outside the health sector and the domain of health authorities, such as trade or education. In addition, governance complexity has grown as a consequence of the emerging in the last decade of new trans-national actors, which have substantially modified the power balances and global decision-making processes related to health.

The complex scenario described above requires the education of a new class of professionals - not only of those with a background in health sciences - capable of measuring the consequences on health of their decisions and activity, and equipped with the appropriated multidisciplinary knowledge, skills and motivation to act “for” health. Undoubtedly preparing this kind of future professionals is a fundamental role of the University, and should be an absolute priority for medical schools. Instead, especially the latter, at least in Italy, seem rigidly blocked on the prevalence of traditional biomedical curricula [3][4].

Development in health, understood as action to improve health condition world wide, is strictly connected to the described global and interdisciplinary dimensions, including when prioritizing populations in highest need. Instead, too often global health tends to be used exclusively to mean technical assistance in the provision of health services in poorer areas of the world. Without a clear understanding of the links between health and social determinants, and their transnational dimensions, and without a thorough appreciation of how health systems work, those health services might not only prove inadequate and unsustainable, but also contribute to further fragment and disrupt already weak national

health systems.

Thus, development cooperation in health cannot be separated from the wider global health framework. A dimension that has been introduced in the guidelines published in 2009 by the Italian Ministry of Foreign Affairs, Directorate general for Development Cooperation. The document, titled “Global Health: Guiding Principles of Italian Development Cooperation”, aimed at “guiding health programmes of the Italian Development Cooperation, toward the strengthening of complementarity and consistency of the Italian cooperation system and to promote the alignment of official development aid policies to the policies of partners countries, as well as their harmonization with those of other donors and specifically of the European Union” [5].

In that document two leading questions are of specific relevance for the University: “Partnerships and frameworks to enhance cooperation”, and “The link between knowledge and power within the processes of local and global development” [5]. Papers in this section touch upon the role and experience of universities in deepening the understanding and the practical application of those guiding principles (the fight against poverty and inequalities, universal and equitable access to health services, strengthening national health systems, participation of the communities, international partnership in scientific research and education, aid effectiveness).

Italian universities may pursue this objective through research activities, appropriate interdisciplinary and intercultural training paths, and providing adequate know-how and technology, including interacting with competent public institutions and civil society organizations in support of targeted initiatives of education, information, prevention and control.

The shortage of health workforce in resource-poor countries is one of the critical challenges to access to care. Cooperation between the Universities in the rich North and those in the poor South of the planet can play an important role in improving the local response to training needs. However a balanced relationship among partnering institutions, careful consideration of cultural, social and economic factors, and prioritization of local needs are paramount for a successful collaboration. Approaches such as distant learning, courses leading to double degrees or international accreditation, and proper accountability measures, may prove additional co-factors of success [6].

Framing health as a universal human right and recognizing equity as a fundamental principle in global health, and therefore in development cooperation, implies reaffirming the “health for all” goal and the Alma Ata Declaration (1978) emphasizing Primary Health Care as the most appropriate strategy to reach that goal with universal access to essential drugs as one of the core objectives. Today, the increasing diffusion of counterfeits further challenges the provision of effective care to populations in need. Again, a possible answer may come from increased local capability. Defining the quantitative dimension of the problem and training health professionals to enable local health institutions to locally produce essential drugs according to their needs is another example of the role that University may play in development cooperation [7].

More and more development cooperation involve multiple stakeholders in various forms of networks and partnerships, and harmonization and coordination become vital elements for effectiveness. As part of the autonomy constitutionally granted to Italian Regions, most of them have adopted regional laws providing both for financing and management of their development cooperation activities. The Tuscany Region was the first in establishing also a Global Health Centre aiming at facilitating the partnership and coordination among regional stakeholders involved in international health cooperation projects supported by the Tuscany Region. University is an important component of that partnership [8].

Universities can also be on the receiving side of their relation with international health development cooperation. Cooperating with countries in the developing world provides a fundamental contribution to the process of growth of the university wishing to gain a global perspective. The exposure of staff and students to international health cooperation activities enables them to appreciate the diversity, resisting discrimination, and contribute to the efforts aiming at improving society as a whole. Universities must also be able not only to adequately prepare young people seeking to enter the world of health development cooperation as competent and sensible professionals but as well to provide students and faculty with the adequate analytical framework and methodological tools. The aim should be to reaffirm health as a fundamental human right and a resource of the community, to address the power relations between the medical profession and the community as a determinant of health and to engage in working practices for addressing them. Adopting in the process a self-reflective approach, universities genuinely committed to advancing the right to health may invest in developing innovative methods and opening participatory, horizontal academic workspaces where research and teaching are viewed as tools for social change and health promotion. The main problems that are likely to be encountered in this process may be related to the traditional, conservative attitude of medical faculties confronted with the need for change, the difficulty of health professionals to address the issue of power relations and the trouble experienced by physicians in accepting multi-methodological approaches and working in multi-disciplinary teams [1].

The participation of universities in international health development cooperation is based on the vision of it as a process of progress and social, economic, political, cultural, and technological change which, emerging from the collective will, requires the organization and the participatory, democratic use of power by members of a group. Popular education in general, and in particular higher education, is an essential component of the process of expanding opportunities for freedom for people and societies. As a result, strengthening the university system and promoting access the higher education are essential objectives of universities in international development cooperation.

Similarly, a goal of health development co-operation for the University is to work together to try and resolve the difficulties and contradictions related to the fight against poverty and development processes, through the promotion of research in fields related to these goals, i.e. the social and political determinants of health such as equity, environmental sustainability, peace, and quality of life, within a conceptual framework of human rights and social justice.

To avoid focussing exclusively on knowledge and technology transfer or on philanthropic “doing good” rhetoric, international development cooperation for health should translate into a meaningful strategy whereby universities commit themselves to a bold process of “deconstruction” of the many clichés and stereotypes which make up the current, conventional “underdevelopment” and “development aid” discourse. Universities have a clear and, obviously, “universal” mandate to bring the world, in all its cultural and physical diversity, to their students and other constituents. Educational programmes and research should provide an introduction to the complex global context. These activities, together with the possibility of international experiences, help to prepare students for active participation in the economy and global society.

From such a perspective, the role of international health development cooperation for the university cannot be regarded simply as one of the functions within a generic process of international co-operation between the University of the North and South of the world or a sort of exotic appendix mostly intended as flagship projects meant to embellish academic institutions. Universities adopting a development cooperation approach in its fullest meaning, especially in the global health field, should instead aim at enriching humanly and academically the people who participate in this effort and the structures that compose it. Cooperation and selfless commitment to solidarity, human rights and social justice should be their powerful hallmarks.

### ABSTRACT

How is globalization affecting the determinants of health, health care systems and the ethos and practice of medicine? What are the effects of global governance “of” and “for” health and how do new international actors and transnational development cooperation impact on the balance of power and global decision-making? In particular, what role should Italian universities play to have some relevance on the new global context? Answering these crucial questions means raising the issue of the social responsibility of the University as an institution, and not just of the School of Medicine. The process of internationalization of Italian academic institutions provides the chance to (re)-discover from a global perspective the ethical and social motivations that are at the foundation of health professionals’ education. It is also an opportunity to emphasize the importance of “global citizenship”, promoting equity and the right to health, the central themes of the new paradigm of Global Health. The document of the Directorate General for Development Cooperation (DGCS), “Global Health: Guiding Principles for the Italian Cooperation (2009)”, although not free from internal institutional contradictions, provides important insights into the University’s mission to combine production and reproduction of knowledge with the moral duty to strengthen the ownership and capacities of vulnerable populations in identifying their health needs and assessing the quality of services, according to an approach that encourages the participation of communities in the protection their own health. In this sense, it is essential to support the crucial process of transformation of practices and everyday interactions between individuals, inside and outside the University.

### INTRODUCTION

The idea of globalization evokes cross-border flows of people, goods, ideas, values, knowledge, technology and money leading to a highly interconnected and interdependent world. Globalization is a multidimensional process, with multiple and diverse effects (economic, social, cultural, political, technological and environmental) on individual countries and population groups, demanding responses requiring the engagement of multiple sectors, including health.

The term “Global Health” is rightfully part of the contemporary scientific discourse, extending beyond that of International Health, that merely refers to health issues in bilateral or multilateral relations among countries, focuses on health issues of, and interventions in countries other than one’s own, especially those of low-income and middle-income, and embraces a few disciplines but with no attention to multi-disciplinarity. [1]

Global Health emphasizes the new transnational dimension of the several geopolitical factors that affect the determinants of health, as well as the strategies needed to cope with the new, emerging challenges. [2] National borders, in fact, do not constitute a significant barrier to the spread of diseases and their determinants, and they no longer represent the only spatial and cultural boundary for the development of health policies, [3] nor these can alone take into account the complex interaction of social, economical and environmental determinants of health. To understand the determinants of health and develop adequate responses requires full awareness of the global forces that impact on health and its distribution within and between countries, of how societies respond to health needs and of how different cultures more generally perceive and define health and disease.

### WHY GLOBAL HEALTH IN HIGHER EDUCATION?

Thus, higher education aiming at preparing human resources capable of adequately responding to today's and future health needs must take responsibility for the mandate to create professionals with the human quality and a broad range of professional competences (knowledge, expertise and attitude) required to face the challenges of globalization, its impact on human health and on global, national and local health systems. Due to the multicultural nature of modern societies, the increase of economic refugees and victims of violence, the growing healthcare demand created by the

expanding international tourism, and the health consequences of demographic, environmental, technological and socio-economic changes, among others, health professionals are more and more confronted with different cultures and patients coming from other parts of the world, are involved in various forms of multi-centric research, are employed in companies, intergovernmental or international non-governmental organizations, international development programs or are expected to give expert inputs into disputes about global development issues. Similarly, experts from other disciplines increasingly contribute to decision-making in forums outside the health sector, which nevertheless have considerable impact on health, such as economic, social and environmental national and international institutions, and transnational private, public and hybrid networks. All these professionals do have the option, together with health professionals, to engage themselves for health.

Besides the need to update content and teaching methods, further concern is gradually emerging about the danger that health professionals might lose sight of their primary objectives and fundamental values. [4] The financial, legal and political issues introduced by the neo-liberal, pro-market health sector reforms are, in fact, likely to divert medical education from its original mission. Over a decade ago the American Association of Medical Colleges took note of the vital need to acknowledge and nurture the social contract that exists between medical schools and the community they are expected to serve. Central part of this agreement is to train students to become socially responsible professionals, i.e. people who, aware of their responsibility towards human society, are prepared to willingly take part in activities that contribute to the welfare, health and prosperity of a community and its members. [5] The ethical commitment cannot be limited to one category of professionals, though. More and more, as we highlighted above, many professionals outside a strictly defined health-sector are increasingly responsible for health-related issues locally, nationally and globally. Recent studies and empirical investigations have shown a robust association between inequities and unsatisfactory health trends, and the process of globalization led by neoliberal economic policies, beyond the mere consequences of health sector reforms. [6] Such a global scenario requires that students be engaged in a wide range of disciplines that reflect the values and the social mission orienting their professional future. Thus, global health teaching should also entail an ethical commitment to educate future professionals to social justice and to their active commitment in correcting the global processes at the root of human suffering and health inequities. [7]

From the dread of the HIV/AIDS pandemic to the dispute on the access to essential medicines and to basic health services provoked by the World Trade Organization, [8] in order to create this type of professional the traditional curriculum oriented to our domestic health problems is obviously not enough. It is instead essential to consider how socio-economic, cultural and environmental factors transnationally affect people's health and facilitate our understanding of how the global burden of disease differs from one country to another and within the same country. Moreover, the study of health policies and health systems at the international level is essential to build the conceptual framework needed to address the multiple and complex interconnections of the determinants of health. All this is what gives significance to the term "Global Health".

## **GLOBAL HEALTH AND THE INTERNATIONALIZATION OF THE UNIVERSITY**

There is widespread interest for the internationalization of our universities. What does this mean and how does it relate to the process of globalization and the changing context described above? [9] For some, [10] the concept of internationalization refers to the response needed to cope with the profound changes brought about by globalization. This requires a better understanding of the diversity of social, cultural, ideological and political issues affecting today's globalized world.

According to Knight [11] the internationalization of an academic institution is "the process of integrating an international, intercultural or global dimension into the purpose, functions [research, teaching and services] or delivery of higher education at the institutional and national levels." The international approach of a University includes both cross-border and campus-based initiatives. The first type, "internationalization abroad", relates to academic staff mobility through exchanges, field works, sabbaticals, recruitment of international students, joint degree programmes, and international development agreements. The second type, "internal internationalization", is the introduction of an international and intercultural dimension into the teaching and research process "at home". To do this, we need reforms geared towards a curriculum that prepares students to develop international awareness and intercultural skills through appropriate educational programmes, innovative methods of learning, extra-curricular activities, activation of relationships with local ethnic and cultural groups, including the inclusion of foreign students and teachers in the internal life of the host University.

The idea of internationalization of higher education can also be an expression of different worldviews. On the one hand, internationalization can be understood as the institutional process by which the University can compete on a global level in the training market. Another way to see internationalization is as an example of global cooperation and international and intercultural sharing in an ideal "global village". A third model aims at social transformation through a critical analysis that rejects the supremacy of the market and recognizes the reality of marginalized groups produced by the neo-liberal globalization. In this model of internationalization, research and training, guided by the principles of reciprocity, mutual exchange and global partnerships, lead to increase awareness of the inequalities between and within nations. [12] Regardless of individual preferences, the very existence of these different models is an expression of the fact that universities are values-based organizations and, as such, can facilitate a transformation of the social order. On

the other hand, the choice of the model has evidently great importance and raises the question of the social responsibility of the University.

## UNIVERSITIES AND SOCIAL RESPONSIBILITY

In fact, in the recent years an increasing number of universities around the world, and in particular their Medical Schools, have been developing a critical reflection on their “raison d’être”, the relevance of their programmes and their impact on health systems and population health needs. In other words, they are becoming aware of their responsibilities towards society. [13] The World Health Organization (WHO) defines Corporate Social Responsibility of the Schools of Medicine as “the obligation to direct their education, research and service activities toward addressing the priority health concerns of the community, region and / or nation that have the mandate to serve.” [14]

Internationalizing health professionals’ education means putting in place strategies and institutional actions aimed at creating graduates able to effectively perform their profession in a society constantly changing, equipped with the right expertise in a wide range of general areas, including “global citizenship”. [15] The College of Medicine, University of Saskatchewan, Canada, interprets internationalization as “a reciprocal process, where communities and institutions at local and international level tend to share ideas and knowledge and to learn from experiences, cultures and the search for the other.” [16] The final product of such an educational orientation is the development of a “global perspective”. In this sense, investing on the internationalization of the University can be a useful mechanism to make social motivation and humanitarian purposes (re)-emerge after a long, dormant period and, perhaps, undermine the inertia and resistance to change typical of the academia.

Moreover, the concept of internationalization *of*, and *for* health professionals’ education has no doubt a political significance. Teachers in the health field bear additional responsibilities to address the harmful health effects of the growing socio-economic inequalities and unequal distribution of determinants of health, the relentless movement of masses of migrants, the commodification of health by free-market ideology, the new configuration of global health governance whereby undemocratic supranational institutions and questionable philanthropic capitalists erode the leadership of intergovernmental organizations, such as the WHO, the only formally mandated and most qualified agency to protect the health of the planet. The impact that these changes have on human health and health inequalities is documented by an extensive and authoritative scientific literature [17][18] and calls into question the social role of the entire University.

## GLOBAL HEALTH AND DEVELOPMENT COOPERATION

An important component of training in Global Health is related to the appraisal and critical analysis of issues related to organizations, ways and means of international health development cooperation with countries and people in the most disadvantaged socio-economic conditions. As social justice is the foundation of public health, [19] the main reason for the inclusion of this subject in the educational process of future health-related professionals is their moral obligation to deal with unmet needs and health inequities including the health gap between the poor and rich countries.

“A child born in a Glasgow, Scotland suburb can expect a life 28 years shorter than another living only 13 km away. A girl in Lesotho is likely to live 42 years less than another in Japan. In Sweden, the risk of a woman dying during pregnancy and childbirth is 1 in 17.400; in Afghanistan, the odds are 1 in 8. Biology does not explain any of this. Instead, the differences between - and within - countries result from the social environment where people are born, live, grow, work and age.” [20] The first step towards a solution of these problems is an increased awareness that comes from adequate information and training. A further reason for exposure and involvement in these issues lies in the competence and sensitivity for which the student is enhanced to appreciate the diversity and combat prejudice, analyse the change and the forces that shape society, and the increased capacity to operate in a varied range of circumstances. [21]

Increasingly universities include in their programmes stages and experiences of variable length with partner institutions in disadvantaged countries and limited resources settings. Benefits that students can enjoy at individual level by interacting with situations of poverty, exclusion and social injustice cannot be underestimated. In Canada, young people who have taken courses in global health are reported as having learned to think in an innovative way and acquired a greater enthusiasm for medical studies. [22] Training and experience in the field of international health, if properly framed in a more comprehensive understanding of Global Health, also promote knowledge and behaviours in support of the values of diversity and social justice, the importance of a cross-sectoral and interdisciplinary approach to health, the inter-relationship between health and human rights and the impact of socioeconomic inequalities on individual health and population: quite a powerful set of tools *for* health care providers in a multicultural and socially stratified society as the one we are living in.

Encouraging people to “field experiences” leads to another important advantage: doctors, nurses, and other professionals and academic staff who have practiced in poor countries and disadvantaged circumstances, or have made first hand experience with similar themes, are much more inclined to work in primary care, general and preventive medicine, and health promotion. Having appreciated what it means to assist people in extreme need leads in general to

also continue this type of activity once back in the country of origin. [23] However, in extending overseas experience in “Northern” training programmes, it will be important that such experience is not gained at the expense of already overstretched training programmes in low-income countries’ partner institutions. Such posts will need to be properly resourced and should ideally be part of broader capacity strengthening relationships between partner institutions including, where appropriate, the possibility of reciprocal experience for overseas trainees. [24]

In a global health education perspective, however, the overseas experience needs to be part of a wider analysis and understanding of the macro-political and economic environment, including the global aid architecture and power relations among international and transnational actors, together with their influence in determining the priorities of global initiatives. It has been argued, for example, that international health cooperation with poor countries may also be a factor in strengthening national security in the global North countries by limiting both the prospect of conflicts [25] and the increasing migratory movement. [26] Not to mention the positive, though perhaps deceptive, effect on the prestige and stature of more magnanimous international donors. However, such considerations suffer of a rather mono-cultural (western) outlook and do not take into consideration the considerable changes of global (and specifically health-related) governance and the increasing complexity of relations brought about by the astounding mushrooming of new private actors, global initiatives and public-private partnerships, the growing role of emerging countries, and new approaches to international cooperation. This calls for an extra responsibility of the University in the fulfilment of its double mandate of education and research.

In this regard, focusing on our own domestic context, what is the role of the University in the Global Health strategies of the Italian development cooperation?

## **THE ROLE OF THE UNIVERSITY IN THE GLOBAL HEALTH STRATEGIES OF THE ITALIAN DEVELOPMENT COOPERATION**

In 2009 the twenty year-old Italian Development Cooperation for Health (DCH) guiding principles [27] were reviewed and reformulated through a participatory process involving experts from a range of public and private institutions, including from five Italian universities (Università Bocconi, Università di Bologna, Università di Firenze, Università “La Sapienza” di Roma, Università “L’Orientale” di Napoli). [28]

The 1989 principles reflected both the Alma-Ata Declaration and the National Health Service (Servizio Sanitario Nazionale - SSN) approach to providing health for all, including equitable distribution and access to health resources, emphasis on prevention, community participation, technological appropriateness, inter-sectorality, promotion of local self-sufficiency, and support to the development of local health systems. [27]

In line with these principles and its integrated approach to health and development, the new guidelines titled “Global Health: Guiding Principles for the Italian Cooperation” (hereafter “the Guidelines”) insisted on a holistic approach to health as part of wider poverty reduction strategies, strengthening health systems, universal and equitable access, and aid effectiveness for global health, including the need to align global health initiatives with national systems. [28] Although not free from internal institutional contradictions, the 2009 Guidelines provide important insights into the University’s mission to combine production and reproduction of knowledge with the moral duty to strengthen the ownership and capacities of vulnerable populations in identifying their health needs and assessing the quality of services, according to an approach that encourages the participation of communities in the protection their own health.

From the preface, the document frames DCH in the wider context of “health as universal human right” and “an essential condition for poverty reduction and socio-economic development”. It stresses the complexity of the health sector, which requires interaction with other sectors of development and indicates the primary responsibility of health systems in granting the quality of population’s health and its level of equity and protection, deriving from their function of social institutions in the context of “the contract between the State and the citizen”. Indeed, the system approach continues to orient the discourse of the Italian Cooperation in Health (and in other sectors), while contradictions arise when the Italian contribution to DCH in the multilateral system is identified with participation in Global Health Initiatives<sup>1</sup> characterized by their vertical mono- or pauci-thematic approach, contributing to fragmentation and contrasting the internationally shared call to ownership, alignment, and harmonization of development aid.

### **Box 1 - Guiding principles of the Italian Development Cooperation in Global Health**

- Reference framework.
- Fight against poverty and socio-economic inequalities: social determinants of health.
- Universal and equitable access to health services.
- National health systems; Community participation.
- Scientific research, knowledge networks and cultural promotion.
- Natural and human made disasters.
- Development aid effectiveness for global health.

<sup>1</sup> Global Poliomyelitis Eradication Initiative - GPEI; the Global Fund to fight against HIV/Aids, Tuberculosis and Malaria - GFATM; Global Alliance for Vaccines and Immunizations - GAVI; International Financing Facility fro Immunizations - IFFIm; Advanced Market Commitment - AMC.

The Guidelines are organized around a general framework and seven themes (Box 1), including “Scientific research, knowledge networks and cultural promotion” of particular relevance to the University's role. The guiding principle of this theme is the promotion of international partnership for research and training “among peer institutions and actors, or carriers of different knowledge” where ‘different’ is to be understood as ‘unconventional’. To that purpose the identified lines of activity are: a) operational research programs that should involve local community and health personnel participation; b) the strengthening of the partner countries' scientific research capacity, including through increasing the expenditure in research related to health problems affecting the poor; c) the research of new drugs and vaccines, identifying the priorities based on health needs and granting access of developed products to partner countries' populations; d) the assessment of health technologies and on health systems capable to promote effective policies and practices. It is striking to note that no activity line is dedicated to higher education and training in health, despite training being mentioned in the guiding principle. In this regard, it might be important to explore whether this conspicuous omission does simply denote a material error or instead it reflects a conscious underestimation of a real need.

In addition, it is interesting to note that the Italian Development Cooperation Law (n.49/87) [29] does not foresee the possibility to finance research projects, but only projects aimed at “the transferral of appropriate technologies” to developing countries. This represents a substantial difference with other donors (such as UK, Sweden or Spain) that do allow their aid agencies to finance development-related research conducted by their own research institutions. In that sense, it could be argued that research mentioned in c) should not be financed through official development aid regulated by Law n.49/87. Indeed, Italian participation in innovative financial mechanisms such as the AMC (Advance Market Commitment), specifically aimed at financing research mostly led by the private industry in technologically and economically most advanced countries, would seem extending beyond the limits allowed by Law n.49/87.

However, the role of the University necessarily extends beyond the promotion and support of research in developing countries. As the primary source of education of human resources that will feed the development cooperation system, as well as the privileged place for research, the University may play a fundamental role in linking its educational and scientific activities to increase, on the one hand, the capacity of the Italian development cooperation system to respond to the needs of global health and accomplish the principles it adopted to respond to those needs. On the other hand, it may contribute in linking that effort to collaborative activities with peer institutions in partner countries aiming at developing local capacity.

The role that the Guidelines attribute to social determinants, health systems and equity reflect the characteristics of the Italian approach to health (as a fundamental Constitutional right embodied in its universalistic National Health Service, etc.) in the wider context of international agreements, conventions and other documents mentioned in the general framework of the guidelines. Thus, one would imagine that those same principles are already integrated in the teaching program of Italian medical schools. Unfortunately this is not the case. Besides a few general concepts presented during the course of Hygiene and Public Health, Italian medical and other health sciences students are rarely exposed to these principles and approach during their undergraduate studies, and, unless they chose to follow postgraduate courses in Public Health or related disciplines, they may enter the profession without or with minimal knowledge of the principles on which the whole system is based.

Moreover, principles such as those listed under the sections “Fight against poverty and socio-economic inequalities” or “Community participation” are even more distant from the still prevailing bio-medical approach of Italian medical schools, where interdisciplinary exposure is totally missing. Providing future health professionals with the competences such as those necessary to adopt “integrated approaches that may act on education, nutrition, housing and working conditions, and on the environment”, or to correctly act for “a more equitable distribution of power, money and resources” with an inter-sectoral vision, or to empower communities through their “involvement in the evaluation, management, and communication of environmental and working risks”, or to operate in different cultural contexts “valuing traditional practices and interpretations of health problems”, requires a deep rethinking of today's programmes and pedagogic approach of medical schools, and in general of a University system which largely lacks flexibility and dynamism.

It should be added that the Guidelines refer to the need to strengthen the complementarity and the consistency of the Italian Development Cooperation “system”, which however does not fit into the legal and organizational framework set by the law 49/87 more than 25 years ago. At that time, in fact, Italian policymakers did not foresee the increasingly diverse and rather fragmented initiatives that public institutions and private organizations would have introduced in the field of international cooperation, and whose reform is long overdue.

## CONCLUSIONS

The acceleration of the globalization process and the dominance of the neoliberal model have deeply influenced population's health and the way national health systems interact in the wider global health system. Traditional actors and approaches to development cooperation are confronted with deep changes in the aid architecture and in the balance of power in global decision-making, as well as with substantial transformations in the way actors operate and interact at the national and local level. More and more health professionals need to develop new competences involving knowledge derived from non-medical disciplines, while professionals with different disciplinary background need to

complement their skills with knowledge and expertise enabling them to act *for* health.

In this context the University needs to reflect on, and eventually redefine its social responsibility, and with it its ethical framework, methodological approach and content of the educational project. In essence, in globalized times the basic profile of health and *for* health professionals operating in a national health system does not substantially differ from that of their peers engaging in the global arena or specifically in development cooperation settings.

The Global Health Guidelines that Italy has adopted, and that ought to inspire the entire national development cooperation system, show some internal contradictions but may offer an inspiring contribution to the redefinition of the curriculum of medical schools and other University departments whose graduates, whatever their discipline, will predictably play a role in influencing health determinants. Indeed, although individual experts from a number of universities contributed to the formulation of the Guidelines, the Italian University, and specifically the Medical Schools, do not respond to the needs of human resources that those guidelines envisage. Thus, a process should be promoted aiming not only at increasing the offer of optional courses in Global Health to students in all faculties, but also at mainstreaming Global Health issues in the educational experience of future health professionals.

### ABSTRACT

Global health and *for* health governance have been increasingly recognized as key elements of sustainable development. At the same time, in the last two decades there has been a dramatic increase in the number of public and private actors involved international development cooperation and of the overall complexity of the global health scenario. Traditional competences have become insufficient and there is a growing demand for professionals who combine a thorough understanding of health-related challenges with multidisciplinary training in social sciences, economics, and management. This led, in the last few years, to the mushrooming of courses dedicated to global health and contributing to obtaining an academic degree.

We review our recent attempt to innovate the educational offer in global health policy and management, as part of a wider initiative involving a consortium of academic institutions in Italy, and analyse the recent trend in global health education, focusing mainly on interdisciplinary approaches to global health education as those proposed in non-medical schools and to students with no background in health disciplines.

We conclude that while global health and development is certainly an emerging area in the higher education systems of many countries, the international offer of graduate programs is highly dominated by programs taught in medical or public health schools, failing to combine health sciences with economic, social, and management sciences. We argue that the multidisciplinary nature of global health education programs should be improved.

### INTRODUCTION

Health has been increasingly recognized as a key element of sustainable economic development, global security, effective governance, and human rights promotion [1]. Since the late 1990s, the role of health in global development policies became more relevant, as shown by the fact that three out of the eight Millennium Development Goals (MDGs) set forth in the year 2000 by United Nations Millennium Declaration are related to health targets (MDG 4: Reduce child mortality, MDG 5: Improve maternal health, MDG 6: Combat HIV/AIDS, Malaria and other diseases). This shift in attention to health also resulted in an unprecedented growth at a global level of financial resources destined for the development of the health sector [2], although this trend is now slowing due to the prolonged economic crisis. The media are increasingly referencing the idea of global health (GH), multilateral and bilateral donors are put increasing emphasis on it, and global health-related activities from the global philanthropy sector are increasing. A growing number of global initiatives and actors increased the complexity of the GH governance and management structure, posing new challenges to international institutions with the mandate of international coordination, the most important of which being the World Health Organization (WHO).

Driven by influential academic research, there has been a qualitative shift in GH priorities toward a better understanding of (and support for) social determinants of health [3] and best practices in health systems management and policy implementation.

Besides the obvious relation of GH with public health and transnational charitable activities, GH has also been described as investment (to maximize economic development) and as a strategic foreign policy imperative for both political and economic reasons [4].

As a consequence of these trends there is a growing demand for professionals who combine a thorough understanding of health-related challenges with multidisciplinary analytical, policy-making, economic, and management skills, as well as the capacity to interact with diverse stakeholders at all levels.

The global job market is in fact offering unprecedented opportunities for graduates with these skills in both the private and the public sector, as well as in the emerging area of public-private endeavours. International institutions, development cooperation agencies, pharmaceutical, biotech, and medical devices companies, central and local governments, public, private, non-profit, and commercial providers, insurance companies are the privileged targets for

the competences related to GH. The need for research in GH is also growing and is increasingly using innovative approaches that link health to political economy, social and management sciences, and international law.

The subject attracts new generations of students and scholars and the offer of courses in this new area is booming. However, there is still wide discrepancy in the content among GH courses offered around the world and some times the denomination GH is arguably used to refurbish pre-existing courses in “international health”, “tropical medicine”, and others in a mere response to marketing needs [5] and cosmetic re-labeling of old patterns, objects, and interests without real social innovation [6].

On one side the question arises “what should be taught when we teach global health?” [7], on the other “where and to whom should global health courses be offered?”.

Due to the complex characteristics of the GH arena and the multidisciplinary nature of the field, post-graduate employment and continued research in the field inevitably necessitate a more comprehensive, interdisciplinary skill set which covers scientific, political, social, and economic disciplines. It is only with this interdisciplinary mindset that it is possible to effectively perform analyses, engage in policy-making, and manage activities both among the various sectors as well as between highly intertwined, yet separate, actors including the public sector, the private sector, and civil society. Similarly, the need to include multiple consolidated disciplines (sociology, political sciences, economics, anthropology, and others) allows understanding GH as more than simply the global dimension of public health [8]. Nevertheless, the international offer of graduate programs is highly dominated by programs taught in medical or public health schools. These programs, which often fail to combine health sciences with economic, social, and management sciences, also tend highly target medical and health sciences students.

We define “Global health as an emerging area for interdisciplinary studies, research and practice that considers the effects of globalization on health – understood as a complete state of physical, mental and social well-being – and the achievement of equity in health for all people worldwide, emphasizing transnational health issues, determinants and solutions, and their interactions with national and local systems.” Thus, in our vision “Global Health Education” should aim at providing skills beyond “health” studies and supplementary to those acquired through training in specific disciplines, and its outcome should produce professionals who, whatever their specific field of training may be (e.g. medicine, economics, sociology, natural sciences, engineering, etc.), understand how their professional work on local levels can feed into or be linked with global actions [9] in a truly “g-local” approach.

The inclusion of equity in the definition also has methodological implications. GH studies should engage students in a thorough reflection on the values and social mission of future health and *for* health professionals. In other words, GH teaching should also imply an ethical commitment to educate future professionals in social justice and their non-neutral role in correcting global processes at the root of human suffering and inequities in health [7].

Between 2009 and 2012, the Global Health and Development Group of CERGAS at Università Bocconi coordinated a consortium of academic institutions including Università degli Studi del Piemonte Orientale and Università degli Studi di Milano-Bicocca, which spearheaded a project aimed at introducing or consolidating courses in GH in non-medical departments of the three institutions. The project was supported by a grant from the Fondazione Cariplo. The project aimed at addressing the lack of competences and skills in GH-related topics through increasing the existing offer with the creation of multidisciplinary courses and specific tracks on GH open to Italian and international students of different universities; developing research capacity and skills at postgraduate and PhD level and promoting research partnerships and international networking through the organization of conferences and workshops.

To contextualize the above mentioned experience, in the following section we analyze the recent international trend in GH education, focusing mainly on interdisciplinary approaches to GH education as those proposed in non-medical schools and to students with no background in health disciplines. To that purpose we make specific reference to recent trends of GH teaching activities in Italy, France, the UK, in the USA, and in the Latin American subcontinent. We then present our firsthand experience in introducing and consolidating GH education in non-medical schools in Italy, with specific reference to Università Bocconi and its school of management.

In the conclusive section we argue that the multidisciplinary nature of GH education programs should be improved.

## TRENDS IN GLOBAL HEALTH EDUCATION

In Europe as in the Americas and in almost every continent there has been an astounding increase of courses related to, or including “global health” in their title. In a recent review Harmer [10] has shown that in the UK there are far fewer opportunities for undergraduate students than postgraduates to study either international or global health. Furthermore, amongst undergraduate students, medical students have more opportunity than non-medical students, also because of the availability of intercalated one-year degrees. While GH has been widely confined to medical schools there are some signs that “non-health” departments are beginning to offer GH courses – Edinburgh and Glasgow’s Schools of Social and Political Science, for example – suggesting a slow recognition that educating about GH is not just the responsibility of health departments. In addition, UK based distance learning opportunities are making a GH education truly global, in terms of geographical location at least. Nevertheless, it has been observed that: “There continues to be confusion about exactly what GH teaching opportunities are available at universities in the UK” [11] and “a public database of global health teaching programs” has been recommended “to signpost prospective students” [11].

Curiously, as Gautier [12] highlights, in **France** and Francophone Universities (Universités de la Francophonie), the only courses mentioning global health in the title are courses offered to Masters students at Sciences Po (France) and open seminars at the Collège de France, which are both taught in institutes not primarily related with health and medicine. They also appear to be the only two definitively looking at GH in a more comprehensive way. Although not tailored to any specific background, all the other several courses addressing global or international health as the core curriculum identified in France at both graduate and postgraduate level, seem to have in common the orientation to health in developing or resource-scarce countries.

In the **United States of America** where a surprising increase in number and diversity of GH course offerings over the past five to ten years has also been observed, the idea and definition of GH is still in its early stages and has yet to fully form its identity as a subject matter. However, in her extensive review about GHE in the USA, Procacci [13] notes that while the number of graduate courses offered within US-based institutions and offered abroad is quite comparable, when comparing the number and type of undergraduate course offerings, the United States is significantly ahead of its European counterparts, indicating that the USA is making a significant investment in a younger crop of graduates in order to instill the importance of GH. The study also highlighted that there is still a heavy presence of public health and medical schools in the teaching of GH, particularly at the graduate level which gives a weighty slant toward the medical, public health, and scientific aspects of GH. Nevertheless, this perspective does seem to be changing, even within SPHs, and it will be interesting to observe the continued transformation of GH degrees in the United States during the next decade.

Based on the findings of a recent research at the end of 2012 in **Latinamerica** no more than 10 Latinamerican institutions were reporting activities broadly defined as GHE [14]. These programs appear to have a number of unique features that distinguish them from the GHE programs in English-speaking North America and other countries in Europe. First, in Latin America the subject matter of the courses tends to focus on the impact of the globalization phenomena on population health and health systems and policies in the individual country where the course is being offered, as well as in the Latin American region as a whole. For the most part, the courses aim at instilling critical thinking and analysis of the global institutional and power structures dominant in contemporary society. This type of analysis naturally encompasses a multidisciplinary approach requiring the participation of specialists from a variety of disciplines such as economics, political science, anthropology, diplomacy and political science, etc. In addition to the critical discourse prominent in Latin American GHE programs, courses expect students to propose actions or projects to counteract the negative effects of globalization in their countries or communities. It appears that, being mainly low- and middle-income societies with high levels of social inequities, Latin American GHE focuses on the analysis of economic globalization on the generation and preservation of health inequities, as well as the design and implementation of measures that may contribute to resolving this situation. Also in Latinamerica GH teaching remains confined to health institutions, however most programs have a clear public health orientation with little or no involvement from the biomedical and clinical disciplines. As in Europe, the majority of the courses are geared to graduate level students and/or to professionals seeking continuing education credits. As yet, there are fewer programs for undergraduate students at Latin American universities. Thus, introducing GHE in undergraduate health careers curricula is an important pending task also for the Latin American region. Finally, most GHE courses in Latin America use, at least partially, web-based distance teaching methods. Use of synchronous and asynchronous learning technology platforms are basic tools in teaching GH in the region [14].

Global health has been taught in **Italy** for over a decade and, interestingly enough, it was first introduced in non-health faculties. Still, today, the only compulsory GH course is the one introduced in 2001 as part of the program of a Masters of Science of the faculty of Sociology of the University of Milan-Bicocca [15][16]. Nevertheless, thanks in particular to the successful partnership among several institutions, NGOs, and medical students, organizations that gave rise to the Italian Network of Global Health Teaching (RIISG), elective courses in GH have been introduced in several medical and health sciences schools and are increasing in number and quality [17]. Unfortunately, the rigidity and segmentation of the Italian academic system on one side does not allow the introduction of new compulsory courses within medical schools, on the other it makes almost impossible the exposure of medical students to other disciplines in the course of their studies. Despite being constantly highlighted as a fundamental aspect in GH education, in Italy and elsewhere, the importance of GH for future professionals in non-health sectors is still widely underestimated and the extension of GH education in those domains, and a truly trans-disciplinary approach still represents the biggest challenge.

## GLOBAL HEALTH EDUCATION IN A NON-MEDICAL SCHOOLS IN ITALY: THE CASE OF THE UNIVERSITÀ BOCCONI AND ITS SCHOOL OF MANAGEMENT

### Global health and development at the undergraduate level

As described above, in Italy, GH education has been limited to courses and programs in medical schools and to a few experiences at the graduate or postgraduate level in non-medical faculties. Until Università Bocconi offered this course, no Italian University ever offered a course in GH at the undergraduate level outside a medical schools.

As part of the Global Health and Development Teaching Project, supported by Fondazione Cariplo, in the academic

year 2010/2011 the undergraduate school of Università Bocconi introduced, for the first time, an elective course titled “Global Health and Development, Policy-Making and Management”. The 48-hour course (6 credits in the European Credit Transfer and Accumulation System; ECTS) was offered by the Department of Policy Analysis and Public Management to two student types: students in their third year of the undergraduate degrees offered at Università Bocconi<sup>1</sup> and undergraduate and postgraduate students visiting Università Bocconi from other foreign universities as part of international exchange programs.

#### *Course objectives, structure, and approach*

The course was designed to provide a comprehensive introduction to the fundamentals of GH and development, with a special emphasis on the linkages between global strategies and national health policies and systems. The specific objectives of the course were to allow students:

- to become familiar with a multidisciplinary approach to key issues in GH;
- to develop a systematic and critical view on GH in the wider context of global development;
- to examine policies, strategies, and managerial approaches of global actors;
- to identify the key issues in health policy formulation and implementation in developing countries; and
- to be able to adopt a systematic view on the main challenges related to health systems, policies, and management in developing countries.

The course was structured in two conceptual blocks. The first block introduced students to global health-related issues, analyzing the relevant connections between the process of globalization, development and health. It then analyzed GH governance and its impact on health systems and access to health services in the wider context of development policies and assistance. The second block, after an introduction to health systems and policies in developing countries, focused on:

- the relationship between development assistance and health systems development;
- health financing and incentive mechanisms to improve the quality of and access to healthcare; and
- delivering health services and the role of healthcare management in developing countries.

The course was entirely thought by faculty members and international experts. Attending students were assessed via a midterm, a written exercise (30%), a group project (20%), and an individual research work (50%). Non-attending students were assessed only through a written exam (100%).

#### *Students and expectations*

The course attracted the interest of more students than expected with 59 students enrolled in the first year and 42 in the second. Although unconventional for students of Università Bocconi, with those numbers of enrolment the course appeared rather attractive to students of the third year, particularly when compared with enrolments in other electives.

In both years around 64.5% of enrolled students were Italians, which is slightly higher than the overall average for optional courses taught in English at Università Bocconi. In the first year, 68.7% of students enrolled came from two Bachelors courses, CLEAM and CLES, while 31.3% came from the international exchange program. In the second year, the proportion of enrolled students belonging to the exchange program decreased to 26.3%, as did the percentage of students from CLES (15.8%), while the percentage of students registered from CLEAM increased to 57.9%. This change in the distribution of students across bachelor degrees is not easy to interpret. A possible explanation may be that while there is a latent interest for GH and development among students studying Economics and Social Sciences, the course was more suitable for students studying Business Administration and Management. In fact, at the beginning of the first year, students were asked about their expectations regarding the new course, and around 26% of students mentioned that they expected to learn about the link between health and economics. This topic was covered by the course, but only to a limited extent. Among other aspects students seemed to be more frequently interested in learning about health systems, problems of both developed and developing countries, and inequalities in health.

#### *Course evaluation and perspective*

The experience gained in the two academic years in which the course was delivered, offers some interesting lessons for the future development of courses in GH and development in non-medical schools. Students highly appreciated the unconventional topics (for economics and management students) examined during the course. In both years, students showed strong interest for the new topics and a surprising curiosity for issues beyond the traditional boundaries of

<sup>1</sup> Bachelors of Business Administration and Management (CLEAM); Bachelors of Economics and Finance (CLEF); Bachelors of Economics and Social Sciences (CLES); Bachelors of International Economics and Management (BIEM); Bachelors of Economics and Management in Arts, Culture and Communication (CLEACC).

economics and management courses taught at Università Bocconi. The interest for the topics taught in the course was also confirmed by the choice of 16 students (15.8%) to develop their final thesis on GH and development-related topics. This is a remarkable outcome as the final thesis of undergraduate students is rather important in directing future academic or professional careers.

Nevertheless, students' evaluations of the course, particularly those students participating in the inaugural year of the course, indicated a number of areas in which improvements could be made, mainly related to general aspects regarding the content of the course and the teaching approach. Many students felt that to take full advantage of the course, they would have needed more previous knowledge; a more structured teaching material would have helped them to better follow the lectures; and the exam procedure could have been better clarified in advance. These observations were all taken into account in planning the course in the second year. In particular, a full set of lecture notes, complete with copies of all the proposed reading, was prepared and distributed to students in advance. A better understanding of students needs and expectations also helped the instructors better sculpt the course, and the second year students' evaluation yielded better scores in all domains compared to the previous year.

### **Implementing a global health specialization in the Masters of International Healthcare Management, Economics, and Policies (MIHMEP)**

Since 1999, SDA Bocconi, the Management School of Università Bocconi, has offered Masters International Health-care Management, Economics and Policies (MIHMEP) providing an interdisciplinary and international education program specifically focused on healthcare management and policy. This was possibly the first program to be launched in Europe offering such a comprehensive approach to health, beyond traditional "business administration" on one side and "public health" approaches on the other. From the beginning, the course was based on an itinerary comprising 9 months of classroom activities and a three-month field project. Thus participants develop both theoretical and practical skills in management, economic analysis, policy analysis and formulation, and epidemiology.

Over its first ten years of life, MIHMEP's electives expanded from 5 to 14, encompassing new themes and partnering with additional professionals and masters programs. In the academic year 2002-2003, the GH focus was introduced, with two, 24-hour elective courses: "Global Strategies for Health" and "Policy and Management in Developing Countries", both of which are still taught [18]. Since its introduction in 2002-2003 students always very positively evaluated the elective course in "Global Strategies for Health", giving constantly scores between 9/10 and 10/10 in response to questions such as "interest of topics" and "professional utility", and suggesting in their qualitative evaluation, to make the course a compulsory one and expanding it to cover more topics related to global health. In addition to content, "interaction", "firsthand examples", and "emphasis on improving critical skills" were other convincing observations that pushed the direction of MIHMEP to further expand the course into a specialization.

In the academic year 2010-2011, the 12th edition of MIHMEP, the structure of the masters course was reorganized and new emphasis was put on the global dimension. While maintaining its original acronym, the claim of the course became "Find the right way to global health management". Accordingly, a Global Health and Development (GH&D) specialization track was introduced together with the Healthcare Management (HCM) and Pharmaceuticals and Medical Technology (PMT) specializations. Students are expected to choose one among the three. Each specialization has a total number of 120 hours of specialization courses and seminars to be taken by every MIHMEP student, mainly during the third term. After the completion of MIHMEP, students are awarded the MIHMEP Diploma and a separate certificate reporting the specialization undertaken.

#### *The structure of the GH&D Specialization*

In the first term, all MIHMEP students follow basic courses in epidemiology, healthcare systems and policy, health economics, foundations of management, and quantitative methods. In the second term, three additional compulsory courses are taught: "Economic Evaluation of Healthcare Programs", "Issues in Public Health", and "Financial Accounting". The third term is dedicated to the specialization. To increase multidisciplinary interchange, the courses of the GH&D specialization are also open to students from the Masters in Public Management (MPM), also taught at SDA Bocconi.

Consistent with the GH definition adopted by the Global Health and Development Group at CERGAS-Bocconi, the GH&D specialization aims at analyzing GH issues as they emerge from the tighter connections between globalization, development, and health. Through examining structures, policies, strategies and managerial approaches of both public and private (profit and non-profit) global actors, the GH&D specialization prepares students to become active actors in the achievement of equity in health worldwide, emphasizing transnational health issues, determinants and solutions, and their interactions with national and local systems. The specialization provides students with an overview of challenges in the changing global scene in health-related policy-making and management at global level. The specialization also allows students to understand key issues of healthcare systems, policies, and management in developing countries. Additionally, students obtain training in program/project management in an international context and are provided with policy evaluation skills.

Students that chose the GH&D specialization are supported in the development of policy-making and management skills which are interdisciplinary, intercultural, multi-level (global, national, local), dynamic (managing change) and

analytical; they are also given the capacity to manage relations with different sectors and actors in society (public, private, civil society) in different socioeconomic and cultural contexts and manage interactions at all levels.

The GH&D specialization requires a total of five mandatory courses: “Global Health Strategies”, “Health Management and Policies in Developing Countries”, “Program Design, Management and Evaluation”, “Evidence-based Policy Evaluation”, and “Managing Challenges in Global Health”. In addition to the chosen specialization, to receive the MIHMEP Diploma students have to choose two subsequent courses (minimum 48 hours of coursework) from the other MIHMEP specializations. The choice of these additional courses can be based on the individual's interests and future career expectations, giving an added value to the topics addressed in the student's specialization.

The “Global Strategies for Health” course is introductory to the GH&D specialization. It first aims at fostering understanding and critical approaches to concepts such as globalization, development, and health, and the linkages between issues and processes. Students are introduced to the GH system, its architecture, and the factors that determine its governance. The structure, policies, and strategies of both public and private (profit and non-profit) global actors are studied, as well as the overall influence of those actors in determining changes on domestic health systems and access to health services. Finally, the global mechanisms of development assistance in health and health financing are presented.

The course, “Program Design, Management, and Evaluation” introduces students to project cycle management, enabling them to prepare logical frameworks, to identify and formulate projects through a participatory approach, to define project documents and to assess their quality. The course, shared between MIHMEP's GH&D specialization and the SDA Bocconi Masters in Public Management (MPM) concentration in Management of International Organizations and NGOs, has an intersectorial approach to development cooperation and proposes a critical analysis of development cooperation instruments.

In the course “Evidence-based Policy Evaluation” students are invited to apply policy evaluation tools in a number of cases, both in high and middle to low-income countries.

The course is divided into two parts: one methodological and one based on case studies. The first explores the logics of policy evaluation and a number of quantitative and qualitative methods (such as randomization, non-experimental data treatment/control, matching, regression discontinuity design, and instrumental variables). Practical case studies, however, represent the main part of the course.

In the course, “Health Management and Policies in Developing Countries”, students are invited to look more in detail to the described interactions in the context and from the perspective of low-income countries. Here, case studies are used and a more practical approach is adopted.

Finally, in a cycle of seminars on “Managing Challenges in Global Health”, students have the opportunity to debate with senior international professionals and discuss the on-the-job experience in managing the challenges posed by a wide range of specific GH issues and practices such as migration, mental health, ethics, pandemics, global food system and obesity, global communication, disasters and emergencies, and demographic changes.

As an integrating and practical activity of the GH&D specialization, an innovative Study Tour at the principal organizations of GH headquartered in Geneva, Switzerland, was undertaken.

#### *Who chooses to specialize in global health?*

Based on MIHMEP students' specialization choices, interest in GH and development was comparable to that in the other two specializations, notwithstanding the perceived smaller chances of employment and career perspectives after completing the masters, especially if compared with specialization in pharmaceutical and medical technologies. 13 students out of 38 (34%) chose the specialization in the academic year 2010-2011 (MIHMEP 12), and 11 students out of 33 (33%) in the academic year 2011-2012 (MIHMEP 13).

Although two years of observation do not offer an adequate sample for significant conclusions, it appears that students with a background in health sciences (medicine, nursing, etc.), law, and humanities tend to choose the GH&D specialization.

In terms of geographical origin and diversity, 46% of the students choosing GH&D specialization, came from non-European Union (EU), low-income countries.<sup>5</sup> This does not differ substantially from the percentage (42%) of students from non-EU, low-income countries comprising the overall MIHMEP student body during the two observed years. In other words, interest for GH&D seems not to be significantly influenced by the economic development of the country of origin. However, it must be noted that the number of students from low-income countries choosing GH&D may be biased by the fact that this choice was favoured through fee-waiver grants provided by the Cariplo Foundation to students from those countries. Over the period 2009-2012 (i.e. MIHMEP 11, 12 and 13) the Foundation provided 7 full fee-waiver and 8 half fee-waiver grants.

#### *Responsiveness to student expectations*

As is the case for all MIHMEP courses, courses within the GH&D specialization were individually evaluated by students who were asked to give scores (1-10) on aspects such as: course contents (balance between theory and practical examples, interest of topics covered, professional utility, degree of in-depth study), general aspects (quality of teaching, appropriate use of different teaching methods, quality of course material, balance of workload, evaluation

method/exam), course organization, and faculty. Comments were also allowed both on the overall quality of the course and on individual professors.

While most of the parameters are very specific to the course organization and how it is taught, observations regarding interest in the topics covered and professional utility may help to evaluate the perceived relevance of the proposed topics in relation to personal interests and future career pathways.

In 2011, the opinions expressed by students regarding the “Global Strategies for Health” course were very much in line with previous years and scoring over 9/10 for both interest and professional utility. Instead, in the following year (2012) both these aspects were scored slightly below 7/10, for the first time in its ten years of existence. Without having the possibility to compare results on a similar time scale, but only with the previous year, a similar drawback was recorded also for all other courses in the specialization, with the only exception being in “Evidence-based Policy Evaluation”. The latter received a score slightly higher to that - already very positive - recorded in 2011 when it was introduced. It must be noted that there were no substantial changes from one year to the other, thus student’s less favourable judgment of four out of five courses may be at least partially attributed to the composition of the class. However, the very practical and interactive nature of the “Evidence-based Policy Evaluation” course may also indicate that learning and applying tools to case studies is seen as the most useful approach in view of future professional challenges in the international arena.

### *Internships and job placement*

The students who choose the GH&D specialization are expected to develop their careers in international institutions and NGOs, global public-private partnerships, bilateral development cooperation agencies, national health authorities in low-income countries, the transnational corporate sector, or as international consultants.

Regarding internships both for MIHMEP 12 and 13, GH&D specialization student internships were mostly spent at international institutions and NGOs (7 for MIHMEP 12; 3 for MIHMEP 13); the others were distributed among public healthcare entities (1 and 2, for respective years), consulting firms (1 and 2, respectively), private industry (2 and 2, respectively), and research centers (1 and 2, respectively). In 2010-11 one student was intern assigned to a bilateral development agency.

An analysis of available information (personal information and/or research on LinkedIn) on post-graduation, job placement status of all MIHMEP alumni, roughly one third of the alumni are placed in the Pharmaceutical and Medical Device Industry category, one third in healthcare and public health services (public and private), and another third widely distributed among a variety of sectors (half of which are in academia and research).

For MIHMEP 12 (2010-2011) separate data are available for the 13 students who chose the GH&D specialization: 6 (46%) are currently employed in universities and research centers, 6 (46%) are equally distributed among public healthcare, international organizations and consulting firms, and one student is currently employed by a bilateral development cooperation agency. Again, numbers are too limited to drive firm conclusions, but it seems that an association exists between the GH&D specialization and employment in research.

### *The Professional Study Tour*

The “Study Tour” is an experience-based curricular innovation [19] only recently introduced in GH courses with the aim of addressing this theory-practice gap. By giving students the opportunity to observe theory being applied in professional practice, study tours may provide students with an experience-based component often lacking in the classroom setting [20]. It has also been argued that a short-term study tour abroad could efficiently increase students' global awareness and lay the foundation for the development of a sophisticated global mindset in future managers [21].

Despite its popularity in business schools and traditional business programs, the Study Tour does not appear to be widely used in “Global Health Masters” programs at present. The majority of short-term study tours associated with GH programs are largely based on engaging students in a 1-2 weeks module in fieldwork in a low- or middle-income country. As shown in a recent extensive research on GH programmes only the Management Center in Innsbruck and the University of Leeds offered similar study tour programs to Geneva associated with their Masters programs, while the University of Wisconsin (USA) offered a five-day study tour to the United Nations (UN) in New York associated with their “Certificate in Global Health”, an undergraduate program [22].

The study tour to Geneva, was introduced as part of MIHMEP GH&D in 2011 as a means to expose students to real-life management and policy debates and the professionals in the GH domain. It lasted 10 days in 2011 and 7 days in 2012, during which the students engaged in a series of meetings with those currently working in the GH arena. The large historic actors as well as the small, emergent players were visited, including multiple departments and hosted partnerships in the WHO, UNICEF, the GAVI Alliance, the Global Fund, the International Labour Organization (ILO), the International Organization of Migration (IOM), UNAIDS, the International Committee of the Red Cross (ICRC) and the International Federation of the Red Cross and Red Crescent Societies (IFRC), NGOs, the International Federation of Pharmaceutical Manufacturers and Associations (IFPMA) and other expressions of the corporate sector, the WTO, NGOs, the Missions to the UN and Bilateral Development Cooperation agencies.

Students were divided into groups of 4-5 people, each group meeting a different organization each day, with a full participants meeting in the afternoon to discuss the morning meetings. While each group did not visit the same

organizations, the goal was that each group had the possibility to meet with each type of GH organization. The afternoon meeting then provided the opportunity for each group to present a brief synthesis of what was observed during the visit and an opportunity for comparison. When possible, evening dinners were also included in the program in an effort to maximize networking opportunities for the students outside of the workplace environments.

In participant students' view most successful and effective meetings included those offering a honest discussion of the organization management structure, panel discussions with more than one presenter instead of a single individual giving a brief overview of the work. Opportunities to ask more in-depth questions about the actual inner workings of the organization, were highly appreciated as well as presentations which offered practical advice on how to enter the field and career guidance, job connections, and internship opportunities. This “daily wrap-up” gave the students an opportunity for further, more in-depth communication among themselves regarding the organizations visited and the functioning of the management structures observed [22].

#### *From education to research in global health*

Understanding mechanisms and processes influencing GH governance are fundamental fields of economical and managerial research that need specific training programs. Thus the fourth pillar of the Global Health and Development Program was aimed at building capacity to undertake research in GH policy-making and management among graduate students and junior researchers. The “education to research” program offered young researchers and students the possibility to work with senior researchers in GH and development.

Final theses in GH and development were promoted among undergraduate and graduate students with a significant number of them choosing to elaborate their final thesis in this field and in a number of cases, students linked the thesis work and data collection with an internship in organizations in developing countries.

With the aim of promoting capacity building in GH research the support to a specific PhD project was included in the GH education initiative developed at Università Bocconi, with the support of the Cariplo Foundation. The PhD project was devoted to filling the knowledge gap existing on funding priorities of global philanthropy, an issue relevant not only for GH policy-making, but for foundations themselves, which are under constantly increasing pressure to be both effective and legitimate actors in GH governance.

## **CONCLUSIONS, LESSONS LEARNED AND PERSPECTIVES**

The introduction of GH electives at Università Bocconi undergraduate school, a pioneering experience in the international scenario of economic studies, elicited a good response among students. Proposing GH electives at MIHMEP represented a relatively early attempt, as compared with its international competitors, to introduce future executives to the new emerging health challenges of a globalizing world, nevertheless it was the start of a specific specialization track that allowed MIHMEP to introduce itself as a pathfinder to “global health management”. Combining “management, economics and policies” approach to health still constitutes MIHMEP's comparative advantage with respect to its international competitors, especially when compared with those that restrict the idea of GH to traditional public health or even biomedical approaches. Nevertheless, we believe that to better respond to today's health and healthcare challenges, with national policies being heavily influenced by transnational social determinants, the offer of GH courses should be wider both at undergraduate and postgraduate level. The main limitation of elective courses in GH is its limited cultural impact, as only motivated students will expose themselves to the subject, thus the GH perspective should be mainstreamed throughout master courses, such as MIHMEP, that aim at providing future professionals in the GH arena with the information and intellectual tools for a critical contextualization of their action. The right balances between different theoretical and practical approaches need to be constantly sought. Indeed, experience shows that especially executive students tend to value more teaching based on case studies and the application of practical tools. Among these the Professional Study Tour was an effective tool for developing contacts, expanding classroom experience and creating the linkages between the theoretical and the practical aspects of GH.

With the acceleration of the globalization process, the interdependency among national health systems and the interconnectedness between health and the multifaceted aspects of development have dramatically increased. New challenges call for fundamental changes in higher education systems that must be understood within the larger context of the internationalization of higher education. Academic institutions must take into consideration the increasing mobility in the globalised world, and rethink the modalities of their programs in order to consider students that may be working anywhere in the world, and possibly in more than one country, frequently shifting between different socio-cultural and economic settings.

Health and the health sector are peculiar in many respects; from the economics of ill health and health systems, to services' management and policy-making, these fields require specific competences. This explains the poor performance of professionals with a “generalist” background in dealing with health-related issues (whether within or outside the “health sector”); this problem ranges from economists working in Ministries of Finance to academics, to managers of healthcare organizations and GH initiatives or foundations to local, national, and global politicians. Higher education programs should, therefore, reflect these peculiarities, and try to capture early in their studies the interest of future professionals that may not work for their entire career in direct contact with health services.

Despite the overall growth, the international offer of undergraduate and graduate programs in GH is highly dominated by programs taught in medical or public health schools. These programs, often fail to combine health sciences with economic, social, and management sciences, and also tend to be highly targeted to medical and health sciences students with components related to global social, economic, political, and environmental determinants, global governance for health, and health policy and systems remaining still rather marginal. Global health education should, by definition, develop interdisciplinary competences and skills to operate in the health sector and health-related socioeconomic areas. Global health programs should provide students with advanced theoretical and practical knowledge in public health, economic development, management, international law, and other disciplines relevant to policies for health, as well as with quantitative and qualitative tools necessary to generate, analyze, and interpret information emerging from the rapidly changing GH and development fields. In addition, graduates should be challenged with main issues relevant to the development and implementation of health policies in countries at different developmental stages. Thus, overall, the multidisciplinary nature of GH education programs should be improved.

Almost by definition, the nature of GH requires combining teaching to research and practice in a continuum between innovation, validation, and application; instead probably due to the still rather archaic and rigid structure of academia in many countries GH is hardly included into the mainstream academic field.

Finally, if the idea is accepted that the concept of GH encompasses the overall goal of equity, GH education cannot exist independently from a wider ethical framework, this must be reflected in how GH is taught. Beyond knowledge transfer and the acquisition of technical skills (“how to do”), the GH learning process needs to include the “how to be” in a globalized world with health and equity as common goods and fundamental human rights.

## ACKNOWLEDGMENT

The initiatives of the Consortium (made of Bocconi, Milan-Bicocca and Piemonte Orientale Universities) mentioned in this article were supported by the Cariplo Foundation through grant n° 2008-2428.

### ABSTRACT

The shortage of health care personnel in resource-poor countries is critical, leaving many areas of the developing world, mainly rural, without access to care. Limited quantitative and qualitative capability of local academic institutions to train health care professionals, migration of physicians, nurses and faculty staff and lack of motivation to work in the most poor and rural areas are among the key causing factors. Possible proposed solutions are increasing training capability, adaptation of curricula with exposure of medical trainees to community needs, implementing task shifting, training mid-level personnel, increasing social accountability and promoting links among the different interested social sectors, namely health and education sectors. Academic institutions from western countries may facilitate these actions, provided that (i) a balance relationship is established with southern institutions, (ii) cultural, social and economic factor and are carefully considered and (iii) local needs are prioritized. Apart from traditional partnering, also including long distance learning, innovative ways to assist in establishing research careers and in establishing quality control procedures and accreditation are possible ways of north-south academic collaboration.

### BACKGROUND

The shortage of health care personnel in resource-limited countries is limiting the right to care of billions of people around the world. This is particularly true for the African continent, where the global burden of diseases is estimated to be as high as 27% of the world's total despite the fact that only 12% of the world population live in Africa. To face this critical situation, Africa only have 3,5% of the total healthcare workforce and 1.7% of the physicians in the world [1].

This shortage affects all health professionals, from physicians to nurses, from pharmacists to any other qualified health profession [2]. The gap with western countries is enormous. As an example, the number of physicians in the USA is 270 per 100.000 population, while the corresponding number is 2.3 in Tanzania and 1.1 in Malawi [3]. This shortage is critical, as recognized by the World Health Organization that has dedicated to this topic the WHO Report in 2006 requesting for urgent interventions. The shortage is even more critical if one considers that over 75% of medical doctors in Sub-Saharan Africa live and work in the urban setting, leaving the rural areas nearly devoid of care providers [4].

### THE PROBLEMS AND THE NEEDS

The reasons for this shortage of health care professionals where they are more needed are various.

Firstly, the training capability of health professionals in resource-poor countries is quantitatively limited. According to the African Medical School Study, around 6.000 physicians graduate every year in Sub-Saharan Africa, a lower number than the corresponding figure for Italy alone [5]. This limited capability is due to scarce funding and poor infrastructure, as well as to the shortage of highly qualified teachers, who often search for more remunerative and attractive jobs abroad.

Secondly, a great proportion of doctors, nurse and other health personnel intends to migrate soon after graduation. According to the South African Medical School Survey carried out on 146 medical schools in the African continent, as many as 26% of the respondent graduates reported to have migrated abroad within 5 years after graduation [6]. In some study, as many as 53% of the medical students have indicated their aspiration to migrate after graduation [7]. The

motivations leading health personnel to migrate to more affluent countries are numerous, and probably diversified according to the source country. Among the most quoted reasons in the various available survey are, in decreasing order [4]:

- Better remuneration
- Safer environment
- Living conditions
- Lack of facilities
- No future
- Heavy workload
- Declining health services
- Economic decline
- Poor management
- Upgrade qualification

Understanding the reasons for migration is crucial to define and put into practice strategies to limit the brain drain. Among other factors, attention has been focused on the economic aspect as a key driver of the individual decision to migrate. The importance of the wage gap between source and destination countries have been investigated with contrasting results.

Some authors consider it the key reason for migration, deserving urgent interventions [8] while others estimate that other factors, including working and living conditions, social and political insecurity could play a more important role in the migration decision, leaving little space for interventions based on salary increase [9]. To those reasons it must be added the shortage of physicians, nurses and pharmacists in western countries, that attracts correspondent health personnel to move from their origin country. This is not without cost. It has been estimated that the cost to train a physician in a given African Country may vary from 21.000 US dollars (Uganda) to 58.700 US dollars (South Africa) and that the yearly global benefit obtained by the most desired destination Country is 2.7 billion dollars (UK) and 846 million dollars (the USA) [10]. To counteract this phenomenon, the World Health Organization has lunched the Global Code of Practice on the International Recruitment of Health Personnel [11] requesting all member States to take action to facilitate retention of health personnel in those areas of the world where they are most needed, including financial assistance and partnership to strengthen health education infrastructures. Quite sadly, a recent Cochrane review could only find a single paper assessing interventions to reduce emigration of health care workers complying with the established selection criteria [12].

Thirdly, the social and economic prestige of the health professions is better exploited by physicians and nurses, as well as other health care workers, in the urban setting leaving the most need urban areas with little potential to provide effective care in the poor health structure available. A recent questionnaire survey carried out among medical students in training in six different sub-Saharan countries (South Africa, RD Congo, Kenya, Nigeria, Tanzania, Uganda) showed that only 4.8% of them intended to practice in rural areas, a very worrying figure [13]. However, context-appropriate medical training may correct this tendency, as shown by specific experience in east-Africa showing that exposure of medical students to problem-based learning in the communities may influence their attitude and willingness to work in rural remote areas once graduated [14].

Apart from the quantitative aspect of health education (the number of graduates, physicians, nurses, etc.), the question of quality also applies as a consequence of the scarcity of adequate clinical training structures in developing countries, with particular respect to the African continent.

## THE CHALLENGE OF HEALTH EDUCATION IN RESOURCE POOR COUNTRIES

The challenge of education in resource poor countries (and medical education is no exception) is huge and evolving with time. The responsibility of academic medicine in Africa has been affirmed strongly [15]. No single and flat solution probably exists to overcome the economic, structural, cultural and logistic problems in any single situation, as perspectives and experiences in medical education greatly varies among countries [16].

In fact, as rightly pointed out by Brown and co-workers for the Pacific area, many factors may influence learning and teaching in different areas and in different times, including (i) past regional experiences of health related training, (ii) the impact of culture on learning approaches and teaching styles, (iii) the impact of external (i.e. colonial) influences on curriculum and (iv) the logistic and access challenges of open and distance education [17].

To combat global health worker shortages, many strategies have been put forward, with conflicting results.

Task shifting has been advocated by many international Agencies and adopted by many developing Countries as a strategy to cope with the shortage of high level health care professionals such as physicians and surgeons [18]. Task shifting means the progressive inclusion of tasks, traditionally ascribed to the medical or surgical profession, among the job descriptions of lower level health care professionals. Example of this strategy is the administration of antiretroviral

therapy by nurses in rural areas or the performance of simple surgical procedures (hernias, cesarean section, etc.) by nurses in some specific contexts also as a mean to overcome the many limitations of surgical volunteerism [19].

Furthermore, some countries have explored the new strategy of creating new mid-level personnel with the aim to expand health coverage in the rural areas. This strategy, whose results are now being assessed [20], requires the definition of the role of this new actors and the design of specific training curricula, raising the problem of standardization. From one side, the tasks and the training of these specific intermediate category should be adapted to the local situation for which they have been created. However, from the other side, global standardization of curricula would be desirable to share expertise and compare training experiences [21].

Both task-shifting and the creation of med-level health professionals are not to be considered a makeshift solution in resource-poor settings. Indeed, the contribution of such approach to cope with huge public health problems may prove more rationale than more sophisticated approaches involving highly trained specialists. The most brilliant victories of public health in Africa (small-pox, onchocerciasis, trypanosomiasis, etc.) have been conquered by few generals (the doctors) leading and coordinating a large middle (nurses) or even low level army.

It has also been suggested that retention of health professionals, especially in remote areas, could be improved by the provision of fringe benefits (car, housing, etc.), that might elevate their social and economic status as desired [22]. On the contrary, the widespread use of per diems for in-job training has wasted resources and has incentivized health professionals to actively search for continuous training remunerative activities leaving their clinical duties, an attitude referred to as “*perdiemitis*” [23]. We strongly argue that actions should also be considered to facilitate retention also of the senior faculty staff at the academic level that also suffer from a high rate of migration, depriving the country of the best teaching and management resources.

Reinforcing the perception of the social accountability and ethical commitment of medical trainees with respect to the underserved community is also an endeavor that should be strongly pursued to limit the attitude to migrate. It is comforting to know that attention is being paid to this topic at least in some leader African medical institutions [24].

Finally, the careful planning of training needs for health care professionals (both quantitatively and qualitatively) should involve different sectors at the governmental level, including Ministries of Education, of Health, of Finances and any other relevant official bodies in order to insure sustainability of scale-up, as suggested by the Health World Organization [25]. In particular, the poor planning harmonization between the education sector and the health sector in many developing countries is considered to be a major obstacle to successfully implement a positive and much needed transformation of the global physician education system in resource-poor countries [26]. The survey carried out by the African Medical School Study carefully reviewed the needs of medical education in Africa, also providing sound recommendations to address the issue [5].

## **WHAT WESTERN EDUCATION INSTITUTES MAY CONTRIBUTE?**

Now, in our context, the question is: “how can academic institutions based in industrialized western countries effectively cooperate with academic partners in the southern countries to cope with the shortage of trained health care professionals in those countries most in need?”

Quite surprisingly (and disappointingly), most literature on the medical education needs of resource-poor countries has been published by scholars working in western institutions [16]. Only quite recently, the academic leaders of the southern countries have raised their voice to address the problems and propose solutions [27, 28].

When putting in place a training or research partnership between academic institutions of the North and the South, many possible mistakes may be encountered. Ten of them are tentatively listed below (the ten “sins”):

1. Curricula are designed with a shift towards the needs of industrialized countries
2. Use of sophisticated training material (i.e. skill simulators)
3. Little attention to multidisciplinary approach
4. Tendency to create specialists instead of public health doctors
5. Little involvement of the local public health system and economic authorities
6. Little incentives for local training staff
7. Prolonged period of time for students to be spent in affluent countries, favoring brain drain
8. Social and cultural contexts are not taken into account
9. Unbalance between teaching staff from the north and the south
10. Focus on specific subjects of research with little impact on the final training outcome

Even if partnering for medical education is the more common way to start collaborations, the risks listed above are real and are to be taken into account in order to ensure effectiveness and sustainability. Results of such collaborations are mostly local in size, with little general impact on the education capability of resource-limited settings as a whole. However some positive evidence of more wide networking leading to appreciable, even if preliminary, results do exist [29, 30]. To avoid long periods of stay abroad, the development of joint diplomas (sandwich diplomas) delivered by the partnering universities may provide a suitable solution. Academic hospital twinning initiatives may also contribute to fill the gap of qualitatively adequate training fields that represent a major obstacle for quality clinical training for

doctors, nurses and other health care professionals.

The following are – non exhaustively - among the additional proposed solutions where western academic universities have been considered to play a possible role in assisting academic institution in the south of the world to increase quality and quantity of medical education.

Long distance internet-based teaching resources. They are attractive and have the advantage to limit travels, vacancies and costs. Positive experiences from the technical standpoint have been reported for specific vertical topics, such as HIV [31]. However, such approach requires a very careful design of the curriculum to ensure adaptation to the recipients' settings in terms of social, cultural, legal, economic and, sometimes, religious context. Furthermore, internet-based training requires access to electronic facilities that may be limited in many resource-limited countries, as well as the internet competencies of the trainees [32, 33].

Assistance in quality control procedures, external evaluation and accreditation. The maintenance of high quality of education is a crucial to gain credibility at the national and international level. However, few academic institutions in resource-limited settings have started this process, that may be effectively facilitated by the help of academic institutions in affluent countries, more used to such procedures. Such experience, that may potentially lead to high academic impact, has already been reported recently with positive results [34].

Assisting in developing independent research activity in developing countries. Research capability is crucial to deliver high quality teaching and training. Unfortunately, research (both basic and clinical) is at its infant's stage in developing countries due to the lack of economic resources and skills. Joint research activities have taken place in the past decades between researchers from the North and the South, usually the partner from western partner playing the role of the leader. It is now time that research institutions from the north and the south play a more balanced role, thus favoring the creation of a true independent research career path for young physicians from resource-limited countries, as exemplified by a handle of positive examples [28].

Furthermore, as a general consideration, there is a growing consensus that western destination countries, who most benefit from health care professional migration even in economic terms, should cover a substantial part of the cost involved with these activities [22], a topic that deserves attention in the global political agenda. Finally, we would like to underline the fact that medical training has to consider a shift toward global health and the strengthening of health systems on a global scale, not limited to developing countries but also in the western industrialized nations [35].

## CONCLUDING REMARKS

The critical shortage of health care professionals limits the access to care to millions of individuals in resource-limited settings, and particularly in remote rural areas where the need is higher. This is mainly caused by (i) poor training capabilities of academic institutions in developing countries, (ii) the migration attitude of health care personnel to migrate to more affluent western countries, that recruit the best trained personnel with important economic losses to the source country and (iii) the unwillingness of local doctors to work in rural areas that do not offer economic profit and social prestige. This situation requires urgent action, including a profound transformation of the present training approach, as nicely proposed by Celletti et al. [26], as to (i) adapting curricula to local needs, (ii) promoting strategies to retain key faculty staff, (iii) selection of trainees from areas needing doctors, (iv) expose trainees to community needs during training, (v) promote multisectoral approach to education reforms and (vi) strengthen links between the educational and health care delivery system. Western academic institution may help and facilitate this process provided that past mistakes, leading to the underestimation of social and cultural aspect of education and to the constant predominance of the western partner over the southern one, are avoided. Assistance in quality control procedures, in building up research career paths, and the planning of joint diplomas (sandwich diplomas) are among the possible assisting strategies, waiting that the internet technology is more widespread and reliable providing new scenarios for training activities in constant and balanced partnership as stated in Millennium Development Goal n. 8.

### ABSTRACT

The A.P.P.A.<sup>®</sup> Project is the main activity of *Aid Progress Pharmacist Agreement* no profit association; the Project, started in 2005, is the result of the cooperation between the Pharmacy Faculty (TO) and local Pharmacists. The Project is in agreement with the International Health Cooperation principles and it complies both with Italian and guest Countries laws.

Objectives:

- realizing galenic lab in hospitals located in developing Countries (DC) with the aim of preparing medicinal products which comply with adequate quality requirements, first of all to fight the widespread phenomenon of counterfeit in DC;
- customizing the dosages and pharmaceutical forms according to the actual needs of patients;
- employing local staff, teaching them a “new job” in order to open suitable school;
- minimizing the financial commitment necessary to prepare these medicines.

The Project is structured in six phases, through which it is possible to obtain an effective and functional lab: from a preliminary study of local needs up to a constantly and accurate control of the prepared galenics by analysis in the laboratories of University of Turin.

The pharmaceutical forms proposed are liquid, capsules, ointments and suppositories.

The most important results showed that several Projects are going on:

- *Centre Médico-Chirurgical Maternité la Bethanie*, Douala, Cameroon
- *Hospital Notre Dame des Apôtres*, Garoua, Cameroon
- *Health Center Le Bon Samaritain*, N’djamena, Tchad
- *Hospital Heintsoa*, Vohipeno, Madagascar
- *Dispensario Diocesano*, Ihosy, Madagascar
- *Hospital Nossa Senhora da Paz*, Cubal, Angola
- *A.M.E.N. Onlus center*, Funda, Angola
- *Hospital Saint Damien*, Tabarre, Haiti

Each lab so far has reached a different state of evolution. All of them are growing day by day, helped by the constant support of all team A.P.P.A.<sup>®</sup>, whose purpose is the one of making them independent from both knowledges in handling galenics and economy in order to buy new raw materials using the gain of medicines sale.

### COUNTERFEITS

Nowadays one of the worst plagues of Developing Countries (DC) is represented by the phenomenon of counterfeits. Custom procedures are less stringent, authorities controls are less effective so counterfeit medicines could be easily distributed in the market of these Countries with a substantial loss of public confidence in the healthcare system.

The principal target of counterfeits are life-saving drugs and it increases the risk of resulting deaths, but not only because sometimes it can give rise to events of catastrophic proportions like in Niger in 1995 where about 60.000 people had been injected with a counterfeit meningitis vaccine, or in Haiti in 1996 where a diethylene glycol contamination of pediatric syrup killed more than 80 children [1, 2].

In all DCs anti-retroviral drugs, antimalarics and antibiotics are principally affected, sometimes with staggering percentages: for instance an international study published in 2004 has shown that more than 53% of artesunate tablets sold in south-east Asia did not contain any active ingredient at all, with imaginable consequences on the fight against malaria in those Countries [1, 3].

In order to verify and better understand we have investigated the extent of the phenomenon of pharmaceutical counterfeits in some DC including the Countries where A.P.P.A.<sup>®</sup> is working [4]. With our research we investigated the quality of medicines purchased *in loco* from pharmacies and from unofficial street-pharmacists (figure 1). Samples collected in the different DC were analysed in the laboratories of the Department of Scienza e Tecnologia del Farmaco, University of Turin (Italy).

**Fig. 1** - Cameroun, street pharmacist.

## Results and discussion

The study we conducted confirmed that counterfeit medicines are one of the most problematic issues in DC and we found that the absence of controls and the inadequate pharmacovigilance system causes difficulties both in revealing and monitoring the phenomenon and its effects among the population.

Based on our results it was possible to determine that 50% of tested items were substandard drugs and 2% were counterfeits without the presence of declared API: they could be defined criminal false, a dosage form in which the active pharmaceutical ingredient is completely absent or present in an amount absolutely non effective.

The results also show that Indian drugs are often substandard: 30 out of 61 Indian samples (i.e. 41,7%) showed OOS (Out Of Specification) [5].

These outcomes we found are in accordance with international data retrievable in literature [6-9] and confirmed that the main target of counterfeiters is represented by expensive life-saving drugs (table 1) and this trend is likely to be maintained also in the future [10-14]; this research showed that it is rather common to find counterfeits in Developing Countries, even in astonishing percentages (figure 2).

Reported results and discussed topics point emphasize and increase the relevance of A.P.P.A.<sup>®</sup> Project in Developing Countries.

Therapeutic classes	No. (%) of samples	
	available for analysis	counterfeit
Antibiotics	76 (34.4)	30 (29.7)
Anti-inflammatories	44 (19.9)	22 (21.8)
Antipyretics	24 (10.9)	9 (8.9)
Antimalarics	17 (7.7)	6 (5.9)
Antimycotics	13 (5.9)	9 (8.9)
Antihypertensives	8 (3.6)	1 (1.0)
Antianemics	5 (2.3)	4 (4.0)
Spasmolytics	5 (2.3)	2 (2.0)
Diuretics	5 (2.3)	1 (1.0)
Antiacids	5 (2.3)	2 (2.0)
Bronchodilators	4 (1.8)	5 (5.0)
Others	15 (6.8)	10 (9.9)

**Tab. 1** - Therapeutic classes of the total and counterfeit samples [5].

**Fig 2** - Presence of counterfeit drugs by Country. Red bars – criminal counterfeit; green bars – idoneous; orange bars – imperfect counterfeit [5].

### A.P.P.A.<sup>®</sup> PROJECT

A.P.P.A.<sup>®</sup> [4] is a no profit association based on voluntary work without any profit proposing; its main aim is A.P.P.A.<sup>®</sup> Project, which argues on the realization of galenic laboratories in Developing Countries around the globe in accordance with the guidelines of International Health Cooperation.

The creators of the Project teach through the Pharmacy's students to local staff how to prepare galenic medicines with a high level of quality and consequently security and efficacy. A.P.P.A.<sup>®</sup> Project is built on a close collaboration with the academic world, represented by University of Turin, Faculty of Pharmacy, and with Community Pharmacy.

The main objectives of the Project are:

- realizing galenic laboratories in Developing Countries with the aim of preparing medicinal products which comply with adequate quality requirements, first of all to fight the widespread phenomenon of counterfeit in DC;
- customizing the dosages and pharmaceutical forms according to the actual needs of patients;
- employing local staff, teaching them a new "job" in order to open suitable school;
- minimizing the financial commitment necessary to prepare these medicines.

Many are the main reasons to propose galenics: the first one is that the production system is low cost and the operative procedures are simple; the second one, most interesting and important in our opinion, is the possibility to prepare medicinal products with dosage and pharmaceutical forms according to the customer demand and, of course, to medical prescriptions, last but not least, this Project allows to reduce the use of counterfeit medicines in structures where the galenic lab is located.

When a new galenic laboratory is required we usually conduce a preliminary study that implies for an our staff member a trip on site to value the local situation and recipient areas [step 0 of A.P.P.A.<sup>®</sup> Project]. In this step a precise protocol is used to guarantee all preliminary needed information. Furthermore some medicines should be purchased in local pharmacies and sent to the laboratory of the University of Turin, which will provide for the qualitative and quantitative analyses; the results allow to value if these medicinal products, present on the local market, respect the declared characteristics or are counterfeit.

The Project complies both with Italian and guest Countries laws, always saving the quality of medicinal products. The pharmaceutical forms proposed are liquid preparations, capsules, ointments and suppositories.

This feasibility study is essential to evaluate the actual possibility of opening a new A.P.P.A.<sup>®</sup> lab. Only if we find the real need for the galenic laboratory required, as suggested by International Health Cooperation objectives, we can carry out with the following six phases of A.P.P.A.<sup>®</sup> Project:

1. The first one implies the choice of the place where the galenic lab could be realized. The medical doctor responsible of medical center will put in evidence local pathologies, then will be projected the correct pharmaceutical forms.
2. The second one implies a stage at galenic A.P.P.A.<sup>®</sup> laboratory at the University of Turin (Italy), for students of Pharmacy Faculty -during their experimental thesis-; the stage allows learning necessary to prepare the programmed medicinal products.
3. The third one provides staying in Italy of a person of local staff with the aim of learning the procedures of galenic preparations (about one month work) under Pharmacy's students supervision. During this period we send the material for galenic lab to the hospital (figure 3).

**Fig. 3** - Italy, Romel Cajuste during his stage at A.P.P.A.® laboratory.

4. The fourth one concerns in a training period (about sixty days) in the hospital, during which the technician, who has been in Italy to learn galenic methods and procedures, will be coordinate in his work by the Pharmacy's students on site (figure 4, 5).

**Fig. 4** - Angola, Funda, A.M.E.N. Medical Center.

**Fig. 5** - Cameroun, Garoua, «Notre Dame des Apôtres Hospital».

5. The fifth one concerns in quality control of medicinal products routinely prepared in new galenic lab; moreover some samples of these will be sent to University of Turin, where their quality will be tested.
6. The last one concerns in periodical stages (at least forty days) for students -during their experimental thesis-. These stages will be performed each year both to permit a continuous supervision of medicinal products prepared in the lab and to study new formulations according to the request of the medical doctor responsible of the medical center which might change by the time.

Often many points must be examined and modified considering the reality and requirements of demanding structure, but without losing quality of galenics.

The Project considers a budget which includes equipment but not furniture or raw materials that strictly depends on the therapeutic requirements of the different places. The funds necessary to the whole creation of a lab are raised through the collaboration of groups involved in International Cooperation. It is indispensable to guarantee a good activity of the galenic laboratory for the hospital to reinvest the earning obtained by dispensing of medicines prepared in the conduct of the laboratory. In this way the laboratory will be self-financed and there will be a continuous production. About the raw materials, the hospital can buy them in Italy or other Countries respecting quality and title of the raw materials to be used.

## Results and discussion

Several Projects are going on, at different state of progress:

**Cameroun** - Hospital La Bethanie, Bonaberi-Douala; GinTeam ONLUS; St. Joseph Congregation Hospital, Kribi - Phase 6 of A.P.P.A.® Project

**Cameroun** - Hospital “Notre Dame des Apôtres”, Djamboutou-Garoua; Fondazione CUMSE Onlus - Phase 6 of *A.P.P.A.*<sup>®</sup> Project  
**Chad** - Health Center “Le Bon Samaritain”, Walia-N’Djamena; association tchadienne «Communauté pour le Progrès» (ATCP) ONG; Acra ONG - Phase 6 of *A.P.P.A.*<sup>®</sup> Project  
**Madagascar** - Hospital “Henintsoa”, Vohipeno; Anemon ONLUS - Phase 6 of *A.P.P.A.*<sup>®</sup> Project  
**Madagascar** - Health Center, Eglise Catholique Apostolique Romaine, Ihosy; Anemon ONLUS; Lions Club Torino San Carlo - Phase 6 of *A.P.P.A.*<sup>®</sup> Project  
**Angola** - Hospital “Nossa Senhora da Paz”, Companhia de Santa Teresa de Jesus, Cubal; Dani Instruments S.p.A; Comunità di S. Egidio – ACAP (O.N.L.U.S.) - Phase 6 of *A.P.P.A.*<sup>®</sup> Project  
**Angola** - Health Center A.M.E.N. ONG, Bairro CowBoy, Funda; Dani Instruments S.p.A; AMEN onlus – Italia - Phase 5 of *A.P.P.A.*<sup>®</sup> Project  
**Haiti** - Pediatric Hospital N.P.H. Saint Damien, Tabarre; N.P.H. Italia Onlus, Francesca Rava Foundation - Phase 6 of *A.P.P.A.*<sup>®</sup> Project  
**Sierra Leone** – Hospital “Saint John of God”, Mabesseneh, Lunsar; Saint Joseph Fathers Congregation, Rainbow for Africa, Engim ONG - Phase 1 of *A.P.P.A.*<sup>®</sup> Project

Each lab has so far reached a different state of evolution. All of them are growing day by day, helped by the constant support of all team *A.P.P.A.*<sup>®</sup>, whose purpose is the one of making them independent from both knowledge in handling galenics and economy in order to buy new raw materials using the gain of medicines sale. Our experience has till now demonstrated that at least 5-6 years are necessary because the laboratory reach its independence if there are not changes of personnel.

## **GALENICS FOMULATIONS, QUALITY AND STABILITY CONTROL**

Magistral and officinal formulations (commonly known as “galenics” in homage to Galen of Pergamum who is regarded as the first pharmacist engaged in the preparation of medications) are required to be prepared, labelled and stored using standard procedures and established methods in order to ensure the quality of finished product which is a mandatory prerequisite for its safety and efficacy [15, 16].

Since *A.P.P.A.*<sup>®</sup> Project is based on galenics, we had the necessity to perform a survey on the stability of various galenic dosage forms commonly prepared in pharmacy, in order to investigate the actual stability of these medicinal products [17, 18].

We endeavoured to gather information on stability of galenics at extreme environmental conditions (high temperatures and relative humidity) that might prove useful in those Countries (e.g., African ones) where the tropical climate is a serious threat for the quality of drugs.

Moreover, considering that one of the main aim of *A.P.P.A.*<sup>®</sup> Project is the fight against counterfeits and then the production of quality medicinal products, we settled up procedures to make quality control tests on galenics produced in our laboratories in order to verify and guarantee their quality.

### **Results and discussion**

Storage conditions, chemical and physical nature of the API, containers, environmental conditions and the compatibility of API with excipients might affect considerably the final quality of galenic preparations.

All these factors, considered as a whole, define the use-by date of medicinal products that must be reported on the label. The current legislation has decided to define precautionary validity limits for galenics depending on the nature of their dosage form, leaving to the pharmacist the option to increase these limits relying on scientific data. [19].

Based on our results it was possible to determinate that in tropical Countries the tested dosage forms are stable for a period of 24 months in “Standard” conditions [17]. In “Accelerate” conditions [17], samples were stable for 3 month provided that they have been stored in glass containers, propylene is not suitable at high temperatures due to probable interactions of active substances with extractables and leachables materials from the container. Stability results of samples stored in “Accelerate” conditions also supplied precious information on the expected stability of galenics in tropical Countries where extreme environmental conditions are often a limiting factor for correct storage of drugs. The results do not imply that it is possible to increase the use-by date of all galenics, but it can be done for those dosage forms tested and prepared following standard general principles [16, 20].

To guarantee the quality of medicinal products made in *A.P.P.A.*<sup>®</sup> labs we constantly analyse some samples applying procedures in line with the tests of the European Pharmacopea. The results of the analysis must be within the limits imposed by the law in force, otherwise the medicinal products can not be used [16]. In any Country we operate we claim to meet the requirements of quality, safety and effectiveness required; the consequence was a good answer by local technicians and their proposal to better apply the standard procedures established and shared.

## CONCLUSION

A.P.P.A.<sup>®</sup> Project started in 2005, till now we opened an amount of 8 galenic laboratories in 5 different Developing Countries between Africa and America. The laboratories are now working on and they are at various state of progress. In 8 years about 30 students of Pharmacy have been involved in this Project and about 30 local technicians are working in the opened laboratories.

Through the positive results obtained from the steady execution of quality control tests on galenics made in our labs we demonstrated that it is possible to produce good medicines even in Developing Countries where conditions are not always in favour. It proves that the procedures that we settled up during these years are reliable methods that guarantee the production of medicinal products of high quality.

## ACKNOWLEDGMENT

The authors would like to express their gratitude to all the responsible of structures where A.P.P.A.<sup>®</sup> laboratories are located for the precious collaboration during the execution of the tests on galenics prepared *in loco*, and to all the organizations which contributed to the collection of samples in different DCs:

- Cecilia Allasina, Diocesi di Savona (Central African Republic)
- Dr. Marco Gariazzo, “Amici della Guinea Bissau” Onlus (Guinea Bissau)
- CCM Comitato Collaborazione Medica “Amici della Guinea Bissau” Onlus (Guinea Bissau)
- Dr. Federico Gobbi, World Friends, no profit association (Kenya)
- Dr. Mario Marsiaj, “Amici di Angal” Onlus (Uganda)
- Dr. Bertin Ngy Matamba, “Le Bon Pasteur” Onlus (Congo)

## GHC-TUSCANY: NEW PARTNERSHIPS FOR THE GLOBAL HEALTH

Maria José Caldes<sup>o</sup>, Nicole Mascia<sup>o</sup>, Michele De Luca<sup>o</sup>

<sup>o</sup>AOU Meyer - Regione Toscana, Italy, [salute.globale@regione.toscana.it](mailto:salute.globale@regione.toscana.it)

### ABSTRACT

The Global Health Center is a multidisciplinary facility of the Tuscany Region. Its function is to highlight the connections established between globalization and health in terms of equity, human rights, sustainability, diplomacy, and international collaborations. The Center has a global outlook and allows university professors, university researchers, PhD, graduate students and students from various disciplines, doctors and other healthcare workers (biologists, obstetricians, nurses, medical assistants, etc.) as well as health sector representatives from volunteer organizations to join together, and study and experiment with approaches to both academic and operational global health issues.

The Center will activate transverse and connecting actions in four thematic priorities of interest among all Tuscan, national, and international stakeholders so as not to waste energy, resources, and the capacity for intervention: International health cooperation, Neglected tropical diseases, Health policies, Migrant health.

The Global Health Center is the result of an innovative alliance between healthcare organizations, the Region, the Universities and the organizations and associations, in fact, is based on a partnership that aims to involve, in one direction, all those who are involved in various capacities, in international health cooperation projects implemented by Tuscany Region. In particular, we would like to present three projects in different areas of the world where, thanks to a fruitful collaboration between the University of Florence, the Tuscany Region and the local health authorities, where the opportunity to experiment the added value of the dialogue between various entities and the involvement of the Academy had a significant impact both in the home country as well as in the local contest, We therefore present the results of the following projects aimed at supporting: i) the implementation of the Sistema Unico de Salud (Health National Service) of the Plurinational State of Bolivia: a pilot project in the Chaco Region; ii) the development of Paediatrics and Digestive Endoscopy Medical Center in Nanoro - Burkina Faso; iii) the design of a National Health Accounts and a Diagnostic Related Groups (DRG) Patient Classification Systems in Albania and Developing a Model Prospective Payment and Contract System for Hospitals.

During the last years, a new trend has emerged in the Tuscany Region: it has been consolidated the need to spread awareness of existing inequalities and the causes that have produced them, and the right and duty of citizenship to participate at the decisions regarding the health of all, the duty of the scientific community to systematically address the issues of equity, sustainable development, defence of the dignity and life, the need for deeper study, the independent assessments of a wide transmission information and knowledge, the need to implement international cooperation projects characterized by a system approach to health. This need has been expressed by healthcare professionals (doctors, researchers, academics and representatives of the voluntary sector). This is the main reason why it was born the idea of establishing a facility, whose main objective is the study of the effects of globalization on health. The Global Health Center of the Tuscany Region was established by Regional Council Resolution n. 909 of 15/10/2012. It is a multidisciplinary facility of the Tuscany Region whose objective is to highlight the connections established between globalization and health in terms of equality, human rights, sustainability, diplomacy, and international collaborations.

The Centre based its theoretical approach on the social determinants of health and on the principles of the Declaration of Alma Ata. It uses a multi-disciplinary and multi- methodological approach, with the contribution of both the social sciences and humanities both the natural and biomedical sciences, with a privileged relationship with medical anthropology. The Center has a global outlook and allows professors, university researchers, Ph.D. and university students in various disciplines, doctors and other healthcare workers (biologists, obstetricians, nurses, medical assistants, etc.), as well as health sector representatives from volunteer organizations to join together, and study and experiment with approaches to both academic and operational global health issues.

The Global Health Center promotes the development of 'country projects' - recovering the organizational schemes of International Organizations, in order to help determine favourable conditions for a better quality of interventions not only among the different local actors but also between all the actors that operate in the same area, making an essential contribution to improving relationships and interaction for the co-development. It recognizes the complexity of the health sector and the changing context of global health where growing inequalities helps to fuel the recursive relationship between poverty and health.

The fundamental objective is to enhance, disseminate, and apply knowledge to the four thematic priorities on which the Center is funded.

The Center will activate transverse and connecting actions in four thematic priorities of interest among all Tuscan, national, and international stakeholders so as not to waste energy, resources, and the capacity for intervention. The four thematic priorities are: international health cooperation, Neglected tropical diseases, Health policies, Migrant health.

It is a unique experience in the institutional landscape in Italy, and it has the ambition to be a pilot project. It confirms the principles that the Tuscany Region states both in the “Social and Health Integrated Plan” and in the “Plan of International Activities”, developing a shared and integrated planning, addressing the social aspects health too, trying to innovate a careful but often one-dimensional health vision. In particular, these are the general objectives of the Centre: i) the growth of health workers knowledge (to know), attitude and ability (skills), both during the period of academic training that along their career path, in order to integrate their job profile with essential skills about emerging health needs; ii) the dissemination of knowledge about the social, cultural and environmental determinants that influence health and disease, nationally and internationally, and the ability of medicine and public health to influence them; iii) the recognition and respect of the existence of the plurality of visions of health and disease, as elements that characterize the individual and cultural identity.

The Global Health Center of the Tuscany Region is based in Florence at the Meyer Children Hospital.

The International Health Cooperation activities and the care of children from all over the world is a tradition and a part of the history of Meyer Hospital. This tradition was acknowledged by a legislative act of Tuscan Government on March 26, 2001, which designed the structure of the International Health Cooperation network of the Region.

Since then, the Meyer Hospital has been managing the activities of international health cooperation on behalf of Tuscany Region, coordinating the network of International Health Cooperation through focal person dislocated in each hospital and local health service with the mission of improving global health. International health cooperation is a key-point of the program of the Government of the Region of Tuscany, and it plays an important role in addressing the challenge of cooperation as a contribution to the development of the most disadvantaged countries in the world. In this moment the Tuscany Region is financing approximately twenty international health cooperation projects, implemented in various areas of the world, especially Sub-Saharan Africa, Latin America, the Mediterranean and the Balkans. Beyond the vertical approach by pathology or population, the regional health cooperation strategy aims to strengthen approaches that are cross-cutting, so as to address the structural challenges which put pressure on health systems and thus promote universal access to safe, effective and affordable quality treatment. The priorities of the strategy are:

- the promotion of the health of women and children;
- The fight of communicable diseases;
- The strengthening of health systems and the improvement of access to treatment through the training of human resources and the promotion of both models of sustainable financing for health and efficient health information system in order to guarantee equality of access to care.

Education and training are the common ground for the cooperation between University and Regional Institution. This is not surprising: there has always been a strong emphasis on training in our regional cooperation and in the current international context of increasing globalisation, the conditions of knowledge production, scientific and technological capacity and the volume of information flows, are factors that can determine the economic and social development of countries. Besides the concept of training means a “donation” of technical elements, best practices and working methods, but also provides a return, a sharing of values and knowledge, the enhancement of human potential. In fact, the international health cooperation facility in Tuscany is based on a participatory approach, involving all the Regional Health Service. The specificity of the on-site training also involves to “take home” experiences and contributions that will give added value to our workers and our health services.

For all the above reasons, universities cannot be absent from discussion of development issues; in fact, they are becoming fundamental actors in development co-operation. Even though exchange has always been a part of the University essence, we are now witnessing an important movement towards internationalization, which cannot be indissoluble from the phenomenon of the globalization of culture and exchanges. In the international health field, universities, either in the South or North, have traditionally played an important role which is ever expanding, due to the broadening of the concept of international health. Tuscany was not immune from this process.

In recent years, universities in Tuscany have incorporated international relations and international co-operation as integral parts of their missions and functions. In this way, the university has assumed the responsibility of “co-operating” with other institutions, of working together with others for the same ends. In the Global Health Center all the three Regional Universities are represented through a unique representative.

The support from the Universities in the implementation of some projects has given interesting results. The starting point is that a doctor in training needs some notions and expertise that can rarely be learned in the standard training of the University. It is therefore important to disseminate the awareness that the health system is changing, globally but also locally. For this reason, the Global Health Center of the Tuscany Region organizes regular training activities in the field of global health at the three Tuscan Universities - Florence, Pisa and Siena - and also at a national level. These training courses are related to the four thematic areas of the Centre, with the idea of a virtuous circle of knowledge that establishes the basis of a comprehensive concept of health. One of the possibilities that are offered to doctors in training

(and not only) is to participate in projects of international health cooperation; in particular three projects in different areas of the world have been designed and based on the involvement of the Academy: i) Support and technical assistance to the implementation of the *Sistema Unico de Salud* (National Health Service) of the Plurinational State of Bolivia: a pilot project in the Chaco Region; ii) Support for the development of Paediatrics and Digestive Endoscopy Medical Center in Nanoro - Burkina Faso; iii) Designing a National Health Accounts and a Diagnostic Related Groups (DRG) Patient Classification Systems in Albania and Developing a Model Prospective Payment and Contract System for Hospitals .

## **1. PROJECT “SUPPORT AND TECHNICAL ASSISTANCE TO THE IMPLEMENTATION OF THE SISTEMA UNICO DE SALUD (NATIONAL HEALTH SERVICE) OF THE PLURINATIONAL STATE OF BOLIVIA: A PILOT PROJECT IN THE CHACO REGION”**

The project is part of a number of previous initiatives carried out by the University of Florence, through the Division of Infectious Diseases, starting in 1986 and formalized in 1987 through the signing of an agreement with the Bolivian Ministry of Health, which is still in force. In particular, the main activities were: scientific research and supporting the training of local health workers to promote and support the improvement of public health services of the Chaco Region, especially in the rural areas, where the main population is part of the Guarani ethnic group. In these twenty-six years of constant work, all the activities were carried out according to protocols agreed between the parties. The results of the main research activities have been published in international scientific journals and initially reported in a publication by the Ministry of Health of Bolivia in 1997 (Revista Boliviana de Epidemiología).

In 2011 it was realized the publication of a book entitled “25 años de Investigación en el Chaco Boliviano en el marco de Convenio entre Cátedra Enfermedades Infecciosas de la Universidad de Florencia, Italy, y Ministerio de Salud y Deportes de Bolivia” containing all the 47 articles translated into Castilian on the scientific work carried out in the Bolivian Chaco. The publication was produced on-site with the help of PAHO / WHO, and is currently spreading in print and online. After many years of experience and scientific clinical trials conducted in Latin America, some doctors working in the Division of Infectious Diseases / SOD Infectious and Tropical Diseases in Careggi Hospital, Florence, have developed a specific expertise in tropical diseases, useful for the correct approach to the diagnosis and the treatment of imported pathologies. The project is very articulate, and it provides the following activities: the epidemiological study of infectious diseases in animals and humans, the containment of the spread of bacterial resistance to antibiotics in the area by monitoring the phenomenon in commensal bacteria and pathogens and promoting the prevention of infections in a hospital setting (from the implementation of programs for hand hygiene), strengthening of laboratory services for clinical and microbiological analysis through ad hoc surveys, training of technical personnel and implementation of new methods, control of epilepsy in rural areas and support the epidemiology on promoting independent community organization. Another area of action is the emergency / urgency, in all its aspects: organizational, training and capacity effective and timely response. This last point is a significant element of an universalistic health system.

The priority of the project is now the opportunity to continue working with the Ministry of Health of the Plurinational State of Bolivia, to consolidate this data and especially to implement, together with the local medical team, protocols that can prevent and manage these serious public health problems, and to understand how to integrate these important results in the reform under way in the National Health System. The Health system currently in force is in fact deeply fragmented and it causes unequal access to services. For this reason, the current government is trying to move towards a *Sistema Unico de Salud*, a single system of health, already mentioned in the new Constitution, that aims to provide the access to health services to the entire population, especially the most marginalized. For this reason, it is very important to verify how the Bolivian Ministry of Health is influenced by the Tuscan activities in Bolivia and by the analysis and systematization of the results of studies conducted by the University of Florence. A positive signal is that the Bolivian Ministry of Health has required the Tuscan support, in this phase of restructuring and redefinition of the national health system,. The idea is to try to share the sustainable best practices and the difficulties faced by the Italian health system, and in particular the Tuscan one. For this reason, exchanges and analysis between the two territories will be favoured. On this basis, the Bolivian Ministry of Health has initiated a process aimed at the implementation of the *Sistema Unico de Salud*- SUS, an universalistic health service. This project aims primarily to offer support to the implementation of the Unique Health System, as a pilot project in the area of the Bolivian Chaco.

## **2. PROJECT “SUPPORT FOR THE DEVELOPMENT OF PAEDIATRICS AND DIGESTIVE ENDOSCOPY MEDICAL CENTER IN NANORO - BURKINA FASO”**

This project aims to contribute to the creation of a facility that could ensure an adequate classification and treatment of diseases of childhood, reducing the infant mortality rate in the district of Nanoro. The general objective is to reduce the infant mortality rate in the district hospital through better taking care of paediatric patients. The project started in April 2008 with the creation of a small department of paediatrics and the activation of an agreement between the University of Florence and the Camillian Community. The agreement provides the continued presence of Italian doctors

of the School of Paediatrics in Florence in order to assure the efficient coordination of the activities with local nurses. Before the start of the project, Medical Center of Nanoro was equipped with a department of general medicine with a total of 18 beds including 6 for inpatient paediatric and a recovery center for education nutrition for children suffering from malnutrition. The patient care was not delivered by a specialized in paediatrics nursing team, and co-ordinated by the presence of an internist adult. The first measure taken was to create a paediatric department separate from the adult one. In June 2009, the construction of a new paediatric ward was complete, which currently has 36 beds, 6 inpatient rooms and a room reserved for the most critical patients as equipped to supply a continuous flow of oxygen. At the same time 5 new local nurses dedicated to Paediatrics were hired. From 1 April 2008 to the present, it have been guaranteed the continuous presence of at least one physician specializing in paediatrics, trained in the management of paediatric and tropical diseases, supervised by periodical mission of a specialist tutor.

The task of tutors and trainees, in addition to clinical activities, was to organize training courses for nurses and health personnel that must provide health and hygiene education for the mothers of sick children. Applying the WHO guidelines, the group developed protocols on the most common paediatric diseases (malnutrition, malaria, diarrhoea, pneumonia, meningitis, blood transfusions). The application of these protocols improved the management of patients with a better optimization of resources. The hospitalization times have been abbreviated, especially for some diseases, such as diarrhoea, and the number of readmissions for the same diagnosis is reduced. The project plans to continue and improve ongoing activities: continuous presence of expatriate medical staff, training of nurses and mothers, writing diagnostic-therapeutic protocols, provision of medical supplies, medicines and medical equipment. To improve the assumption and management of malnourished patients, since 2010 has been applied the new outpatient approach, in which was originally planned the use of "Ready to Use Therapeutic Food" (i.e. Plumpy nut), a peanut and milk-based paste that does not require cooking and is storable for months. This approach was reserved for uncomplicated cases (moderate and severe malnutrition without co morbidities) followed with periodic outpatient visits, and it had the advantage of reducing hospitalizations and therefore costs. The critical factor, however, is that the Plumpy nut is not produced in Burkina Faso, but imported. So, if it was able to treat well the malnourished in the first period, it has not deeply affected on the prevention of malnutrition. For these reasons, the project is now proposed to improve the nutritional taking care of children with moderate malnutrition, through the production of enriched flour produced starting from local ingredients that can be easily found by the mothers, and the identification of patterns of diet reproducible at home. One of the new objective of the Nanoro project is to take care of the new-borns. The majority of infant mortality, as confirmed by data from the literature, it is currently focused in this age of life, after the improvement of paediatric care in later life. The main reasons of the high neonatal mortality are: the lack of adequate training of the staff, the very low access of women to the prenatal visits during the pregnancy, the non-attendance of equipment essential for proper management of childbirth and deliver. Most of the neonatal deaths are caused by largely preventable factors, like hypoglycemia, hypothermia and chernittero. Therefore, the project proposes the creation of a specific training course of obstetrical and nursing personnel, through the drafting of specific protocols and the purchase of essential equipment.

Given the high prevalence of gastrointestinal and liver diseases both in adults and children, the project activities has been concentrated on the establishment of a service of digestive endoscopy. There were several missions by expatriate doctors and nurses that permitted the training of three Burkinabe nurses who are now able to perform diagnostic endoscopy and to guarantee disinfection and maintenance of the instruments. It is now necessary to continue the training and supervision to implement the service of diagnostics and to guarantee operational tests too. Finally, the evidence of the high prevalence of cardiac diseases in young adults and also in children and in the elderly, has indicated the need to start a training program for nursing and medical staff.

### **3. PROJECT "DESIGNING A NATIONAL HEALTH ACCOUNTS AND A DIAGNOSTIC RELATED GROUPS (DRG) PATIENT CLASSIFICATION SYSTEMS IN ALBANIA AND DEVELOPING A MODEL PROSPECTIVE PAYMENT AND CONTRACT SYSTEM FOR HOSPITALS "**

The health sector is defined as the priority sector in the Albanian Strategy for the social and economic development. The Albanian Health sector is in the continuing transformation in the function of the realization of the proper standards. To realize the reform in this sector and to help the decision makers in their decision is necessary to have the right information on the source of the financing of health sector, on the destination of the expenditure in this sector and their control. Preparing a national health account in accordance with the international standards in this field, should make it possible the comparability of the performance of the indicators of health sector with them of other countries, so that the Albanian authorities and International Organization which support the development of this sector in Albania, have proper tools in order to define the way and the funds necessary to develop this sector in Albania

The wider objective of the project is to contribute to preserve and improve the health of the Albanian population by increasing efficiency, maximizing productivity in service production and rationalizing the use of resources within public health services.

The project aims to do this by supporting the MoH in the implementation of the strategic priorities aimed at reforming Secondary and Tertiary level of Public Health Care Providers (STC) organizational, managerial and financial

mechanism thus contributing to the Albanian Government efforts to establish a health care system that would meet the needs of the population in a more efficient and cost-effective manner within the available resources

Specific objectives of the project are:

1. increasing the capacity to manage **STC** services in a more efficient way by standardizing administrative guidelines and procedures for managing facilities and by training and continuous education in order to improve the managerial skills and competences of decision makers and to strengthen capacities among the staff in key positions of the health care system and within the **STC**.
2. Improving the health care system financing, including minimizing informal money flows. In particular the project will seek the reduction of informal money flow within the system by monitoring the mechanism of service deliveries through the introduction of: the Health Information System, the Diagnostic Related Groups (**DRG**) classification systems.

Partners of the project re the Albanian Ministry of Health, Tuscany Region and two Universities the one of Florence and the Catholic University “Our Lady of Good Counsel” in Tirana. The project has started in 2010 and is still ongoing.

The project includes two main components:

- I. Technical Assistance for Policy Design and Implementation. This component would develop the training instruments required to achieve the objectives set forth in Ministry’s strategy in the areas of regulation, financing, institutional development and health service provision in terms of human resources skills and capacities. The component has already started and has provided technical assistance and training in the methodology and tools (auditing, budgeting and accounting) of financial accountability.
  - In particular training through workshops an on the job training to the Ministry of Health and National Hospitals personnel on accounting and internal controls and **DRG** system has been carried out. The target groups of these activities were, first of all, the policy planners in Health Ministry and Agencies dealing with health financial resource allocation and health governance as well as health insurance fund staff, medical institution managers and medical personnel. At least 260 people benefit from this technical training.
- II. The second component is intended to develop the medium term and action plan for the introduction of the **DRG** system in collaboration with all stakeholders and submit the plan to be adopted by the Government and identify and develop planning and management courses to be attended by selected staff working on accountability and **DRG** issues. At this point an assessment study concerning the usefulness and reliability of the existing administrative rules, operating procedures and data base and software in selected pilot hospitals with regards the financial accountability has been carried out and specific recommendations on the national procedures and standards as well as on the system concerning accountability has been submitted to the Ministry of Health.

## ARACNE

### Tessere reti per il diritto alla salute dei migranti

Progetto realizzato da CCM – Comitato Collaborazione Medica

#### Presentazione

Il "Progetto Aracne – Tessere reti per il diritto alla salute dei migranti" è nato dalla collaborazione tra il CCM, il centro Mamre e la cooperativa Tavola di Babele. È stato finanziato dall'Unione Europea e dal Ministero dell'Interno attraverso il Fondo Europeo per l'Integrazione dei Cittadini di Paesi Terzi ed è stato coordinato dal CCM.

Le attività del "Progetto ARACNE – Tessere reti per il diritto alla salute dei migranti" sono iniziate ufficialmente nel mese di settembre 2011 e sono terminate il 30 giugno 2012.

una rete per la salute

#### Attività e Risultati

Il progetto ha articolato tra loro attività diverse con l'obiettivo comune di coinvolgere le comunità migranti e le risorse territoriali in iniziative di promozione del diritto alla salute:

- Apertura e gestione di uno **Spazio d'Accoglienza** per i migranti presso la Casa del Quartiere di San Salvario.
- Realizzazione e pubblicazione di una **Ricerca sugli Itinerari Terapeutici** dei migranti.
- Organizzazione di **5 Eventi di Animazione** e sensibilizzazione nel quartiere.
- Organizzazione di **16 Incontri di Formazione** con le associazioni di migranti.
- Organizzazione di **3 Percorsi di Sensibilizzazione** con i giovani (Scuola Manzoni, ASAI, Crescere Insieme) del quartiere.
- Organizzazione di un **Convegno Finale**.
- Produzione di un **Video Documentario** sulle attività del progetto.

#### Formazione con le Associazioni di Migranti

Temi Trattati	n° Formazioni	n° Partecipanti	M	F
Accesso ai servizi	4	35	13	19
Alimentazione	1	15	0	15
Igiene orale	2	33	10	23
Malattie infettive e MST	2	75	60	15
Mediazione ed etnopsichiatria	4	43	8	35
Pediatria	3	36	0	36
Salute materno infantile	2	28	0	28
Sessualità e salute riproduttiva	2	29	16	13

#### Obiettivi

L'obiettivo generale del progetto era quello di promuovere la salute come diritto inalienabile di ogni essere umano, lavorando nello specifico con la popolazione migrante della città di Torino. L'obiettivo specifico del progetto era quello di favorire e migliorare l'accesso ai servizi sanitari e la fruizione degli stessi da parte dei migranti attraverso un'iniziativa pilota nel territorio circoscritto del quartiere San Salvario di Torino, interessato da una forte presenza di immigrati, ma anche da numerose espressioni della società civile.

#### Metodologia

La metodologia del progetto ha previsto un lavoro continuo di mappatura e di presa di contatto con le diverse risorse presenti nel quartiere di San Salvario, al fine di rafforzare la rete dei soggetti interessati al tema "salute e migrazione" e creare spazi di confronto, dialogo e progettazione condivisa. Il coinvolgimento attivo dei mediatori, non solo nelle attività di mediazione vera e propria ma anche in attività di formazione, progettazione, valutazione, sensibilizzazione ed animazione, è stata un punto di forza del progetto, così come la scelta di articolare il più possibile tra loro le diverse attività, con l'obiettivo di creare collegamenti tra iniziative diverse e promuovere nuove sinergie territoriali.

#### Conclusioni

Il Progetto Aracne ha sviluppato una rete efficace che ha permesso di identificare diverse problematiche sommerse e di rispondere a bisogni di informazione e sensibilizzazione specifici. L'incontro con le associazioni e le realtà pubbliche e private del territorio ha permesso di intraprendere azioni di progettazione e ha sviluppato azioni di collaborazione che hanno permesso una maggiore replicabilità dei risultati di progetto e una efficacia delle attività proposte.

<sup>1</sup> Direzione Sanitaria e <sup>2</sup> Servizio Sociale AO Ordine Mauriziano di Torino

<sup>3</sup> Associazione Studio Paziente Immuno Compromesso, ASPIC onlus

#### ABSTRACT

Interventi di Promozione della Salute (PdS) richiedono una interrelazione tra:

- ospedale /medico - paziente/utente
- ospedale /medico - risorse sanitarie comunitarie
- paziente /utente - risorse sanitarie comunitarie

Il framework entro cui muoversi può essere quello delineato dalla figura, in cui i tre cerchi, raffiguranti le differenti tipologie di relazione, presentano un'area di contatto comune che simbolicamente non solo identifica la sede di partenza dell'intervento, ma anche la misura della sua efficacia<sup>1,2</sup>.

La presente iniziativa diretta a migranti fa riferimento a quanto sopra sinteticamente esposto. L'obiettivo è quello di implementare e valutare interventi di PdS basati sull'evidenza, utilizzando mediatori culturali opportunamente preparati. Il loro ruolo è quello di informare l'utente su come mantenersi in salute, e di indicargli la sede dove effettuare l'intervento di prevenzione previsto.

Le azioni progettuali, ispirate e realizzate sulla base delle raccomandazioni contenute nelle Linee Guida USPSTF<sup>3</sup>, hanno come elemento chiave la verifica dell'efficacia e dell'efficienza della Rete sanitaria di Riferimento e di Supporto (RsRS) cui l'utente è inviato dal mediatore che l'ha preso in carico.

Il Progetto si svolge presso l'AO Ordine Mauriziano di Torino, è iniziato nel marzo 2013 ed ha la durata di un anno.

A quattro mesi dall'inizio del Progetto, le azioni realizzate sono: 1. attivazione di Info point su PdS, presso lo sportello delle Associazioni di Volontariato dell'AO Ordine Mauriziano; 2. formazione dei mediatori con una prima valutazione dell'apprendimento; 3. produzione in quattro differenti lingue di materiale informativo sulla salute; 4. iniziale utilizzo delle risorse comunitarie (RsRS), con il limite che è ancora in via di definizione la modalità per verificarne efficacia ed efficienza.

#### OBIETTIVI

**Obiettivo principale.** Nell'ambito della Promozione della Salute diretta a migranti, ottimizzare l'accesso alla rete sanitaria per interventi di riconosciuta efficacia, attraverso la valorizzazione del ruolo di mediatori culturali "competenti".

**Obiettivi secondari /risultati attesi:**

1. Operatori Sanitari Volontari (OSV) e Mediatori Culturali (MC) "competenti", provenienti da 4 differenti aree geografiche (Romania, Cina, Paesi Arabi e dell'Area Sub Sahariana), informano / sensibilizzano utenti / pazienti su interventi di Promozione della Salute e ne indicano il percorso all'interno della RsRS per l'effettiva realizzazione.
2. Formazione dei Mediatori Culturali (MC), associata a verifica delle conoscenze acquisite.
3. Preparazione e diffusione di materiale IEC (Informazione, Educazione, Comunicazione) in quattro differenti lingue, allo scopo di facilitare la comprensione di messaggi di PdS.
4. Identificazione ed utilizzo della Rete sanitaria di Riferimento e di Supporto (RsRS) per il completamento di interventi raccomandati.

#### METODOLOGIA

**Durata del Progetto.** 1 anno.

**Sede.** Sportello Associazioni Volontariato, AO Ordine Mauriziano di Torino.

**Promozione della Salute.** Gli interventi raccomandati sono dedotti dalle Linee Guida USPSTF 2012<sup>3</sup> su cui è costruita tutta l'attività progettuale. In particolare, *medici volontari ASPIC* sono impegnati in traduzione inglese - italiano di Linee Guida e materiale informativo per il paziente; *mediatori culturali*, appartenenti alle 4 differenti aree, studiano e traducono nella propria lingua il materiale informativo assegnato e utilizzano le conoscenze acquisite in occasione di interventi presso lo sportello informativo e/o le UUOO.

**Formazione dei MC.** È realizzata attraverso lo studio dei contenuti delle Linee Guida e relativa trasformazione e traduzione in materiale informativo per l'utente dello stesso Paese di origine.

**Preparazione materiale IEC.** Percorso: ricerca tramite Internet di materiale informativo "di base" sui temi affrontati dalle Linee Guida; traduzione inglese - italiano, focalizzando i contenuti sulle raccomandazioni di grado A e B; adattamento del materiale alla popolazione target; traduzione dello stesso in quattro differenti lingue.

**Revisione periodica delle conoscenze acquisite dai MC.** Programmata ogni 4 mesi e realizzata con la somministrazione di questionario sui contenuti delle Linee Guida, composto da circa 60 domande.

**Monitoraggio.** Le azioni sopra elencate sono annotate in registri e, successivamente, trasferite su file Excel. A scadenza coincidente con la stesura del Report di Progetto (ogni 4 mesi a partire dalla data di inizio progetto), è effettuata analisi dei dati raccolti.

**Valutazione.** È realizzata attraverso confronto tra primo e secondo semestre; si intende utilizzare indicatori di tipo qualitativo e quantitativo nell'ambito delle seguenti aree: a) accesso all'info point su Promozione della Salute da parte delle differenti etnie; b) utilizzo dell'info point da parte delle UUOO dell'ospedale; c) per i casi in cui sono stati identificati gap nell'ambito delle tre differenti interrelazioni (ospedale - paziente, ospedale - comunità, paziente - comunità) descrizione da parte del mediatore culturale dello scenario (caso studio) con evidenziazione dei fattori che incidono negativamente e dei possibili rimedi; d) utilizzo della RsRS per interventi di PdS; e) efficacia della RsRS nel fornire interventi di PdS, valutata con questionario somministrato all'utente.

#### RISULTATI RAGGIUNTI

Ad oggi sono realizzate o in fase di implementazione le seguenti azioni.

1. È stato attivato l'Info point su Promozione della Salute, presso lo sportello delle Associazioni di volontariato dell'AO Mauriziano. Ciascun mediatore garantisce la propria presenza per 3 h/settimana e, se richiesto, effettua interventi presso le UUOO. Le caratteristiche degli interventi effettuati nei primi 40 giorni di attività possono essere così riassunte:
  - Popolazione raggiunta suddivisa per genere e per area di provenienza maggiormente rappresentata: donne, 93% e, rispettivamente, Paesi Arabi, 64%
  - UO Ospedaliere richiedenti i MC: ostetricia, 78%; altre UUOO (PS, Dialisi, Day Surgery), 22%
  - Contenuti dell'attività IEC svolta: informazioni su patologia di base, 32%; percorso clinico - diagnostico post dimissione, 29%; allattamento al seno, 21%; dieta, 11%; altro, 7%
2. Nel mese di luglio è stato condotto il primo test di verifica dell'apprendimento dei MC sul materiale di studio consegnato all'inizio del Progetto. Tutti hanno risposto positivamente, ma con punteggio non elevato.
3. Il materiale IEC in quattro lingue sino ad ora prodotto riguarda i seguenti temi: "Star bene dipende da te", brochure contenente interventi di prevenzione raccomandati in base a genere e a fascia di età; Contraccezione: i differenti metodi; Pianificazione di una sana gravidanza; Screening dei tumori femminili; Note informative su "Trasmissione di agenti infettivi in Ospedale"
4. Identificazione e utilizzo della Rete sanitaria di Riferimento e di Supporto (RsRS) al fine di completare l'intervento di Prevenzione / Promozione della salute. Nel definire i percorsi si è tenuto conto del contesto caratterizzante i tre elementi che condizionano la realizzazione dell'intervento: paziente, strutture sanitarie e risorse comunitarie. Ciò che è emerso sin dall'inizio è che sia la Struttura Sanitaria nel suo insieme (Ospedale e territorio) che risorse comunitarie sono impegnate a gestire la patologia, ma non la PdS. Nonostante le raccomandazioni di tutte le Società Scientifiche, la prevenzione resta confinata in un ruolo del tutto secondario.

#### CONCLUSIONI

Gli interventi programmati si stanno realizzando secondo il Piano; è stato attivato l'Info point su PdS, comincia ad essere prodotto materiale informativo, sono iniziati gli interventi sul campo. Risultati degni di valutazione più approfondita saranno possibili solo a fine Progetto, quando si potrà disporre di una casistica più ampia.

In itinere sono emerse almeno due problematiche per le quali si ritiene necessario il supporto dell'Università.

La prima riguarda la messa a punto di materiale IEC "di base" nelle quattro differenti lingue. L'aspetto tecnico è difficilmente criticabile, essendo le Linee Guida di riconosciuta valenza scientifica, ma, ci si è chiesto, l'aspetto culturale è stato adeguatamente preso in considerazione? Il messaggio potrà essere recepito dall'utente straniero? Per contro, nell'ottica di una comunicazione che deve porre il paziente in grado di decidere in modo autonomo e consapevole, l'operatore sanitario italiano si è posto il problema che scelte per la salute potrebbero essere non condivise, e quindi disattese, per motivi legati alla cultura del Paese d'origine?

Il secondo punto fa riferimento alla valutazione qualitativa della Rete sanitaria di Riferimento e di Supporto. Se si eccettuano alcuni screening per la prevenzione dei tumori (cancro del seno, della cervice uterina e del colon retto), ben poco tempo è dedicato ad interventi fortemente raccomandati per prevenire patologie che già oggi incidono pesantemente sul Sistema Sanitario Nazionale. Disinformazione e scarse conoscenze sono spesso presenti nella popolazione italiana: e in quella straniera? Al di là di quanto fatto attraverso media, marketing sociale etc, esiste una via strettamente sanitaria per fornire informazioni scientificamente controllate? Lo sportello informativo a livello ospedaliero o sul territorio (medico di base o strutture del privato sociale) può essere un'opzione valida? La presente esperienza cerca di approfondire questo aspetto, ma il futuro, scarsamente delineato dal punto di vista strutturale e dei contenuti, è cosparso di incertezze.

Si ringraziano i seguenti Enti, Organizzazioni che supportano il Progetto: AO Ordine Mauriziano di Torino, ASL To 2, Centro Servizi Volontariato VSSP, SERMIG, Fondazione CRT.

Il progetto è ideato e realizzato da ASPIC onlus, associazione impegnata in interventi di Promozione della salute diretti a migranti e di lotta alla malnutrizione infantile nei Paesi a basso reddito.

## IMPACT OF PREGNANCY AND LABOUR COMPLICATIONS ON NEONATAL OUTCOMES: A RETROSPECTIVE COHORT STUDY IN A RURAL HOSPITAL OF ETHIOPIA

Elisa Bobba (University of Torino – Medicine and Surgery)

in collaboration with Comitato Collaborazione Medicina

Figure 1 Bale zone (Oromiya Region), Ethiopia.

Despite significant efforts towards the achievement of MDG, Ethiopia is still very far from the MDG 4 target for 2015 (Table 1). However, data regarding MNCH (Maternal Newborn and Child Health) are scanty and limited. In Ethiopia, all main indicators (neonatal, infant and under 5 mortality rate) are below the Sub-Saharan Africa average and Oromiya is one of the worse performing Regions in the country.

### Background

	GLOBAL	SUB-SAHARIAN AFRICA	ETHIOPIA	OROMIYA REGION	Ethiopia MDG 4 TARGET
<b>NEONATAL MORTALITY</b> Number of deaths per 1,000 live births within the first month of life	22	34	37	40	16
<b>INFANT MORTALITY</b> Number of deaths per 1,000 live births within the first year of life	37	69	59	73	32
<b>UNDER-5 MORTALITY</b> Number of deaths per 1,000 live births within the first 5 years of life	51	109	86	112	56

Table 1 Trend in Early Childhood Mortality, EDHS 2000, 2005, and 2011

### Achieved Results

Although the main evidence emerging from the results is the **inconsistency of data available**, their collection and standardization reflect a significant effort to represent the real status of health care in a referral hospital of the zone. The limited **number of ANC** (Ante Natal Care) visits is the first risk factor influencing both the pregnancy and labour complications and the neonatal outcomes, followed by **hypertensive disorders and severe anaemia**. (Table 2)

© Abbas / Magnum Photos.

### Objectives

The overall objective of the study is to explore the main risk factors affecting neonatal health during pregnancy and delivery in Goba Hospital, referral centre of Bale Zone, in Oromiya Region. (Figure 1)

The final goal of the research is to support the development of **more effective interventions** to enhance MNCH in the zone.

© Bekele Degefe / Magnum Photos.

### Methodological approach

The research is a **retrospective cohort study** based on data retrieved from **1,283 medical records** of women who delivered at Goba Hospital in 2004 EFY (Ethiopian Fiscal Year: Sept 2011-Sept 2012). (Figure 2) Qualitative data were collected from **face to face discussions with the HW** (Health Workers) employed in the hospital maternity department.

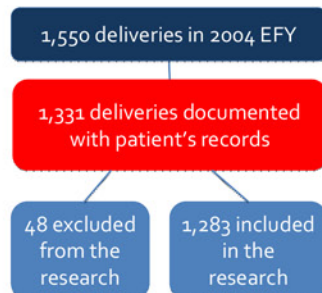

Figure 2 Sample size of the study.

### Conclusion

Scaling up the coverage and the efficiency of ANC services seems to be the most pressing priority to enhance MNCH. **Strengthening the quality data management through simple ICT** (Information and Communication Technology) strategies is crucial to ensure continuous monitoring and evaluation of hospital services provided. **Telemedicine and m-health** can provide opportunities for continuous medical education to HW in remote areas, and eventually contribute to the improvement of care provided to patients. Crucial is a close **collaboration between hospital staff, local authorities and stakeholders** supporting MNCH services to ensure the supply of all needs in terms of equipment, health staff requirement and training.

## POSITIVE AND NEGATIVE EFFECTS OF FINANCIAL AND NON-FINANCIAL INCENTIVE MECHANISMS FOR HEALTH WORKERS IN RURAL AND REMOTE AREAS OF ETHIOPIA. FOCUS ON OROMIYA, SOMALI AND TIGRAY REGIONS

Maria Alessandra Brocardo (University of Torino – Political Sciences)

in collaboration with

Figure 1 Ethiopia.

### Background

The poor quality and effectiveness of Health System in Developing Countries is often linked to a deficiency in terms of local human resources, key to ensure quality and effective health services. The crisis of Human Resources for Health (HRH) stems from the limited number and/or inadequate capacities of health staff in delivering quality care, as well as from the low retention rates in remote and rural areas. Most African Governments and the international community are exploring different strategies to tackle this challenge. The provision of financial and non-financial incentives to health professionals is one of the most commonly adopted strategies to facilitate the delivery of basic care to remote communities.

	OROMIYA		SOMALI REGION		TIGRAY		ALL ETHIOPIA	
	N. of staff	Density (1,000 people)	N. of staff	Density (1,000 people)	N. of staff	Density (1,000 people)	N. of staff	Density (1,000 people)
Medical Doctor (Specialist)	194		56		37		2,152	
Medical Doctor (Generic)	184	0.734	15	0.473	64	1.176	1,001	0.844
Health officers	448		12		188		1,606	
Nurses (all types)	5,040		314		2,332		20,109	
Midwives	287		45		185		1,379	

Table 1. Health Staff number and density per population in different Regions of Ethiopia (Source: Africa Health Workforce Observatory, 2009)

### Achieved Results

The research has compared existing incentive mechanisms for HRH in 3 Ethiopian Regions (Oromiya, Somali and Tigray) to analyze stakeholders' approaches and review the perceptions of local and international sector staff on their effects. Incentive mechanisms are applied by most service providers and recognized as key factor in HRH policies. Anyhow, no agreement is reached on a univocal definition of 'incentive', neither a shared strategy on their utilization has been developed. Incentive mechanisms have been found impacting both positively and negatively on HRH retention capacities, but are not the only effective tool to strengthen health service delivery in remote areas of Ethiopia.

### Objectives

The research aimed at identifying potential positive and negative effects of specific financial and non-financial incentive mechanisms for HRH, comparing different strategies adopted by Non Governmental Organizations (NGOs) and International Agencies (IA) engaged in the promotion of access to health for all. Ethiopia has been selected as case-study.

### Methodological approach

A desk research was conducted, reviewing the topical literature at global and Ethiopian level. Semi-structured interviews were conducted with key informants from international NGOs, IAs, local authorities and health staff working in rural areas of the 3 selected Regions. Interviews were analyzed through a simple coding system grouping the retrieved information onto a number of key topics, mainly referring to the strategies and effects of the incentive systems and to other possible measures to address the HRH crisis.

TIPOLOGY OF INCENTIVES	
<b>Financial incentives</b> <ul style="list-style-type: none"> <li>• Terms and conditions of employment (salary, wage, pension, insurances, allowances)</li> <li>• Performance payments (achievement of performance targets, length of service, location or type of work)</li> <li>• Other financial support (fellowships, loans)</li> </ul>	<b>Non-financial incentives</b> <ul style="list-style-type: none"> <li>• Positive work environment (sufficient resources, recognition, supportive management, equal opportunity policies etc...)</li> <li>• Flexibility in employment arrangements</li> <li>• Support for career and professional development</li> <li>• Access to some services (health, transport, housing, recreational facilities, child care and school)</li> <li>• Intrinsic rewards (job satisfaction, personal achievement, commitment on job, etc...)</li> </ul>

Table 2 Definition of Financial and Non financial Incentives (Source: WHO)

### Conclusion

Financial and non financial incentive mechanisms in Ethiopia are considered instrumental to motivate HRH to work in remote areas and reduce turn-over rates. Therefore, their main positive effect is directly linked to the possibility of ensuring basic care across the whole Country. Anyhow, financial incentives may negatively impact on the international aid dependency of the Ethiopian Health System as well as exacerbate the risk of biasing Government staffs' salary expectations and/or causing discrepancies/inequalities in employment conditions. On the contrary, non-financial incentives – in particular a conducive working environment and training opportunities for health staffs – are highly appreciated and can ease HRH retention.

marco.foletti@med.unipmn.it — <http://crimedim.med.unipmn.it>

A call for professionalizing humanitarian health care assistance has been launched by the international humanitarian community. At the same time, the interest showed by residents in taking part in international humanitarian apprenticeship has seen a growing trend. In October 2011 a new partnership between the Research Centre in Emergency and Disaster Medicine (CRIMEDIM) at the Università degli Studi del Piemonte Orientale and the NGO Rainbow for Africa was signed. The foregoing convention allow residents enrolled in the anesthesia and critical care

residency program to participate in humanitarian apprenticeships in developing countries.

The main framework of the partnership consist on completing a prior blended learning training program and, subsequently, participating in an international apprenticeship taking place in an underserved country. The purpose of such a partnership lies in developing the following aspects: improving medical skills of the residents, providing education for the local staff and setting up innovative research projects aiming to support the development of resource-constrained health systems.

According to the current literature, the following subjects were developed to be included in the training course: safety and security in the field; sanitation, vaccinations and tropical medicine; knowledge of the operational context, anesthesia in poor resource settings; foreign languages and psychology applied to humanitarian aid. To date, a total of 8 residents have completed the course as prior preparation to an international humanitarian apprenticeship in Senegal, Sierra Leone and Burkina Faso. All of them affirmed that this preparation has improved their general

understanding of the host country context. Further assessments are required to better define the extent to which our program has enabled them to work more efficiently in such challenging environments.

### Humanitarian Medic: an innovative training program for the professionalization of humanitarian health workers in anesthesia and critical care medicine during residency programs.

Ingrassia PL, Ragazzoni L, Foletti M, Ripoll A, Della Corte F.

CRIMEDIM - Centro di Ricerca Interdipartimentale in Medicina di Emergenza e dei Disastri ed Informatica applicata alla didattica e alla pratica Medica

Università degli Studi del Piemonte Orientale 'A. Avogadro'

Via Lanino 1, 28100 Novara, Italy.

luca.ragazzoni@med.unipmn.it — <http://crimedim.med.unipmn.it>

Over the last few years, international concern has been risen regarding the need for a professionalization in humanitarian assistance. Regardless of the skills related to their respective specialties, humanitarian health workers are required to gain a global understanding of the humanitarian sector. Moreover, engaging in international conventions among developed health centers and host low-income countries has been defined by the international literature as an innovative strategy to set up new research projects in underserved settings.

However, in order to comply with both university training curriculum and humanitarian requirements,

international apprenticeships in the field need to be properly designed and integrated in residency programs.

The Research Center in Emergency and Disaster Medicine (CRIMEDIM) at the Università degli Studi del Piemonte Orientale wishes to develop a training program to promote the professionalization of Italian residents in anesthesia and critical care medicine in the field of humanitarian health, in collaboration with different national NGOs and with the active participation of other academic and non-academic organizations recognized at national and international level.

This training program will aim at creating professional health workers able to proficiently take part to international humanitarian aid programs which require high

competence in anesthesia and critical care medicine, alongside with a common background encompassing tropical medicine, public health during emergencies, and disaster medicine. Distance learning, high-fidelity and virtual reality simulations, internship and apprenticeship, thus training in the field, will be the most relevant didactic tools used in this training program. It will last 7 months, divided in 10-week distance learning, 2-week internship in pediatric emergencies, 1-week residential workshop and 4-month apprenticeship in the field.

## Selezione e uso di idonei alimenti locali per la prevenzione della malnutrizione infantile

Bruna Santini<sup>1,2</sup>, Emanuela Nigro<sup>1</sup>, Maria Luisa Soranzo<sup>2</sup>

1- Dipartimento di Scienze della Sanità Pubblica e Pediatriche, Università di Torino/OIRM, 2 - ASPIC onlus

### Abstract

L'età compresa tra la nascita e i 24 mesi è critica per lo stimolo di una crescita ottimale e di sviluppo corretto a lungo termine. In questa fase critica il fabbisogno di nutrimenti (micronutrienti e densità energetica degli alimenti) è fondamentale per il corretto sviluppo staturale e intellettuale. La prevenzione della malnutrizione infantile deve essere progettata specificatamente per questo periodo, unendo l'educazione sulle corrette pratiche alimentari (incluso l'allattamento al seno esclusivo nei primi 6 mesi) a una produzione e diffusione di alimenti complementari nutrizionalmente adeguati, prodotti localmente e a costo accessibile. In questo lavoro sono esposti alcuni criteri e raccomandazioni per una corretta strategia preventiva della malnutrizione infantile.

### Obiettivi

In tema di Salute Globale, le malattie croniche rappresentano oggi la causa prevalente di morbidità e mortalità nell'adulto e la loro prevenzione richiede importanti investimenti economici. Nei Paesi a basso reddito la **malnutrizione materno-infantile** e le malattie trasmissibili associate determinano nei bambini di età ≤ 5 anni un tasso di mortalità ancora troppo elevato rispetto a quanto indicato negli Obiettivi di Sviluppo del Millennio dell'ONU (2000). La Convenzione delle Nazioni Unite sui Diritti del Bambino (1989) riconosce il diritto al più alto standard raggiungibile di salute e ad una nutrizione ottimale. Dal punto di vista dietetico, un' **adeguata alimentazione complementare** all'allattamento al seno (esclusivo sino al sesto mese e possibilmente prolungato) dovrebbe essere la risposta più naturale per la prevenzione della malnutrizione. La realizzazione di questo obiettivo non è così banale nella realtà dei Paesi a basso reddito. In tutti i protocolli di trattamento per il recupero nutrizionale è previsto l'uso dei **prodotti ipercalorici pronti all'uso** che, nonostante siano stati messi a punto per le situazioni di emergenza, hanno in gran parte sostituito l'**utilizzo delle farine arricchite**. Queste farine invece, prodotte e rese disponibili localmente presso i servizi ambulatoriali di salute pubblica potrebbero divenire la base dell'alimentazione complementare.

### I punti di partenza

Intervento tra 6-24 mesi, periodo nel quale si manifesta lo *stunting* e nel quale viene introdotto altro cibo rispetto al latte materno. Identificazione del momento ideale in questa finestra temporale.

Contributo del latte materno e cibo complementare al fabbisogno energetico

Food and Nutrition Bulletin 24 (1), UNU 2003

Esempio di farina arricchita

- FARINA DI MIGLIO 45%
- FARINA DI SOIA 20%
- LATTE IN POLVERE 15%
- ARACHIDI 10%
- ZUCCHERO 10%

- Per 100 g:
- 18.6 g di proteine (17,2 %)
  - 55 g di glucidi (51,1%)
  - 15.2 g di lipidi (31,7%)
  - 431 Kcal

- 1 Kg /sette per ogni bambino, garantisce un apporto giornaliero di 140 g:
- 26 g di proteine (17,0%)
  - 77 g di glucidi (50,5%)
  - 22 g di lipidi (32,5%)
  - 610 Kcal

R. Piemonte, progetti DIAMA

L'alimentazione familiare deve essere adeguata alle necessità nutrizionali e digestive di questa età:

- gli alimenti sono spesso carenti di Fe, Zn, Ca, vit.A ecc (bassa concentrazione, presenza di antinutrienti e ridotta biodisponibilità)
- gli alimenti necessitano di corretta conservazione e preparazione
- pochi gli alimenti di origine animale (costo, reperibilità, credenze)

### Strategie

#### PER ESSERE ADEGUATO IL CIBO COMPLEMENTARE DEVE ESSERE:

- Pulito e sicuro
- Facile da preparare a partire dai cibi della famiglia
- Disponibile localmente e conveniente dal punto di vista economico
- Facile da mangiare
- Gradito dal bambino
- Ricco di apporto calorico e di nutrienti
- Ricco di micronutrienti specifici biodisponibili

#### Quanti micronutrienti fornire con i pasti complementari?

fabbisogno secondo l'età

meno

concentrazione nel latte materno

moltiplicato

volume di latte materno assunto

#### Come scegliere gli alimenti?

Per capire quale alimento scegliere per garantire un adeguato apporto di un micronutriente, occorre definire la densità nei vari alimenti

Densità

quantità di micronutriente necessaria

diviso

calorie fornite dallo stesso alimento X 100

### Esempi

DIAMA (Dipartimento di Scienze della Sanità Pubblica e Pediatriche, Università di Torino)

R. Piemonte, progetti DIAMA

PREPARAZIONE

Singolare la farina con un po' d'acqua, versare poi l'equivalente di un bicchiere colmo di acqua (200 ml) e mescolare sul fuoco, per 10 minuti, mescolando a partire dall'inizio del forno.

**Soluzioni?** Nei Paesi più poveri è fondamentale prevenire la malnutrizione infantile con strategie sostenibili che rendano accessibile quanto necessario per un'alimentazione familiare adeguata. La promozione del microcredito è una possibile importante soluzione per incentivare una produzione alimentare finalizzata a migliorare la qualità del cibo complementare con adeguato apporto di «proteine nobili» e buona concentrazione dei micronutrienti a rischio: esempi sono la produzione di *Spirulina spp.*, l'allevamento ittico e la coltivazione della *Moringa oleifera* (Progetto DIAMA 4, Regione Piemonte: Ricominciamo dai villaggi 2011/2012).

### Background

Health information is crucial in support of the decisions in health care. Also in developing countries is essential to access the published scientific papers to improve the quality of care and the health workers in the field. Almost all the scientific journal are published in electronic format and it is possible to browse the journal or search bibliographic databases like Medline, Embase, SciFinder. In developing countries it is difficult to get to internet and spend hours on line to get the scientific papers needed in a particular situation.

### Achieved Results

We prepared group of medical experts in different fields of medicine. A Web storage repository was implemented for upload and download scientific papers. Monthly we search the bibliographic databases to select important scientific papers to be uploaded in the repository database. We prepare a monthly newsletter to be distributed to CCM personnel. Each individual can select the papers needed and download when the digital connection is available.

### Objectives

The overall objective of the project is to develop a bibliographic database with selected papers related to the main health projects of the CCM. We publish a monthly newsletter sent to all the persons working for CCM. The newsletter incorporate textual hyperlink to download the interested full text paper. The person can also log in the database for individual search (Fig.2).

Figure 1. List of the scientific fields of the bibliographic repository.

### Methodological approach

A panel of experts in different health fields (Figure 1) search monthly Medline, Embase SciFinder to find new interesting published papers. Each expert upload the .pdf paper in the repository. Each month a new letter is prepared and sent to all persons working in projects of CCM. For each paper the expert write the bibliographic data, a short summary, the size of the file and an hypertext link to allow the fast download of the file.

Fig. 2. Web access of the Search interface

### Conclusion

The work in developing countries needs a scientific and bibliographic support to improve the quality of health care. The update of scientific information is essential to assist the projects of CCM. We have developed a simple, non expensive, flexible system to support the health workers in the field. We can also support specific bibliographic request on demand and provide the person with full text papers.

## FOREWARD TO THE ORAL SESSION “GEOMATICS FOR EMERGENCY MANAGEMENT”

Piero Boccardo\*

\*Politecnico di Torino, Italy, [piero.boccardo@polito.it](mailto:piero.boccardo@polito.it)

Disasters can be defined as “a serious disruption of the functioning of a community or a society involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources” (UNISDR 2009). Disasters can be classified according to the main causes, i.e. natural, technological or manmade disasters.

The effects of natural disasters on the environment and on the population can be understood by analyzing the relevant statistics over the past years, in terms of both economic and human losses. The information collected by the Centre for Research on the Epidemiology of Disasters (CRED) at the School of Public Health of the Université Catholique de Louvain located in Brussels, Belgium, and more specifically the data stored in the EM-DAT database (EM-DAT is a global database on natural and technological disasters that contains essential core data on the occurrence and effects of

more than 17,000 disasters in the world from 1900 to present) highlights (Guha-Sapir 2011) that in 2010 a total of 385 natural disasters were registered, with more than 297,000 casualties [Guha-Sapir et al., 2012]. Over 217 million people were affected worldwide and \$123.9 billion of economic damages were estimated. Similar to the average over the last decade, hydrological disasters (events caused by deviations in the normal water cycle and/or overflow of bodies of water caused by wind setup, i.e. Flood and Mass Movement events) were by far the most numerous disasters in 2010, representing 56.1% of the total disaster occurrence in that year, and together with meteorological disasters - the second most frequent calamitous event – accounted for 79% of total occurrence.

Economic damages from natural disasters in 2010 were over 2.5 times higher than in 2009 (\$47.6 billion), and increased by 25.3% compared to the annual average for the period 2000-2009 (\$98.9 billion). From a geographical point of view, some 89% of all people affected by disasters in 2010 lived in Asia. Nevertheless, the European continent faced the biggest increase in disaster occurrence, whereas Asia had the largest decrease, counting fewer disasters, victims and damages compared to the last decade’s annual averages.

Disaster Risk Reduction (DRR) activities are aimed to limit the impact of a disaster when it occurs, mainly by strengthening the community’s capabilities to cope with a disaster, or to reduce the possibility of a disaster occurring. As clearly highlighted by the Disaster Risk Management (DRM) cycle, a general strategy commonly adopted to fulfill the aforementioned goal is based on an iterative cycle comprising the following phases:

Risk assessment, Mitigation and Prevention, Preparedness, Prediction and Warning, Response, and Recovery. Geomatics definitively plays a crucial role in the DRM cycle. Spatial Data Infrastructures (SDI) makes available global reference geospatial data and services that are transversally exploited in all the aforementioned DRM phases. Furthermore, the growing use of interoperable data formats based on international standards (e.g. Open Geospatial Consortium standards) make easier the integration of local geospatial datasets.

Early warning systems often rely on satellite remote sensing data to feed forecasting or nowcasting systems aimed “to generate and disseminate timely and meaningful warning information to enable individuals, communities and organizations threatened by a hazard to prepare and to act appropriately and in sufficient time to reduce the possibility of harm or loss” (United Nations 2009). Undoubtedly, data acquired by ground measuring stations are also involved in the process, but again the accurate georeferencing of such information is a crucial feature.

Adnan et Al. paper represents a good example of global early warning systems based on open source data such as Tropical Rainfall Measuring Mission (TRMM) Multi-satellite Precipitation Analysis (TMPA), the most commonly used data for detecting critical rainfall events.

This contribution presents the evaluation of TRMM monthly rainfall data (3B43) for Pakistan, using 15 years data from 1998 to 2012 in comparison to the ground rainfall data for the same period.

For calibration, regression analysis was performed for each month on the data of rain gauge stations and their corresponding pixel values from the satellite datasets. Regression equations were used to develop the calibrated seasonal and annual rainfall maps, as well as the monthly rainfall maps on district level.

From an operational point of view, recent major disasters (i.e. 2013 Philippines Typhoon, 2011 Italy earthquake, 2010 Haiti earthquake, 2010 Pakistan Flood and 2011 Japan tsunami) clearly demonstrated the potential role of geomatics in supporting emergency response and recovery. Remote sensing based analyses are nowadays frequently adopted to support both decision makers and responders in the field during disaster management activities, as recently clearly pointed out by the United Nations in the 2011 humanitarian appeal: “[...] Remote sensing in the hours and days after the Haiti earthquake yielded estimates of numbers of severely affected people that stood the test of time and allowed an unusually rapid flash appeal. [...] Similarly, in Pakistan, the plans in the revised flash appeal were mostly

able to encompass the still expanding scale of needs thanks to information management using remote sensing and other resources necessary for a situation of limited ground access." (United Nations 2011. Section "Major natural disasters in 2010 and lesson learned").

Domeneghetti et Al. clearly highlights in his contribution the role of geomatics in an International cooperation framework as far as flood risk mitigation is concerned.

Based on the lesson learned after 2004 flood event in Haiti and Dominican Republic, the General Direction for Development and Cooperation of the Italian Department of Foreign Affairs funded through the Istituto Italo-Latino Americano (IILA, [www.iila.org](http://www.iila.org)) an international cooperation initiative (ICI), coordinated and directed by the University of Bologna.

The initiative involved Haitian and Dominican institutions and consisted in two main components: (a) institutional capacity building on flood-risk management and mitigation measures and policies; (b) hydrological and hydraulic analysis of the May 2004 flood event aimed at formulating a suitable and affordable flood-risk mitigation plan. The second component of the cooperation is the main focus of this paper and in particular, starting from some logistical and technical constrains, a topographic survey based on GNSS technology that enabled us, in a short time, to survey river cross sections and construct Digital Elevation Models for two areas where to conduct numerical hydraulic modelling and to pre-design hypothetical flood-risk mitigation measures. The paper reports and discusses the main phases of the project.

From a technical point of view, different type of remote sensing considered, including terrestrial, satellite and aerial remote sensing. The choice is mainly based on the type of disaster and the approximate extent of the affected areas. Generally, the main source of data for response activities is satellite remote sensing, since it allows monitoring areas with accessibility issues with a wide footprint on the ground. Furthermore, modern agile satellites can be triggered in a very short time (first images showing the impact of the earthquake that struck Haiti were acquired the morning after the quake). As far as the temporal resolution is concerned, the recent availability of constellation drastically increase the satellite revisiting time, allowing to monitor in near real-time fast dynamic phenomena. Very high resolution (VHR) imagery (with a ground sample distance up to 0.5 m) are characterized by a very high level of detail that can be exploited not only from a geometric point of view (for map updating and creation purposes) but especially in terms of semantic content, crucial feature when assessing the impact of a disaster. On the contrary, high resolution imagery are characterized by a smaller footprint and a limited spectral resolution, characteristics that may limit the effectiveness of automatic classification algorithms as well as the use of this type of data when monitoring country-wide disasters.

Radar data are generally exploited when the persistency of cloud cover make optical data unusable or to extract very accurate information on ground displacements by means of phase data processing.

Particularly impressive seems to be the potentialities of UAV (Unmanned Aerial Vehicle) potentialities as described in Aicardi et al. In this paper the research group of Geomatics of the Politecnico di Torino has developed a set of interchangeable pods that can be mounted on a mini-UAV (a Hexacopter by Mikrokopter) devoted to emergency management in case of environmental disasters. This instrument is a low-cost mini-UAV equipped with photogrammetric sensors and capable of autonomous navigation (real time GNSS/IMU) and automatic digital image acquisition (characterized by a suitable geometric and radiometric quality). The platform is easily transportable on normal aircrafts and usable on the field, autonomously, by a couple of operators. The main innovation is to permits a real direct photogrammetric surveys in remote and disaster-affected areas in a short-range operative zone where it is not possible to carry out traditional photogrammetric flights. The acquisition technique allows the update of existing maps. Nevertheless, some test flights and practical applications have been performed in order to assess the autonomous flight performances and the suitability for photogrammetric flights.

As far as the damage assessment is concerned, up-to-date remotely sensed data are processed in order to extract the value added information required for that specific disaster type, i.e. flooded areas in case of flood events, collapsed buildings or temporary shelters in case of earthquakes, lava flows of ash fall contours in case of volcanic eruptions, ground displacements in case of mass movements, active fires or burned areas in case of forest fires. Depending on the type of input data available (optical or radar, panchromatic or multispectral, high or low spatial resolution, multi-temporal or just postevent acquisition) both semi automated and supervised classification algorithm, pixel based or object-oriented data can be exploited in order to derive the aforementioned information.

Unsupervised change detection algorithms are generally adopted when suitable pre event data are also available. Radar amplitude images can be processed in order to easily identify water bodies on the ground or to capture damaged areas by means of multi temporal SAR data processing, computing correlation coefficients or carrying out amplitude coherence analysis.

The availability of phase information allows adopting SAR interferometric analyses (InSAR) to provide information on the relative ground displacement after natural disasters.

It is important to stress the limits of remote sensing in assessing the impact of disasters, especially in urban environments, mainly due to intrinsic limits of vertical images. Georeferenced data acquired in the field are therefore crucial to correctly integrate and to validate the outcomes of the aforementioned analyses. Easy to- use GPS-based devices as well as crowdsourcing can be adopted to cope with the need of ground data and information.

The licensing policy of the data providers is another crucial feature that has to be carefully considered. International initiatives exist with the aim to supply remotely sensed data and/or related analyses when major disasters occur, such as

the International Charter “Space and Major disasters,” Sentinel Asia, Google Crisis Response and, in the framework of the European Programme Copernicus (formerly GMES - Global Monitoring for Environment and Security), GIO-EMS.

Remote sensing based analysis supports emergency management activities by providing the necessary georeferenced information to users in different formats and modalities. The response phase outputs are normally in shape of cartographic products where the value-added information (i.e. flooded areas) is integrated with cartographic reference datasets. As far as the warning phase is concerned, the common output is the approximate location of a disaster (i.e. earthquake epicenter, flood affected region), or, in case of alert based on forecasting models, the estimated location of the affected areas (i.e. coastal areas hit by a tsunami or a predicted storm path).

Dissemination process has the same importance as that of the analysis and map production phases. Final products should reach decision makers at the right moment and in the right place, taking into consideration environmental factors and potential network connectivity issues. Normal ways of dissemination includes email attachments sent to predefined mailing. Another dissemination option is the delivery to specific portals, focused on emergency management, that aim to gather the relevant and reliable information and analysis related to the latest emergencies (i.e. ReliefWeb). With the increasing dependence on geographical information, the demand for raw vector datasets that perform analysis better tailored to the end user needs is also increasing. Also, customized WebGIS applications are being largely implemented (and deployed immediately after specific disaster events) in order to distribute vector data that conform to OGC standards.

## EVALUATION OF TRMM SATELLITE DATA FOR MAPPING MONTHLY PRECIPITATION IN PAKISTAN BY COMPARISON WITH LOCALLY AVAILABLE DATA

### ABSTRACT

Increase in global average temperatures, widespread snowmelt and rising sea levels are important evidences of climate change, causing severe changes in the spatial and temporal rainfall patterns and increasing the frequency of related natural disasters like floods and droughts. This scenario increases the importance of satellite data for effective monitoring and forecasting of such disasters. Such data become more valuable in case of less developed countries where there is limited availability of local data. The open source and most commonly used data for detecting critical rainfall events are taken from Tropical Rainfall Measuring Mission (TRMM) Multi-satellite Precipitation Analysis (TMPA). This paper presents the evaluation of TRMM monthly rainfall data (3B43) for Pakistan, using 15 years data from 1998 to 2012 in comparison to the ground rainfall data for the same period. For calibration, regression analysis was performed for each month on the data of rain gauge stations and their corresponding pixel values from the satellite datasets. Regression equations were used to develop the calibrated seasonal and annual rainfall maps, as well as the monthly rainfall maps on district level. The calibrated monthly datasets were validated by calculating Nash-Sutcliffe Efficiency of TRMM estimates before and after calibration. The original TRMM 3B43 data was found quite reliable for its direct use with NSE values ranging from 0.73 to 0.92 for different months, while the calibration further improved the NSE by about 5% on average. However, the NSE values were decreased after calibration for the months of July, August and September, indicating that high accuracy and care is required along with much dense rain gauge network to perform calibration in hilly areas having local gradients and heavy orographic rainfalls during these rainy months. For dry months of winter, i.e. October to December, TRMM rainfall estimates were found relatively less accurate, but NSE values were improved by 10-15% after calibration in these months.

### INTRODUCTION

Climate change impacts in terms of increased global temperatures and high spatio-temporal variability in rainfall patterns are being witnessed worldwide. These primary impacts are providing base for several inter-related issues and emerging challenges for water resources, agriculture, energy and other socioeconomic sectors. Increased frequency and severity of natural disasters like floods and droughts are also an important aspect of the adverse climate changes. Rainfall is an important factor of the hydrologic cycle and has key role in different phenomena like surface runoff generation and hydropower potential, occurrence of floods or droughts, and sustainable agriculture and food security. Therefore, the need for reliable and high resolution rainfall data, both spatial and temporal, is crucial for sound hydrologic studies and for timely detection and management of natural disasters like floods and droughts.

Rain gauges have been, and are still being considered a reliable source for providing reasonably accurate point rainfall measurements. However, point rainfall measurements do not provide true estimation of areal rainfall [1, 2], particularly when there exist local rainfall gradients as in case of Himalayas [3, 4, 5]. The areal rainfall estimation is mandatory at proper spatial and temporal scale for conducting studies at basin level [6]. This scenario raises the importance of satellite data for effective monitoring of rainfall for conducting catchment level water studies and combating disasters. Use of such data becomes more important in case of developing countries where there is limited availability of local data in terms of sparse rain gauge network, which cannot detect rainfall variations caused by topography and orographic effects, and thus, results in erroneous estimates of areal rainfall [7].

Satellite-based precipitation products have become an important alternative source of information [8], under the need for more accurate spatially distributed rainfall estimates [9]. Some important remotely measuring precipitation instruments are active Precipitation Radar (PR), passive Microwave Radiometer (MWR) such as Tropical Rainfall Measuring Mission (TRMM) Microwave Imager (TMI) and Infrared Radiometer (IR)sensors [10, 11]. The active PR

sensor records the three dimensional structure of the rainfall distribution [12]; IR observations provide indirect measurements at the top of clouds [10]; while the TMI detects the radiation emitted by the water fraction in the vertical profile of the atmosphere [13].

The TRMM Multi-satellite Precipitation Analysis (TMPA) provides very high temporal (3 hourly) and spatial ( $0.25^\circ \times 0.25^\circ$ ) resolution products using combination of sensing instruments. However, the indirect nature of precipitation measurement by the sensors shows some uncertainties too [14, 15], associated with lack of rainfall detection, false detection and bias [16]. Franchito et al. (2009) [17] have reported both temporal (8% to 12%) and sampling (30%) errors in satellite rainfall estimates. These biases and random errors may be due to sampling frequency, diurnal cycle of rainfall, non-uniform field of view of sensors, and the uncertainties in the rain retrieval algorithms [18, 19, 20, 21, 22, 23]. Therefore, satellite rainfall estimates are needed to be evaluated to reduce such errors, especially on regional basis instead of using global approximations [24, 25].

Many scientists have made efforts at global and regional scales for the evaluation of satellite products by comparing them with the field rainfall measurements, which showed varying accuracies in different regions and for different methods. Adeyewa and Nakamura (2003) [26] used Global Precipitation Climatology Center global-precipitation-analyses rain gauge data for comparison with TRMM Precipitation Radar (PR) data, the threshold-matched precipitation index and the TRMM-and-other-sources ‘‘best-estimate’’ data product (3B43) for 36 months over the major climatic regions in Africa. They found close agreement of 3B43 product with the rain gauge data, and even used it as a substitute of rain gauge data over the South Atlantic Ocean for the validation of other satellite products. Ji and Stocker (2003) [27], and Chokngamwong et al. (2005) [28] observed correlations of 0.56 and 0.86 between the satellite and rain gauge measurements, respectively. Dinku et al. (2007) [29] estimated Nash–Sutcliffe efficiency of 0.81 and root mean square error of 25% between the satellite and rain gauge data averaged over  $2.5^\circ$  grid boxes. The accuracy for a single  $25 \text{ km} \times 25 \text{ km}$  pixel containing 23 rain gauges in Oklahoma was tested by Villarini and Krajewski (2007) [30] and a correlation of 0.55 was found between the satellite and rain gauges values. Cheema and Bastiaanssen (2012) [31] performed calibration of TRMM 3B43 data product for the year of 2007 over Indus basin using regression analysis and geographical differential analysis techniques. They reported decrease from pre-calibration to post-calibration deviation between TRMM data and rain gauge data to be 10.9% to 6.1% for annual time periods, and 34.9% to 15.4% for monthly periods.

This paper presents the evaluation of TRMM monthly data (3B43) over 15 years from 1998 to 2012 for Pakistan to investigate its scope for detection and management of natural disasters like droughts and floods. Monthly rainfall products at high spatial resolution are very useful for conducting drought studies, but daily or even 3-hourly datasets (TRMM 3B42) are considered better to conduct sound rainfall-runoff studies and managing floods. However, it is worth mentioning that the TRMM research datasets also incorporate the monthly rain gauge data for automated calibration [9]. For this purpose, the available 3-hourly estimates are summed over the calendar month to create a monthly multi-satellite (MS) product, which is then combined to monthly gauge data using inverse-error variance weighting, as reported by Huffman (1997) [24, 32], to create a post-real-time monthly satellite-gauge combination (SG) product, known as TRMM 3B43 product. Then for each grid box, monthly SG/MS or 3B43/MS ratio is computed and applied to each 3-hourly field in the month, producing the final 3B42 product. Thus, it is believed that the evaluation of monthly product (3B43) for an area might also help in providing guidelines for the use of daily and hourly products.

## **MATERIALS AND METHODS**

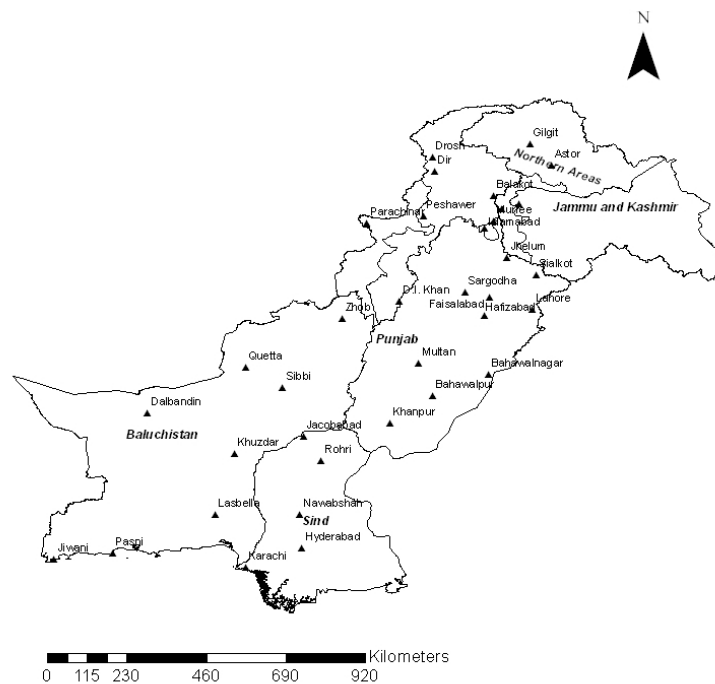

### **Description of Study Area**

Pakistan is one of the developing countries, covering an area of 79.6 Mha and represents a region which is highly prone to climate change. Ranging from coastal areas along the Arabian Sea in south to the glaciated mountains in north (Figure 1), Pakistan possesses a landscape having high diversity in terms of plains, deserts, plateaus, hills and glaciers. Geographically and from water resources point of view, Pakistan can be divided into three major parts: the northern highlands and north-eastern Himalayan mountains contributing by snowmelt and rainfall to the mighty Indus River and its tributaries; the Indus River plain which covers major area of Pakistan including KP, Punjab and Sind provinces; and the Balochistan province which lies in the south-west and is mostly under drought conditions due to arid climate. Major part of Pakistan is under arid to semi-arid climate with relatively higher rainfalls in the northern areas and lower towards the middle and south. Two important sources of rainfall are monsoon causing heavy rainfalls and frequent flooding from June to September, and the western disturbances contributing in terms of rain and snowfall over hilly areas during winter. However, there is high variability in seasonal rainfalls with monsoon season contributing alone to about 70% of annual rainfall, and dry months of October and November with almost no rain. In addition to seasonal differences, annual rainfall also varies greatly from year to year and occurrences of alternate flooding and drought are common.

## Data Availability

The satellite rainfall data used in this study were obtained from TRMM Multi-satellite Precipitation Analysis (TMPA), which makes use of the microwave and infrared precipitation estimates by the TRMM's onboard instruments as well as integration of the monthly rain gauge data for the post-real-time research products. The instruments onboard TRMM include Precipitation Radar (PR), Microwave Imager (TMI), Visible and Infrared Scanner (VIRS), Clouds and the Earth's Radiant Energy System (CERES), and the Lightning Imaging Sensor (LIS). Different types of TRMM products are available on NASA's website; monthly rainfall product (TRMM 3B43) was downloaded and processed for 15 years from 1998 to 2012 using ftp protocol and Python code for automated conversion of data into Geo-TIFF format for their use in ArcMap.

For calibration purposes monthly ground rainfall data over the same period of 15 years for 35 rain gauge stations were obtained from Pakistan Meteorological Department (PMD); the location of stations is shown in Figure 1. Although the rain gauge network is sparse compared to the vastness of area [31], this was the only reliable source of ground rainfall data. Rain gauges may also have some errors, but are normally considered correct and true representative of point rainfall [31, 33] in a basin for validation of other datasets. Moreover, use of 15 years data to have average annual and monthly rainfall values, both for satellite and rain gauge data, may be considered helpful in neutralizing any biases in both datasets.

**Fig. 1** - Map of Pakistan with provincial boundaries and location of rain gauge stations used in this study.

## Calibration using Regression Analysis

There have been found a relationship between the TRMM rainfall estimates and rain gauge observations by many scientists [26, 8, 31]. The empirical relations were developed for each month using regression analysis on data from 29 rain gauge stations and the corresponding pixels in TRMM grid data which were identified using spatial join overlay technique in ArcMap. Data for remaining six rain gauge stations were used for validation purposes only, following the calibration and validation stations ratio adopted by Cheema and Bastiaanssen (2012) [31]. To have best relationships and address the non-linearity in both datasets, second order polynomial equations were developed with zero intercept, which can be described as:

$$R_{\text{cal}} = R_{\text{gauge}} = a (R_{\text{TRMM}})^2 + b (R_{\text{TRMM}}) \quad (1)$$

Where  $R_{\text{cal}}$  is the resulting calibrated TRMM rainfall,  $R_{\text{TRMM}}$  is the TRMM rainfall from original 3B43 product, and 'a' and 'b' are the regression coefficients for the calibration of 3B43 product for Pakistan.

## Development of Calibrated Rainfall Maps

By the use of developed calibration equations for each month, new monthly rainfall raster, and in turn, the seasonal (six monthly) and annual raster datasets were developed using map algebra tool. The year was divided into two six monthly parts keeping in view the two prevailing cropping seasons in Pakistan, i.e. Rabi (from November to April) representing the relatively dry winter and a bit hot spring with rainfall currents due to western disturbances, and Kharif

(from May to October) representing the hot summer and rainy season having heavy monsoon rains, but also a part of the post- monsoon season in October with almost no or very less precipitation. To have district level monthly satellite rainfall maps for Pakistan, the calibrated raster datasets were converted to polygon or vector files which were combined with the vector file of local administrative/district boundaries. Union of the two layers with defining proper statistical parameters resulted in estimating average monthly rainfall for each administrative division.

### Validation

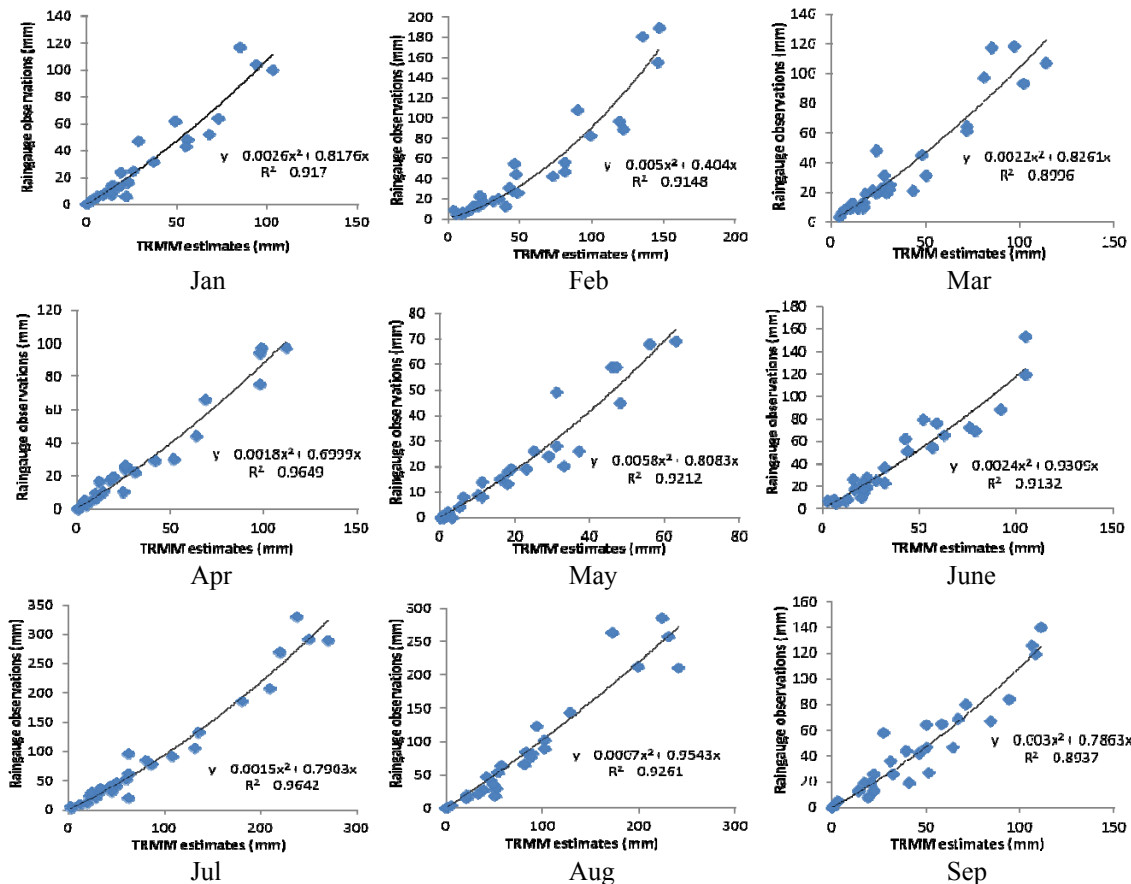

For performance evaluation and validation of the original TRMM data and the calibrated rainfall maps, six remaining rain gauges' measurements and their respective pixel values were used to estimate Nash-Sutcliffe Efficiency (NSE) for each month. NSE determines the relative magnitude of noise in estimated data compared to the measured data [34], using following relation:

$$NSE = 1 - \frac{\sum_{i=1}^n (R_{rgs} - R_{trmm})^2}{\sum_{i=1}^n (R_{rgs} - \langle R_{rgs} \rangle)^2} \quad (2)$$

Where  $R_{rgs}$  is the measured/observed rainfall for a specific rain gauge,  $R_{trmm}$  is the satellite rainfall value for the respective pixel,  $\langle R_{rgs} \rangle$  is the mean observed rainfall, and  $n$  is the total number of observations or rain gauge stations used for the validation purpose. Value of NSE ranges from  $-\infty$  to 1; values between 0.0 and 1.0 are generally considered as acceptable, while the values less than 0.0 indicate that the observed mean is more accurate than the estimated value, which is unacceptable. NSE was calculated for each month as well as for the whole year to evaluate the accuracy of TRMM 3B43 product and the performance of calibration work using the pre-calibration and post-calibration satellite rainfall maps, respectively.

### RESULTS AND DISCUSSION

Figure 2 shows the comparison of satellite rainfall with rain gauge measurements for all the months, along with the resulting second order polynomial equations and respective  $R^2$  values.

Fig. 2 - Regression analysis for 15 years' mean precipitation values of 29 rain gauges vs TRMM 3B43.

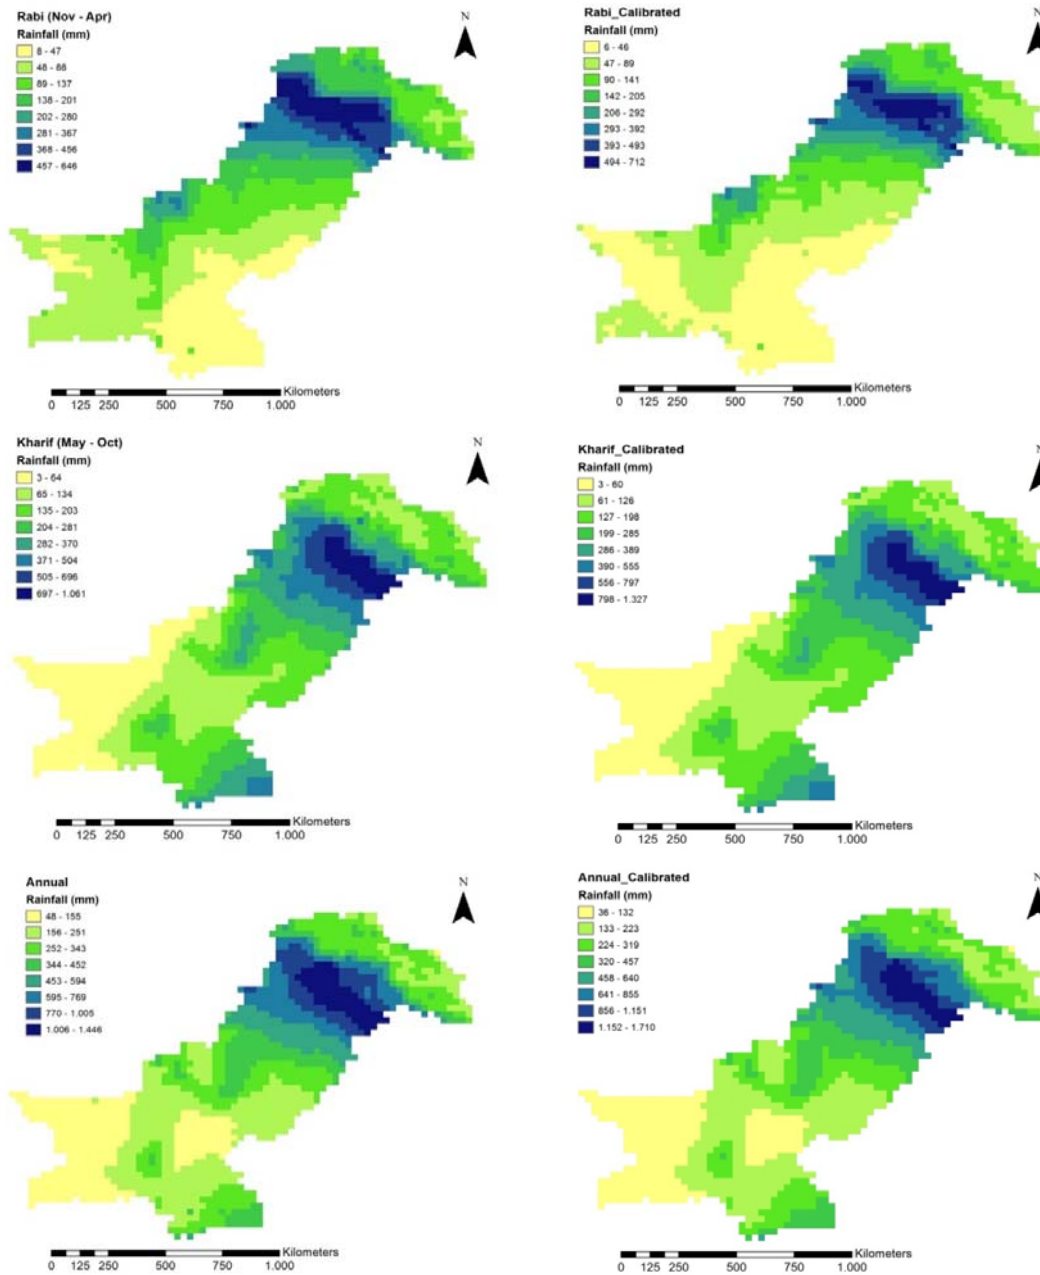

Fig. 3 - Seasonal and annual maps of satellite rainfall before and after calibration.

For most of the months, resulting curves were of the parabolic form with their convection towards horizontal axis, indicating that the overall TRMM satellite estimates are on higher side a little, but leading to the underestimation at higher rainfall values; similar trends were experienced by other scientists [28, 35, 31]. However, almost linear behavior was seen for the months of October and November, as the total rainfall in these months was very low, i.e. up to 40 mm month<sup>-1</sup>. Therefore, it can be seen that actually these lines represented just the lower one-third part approximately of the curves for other months, and thus, showed almost a linear behavior with little overestimation by the satellite. High

correlation was found between two datasets for all months with  $R^2$  values ranging from 0.87 for December to 0.98 for October.

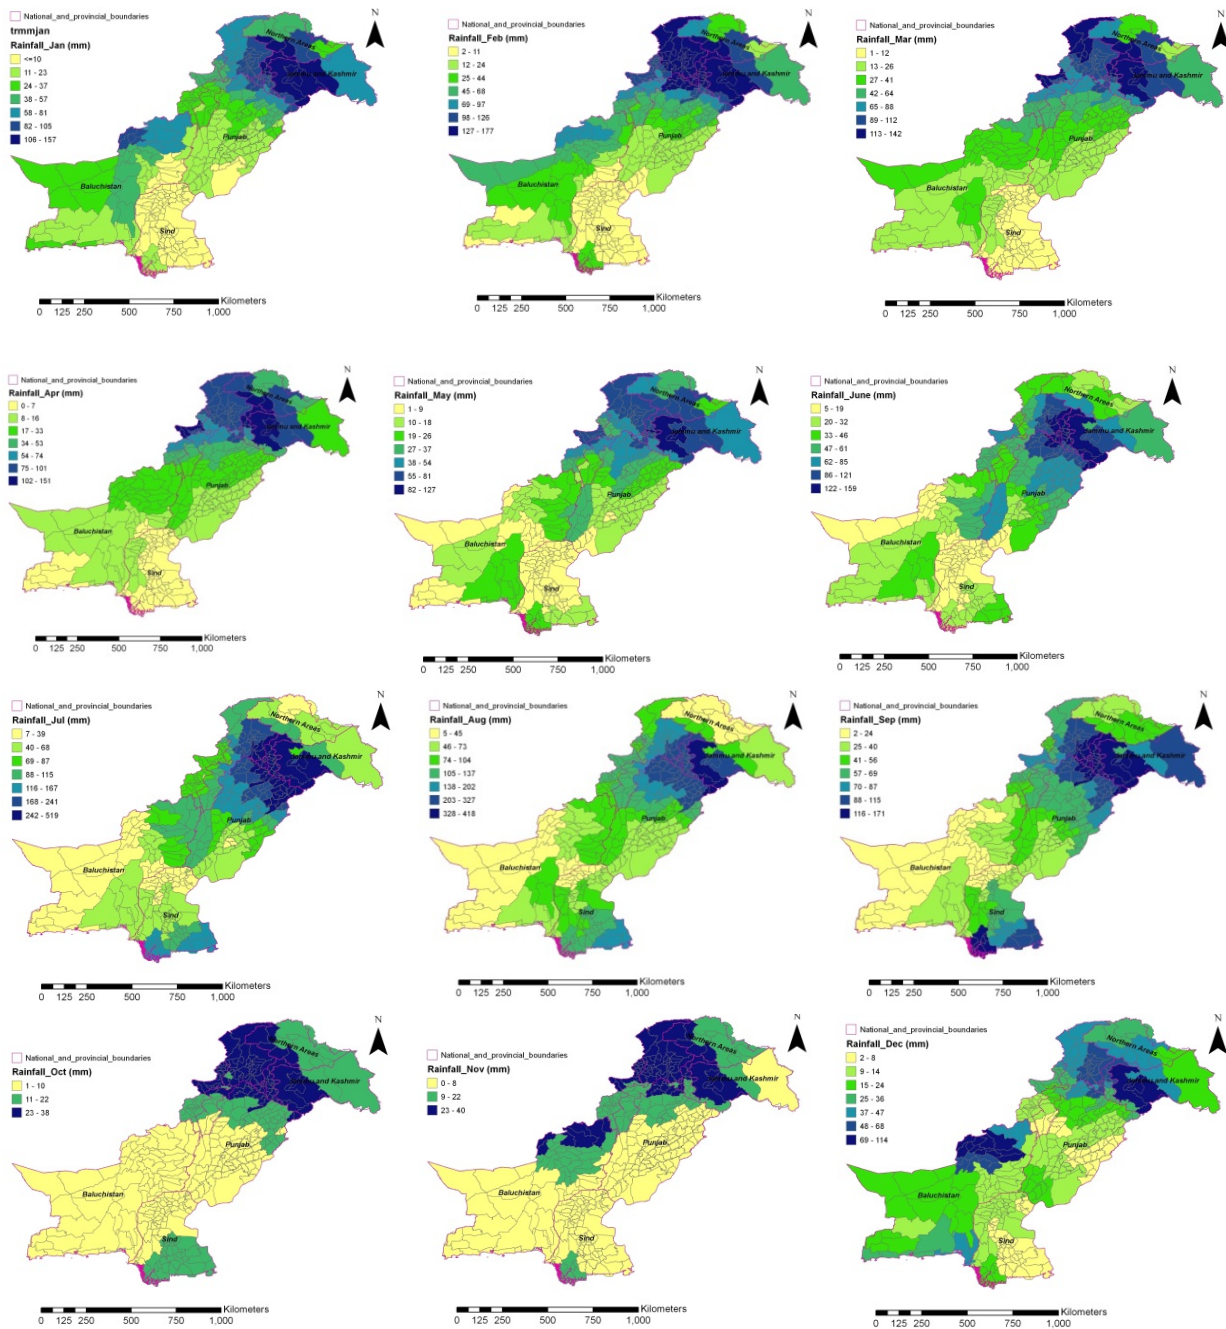

Fig. 4 - District level monthly satellite rainfall maps.

The seasonal and annual raster maps before and after the calibration of satellite data have been shown in Figure 3. From Figure 3, it can be seen that in Rabi season, representing the low rainfall winter and spring season, calibration work improved the satellite data and there was found a shift of south-western areas (Balochistan province) from rainfall class of 45-90 mm to that of below 45 mm. Similar little variations were found in the distribution of other classes before and after calibration. For Kharif season, representing the summer and monsoon rainfall season, the distribution of rainfall classes was found almost similar before and after calibration; and similar was the case for the whole year mapping. The upper Punjab province areas, which are at the foot hills of Himalayan Mountains, were found under heavy rainfall in Kharif season due to monsoon winds and orographic effects. The annual maps show that the upper Punjab foot hills areas and upper KP province are under severe climate change impacts in terms of heavy rainfall, which mostly result in flooding in the downstream areas of KP, Punjab and Sind provinces. South-western areas in Balochistan province and some desert areas in the north-eastern Sind province were found under the severe drought risks with arid climate having average annual rainfall in the range of 35-135 mm. Areas in the southern Punjab and the

belt along the mutual boundary of Sind and Balochistan provinces were also found under arid to semi-arid climate with average annual rainfall in the range of 135-225 mm, thus having threat for agriculture in terms of temporary crop water stresses. For further understanding of spatio-temporal rainfall variations, monthly rainfall maps on district level were also developed (Figure 4), which can be highly helpful for having idea of monthly average rainfall for each district and planning strategies for pre-event management of flooding and/or water shortage periods.

For validation purposes, monthly and annual values of Nash-Sutcliffe Efficiency (NSE) for pre and post calibration TRMM rainfall estimates are presented in Table 1, and their variations within the year from month to month are further elaborated in Figure 5. Table 1 show that TRMM rainfall estimates even without calibration were found as a useful source of rainfall grid data in comparison to sparse rain gauge network, having NSE values in the range of 0.73 to 0.92. The calibration work performed in this study further improved the NSE values for the satellite rainfall estimates, but this improvement was only about 5% on the average. It is important to mention that the NSE values were found high (0.85-0.95) in the summer and monsoon months, i.e. from April to September due to relatively heavy rainfalls during these months, but the calibration approach even decreased the NSE values for the rainy months of July, August and September. Reasons for this extraordinary result were investigated and major deviations between rain gauge and pixel values causing low NSE values during these months were found for the hilly rain gauge stations, which are under high wind and orographic effects during the monsoon period. In these areas during monsoon season, there may be high variations in rainfall from pixel to pixel and even within a pixel covering an area of about 25 x 25 km<sup>2</sup>, thus any comparison or calibration in these areas using sparse rain gauge network may further increase the biases [31]. Table 1 and Figure 5 show that the lowest NSE values were recorded for the months of October, November and December; but the accuracy was greatly improved here by the calibration work resulting in an increase of 10-15% in the NSE values. This finding also matches with the results of other scientists [5, 31], who stated that TRMM overestimates the low rainfall, but very low rainfall rates are difficult to measure by the precipitation radar (PR) of TRMM due to detection limitation. Thus the accuracy of satellite rainfall estimates was found a little lower in these months, but greatly improved by the calibration work because high wind speeds and orographic effects were almost absent in these months.

**Tab. 1** - Pre and post calibration NSE values for TRMM rainfall estimates

Month	Pre-calibrated NSE	Post-calibrated NSE
January	0.81	0.83
February	0.85	0.89
March	0.81	0.83
April	0.89	0.91
May	0.92	0.94
June	0.92	0.95
July	0.92	0.89
August	0.91	0.89
September	0.84	0.81
October	0.75	0.84
November	0.77	0.85
December	0.73	0.83
Overall Value	0.89	0.91

**Fig. 5** - Variations in pre and post calibration NSE values from month to month.

**SUMMARY AND CONCLUSIONS**

TRMM rainfall products have become an important source of high spatio-temporal resolution grid data for their use in climate change and water resources studies. Many scientists have conducted studies for the evaluation of TRMM data in different parts of the world, as well as in Indus Basin covering the major area of Pakistan. This study was novel in this sense that 15 years data from the initiation of TRMM program, i.e. 1998 to 2012 was utilized, with the assumption that averaging of both the satellite and rain-gauge datasets over the period of 15 years will help neutralizing the errors and biases in both datasets. The study concluded that TRMM data are quite reliable for their direct and real time use for conducting any rainfall-based studies. For conducting high accuracy studies, these can be further calibrated by adopting suitable calibration techniques. However, for high mountainous areas with heavy orographic rainfalls, regional calibration should be performed very carefully and for limited areal extents using as much dense and uniformly distributed rain gauge network as possible.

## ACKNOWLEDGEMENTS

This study was technically supported by ITHACA Research Center regarding TRMM satellite data processing and use. The authors also acknowledge Pakistan Meteorological Department (PMD) for providing rain gauge stations data. Special thanks to Higher Education Commission (HEC), Pakistan for providing financial support in the form of PhD scholarship to conduct research activities.

### ABSTRACT

Isla Hispaniola (Haiti and the Dominican Republic), one of the poorest regions of the planet, has repeatedly been hit by catastrophic natural disasters that caused incalculable economic losses and killed thousands of people. One striking example is the disastrous flood-event that occurred in the transnational basin of River Soliette on May 24th, 2004. The event was produced by a severe tropical storm originated over the Caribbean Sea from an intense low-pressure system, and killed over 1000 Haitian and Dominican people, wiping out a number of rural villages. The General Direction for Development and Cooperation of the Italian Department of Foreign Affairs funded through the Istituto Italo-Latino Americano (IILA, [www.iila.org](http://www.iila.org)) an international cooperation initiative (ICI), coordinated and directed by the University of Bologna. The initiative involved Haitian and Dominican institutions and consisted in two main components: (a) institutional capacity building on flood-risk management and mitigation measures and policies; (b) hydrological and hydraulic analysis of the May 2004 flood event aimed at formulating a suitable and affordable flood-risk mitigation plan. The second component of the cooperation is the main focus of this paper and in particular, starting from some logistical and technical constraints, a topographic survey based on GNSS technology that enabled us, in a short time, to survey river cross sections and construct Digital Elevation Models for two areas where to conduct numerical hydraulic modelling and to pre-design hypothetical flood-risk mitigation measures. The paper reports and discusses the main phases of the project.

**KEY WORDS:** FLOOD RISK MITIGATION PLAN, TRANS-BOUNDARY CATCHMENT, GNSS, DEM

### INTRODUCTION

Over the last decades the island shared by Haiti and the Dominican Republic, known as Isla Hispaniola (see Figure 1), has been affected by a number of severe hydrological events that causes thousand fatalities and incalculable damages to structures and environment. One of the most devastating and striking example is represented by the catastrophic flood occurred on May 24th, 2004, where a tropical depression in the Caribbean Sea caused a flash-flooding in the transnational basin of River Soliette, causing floods and landslides. According to the estimation provided by the US Agency for International Development [1], the event hit the larger urban settlements of the catchment, destroying a large part of Jimani (on the Dominican part of the catchment; see Figure 1) and Fond Verrettes (on the Haitian side of the river basin; see Figure 1), killing over 1000 Haitian people and more than 400 people in the Dominican Republic wiping away several rural villages.

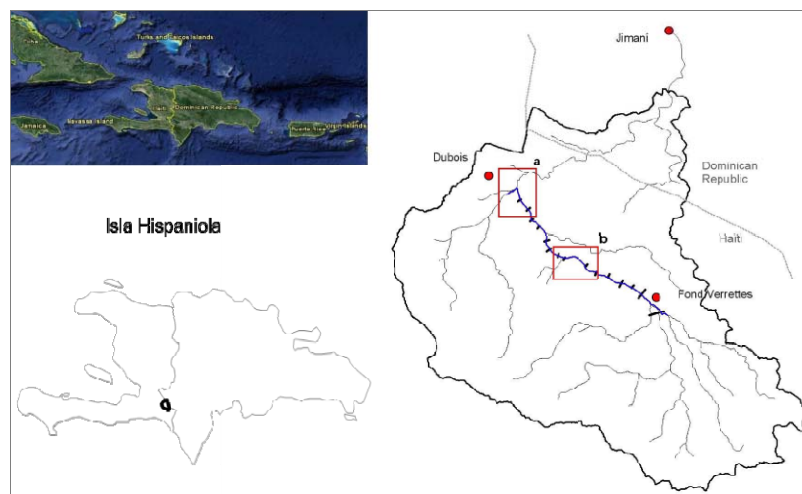

The extremely high hydro-geological risk of the Isla Hispaniola seems to be the result of a combination of different factors, such as the meteorological exposition of the area (i.e. the high frequency with which the island is hit by extreme events) and the high vulnerability of the territory. In particular, this latter aspect has been significantly accentuated by an uncontrolled development of human activities (e.g. the intense process of deforestation) and unplanned urban expansions which interest the whole river catchment.

In this context, developed countries should assist emerging countries in the field of flood-risk mitigation and flood protection planning, providing local technicians with the required instruments and knowledge necessary for the identification and implementation of structural and non-structural measures aimed at the reduction of the hydraulic risk.

It was in this perspective that the General Direction for Development and Cooperation of the Italian Department of Foreign Affairs funded through the Istituto Italo-Latino Americano (IILA, [www.iila.org](http://www.iila.org)) an international cooperation initiative (ICI), coordinated and directed by the University of Bologna (UniBo). The ICI involved local experts, public bodies and institutions (i.e., Secretaria de Estado de Medio Ambiente, SEMAR, and Instituto Nacional de Recursos Hidráulicos, INDRHI - <http://www.indrhi.gob.do> - in Dominican Republic, Ministère de l'Agriculture, des Ressources Naturelles et du Développement Rural, MARNDR - <http://www.agriculture.gouv.ht> - in Haiti), pursuing three main objectives: (a) institutional capacity building in the context of flood-hazard assessment and flood-risk management for Haitian and Dominican experts working on local public institutions; (b) investigation of the hydrological and hydraulic behaviour of the River Soliette (i.e. reconstruction and numerical simulation of the May 2004 event); (c) relative to the

prototypical case study of Soliette trans-boundary river-basin, identification of guidelines for the development of flood-risk mitigation plans and for the selection and pre-design of the most suitable structural and non-structural mitigation and adaptation measures.

Referring to this experience the paper summarizes the ensemble of activities implemented in the different context of the ICI. In particular, it reports a general overview for what concern the institutional capacity building and the hydrological reconstruction of the May 2004 event (objectives (a) and (b); deeply investigated and described by Brandimarte et al. [2]), while it mainly focuses on the topographical and hydraulic analysis carried out for the evaluation of flood-risk mitigation measures for the upper part of the catchment (objective (c)). In relation to the latter point, even if the manuscript does not present new instruments or methodological applications it reports a valuable way to reconcile topographic and geometric data required for the application of hydraulic numerical models with the necessity to operate in remote areas, where unfavourable operational (i.e. limited economic resources) and environmental conditions are combined together, avoiding the possibility to use up-to-date instrumentation and survey procedures (i.e. LiDAR or photogrammetric survey).

**Fig. 1** - Trans-boundary catchment of the River Soliette: principal hydrograph network (black tin line), modeled reach (blue tick line) and river cross-sections (black segments); red boxes identify the areas of interest for detailed topographic surveys.

## INSTITUTIONAL CAPACITY BUILDING

The institutional capacity building involved 12 junior local engineers (6 from Dominican Republic and 6 from Haiti) working for local public bodies or institutions (i.e. INDRHI, SEMAR and MARNDR) who attended a series of master classes for an overall period of 9 months. These classes, organized and coordinated by a pool of Italian researchers of the UniBo, focused on the fields of integrated water resources management and flood-risk mitigation, deepening in particular the following issues: hydrology and fluvial hydraulics analysis, hydrologic statistics, geographical information systems (GISs), topographical and geological analysis of the Isla Hispaniola, water distribution systems, structural and non-structural measures for flood-risk mitigation.

Since the final aim of the initiative was to enable 12 junior engineers to elaborate a possible flood-mitigation plan for the trans-boundary catchment, the master classes were also supported by practical activities through several computational experiments and field trips (see Figure 2).

These field trips were not only useful for participants' awareness about the damages of the May 2004 flood event, but they also provided the opportunity to better understand people habits, water education and awareness about the flood risk associated to the river Soliette. Furthermore, some of those field activities also focussed on the implementation of a detailed topographical survey of the upper part of the basin, providing a valid example on how to reconcile topographic data requirements for numerical hydraulic models in the context of flood-risk assessment in remote areas.

## HYDROLOGICAL ANALYSIS AND FLOOD-RISK MITIGATION PLAN

### Study area and numerical reconstruction of the May 2004 event

The study area is represented by the trans-boundary catchment of River Soliette (Figure 1), situated in the southern part of the Isla Hispaniola. The overall extension of the drainage area is c.a. 135 km<sup>2</sup>, of which about 20% (lower basin) belongs to the Dominican Republic, while the remaining part (upper basin) belongs to Haiti. Stream-channel slopes

range from 17% (upper basin) to 2% (lower basin) and it is often characterized by zero-flow period during most years. The two main urbanized areas in the basin are Fond Verrettes, in Haiti, and Jimaní, in the Dominican Republic (red dots in the Figure 1). Fond Verrettes lies on a wide plain area in the Haitian mountain side of the River Soliette, surrounded by steep slopes. During years preceding the 2004 flood event Fond Verrettes and Jimaní extended, getting in proximity to the main channel (Fond Verrettes), or occupying rather large portions of the alluvial bed of the River Soliette (Jimaní). Evidently, the unplanned and uncontrolled expansion of Fond Verrettes and Jimaní increased significantly the vulnerability of the area to flooding.

**Fig. 2** - Institutional capacity building through theoretical and field trips activities (left and central panels) and a statement of Environmental Educational activities for the population living in the flood prone area (right panel).

In addition, since the extreme poverty conditions of this particular area, the wood represents the main source of energy for the population of the island, with the result that the Haitian territory is affected by an intense deforestation process along the steep slopes of the river basin (see Figure 3). Especially in the upper and central part of the catchment (Figure 1), due to steep slopes (around 17% on the upper basin) and deforestation process that increase the soil erodibility, flash-floods can move large volumes of sediments and represent a big risk for urban areas situated along the reach or in the lower part of the catchment (i.e. Jimaní). As a consequence of this condition, the May 2004 event, characterized by extreme rainfall intensity, was also characterized by an intensive sediment transport, in some cases with boulder of about 2-3 m that were responsible for most of the damages (Figure 3).

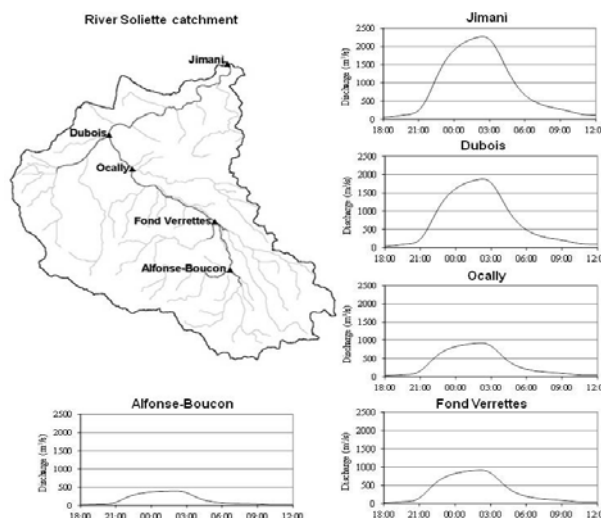

**Fig. 3** - Pictures taken from the basin of the River Soliette: example of the extensive deforestation process in the upper part of the basin (pictures on the left side) and pictures taken after the May 2004 event highlighting the erosion process and the dimension of transported boulders (pictures on the right side).

Concerning the study area, since the absence of a systematic measurement network in the river basin, the available hydraulic information was very sparse and referred only to low-flow conditions [3]. In this conditions in which historical information on flood events are particularly limited it is not possible to implement a traditional flood frequency analysis for the estimation of hydrological events associated with a specific return period. Starting from these considerations, in order to evaluate the hydraulic behavior of the River Soliette during severe hydraulic conditions, the study refers to the May 2004 event. Even if two previous studies provided an estimation of the peak flow at Jimaní [4][5], Brandimarte et al. [2] provided a first comprehensive hydrological analysis of the May 2004 event. Taking advantage of the collaboration between Haitian and Dominican institutions, triggered by means of the ICI, Brandimarte et al. [2] acquired rainfall data for the upper portion of the catchment, enabling the implementation of a quasi-distributed hydrological model (see e.g. [3]) for the comprehensive trans-boundary basin. Referring to topographic and morphological information provided by local authorities (e.g. land-use, soil-type variability and a coarse DEM for the whole river basin) the catchment was divided into 10 sub-catchments. Demanding to Brandimarte et al. [2] for more details on the reconstruction of the May 2004 flood event, Figure 4 summarizes the results of the hydrological analysis, providing the flow hydrographs at the catchment outlet (Jimaní) and at the confluences of the main tributaries of the River Soliette.

### Flood mitigation plan for the River Soliette catchment

Referring to the extreme event of the 2004, Brandimarte et al. [2] proposed a rather complex compound of structural and non-structural measures that should be implemented at the catchment scale for the mitigation of the flood-risk. Since the heterogeneous hydrological and morphological characteristics of the upper and lower part of the basin, a comprehensive flood mitigation plan has to rely on several mitigation measures that must be implemented in a context of a wide and complete cooperation between Haiti and Dominican Republic. In fact, while fluvial erosion and impulsive sediment transport are the main issues affecting the mountainous part of the basin (the high river slope and wide deforestation favor soil erodibility), the lower part is characterized by gentler slopes that facilitate sediment deposition, generating alluvial deposits which may result on extended flooding. Concerning the lower portion of the basin, Brandimarte et al. [2] proposed a set of different measures, such as: masonry lengthwise embankments for flood restraint in proximity of urban areas of Jimani and a series of non-structural measures which pursued flood-risk mitigation addressing the vulnerability of people and the adaptive capacity of the society (e.g. identification and delimitation of flood prone areas for controlling urban expansion, environmental education campaign for people leaving on floodable area and the implementation of a flood warning system).

**Fig. 4** - Sections of interest of the Soliette catchment with relative flow hydrographs reconstructed for the May 2004 event by means of a quasi-distributed hydrological model (see [2] for more details).

Concerning the lower portion of the basin, Brandimarte et al. [2] proposed a set of different measures, such as: masonry lengthwise embankments for flood restraint in proximity of urban areas of Jimani and a series of non-structural measures which pursued flood-risk mitigation addressing the vulnerability of people and the adaptive capacity of the society (e.g. identification and delimitation of flood prone areas for controlling urban expansion, environmental education campaign for people leaving on floodable area and the implementation of a flood warning system). In relation with these measures, Figure 5 highlights the importance of institution and people awareness of hydraulic risk, showing how a large part of damages and fatalities occurred in 2004 could have been avoided in case of considering the flood hazard in the urban expansion plan.

Considering the upper Soliette basin, flood mitigation measures rely on a system of structural and non-structural measures, such as the strengthening of the pluvio-hydrometric gauging network (actually almost absent), the promotion of an environmental education campaign for the population living in the flood prone areas, the delineation of flood prone areas for controlling urban expansion and the promotion of a reforestation program in order to reduce the intense soil erosion and sediment transport observed during the 2004 flood event. In relation to this last problem, the most significant efforts planned in terms of structural flood-risk mitigation measures should be dedicated to sediment retain, ensuring the reduction of solid deposition in the lower part of the catchment. Starting from these outcomes, the present work took advantage of more extensive topographical surveys carried out on the upper part of the catchment, that were not available during previous studies, in order to further investigate flood mitigation measures along the River Soliette, evaluating in particular the opportunity and the benefits related to the implementation of a system of three “filtering” dams for retaining solid material.

### HYDRAULIC-MODELING REQUIREMENTS AND OPERATIVE CONSTRAINTS

Next sections of the manuscript focus on the conflicting elements that characterized the evaluation of the feasibility of a system of three “slit” check dams in the upper part of the catchment: from one side the adverse operational condition in which we operated (limited economic and human resources and remoteness of the study area), and from the

other side, the need to provide high resolution and accuracy topographic data for the implementation of a numerical hydraulic model along the upper part of the River Soliette.

Since the river appears single-channeled in the upper part of the basin we refer to a Preissmann Scheme one-dimensional (1-D) hydrodynamic model (see e.g. [6]) for which the topographic representation of the riverbed consists of a series of geo-referenced river cross-sections.

**Fig. 5** - Urban extensions of Jimaní (Dominican Republic) in 1967, 1984, 2000 (areas delimited by red line from left to right) and May 2004 flood extent (dashed line).

The study river reach (of a length of ~7 km) was surveyed extracting several cross-sections with a relative distance of about 400 m, defining the cross-section width to ensure the survey of later banks 10 m above the river thalweg (see e.g. [7] and Figure 1). Furthermore, due to the necessity to design the system of check-dams, the hydraulic model required high resolution Digital Elevation Models (DEMs) for two different areas, pre-emptively identified during field trips as suitable for the construction of the filter dams (see red boxes in Figure 1). Concerning this last point, it is worth to highlight here that no geodetic infrastructure, mobile phone connection nor connections to the Geodetic Nationals Network were available in the study area. Instrumentation and surveying methods adopted in this case are discussed in the remainder of the manuscript.

## TOPOGRAPHIC SURVEY

Technical constrains and limited funds available for the present study prevented from the use of sophisticated instrumentation (i.e. Airborne or Terrestrial Laser Scanning), while the best choice for this kind of survey was indentified in the GNSS (Global Navigation Satellites Systems) technique, whose receivers allow both the framing of the survey in an absolute geodetic and cartographic System and the detailed survey of sections and of digital elevation model (DEM) in selected areas. Since no vertices of a local geodetic frame were available in the area we defined the receiver position in an International Geodetic System (e.g. ITRS) by means of the Precise Point Positioning (PPP) approach which ensure high accurate absolute positioning using carrier phase observations acquired by geodetic GNSS receivers (see i.e. [8]). During the last years the improving of the satellite ephemeris precision, clock models, geophysical models, etc., have permitted a significant improvement of the PPP and nowadays, in case of at least 24 hours windows time observation, the overall accuracy appears comparable to others approaches based on double difference carrier phase data processing (see e.g. [9] and [10]). The final position in PPP is typically given in the same geodetic reference frame of the satellites orbits (IGS) and the transformation to the International Terrestrial Reference Frame (ITRF) is possible applying a daily seven-parameter transformation defined on the bases of orbits and clocks. The parameters of this transformation have been evaluated on a worldwide network (FLINN network) where, for each station, official coordinate in ITRF are well known, by means of the GISPY-OASIS II package, developed and maintained by JPL-NASA.

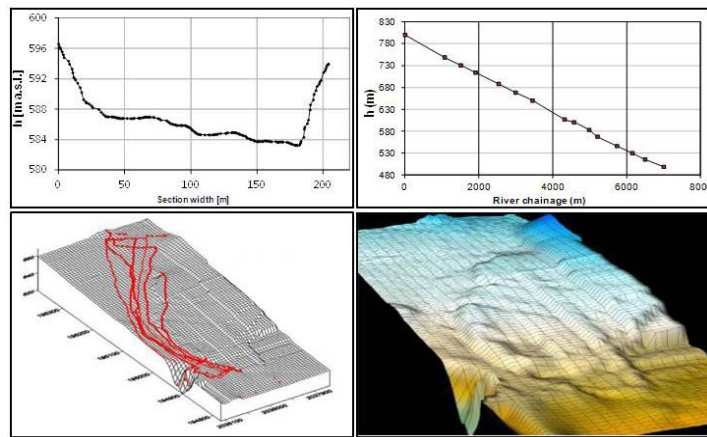

For what concern the detailed survey we adopted the Real Time Kinematic (RTK) technique both for the river sections surveys and DEM realization. In fact, this technique permits to estimate static or kinematic position of a receiver (Rover) in real time with respect a fixed reference station (Master), with an accuracy of few centimeters [9]-[11]. In our application the PPP survey provides precise coordinates in absolute ITRF2000 frame both for the Master and the Rovers positions. Usually the connection between master and rover receivers can be performed using or mobile or radio link. For this survey, since no mobile phone connections were available, we were forced to refer to VHF radio connection, which permits the possibility to send RTK corrections to many rover receivers simultaneously reducing significantly the time for survey.

In these constrained conditions the RTK technique provides some useful advantages. First of all, the surveyor can check on the screen, and in real time, the position of the receiver respect the coordinates of the reference station, with a centimeter level accuracy, and then navigate considering the requirement of the survey. Secondly, the connection with

the master station permits a continuously data quality check that guarantee the final quality of the positioning also if a post processing is required. Concerning the precision of the RTK survey, many experiments are provided in the literature (see e.g. [12]-[14]), while others have been performed also by the authors ([15]), finding a precision in terms of planimetric and height components of few centimeters. In the light of all these considerations, the combination of PPP and RTK techniques constitutes the best approach in remote area, ensuring precision and accuracy which appear more than adequate for the type of survey that must be performed.

The survey was carried out using two different master stations along the valley, one located in the upper part the study area (see Figure 1), in the proximity of Fond Verrettes, and the second one located close to the bottom part, in the proximity of one of the two areas where the high detailed survey had to be performed (see boxes in Figure 1). The fixed coordinates of the two master stations were obtained by means of 20 minutes observation of code single point positioning, with an expected absolute accuracy of a meter. Adopting a sampling time of 1 second each GNSS receiver was set up both for a Real Time positioning and raw data (carrier phase and code) recording. Thanks to the precious logistical and training support offered by Haitian and Dominican Institutions the field survey was completed only in 3 working days, using in total 5 GNSS receiver available for the study.

Figure 6 reports some results of the topographic survey: raw data have been converted from a geodetic system into a cartographic projection (UTM, zone 18), while the points heights have been transformed from ellipsoidal to orthometric ones by using EGM96 geoid model and assuming the geoidal undulation as a constant for all the area. Detailed digital elevation models with a resolution of 1 meter required for the areas highlighted in Figure 1 (boxes) have been realized using kriging geostatistical interpolator, starting from the surveyed profile obtained as before described.

**Fig. 6** - Results of the topographical survey: example of a river cross-section (up-left; see also traces on Figure 1), longitudinal profile of the upper part of the River Soliette (up-right), post-processed analysis with survey tracks and digital elevation representation of surveyed area (bottom panels).

## HYDRAULIC ANALYSIS

### Hydraulic modeling

Given the absence of a reliable data series relative to historical floods occurred over the study area (see also [2]) and considered the extreme intensity of the May 2004 event, we referred to it and, in particular, to the results of the hydrological analysis reproduced by Brandimarte et al. [2] (see also previous section) for the evaluation of flood-risk mitigation strategies along the River Soliette.

We referred to the collected set of topographical information for the implementation of a one-dimensional hydraulic model (1-D model) of the upper reach of River Soliette in order to deepen flood-risk mitigation strategies in the area of interest. In particular, Figure 1 shows the position of 15 cross-sections surveyed along the river, specifically along the stretch that goes from the urban area of Fond Verrettes to the confluence of River Ravine Dubois (left tributary relative to Dubois sub-basin). The 1-D model was built referring to the UNET code [16] that numerically solves the Saint Venant equations, through an algorithm that uses a classical implicit four-point finite difference scheme ([17]). The 1-D hydraulic model, once implemented and calibrated, represents a useful tool which ensure the possibility to investigate several fluvial geometric configurations, testing the efficiency and validity of different hydraulic structures in terms of flood-risk mitigation (see e.g. [18]-[20] for some example on the use of one-dimensional model).

The river geometry were reproduced referring to surveyed cross-sections which cover the overall study area (around 7 km reach of the River Soliette), while boxes on Figure 1 highlight the areas identified as suitable sites for the construction of hydraulic structures finalized to reduce the solid transport and for which two detailed DEMs were retrieved (see Figure 6). Thanks to the presence of detailed topographic models (DEM), both the areas of interest were reproduced more precisely in the 1-D model by adding several additional river cross-sections extracted by means of

Geographic Information System tools. Due to the lack of observed hydrometric data for the model calibration, roughness coefficients adopted in the model were defined referring to typical values reported in the literature for river beds of similar characteristics (i.e. coarse sediments, pebbles and big boulders; [21]).

### Flood-risk mitigation measures for the upper part of the River Soliette catchment

In order to reduce the flood hazard and flood exposure at the catchment scale it is necessary to envisage a comprehensive flood-risk mitigation plan composed of a series of different measures. Considering the upper part of the River Soliette, Brandimarte et al. [2] suggested the implementation of a series of non-structural measures, like for example the strengthening of the pluvio-hydrometric gauging network (actually almost totally absent), the delineation of flood prone areas for controlling urban expansion, the promotion of a reforestation program and the promotion of an environmental education campaign for the population living in the flood prone areas.

Among these, the problem related to the wild deforestation sounds particularly important in the light of significant problems related to sediment transport as observed during last major floods occurred in the area. In relation to this evidence, the most important efforts planned in terms of hydraulic infrastructures (structural measures) should be dedicated to the sediment retain, ensuring the reduction of solid deposition in the lower part of the catchment (i.e. alluvial fan near Jimaní, Dominican Republic) and avoiding the risk of flow levels rising that could originate floods on the urban area. In this context, the present work investigates the opportunity to implement a series of structural measures finalized to sediment retain in the upper part of the catchment. Referring to boxes reported in the Figure 1, the hydraulic analysis investigated the suitability of a system of three “filtering” dams (otherwise identified as “selective” or “slit” check dams). Figures 7 (upper panels) reports a detailed view of the areas identified as suitable for the dams, reporting also the traces of projected filter dams and additional cross-sections (yellow traces) extracted from detailed DEMs. The panel on the bottom left on Figure 7 reports the frontal view of one of the designed slit dams, while the panel on the bottom right highlights the results of the hydraulic simulation carried out over the study area.

This kind of dam is usually characterized by one or more narrow, vertical openings, going from the dam base up to the weir. The adoption of this structures appears the best solution for this case study because the sediment retain is obtained through the backwater effect induced by the structure, that makes possible the deposition of the sediments upstream the dam. Due to the nature of this structure and to the way it interacts with floods and sediments, its behavior appears customized to individual rivers and streams and their specific modalities of sediment transport. Final dimensions of projected dams and their interaction on flood propagation dynamics were investigated by means of the implemented 1-D model (see Figure 7).

**Fig. 7** - Position of designed check-dams for boxes a (upper left panel) and b (upper right panel) of Figure 1; bottom left: frontal view of a slit dam characterized by the vertical opening of about 5 m width; bottom right: three-dimensional view of the River Soliette as implemented in the 1-D hydraulic model.

### FINAL CONSIDERATIONS AND REMARKS

The present paper summarizes the results obtained within the international cooperation initiative (ICI) for the development of a flood-risk mitigation plan for the River Soliette, a transboundary river that flows through Haiti and Dominican Republic. Coordinated by the University of Bologna, the objectives of the ICI can be grouped as: a) institutional capacity building on flood-risk mitigation for local experts; b) hydrological and hydraulic analysis of the transnational River Soliette finalized to flood-risk mitigation. Triggered by the catastrophic consequences of the May 2004 flood event, the ICI promoted the collaboration between Haiti and Dominican Republic, enabling the cooperation of several technicians of the two countries in the field of flood-risk mitigation planning. The present paper briefly

summarizes all the activities carried out during the cooperation which enable an enhanced characterization of the hydrological and hydraulic behavior of the trans-boundary river Soliette (see also [2]). In particular, the present paper mainly focuses on the topographic surveys and data analysis processes implemented on the upper-central stream of the river (Haitian part of the catchment). Referring to river cross-sections and detailed DEMs surveyed during several field trips we implemented a one-dimensional (1-D) hydraulic model for a ~7-km reach of the river. With reference to the May 2004 flood event occurred on the study area and reproduced by Brandimarte et al. [2], we used the 1-D model for the formulation of a suitable trans-boundary flood-risk mitigation plan, analyzing the effect of structural measures. The analysis highlighted how a flood-risk mitigation plan should be considered as a rather complex compound of structural and non-structural measures due to the hydrological and morphological heterogeneous characteristics of the study area.

Concerning the design of structural measures on the upper part of the river catchment, the numerical analysis mainly focuses on the efficiency of a system of three filtering dams adopted as measures for controlling the impulsive sediment-transport phenomena that occur during large flood events, among the main issues affecting the upper and central part of the catchment.

Furthermore, the ICI highlights the importance of an appropriate land-use planning and development as a fundamental step for flood-risk mitigation in this area, whose importance is enhanced by extreme poverty conditions which hamper the possibility of implement costly structural flood mitigation measure. Also, the generalized lack of hydrological and topographical data makes the design and implementation of reliable structural measures for flood-risk mitigations difficult: the absence of hydrological data prevents from a reliable estimation of expected flood event, while the absence of appropriate topographical data results on unreliable hydraulic analysis.

In these contexts, the opportunity to implement fast and reliable survey techniques such as those presented above appears of utmost importance, especially in the cases where global topographical datasets (i.e. Shuttle Radar Topography Mission-DEM; DEM-STRM) do not ensure the resolution and the accuracy required for reliable hydraulic investigations.

### ABSTRACT

The potentiality of the Unmanned Aerial Vehicle (UAV) has already been proved by the military community, which has employed aircrafts without men on-board for reconnaissance missions and attack operations in the enemy field. The technological progress in the electronic and aerospace engineering fields allowed the development of low-cost UAVs characterized by a small size (mini-UAVs) and low weight, that can carry on-board imaging or non-imaging sensors. These advantageous features led the civil community to have an increasing interest in mini-UAVs. The excellent flight performances, the suitability for various types of missions, the inexpensiveness, and the capability to carry on-board different sensors, allow mini-UAVs to be employed in various missions. Nowadays, these systems allow to carry out missions in the following fields: land monitoring, remote sensing, agriculture and public security. Also the photogrammetric community has taken part to the research issues concerning the use of UAVs for map production.

The research group of Geomatics of the Politecnico di Torino has developed a set of interchangeable pods that can be mounted on a mini-UAV (a Hexacopter by Mikrokopter) devoted to emergency management in case of environmental disasters. This instrument is a low-cost mini-UAV equipped with photogrammetric sensors and capable of autonomous navigation (real time GNSS/IMU) and automatic digital image acquisition (characterized by a suitable geometric and radiometric quality). The platform is easily transportable on normal aircrafts and usable on the field, autonomously, by a couple of operators. The main innovation is to permits a real direct photogrammetric surveys in remote and disaster-affected areas in a short-range operative zone where it is not possible to carry out traditional photogrammetric flights. The acquisition technique allows the update of existing maps. Nevertheless, some test flights and practical applications have been performed in order to assess the autonomous flight performances and the suitability for photogrammetric flights.

### INTRODUCTION

World disaster report - 2012 [1] suggests just how many lives have been and will be impacted by reported disasters in the decade 2002-2011 where “disaster” refers to all the events with a natural and/or technological trigger only, and do not include wars, conflict-related famines, diseases or epidemics:

- 7000 disasters in almost 10 years, including about 4000 natural disasters;
- 2684 million of people reported affected, 1.234 million of people reported killed, about the 93% for natural disasters;
- the estimated damage exceeds 1,450 billion euro of which more than 97% of natural disasters;
- the mortality rate increases and peaks after 48 h after the event are unlikely to survive beyond few weeks in the hospital.

The disaster management in emergency applications is always a race against time to move as fast as possible to reach all potential surveyors and yet move slowly enough to avoid creating additional collapse, damage or risk to rescuers and victims. The primary motivation is to save lives. Robots can assist in meeting this goal either by interacting directly with victims or structures or automatic support activities [2].

Advances in control engineering and material science made it possible to develop a particular type of robots: a mini or micro unmanned aerial vehicles (UAVs) equipped with cameras and sensors. The technology has a derivation from military applications; recently, however, products have also been offered for the commercial market and have gained much attention, especially in some cheap products (e.g. Mikrokopter kit or similar). Having access to an aerial view over large areas is helpful in many applications, e.g., in disaster and law enforcement situations, where often only incomplete and inconsistent information is available to the rescue or police team. In such situations, airborne cameras and sensors are useful sources of informations which can help us to build an overview of the environment and to assess the current situation [3].

A conventional UAV can be regarded as an autonomous system that flies in the air, perceives the environment, and

communicates with the ground station. It is typically controlled by a human operator using a remote control. More recent technology ([4]) is equipped with navigation sensors as Global Navigation Satellite System (GNSS) and Inertial Measurement Unit (IMU) to guide navigation using sophisticated on-board electronics that lead to a good stability in the air.

UAVs are valuable sources of information in many application domains such as environmental monitoring, surveillance and law enforcement, and disaster management [5]. Obviously, these application domains have different requirements and constraints regarding available resources, timing, etc. One important task for which UAVs are used is to provide a bird's eye view and thus allow to assess the current situation. Analysing different views, the image quality can be improved and even depth information can be computed, leading to a three-dimensional model of the environment.

The environmental monitoring requires the acquisition of high resolution and multispectral images and geometrical information of the environment, in different epochs. These data are then analysed to completely define the radiometric and 3D geometric characteristics of the interested area and the time evolution of described phenomenon. Accurate and high-resolution images taken from UAVs flying at low altitudes gives much more precise evidence compared to the pictures taken from helicopters or airplanes, thanks to the lower height of the flight. However, it is not necessary to automatically analyse the data and in real time. The Fly Planning of the drones and its optimizations can be prepared off-line. Data analysis is performed off-line after all the data have been acquired, using sophisticated and possibly time-consuming algorithms. The main motivation for using the UAVs is to cover the interested area by using less resources (time, energy, ... ) and they are less intrusive compared to helicopters or airplanes.

Some specific examples may include forests monitoring, agriculture fields or snow terrains. Forests monitoring allows to observe the population of trees and their state as well as to estimate potential damages. In agriculture, UAVs can fly to observe crop growing or to document the damages after a thunderstorm. Analysis of the pictures acquired by the UAVs while flying over snow terrains can be used to estimate avalanche risks.

In disaster management, e.g., earthquake, flooding, wildfire [6], it is important to get a quick and correct overview of the situation since it is not possible to rely on available maps or imagery. Hence, similar to environmental monitoring, a first step is to employ a fleet of drones to map the affected area and thus provide a basis for planning further rescue activities. Additionally, sophisticated image analysis algorithms can be used on the UAVs to detect humans or certain objects and classify them.

The requirements in this application domain are much more stringent. First of all, one cannot rely on fixed infrastructure such as communication infrastructure, powerful central servers and power supply. Planning the mission off-line beforehand is not feasible. So mission planning has to be done on-line and the drones have to fly the calculated routes autonomously. The whole processing of aerial mapping has tight timing constraints; it is not possible to take the images and then employ sophisticated time-consuming algorithms for off-line image stitching. Detecting and classifying objects has to be done by the UAVs and thus requires considerable processing capabilities for real-time image analysis on-board the drones.

In this paper, the authors describe an example of UAV data acquisition and processing for a simulate emergency application. The test area where the simulation was carried out has been described and a detailed description of acquisition phase has been included. Data processing as well as the first results obtained by an automatic data processing that permitted the generation of an accurate digital terrain model (DTM) and an high resolution orthophoto useful to generate a Solid (True) OrthoPhoto (STOP) has been described. Finally some first conclusion are reported.

## TEST SITE

In our study, the technology above described has been used over a stone quarry in Luserna S. Giovanni (Piedmont) (Fig. 1), which is a zone characterized by an important quarrying activity, several stone quarries and with important environmental impacts on the land.

Fig. 1 - The position of the stone quarry.

The quarry was recently closed by the administration because it was declared dangerous for instability and insecurity problems for which it was impossible to continue the extraction work.

The dismissed area has at one hand the landfill site for the material resulting of the extraction activity: this is an incongruent not-accessible hill that we can compare to a landslide to correctly simulate an emergency application. Moreover it was quite difficult to reach many areas of the site, and the reference points were barely recognizable from an ashore point of view, so that the possibility to realize a photogrammetric flight using UAV was extremely useful. In fact, the objective of the work was a survey to obtain a traditional representation such as an orthophoto and a 3D model of the area in order to verify the use of this techniques for the disaster management.

## DATA ACQUISITION

The data acquisition methodology used in this case is similar to the traditional technique used in photogrammetry, using a small drone that allows to acquire aerial images of the site [7]. The aforementioned methodology was accompanied by a topographic survey employed for the determination of the coordinate of several 3D points of the quarry. The flight was previously planned using an existing map and a little scale satellite image, in order to establish the average elevation of the fly, the direction and the number of stripes.

All the acquisition operations have been completed in a few hours without a large number of operators (2 hours and 4 operators). This detail is very important as in emergency situations, which may be the instability of a quarry, it is essential to collect all the necessary data in the shortest possible time and subsequently to process them in the laboratory in order to clear the area as soon as possible.

According to the characteristics of the available data and the site, a map with scale 1: 100 has been chosen to conduct the analysis.

### The topographic survey

Once on field, it was necessary to realize a topographic network in order to use the surveyed point as Ground Control Points (GCPs) or CPs (Control Points) in order to obtain the orientation of the photogrammetric block which could be realize using the UAV data.

In the test site (Figure 2a), 27 points (wooden markers) has been collocated in the area. They have been obviously positioned only on easily accessible sites: in this case, as could be the case of a landslide, not all the area was reachable, but it's sufficient to have some well distributed reference points, eventually integrated with natural ground points, to post-process the photograms. Some targets were placed both on the ground, in order to be visible during the images acquisition step using the drone, and on the vertical wall behind the stone quarry.

Moreover two vertex as reference points (201 and 202) were used; these vertexes were measured with a GNSS instrumentation in static modality, in order to georeferencing this site. The markers' positions (Figure 2b) were measured from reference points using a total station (TS06 produced by Leica Geosystems).

**Fig. 2** - The GNSS vertexes (red) and the surveyed points (green).

The total station measurements concerning the markers (the total station is an instrument that measures the horizontal angles ( $L_{sp}$ ), the vertical angles ( $\varphi$ ) and the slope distances ( $d_i$ )), were processed with the software GEOSW, that give back an .asc file and a .dxf file with the correct coordinates of the markers (Fig. 2-right).

At first, to immediately get a 3D model of the site, the coordinates of the markers were calculated using a local reference system and assigning the coordinates to the point of the total station (coordinates  $X_s=100, Y_s=100, Z_s=100$ ).

However, a new georeferencing from the local reference system to global one (e.g. UTM-ETRS89 geodetic system) using the data obtained from the GNSS receiver is allowed and required.

**The UAV image acquisitions**

The aerial photogrammetry acquisition was carried out with a customized Hexakopter by Mikrokopter (Figure 3a), equipped with a digital camera, SONY-NEX 5 [8].

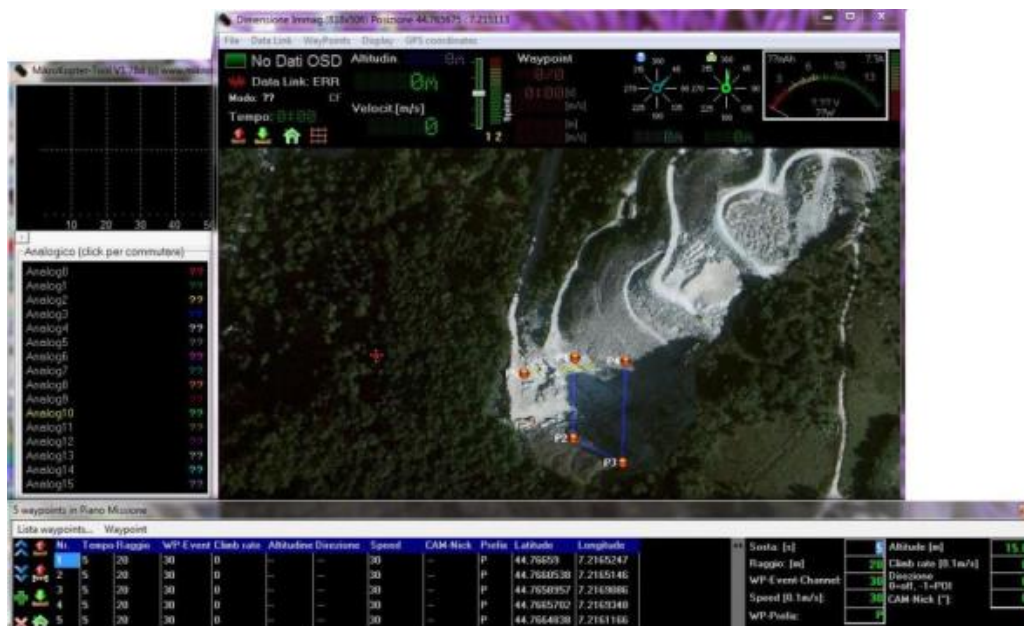

The flight plan elevation of the Hexakopter was set to about 50 meters and, for each flight, two adjacent stripes were acquired in order to obtain overlapped photogrammetric images of the whole stone quarry [9].

In order to maintain the control of the trajectories and the positions, the UAV was connected to a remote computer through an antenna (Figure 3b) (telemetry) and it can communicate with the software that send information about its position, orientation, height and speed. This telemetry allows the measurement and the recording of information between two remote devices in real time using a wireless communication (XBee).

In our case, the planned parameters of the UAV flight has been setting using Mikrokopter Tools: 2D waypoints positions in geographical coordinates, relative altitude with respect the height where UAV taking off the first time, speed for each path and compass direction during the flight (Figure 4). The UAV receives the flight instructions using telemetry and stores them on board to perform an autonomous flight. Anyway these parameter can be manually correct, during the flight, through a remote control, helping it to perform the flight in a correct way.

**Fig. 3** - The UAV (a) and the antenna used for the telemetry.

**Fig. 4** - Planned waypoints for the 2nd flight on the Mikrokopter tools.

Two different flights has been realized, using in both cases four waypoints (Figure 5). One more flight was achieved with a different camera axis: normally it is oriented along nadir direction; in this flight the camera axis has been oriented in horizontal direction, in order to take photos of the rock face behind the stone quarry. This method is

quite interesting because it can be used to take photos from heights that are difficult to reach in other ways. During the survey, 1900 images were approximately captured in about 25 minutes of flight.

Fig. 5 – Trajectories of the two realized flights, as memorized by the incorporated GPS antenna of the UAV.

**DATA PROCESSING**

Once collected the material on the field, a post-processing on site using a notebook could be realized. In this case we simulated this phase in laboratory.

First of all, a small number of images has been chosen for each strip, to ensure a total coverage of the area and an overlap between images of about 60%. For data processing the software LPS (Leica Photogrammetric Suite) of ERDAS suite was employed. As usual the data processing steps are represented by two successive phases: internal orientation and external orientation [10].

The result of the photogrammetric process could be considered as a 3D model, eventually georeferenced in a suitable reference system, which can be used for the digital representation or to extract terrain models, orthophotos, or simply to make measurements.

According to the abovementioned steps, internal orientation was performed by considering the camera parameters: in this case a Sony Nex camera was used, whose calibration parameters were known and represent the input value of the software ERDAS to initialize a new project. In our case they are:

- pixel size: 5,21x 5,21µm;
- focal length: 15,5829 mm;
- principal point position:  $x_0 = -0,0216$  mm,  $y_0 = 0,0364$  mm.

After that, the external orientation was performed, by collimating corresponding points (GCPs) on each image and associating them with corresponding coordinates previously calculated in the local system [11].

The software allows to directly import the ASCII file of the coordinates and display them in the work screen, as it is shown in the red box in Fig. 6, so you can collimate the corresponding point on the images.

Point #	Point ID	Description	Type	Usage	Active	X Reference	Y Reference	Z Reference
1	1	1	Full	Control	✓	16.300	18.090	10.027
2	2	2	Full	Control	✓	17.119	14.971	10.370
3	3	3	Full	Control	✓	17.672	12.867	10.513
4	4	4	Full	Control	✓	17.181	12.013	10.932
5	5	5	Full	Control	✓	14.124	11.202	10.648
6	7	7	Full	Control	✓	16.364	17.848	11.921
7	8	8	Full	Control	✓	17.159	14.814	12.493
8	9	9	Full	Control	✓	18.091	12.254	12.682

Fig. 6 - The points used for the external orientation with the reference coordinate in the local system.

In order to obtain the exterior orientation with sufficient redundancy, in each photo, should appear at least of 4

GCPs, although this number can change from each photogram.

When markers are not sufficient, supplementary points called Tie Points (TPs) are added, using natural references to have a better matching between the images. This is necessary in particular to involve inaccessible areas (present in the photos but, obviously, without markers) in the triangulation process. It is important that GCPs are well distributed, so that all the photograms participate in the triangulation (Figure 7).

It is possible to set some points (that exceed the minimum of 4 GCP for each photogram) as Control Points (CPs) which do not directly contribute to the triangulation process, but they are used to control the quality of the results. Moreover, it is possible to add other Tie Points (eventually automatically recognized by the software) with the aim of improving the quality of results and limit the deformations to have a better matching between the photograms.

**Fig. 7** - Triangulation of the frames used: the triangles are the control points and rectangles are the tie points.

If the first results of the Bundle Block Adjustment are not good, it is possible to delete or deactivate the points that have a big error and restart the triangulation process. For our purpose, according to the objective of the project we decide to consider only points that give an error lower than 20 centimetres in order to fit the admissible error relating with the scale of the final product.

In this way we can achieve a quite good product in a few time: the residual errors are restrained, very inferior to the admissible error (about 5 cm), and the processing time has been about 70 seconds for automatic photos matching and alignment (with an automatic research of control points), 2.5 minutes for constructing the DTM and 40 seconds for generate the textured solid model. So you can quickly have a useful base for researches and studies. With a bit more time you can also introduce known coordinates, in order to georeference the product.

## RESULTS AND ANALYSIS

The software LPS can automatically process the DTM (Digital Terrain Model) of the specify area (Figure 8). It is an array of dimension values on the surface of the ground excluding the buildings, trees and other objects in the area. A 3D model is realized considering a discretization step equal to 20 cm [12].

**Fig. 8** - The DTM of the stone quarry.

The final step is to generate an orthophoto of the quarry.

The orthophoto is a cartographic representation in the form of digital georeferenced image: this corresponds to an orthogonal projection of the territory in the plan maps.

By using the ERDAS software, individual orthophotos were automatically realized after the BBA, which finally were merged in order to create the final mosaic. In the test site, PCI Geomatica were employed for the mosaic realization (Figure 9).

**Fig. 8** - The orthophotos mosaic obtained after the triangulation.

Moreover using the achieved data it's possible to create a Solid (True) OrthoPhoto (Figure 10a, [13]), that is an image made by the fusion between a DTM, that contain the information about the height, and a orthophoto, that described the bidimensional representation. So, using appropriate software ("STOPviewer"), the 3D information could be read in an apparently bidimensional image (Figure 10b).

**Fig. 10** - The Solid OrthoPhoto generated (a) and an example of STOP viewer (b).

A specific software tool developed by the authors in Intel Visual Fortran language ("STOPGENERator") allows to make this product: you can first generate a single DTM of the whole area and then, using it, automatically generate single orthophotos associated with the DTM.

This processing has required 2 hours in order to generate the model and automatically extract the DTM and produce the orthophotos mosaic. For this processing a Lenovo S430 Laptop has been used (equipped with Windows8 professional, 64bit), employing an i7 IntelCore processor (speed 2,9GH) and a DDR3 8 GB Ram.

## CONCLUSIONS

As it is reported in the paper, it is possible to say that the applied methodology is suitable for emergency situations such as the instability of a quarry, as it allows to acquire in a short time all the necessary data and obtain, with simple post processing, 2D and 3D measurable and georeferenced products that allow to study phenomena and plan the activities of recovery or restoration without the need to travel too much on the ground.

Therefore the use of the UAV can be considered adequate in all those situations in which the areas to be detected are hardly accessible or unstable, and there is the need to provide precise data in a short time.

Moreover, flying with an horizontal axis of the camera, we can easily reach different heights without physically move the operator. This can be very useful when emergency situations require it, both in natural and in anthropic context.

## ACKNOWLEDGMENT

This project was carried out for a degree thesis and its realization was made possible thanks to funding from the PRIN 2010-2011, Research programs of national interest called “*Tecniche geomatiche innovative ed emergenti di rilievo, telerilevamento (da aereo, satellite, uav) e WEBGIS per la mappatura del rischio in tempo reale e la prevenzione del danno ambientale*” (person in charge: Prof. Santamaria, Università Partenope , Napoli). A special thanks to prof. Marilena Cardu for the proposal of the site and for her collaboration.

## NOMENCLATURE

CP	Control Points
DTM	Digital Terrain Model
EO	External Orientation
GCP	Ground Control Point
GNSS	Global Navigation Satellite System
GPS	Global Positioning System
IO	Internal Orientation
IMU	Inertial Measurement Unit
LPS	Leica Photogrammetric Suite
TS	Total Station
TP	Tie Points
UAV	Unmanned Aerial Vehicle
E, N, Q	East, North, Geodetic Height
$X_s, Y_s, Z_s$	Coordinate of the point of the total station
$h_s$	Total station height
$h_p$	Prism height
$d_l$	Slope distance
$\varphi$	Zenith angle

International Cooperation Project of Friuli Venezia Giulia

Realisation of a Geomatics Laboratory for the Management of Hydrogeologic and Seismic Risks

Giorgio Poretti, Chiara Calligaris, Michele Ferneti

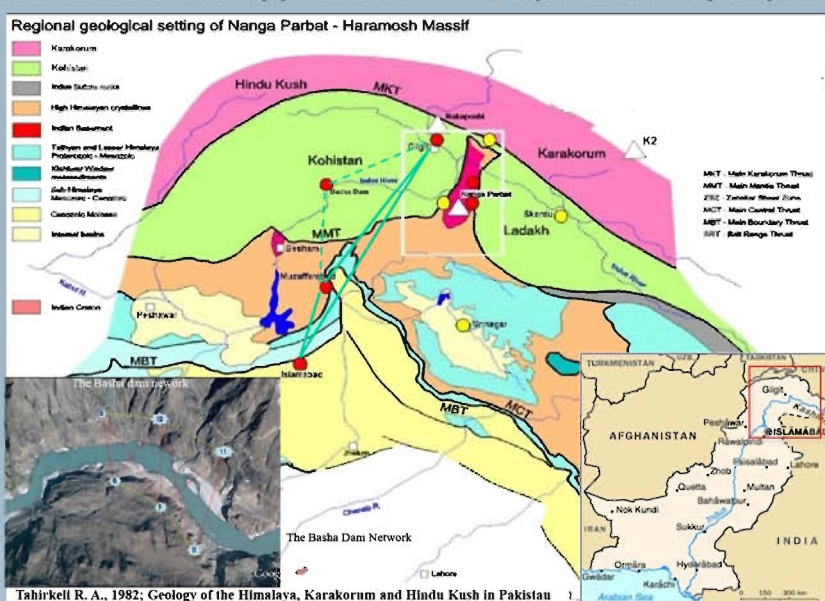

Conference participants in front of the memorial for the 2005 earthquake

The day of the tragedy

On the 5th of October 2005, the Pakistani region of Kashmir suffered a devastating earthquake which caused more than 70,000 deaths and left 4.5 million people homeless by destroying the economic and social fabric of a region on the slopes of the Karakorum, which was enjoying a slow but significant growth in agriculture and craftsmanship. This disaster involved also the University of Azad Jammu and Kashmir (AJKU) located in Muzaffarabad, near the epicenter of the quake, with a loss of 112 students and 10 teachers and an unknown number of wounded. A large part of the casualties was due to the poor antiseismic building techniques and to the landslides produced by the tectonic movement.

Tahirikell R. A., 1982; Geology of the Himalaya, Karakorum and Hindu Kush in Pakistan

The cooperation project was based on a three-year programme that brought to Trieste every year four researchers from Kashmir and provided courses on GIS and seismic risk awareness. Their presence was an opportunity for providing the geologists with the necessary information for the norms to be followed in building at different distances from the epicenter and in the construction of a dam in an earthquake area. They visited the Vajont dam. Within this project a new GNSS permanent station was started at the AJKU and inserted into the GPS network of the Karakorum, carried out within a project of the Ministry of Foreign Affairs in 2010. In August 2013 the first measurements were made calculating the distances between: Islamabad – Muzaffarabad, Muzaffarabad – Gilgit, Islamabad – Gilgit. The measurement of the GPS baselines to the Basha Dam network will be performed in Spring 2014.

Remembering that it had suffered a similar experience in 1976 the Friuli Venezia Giulia Region approved a programme of support for the realisation of a Geomatics Lab at the AJK University. This was performed through the University of Trieste that transferred the expertise acquired by the FVG Region during the period of reconstruction. Particular interest was focused on the study of landslides.

## SUSTAINABILITY OF APPROPRIATE ENVIRONMENTAL TECHNOLOGIES IN DEVELOPING COUNTRIES

CeTAMB, Research Centre on Appropriate Technologies for Environmental Management in Developing Countries,  
University of Brescia, Italy, [cetamb@ing.unibs.it](mailto:cetamb@ing.unibs.it)

### INTRODUCTION

The implementation of technologies in Developing Countries (DCs) often has to face some critical factors, such as: rapid population growth and changing lifestyle; lack of sensitivity and citizen participation; weakness of the regulatory framework and its application; fragmented and inefficient organizations; insufficient and inappropriate material and infrastructural resources; limited financial resources or inefficient management of tariffs; limited human resources (staff size, skills, ability and motivation); lack of environmental monitoring, etc.. These factors are often among the main causes of the failure of international cooperation projects that promote the use of such technologies. Their introduction and dissemination needs a rigorous multidisciplinary methodological approach, which allows a process of selection and implementation of appropriate technologies able to consider the peculiarities of the context and to integrate with the local traditional uses and capabilities of the beneficiary population.

The topic of the panel was discussed through examples of the application of appropriate technologies in the field of water and wastewater, solid waste management and access to energy. The aim was to collect, through extensive discussion with the participants, suggestions useful in identifying criteria for a proper implementation of appropriate environmental technologies in international cooperation projects.

### CeTAMB ACTIVITY

The issues of international development cooperation are often seen as far away from everyday reality in which young people live. The richness of practical experiences in the sector, often available at different scale at local level, gives the opportunity to make young people closer to these issues. Their involvement can be really important, both from an educational point of view for themselves, both as a practical help and motivation to raise awareness and participation in interventions to find appropriate solutions to the real problems of developing countries.

CeTAMB (Research Centre on Appropriate Technologies for Environmental Management in Developing Countries), a research centre based at the Department of Civil Engineering, Architecture, Land, Environment and Mathematics (DICATAM) of the University of Brescia since April 2000, deals with international cooperation with regard to the technical-environmental aspects, trying to work as a meeting point among the academic world, the international cooperation sector and the young people, in particular PhD, university and high school students.

CeTAMB's main objective is the implementation of projects and research activities to improve the quality of the environment and the promotion of the concept of sustainable development in developing countries (DCs) through the application of appropriate technologies. These technologies are designed, planned, implemented, managed according to criteria of simplicity, economy and sustainability, while respecting the peculiarities of the context of intervention. CeTAMB's main intervention sectors are: drinking water supply and treatment, wastewater treatment and reuse, solid waste management and improved energy access from solid fuels.

The activity is carried out through direct participation in international cooperation projects and through the education programs. This allows to achieve the general objectives of the centre:

1. to contribute to the international cooperation sector through the direct participation in projects that are useful and sustainable over time,
2. to apply scientific and rigorous methods, investigating and valuing research and innovation in the field of appropriate technologies for environmental management in DCs,
3. to educate and train young people to the issues of international cooperation.

In order to adopt a multidisciplinary approach in the implementation of these activities, in the years CeTAMB has created a network of contacts, including research centres (Italian and international), Italian and local Non-Governmental Organizations (NGOs) and involving actively high-school and undergraduate students and professionals. Since its born, CeTAMB availed an active collaboration with several local high schools. This synergy allowed not only the participation of a number of classes of young students to training sessions (seminars and conferences organized ad hoc), but also their collaboration in practical projects of experimental research in both laboratory scale and on the field in DCs. Moreover, since 2008, in collaboration with the Faculty of Medicine of Brescia, a PhD course in "Appropriate Methodologies and Techniques for International Development Cooperation" has been activated, aiming to strengthen research in the environmental and health sector.

## CONTENT OF THE PANEL

The panel program touched the different research sectors of CeTAmb activity, with contributions of researchers also from other Departments and Universities. The presentations followed the central theme of the practical implementation of appropriate technologies for the environmental management, discussing their sustainability and providing the audience with an overview on the methodological approach adopted and the outcomes of the field case studies presented. The titles of the presentations are listed below.

- Sustainability of appropriate environmental technologies in Developing Countries, Prof. Carlo Collivignarelli, CeTAmb, DICATAM, University of Brescia
- Sustainability of water supply projects: considerations from two case studies, Eng. Sabrina Sorlini, Eng. Luca Rondi, CeTAmb, DICATAM, University of Brescia
- Healthcare sustainable design in the global south. A tale of two stories, Prof. Marco Morandotti, STEP, University of Pavia
- Valorisation and sustainability of crude earth as building material in Chad and Cameroon, Eng. Angelo Mazzù, DIMI, University of Brescia
- Study and design of a low environmental and social impact landfilling in Togo, Prof, Alessandra Bonoli, Code3, DICAM, University of Bologna
- Appropriate technologies for household cooking with solid fuels in Developing Countries, eng. Francesco Vitali, CeTAmb, DICATAM, University of Brescia

The participation to the panel was high with an audience of more than 30 people from different backgrounds (Universities, ONGs and voluntary associations), that resulted in a lively and interesting final discussion with a lot of questions for the speakers and a wide share of ideas and points of view on the panel topic.

## SUSTAINABILITY OF APPROPRIATE ENVIRONMENTAL TECHNOLOGIES IN DEVELOPING COUNTRIES: GENERAL FRAMEWORK

Carlo Collivignarelli\*, Sabrina Sorlini\*, Francesco Vitali\*

\*CeTAmb, Research Centre on Appropriate Technologies for Environmental Management in Developing Countries, University of Brescia, Italy, [cetamb@ing.unibs.it](mailto:cetamb@ing.unibs.it)

### ABSTRACT

The implementation of technologies in Developing Countries often has to face some critical factors, such as: rapid population growth and changing lifestyle; lack of sensitivity and citizen participation; weakness of the regulatory framework and its application; fragmented and inefficient organizations; insufficient and inappropriate material and infrastructural resources; limited financial resources or inefficient management of tariffs; limited human resources (staff size, skills, ability and motivation); lack of environmental monitoring, etc.. These factors are often among the main causes of the failure of international cooperation projects that promote the use of such technologies. Their introduction and dissemination needs a rigorous multidisciplinary methodological approach, which allows a process of selection and implementation of appropriate technologies able to consider the peculiarities of the context and to integrate with the local traditional uses and capabilities of the beneficiary population.

### INTRODUCTION

The application of appropriate technologies in specific contexts is the basis of a correct approach to the concept of sustainable development, i.e. a development that ensure the satisfaction of human needs and a balanced use of natural resources and of the environment in general, without compromising the quality of life of future generations. This concept is deep rooted in the research conducted within the activities of CeTAmb (established at the Faculty of Engineering, University of Brescia since April 2000) on specific issues of environmental engineering: drinking water treatment, wastewater and municipal solid waste management, access to household energy from solid fuels.

Water supply is a very current issue, since water is a limited resource and increasingly polluted. The consumption of contaminated water is a major cause of human diseases (not only in developing countries). Moreover other problems are related to the availability of a proper water source (with an adequate quantity and at an adequate distance from the house).

Another issue of interest is the management of waste water, which in many situations is carried out without any treatment or via uncontrolled disposal in the environment. This creates significant risks for human health and hygiene and for the environment, due to the high concentration of pathogens in human and animal excreta. Their proper management is required in order to prevent both pollution of natural water bodies and the spread of infectious diseases. It is therefore important to study, design and implement adequate systems for the evacuation of black and grey water , for their treatment and, possibly, for their re-use.

Solid waste management is another serious environmental issue common for both the industrialized and the developing Countries. Although the responsible administrations increasingly acknowledge the importance of adequate wastes collection and disposal, the increasing amount of wastes generated by the rapid urbanization usually is not properly managed, particularly in the developing Countries. The absence of appropriate systems for the collection, treatment and disposal of municipal solid waste (MSW) is often due to lack of awareness and participation of the local community as well as the lack of financial resources and technical facilities.

The use of traditional solid fuels leads to a number of dramatic impacts not only on the users but also for the environment. In order to gather the fuel required for their daily energy needs, householders have to cover every day longer distances carrying heavy loads or invest a significant share of their budget to purchase it in the local market. Besides wasting a resource (for which a lot of drudgery or money were spent), the use of solid fuels on open fires or inefficient stoves results in a range of health-damaging pollutant emission, often under conditions of poor household ventilation. Women and young children, who usually spend many hours close to the smoky source, are the most exposed. Such emissions have also significant global warming effects, due to incomplete combustion of fuel carbon. Moreover, the unsustainable overexploitation of natural resources leads to their faster depletion. Thus, especially for the weakest income classes, energy poverty seems to be a no-way-out situation: by the one side they do not have any financial mean to step up their own energy condition, accessing the use of more convenient, cleaner and modern fuels. By the other side, the limited energy level provides them with no emancipation means, both to improve their quality of life and to eventually start a small income generating activity.

## THE ROLE OF APPROPRIATE TECHNOLOGIES

With the definition of the “Millennium Development Goals” countries of the world have pledged to reduce by half the people without access to basic services. In particular, analysing the major environmental issues, it can be noted that an improvement in the management of drinking water, wastewater and solid waste management plays a critical role in achieving the eight Millennium Development Goals (MDGs). As a result, international cooperation between countries of the North and South of the world may play an important role as a possible tool for moving towards sustainable development at a global level, to open a dialogue between cultures, and to facilitate the development of environmental, economic and social sustainable technologies.

This involves the adoption of a new model of development, which requires the use of non-conventional technologies, the so-called “appropriate technologies”, which are the tool to solve environmental issues but also to allow a more balanced and sustainable relationship between the countries of North and South of the world, with the aim of improving the living conditions of local populations ensuring sustainable utilization of local resources, in full respect and appreciation of local culture.

Indian ideological leader Mahatma Gandhi is often cited as the “mother” of the appropriate technology movement. Though the concept had not been given a name, Gandhi, during his struggle for Indian independence (1915–1945), advocated for small, local and predominantly village-based technology to help India's villages become self-reliant. He disagreed with the idea of technology that benefited a minority of people at the expense of the majority or that put people out of work to increase profit. Dr. Ernst Friedrich Schumacher is credited as the founder of the appropriate technology movement. In 1962, he first articulated the idea of “intermediate technology” as a technology belonging between the capital-intensive advanced technologies of the “West”, driven by large scale production and profit, and the traditional subsistence technologies of developing countries. He promoted technologies that are small scale, labor intensive, energy efficient, environmentally sound and locally controlled to improve a community's standard of living. Appropriate technology is the means to promote technical changes that are effective in enabling people with few resources to work their own way out of poverty. Appropriate technology is intended to build upon the existing skills, knowledge and cultural norms of women and men in developing countries, while increasing the efficiency and productivity of their enterprises or domestic activities. By and large it also seeks to sustain the local environment. Intermediate technology is a technical solution to production needs that has costs higher than those too low of the typical solutions adopted in Developing Countries but lower than the costs too high of the advanced technologies applied in Developed Countries.

“Appropriate technologies” are characterized by some basic requirements. They should:

- solve real problems and needs;
- have a low cost of installation and operation;
- have a rational use of natural resources;
- be simple (in the production/construction phase, in the operation and in the maintenance);
- be affordable for the majority of the local population;
- reduce the environmental impact.

The approach to be taken should aim to identify “technology solutions and practical achievements” adapted to the local culture and available resources, so that the intervention does not result imposed, but, on the contrary, is an expression of a real local need, involving directly the population in the process and making them actors of their own development.

## AN APPROPRIATE METHODOLOGY FOR THE IMPLEMENTATION OF APPROPRIATE TECHNOLOGIES

The concepts discussed above stand in the basis of researches conducted within the CeTAMB's activities. The final goal of our projects is to develop appropriate and sustainable technologies, aimed at solving specific environmental problems in developing countries. In order to achieve this goal, it is essential (though not sufficient) that the activity is supported by a proper and scientific methodology, from the initial setup to the final validation of the project. The preliminary steps (from the identification to the design of the project) are essential to know and understand the context of intervention and to allow to frame the problem and to define the objectives to be achieved. The implementation of the project must aim to identify, plan and realize the most appropriate technical solutions to the context analysed. Finally, the validation of the project is an important step to ensure its effective sustainability (under a social, cultural, economic and technological point of view).

### Setting the project

The projects developed by CeTAMB come from specific requests from international or local NGOs, associations and local authorities. The first step is to know the reality in which the project will be implemented. This first work

requires a 360-degree approach, in order to gather information and data about the area, the population, the social and cultural contexts (social organization, employment, common practices and habits, presence of groups and organizations active in the environmental field or associations/entrepreneurs involved in the management of environmental services, etc.). The second phase focuses on the specific environmental issue under study. General knowledge of the reality and of the specific environmental issues are developed through on-site surveys, collecting data available with the help of local partners or gathering information directly from local stakeholders (interviews with relevant stakeholders, focus group discussions, social analysis). These surveys are also intended to identify the presence of existing projects already in place and to assess the level of awareness on environmental issues to obtain a frame of the territorial and environmental situation. Information/training on environmental issues may be an useful tool to increase the awareness of local population towards a certain topic. The awareness / knowledge of the problems is a prerequisite to try to find a solution and to stimulate the active participation of the beneficiaries of the project. The research for a sustainable technical solution, given the complexity of the social, cultural, economic and technological contexts, must be the result of a close collaboration between the academic staff and who knows and daily lives the local reality (volunteers on site, local governments, technical universities, project beneficiaries). Finally, the last step in the setup phase of the project is the clear definition of the objectives to be achieved.

### **Project development**

The development of the project involves the study, research, design and implementation of the most appropriate technology to context. The technical solution must be identified with the following basic requirements of sustainability:

- environmental: environmental sustainability means a conscious use of natural resources, reducing material consumption and resulting in a reduction of waste from the activities;
- economic: economic sustainability is essential to achieve a stable and durable development (that lasts also after the end of the cooperation action), to increase the employment rate, the generation of income etc.;
- social: social sustainability is a key element for sustainable development , in order to ensure a fair distribution of resources between individuals, the integration of local habits and culture, within the more general framework of the respect for human and civil rights.

#### *Identification of certain "appropriate technology"*

The first step consists in a research of both environmental regulations present in the context studied and of technical solutions already proposed and/or implemented, with the aim of:

- identifying a range of solutions "simplified" and at the same time efficient and respectful of the human health and of the environment (e.g., in the case of water for drinking purposes, must be complied with the limits imposed by the WHO);
- highlighting the advantages, disadvantages and problems encountered in previous experiences under social/cultural and technical aspects.

This phase can be developed through the consultation of bibliographic material, or through a direct or indirect collection of information on site. The identification of a number of appropriate technology, however, must consider the socio/economic environment in which they are going to be implemented. Then their compatibility with the local reality will need to be assessed. For instance, it should be considered the impact of technology on the daily habits of the beneficiaries, on the employment situation , etc..

#### *Testing the technology*

In many cases may be useful to develop a preliminary experimental phase to be conducted at laboratory or at pilot scale (on-site or in Italy), with the aim of identifying the most appropriate technology. Lab tests are designed to verify the literature data collected and to study the feasibility of technical and economic sides. The best option is to set up this phase directly in the local context where the technology is supposed to be implemented, thereby allowing a field assessment of the technology, by-passing problems due to different climatic conditions, to the adequacy of local available resources and skills/knowledge, etc..

#### *Design and implementation of the most appropriate technology*

Given a preliminary evaluation of the technical/economic sustainability of the implementation of the technology through the pilot testing, the consequent phase of design and construction must involve all stakeholders according to respective roles and responsibilities. For example, with regard to the construction phase, it is possible to involve local workshops and laboratories; further contributions to experimentation can come from international and local NGOs, students and researchers from local universities, local authorities and non-state actors.

## VALIDATION OF THE PROJECT

The final stage is the validation of the technology applied at real scale in order to assess the proper functioning in the long-term of the project. This point is crucial, as it allows, by one hand, to make a critical assessment of the project implemented and by the other to appreciate the usefulness of the project. To verify the proper functioning of the technology, the following conditions must be complied:

- a correct operation from the point of view of the process, ensuring the health and environmental yields;
- a proper management of technology , in terms of adequate technical maintenance and proper disposal of residues, i.e. allowing an environmentally compatible management of the technology.

In the evaluation of the technology not only the environmental and technical aspects should be considered but also its social and economic utility, in terms of creation of new jobs, of guarantee of safe job conditions, and of self-sustainability of the activities implemented by means of the technology proposed and promoted by the project.

The second step of the validation regards the assessment of the utility of the project. For this purpose it is useful to respond to a number of questions that allow to estimate the short- or long-term consequences. The following list reports some example questions:

- Has the environmental issue been solved, even partially?
- Are there social positive effects (e.g. creation of job, improvement of living conditions , ...)?
- Was an income-generating activity created? Do the products eventually obtained from the activities promoted by the project (e.g. the re-sale of recovered materials from solid waste) have a market ?
- Are there positive effects on local people's health ?
- Has the awareness work been successful? Do local institutions and association involved continue with the campaign?
- Is the cooperation of local actors active and independent?

Which can be the tools to verify the outcome of a project in a medium- and long-term?

- The first answer comes from the people's feedback! In addition to the impressions that may be collected on-site talking with people, it can be useful to do an *ad hoc* evaluation (even on specific aspects of the project) through the distribution of questionnaires to the stakeholders involved in order to assess the degree of appreciation of the technology.
- The environmental benefit of the technology implemented can also be evaluated through a qualitative environmental monitoring directly on the field, in order to measure and quantify the real impact of the action done.
- The impact on people's health can be evaluated through the analysis of data sanitation available at clinics.
- Finally, the evaluation of the effectiveness of the project on the general development can be assessed by long-term (at least a few years after the end of the project) through the distribution of questionnaires designed to detect and monitor social and economic development indicators (literacy, sanitation, jobs, ... before and after the project).

## CONCLUSIONS

The points in this paper are inevitably partial, being the result of some reflections on the experience gained from CeTAmb made during these years in a particular sector and in certain contexts. The papers presented in this session present case studies of the application of appropriate technologies in the field of water and wastewater, solid waste management and access to energy. The aim is to collect, through extensive discussion with the participants, suggestions useful in identifying criteria for a proper implementation of appropriate environmental technologies in international cooperation projects and to assess the main features to guarantee their sustainability in the long term.

## SUSTAINABILITY OF WATER SUPPLY PROJECTS: CONSIDERATIONS FROM TWO CASE STUDIES

Sabrina Sorlini\*, Luca Rondi\*

\*CeTAmb – Research Centre on Appropriate Technologies for Environmental Management in Developing Countries, DICATAM – Department of Civil Engineering, Architecture, Land, Environment and Mathematics, University of Brescia, Italy, [sabrina.sorlini@ing.unibs.it](mailto:sabrina.sorlini@ing.unibs.it) - [luca.rondi@ing.unibs.it](mailto:luca.rondi@ing.unibs.it)

### ABSTRACT

In developing countries, drinking water supply is still an open issue: in sub-Saharan Africa, coverage of improved water supply gains only the 63%. Some regions are affected by geogenic contaminants (e.g. fluorides and arsenic) and the lack of access to sanitation facilities and hygiene practices causes a high microbiological contamination of water in the supply chain.

The responses to these problems are the several projects on drinking water supply that aim to improve the water availability and quality all over the world. But, how cooperation projects on water supply can be really sustainable? Can implemented technologies still work after the end of the projects? These are questions that every NGO/Association should answer during project elaboration and implementation.

The main factors that can be a source of failure for water supply projects are: complexity or costs of technologies (even if implemented at domestic scale), technical management, level of acceptance by the beneficiary community (that, if does not clearly recognize the technology benefits, can make hardly sustainable the entire project) and level of support by the local and/or national Institutions.

In order to gain the project sustainability, the activities should be clearly focused after a rigorous assessment in the study area regarding the local availability of human and material resources for the technology implementation, the awareness level of the community in terms of technology need and acceptance, etc.

CeTAmb research center (University of Brescia) has surveyed two projects on drinking water management in Senegal and Burkina Faso, which have confirmed the importance of these aspects. The sustainability level was evaluated after the project implementation: in the first case study, several deficiencies were arisen in terms of material availability and costs, whereas the second case study highlighted successful results in regard to water management system sustainability.

### INTRODUCTION

According to the last update of the WHO/UNICEF Joint Monitoring Programme (JMP) for the water supply and sanitation progress towards the MDGs achievement, drinking-water coverage in 2011 still remained at 89% (even if 1% above the MDG drinking-water target). Thus, 768 million people relied on unimproved drinking-water sources [1]. Moreover, it has to be considered an uncountable amount of people that, while disposing of an improved source, consumes drinking-water of poor quality (above all concerning the microbiological quality) due to the lack of proper handling and hygiene during the transport and storage steps.

Meanwhile, sanitation coverage (in 2011) was 64%, off track to meet the MDG sanitation target of 75%. If current trends continue, it is set to miss the target by more than half a billion people. By the end of 2011, there were 2.5 billion people who still did not use an improved sanitation facility. The number of people practising open defecation decreased to a little over 1 billion, but this still represents 15% of the global population [1].

The worst situation is highlighted to be in the sub-Saharan Africa, where the coverage of improved water supply gains only the 63% and the coverage of sanitation facilities reaches the 48% (improved and shared facilities) [1].

Despite several decades of development aid and thousands of international cooperation projects implemented all over the world, the worldwide situation remains critical, as stated above. More efforts have to be put in place in order to overcome these conditions. But every NGO/Association that has worked or is working or will work in this direction should carefully reflect if development aids or cooperation projects are really sustainable according to the local context. Indeed, it is only through a coherent focus on sustainability that international cooperation projects can reach the objectives stated by the MDGs, at least in relation to water supply and sanitation. But what does sustainability mean in development projects? According to the World Commission on Environment and Development, the most widely accepted concept of sustainability is development that meets the needs of the present without compromising the ability of future generations to meet their own needs [2]. In 1993, in *Agenda 21* (document that provides a general framework for investigating sustainability in water and sanitation), UN declared that sustainability is the integration of environmental and development concerns for the fulfilment of basic needs and improved living standards for all [3].

From a water supply perspective, sustainability can be defined as the utilization of water sources while ensuring that the ability of future generations to use the same sources are not affected [4] or as the ability of an ecosystem to maintain ecological processes, functions, biodiversity and productivity water resources into the future [5]. Whereas a sustainable sanitation can be defined as sanitation technically manageable, socio-politically appropriate, systematically reliable and economically affordable that utilizes minimal amount of energy and resources with the least negative impacts, recovery of useable matters [5].

Regardless of the definitions, in order to evaluate and sustain water and sanitation supplies in developing countries, the international literature offers some proposals as: create a “sustainability chain”, consisting of motivation, maintenance, cost recovery and continuing support [6], divide water and sanitation projects in sequential steps as needs assessment, conceptual design, design and action planning, implementation, operation and maintenance [7], or base the project sustainability on three components: effective community demand, local financing and cost recovery, dynamic operation and maintenance [8].

CeTAmb research centre (Research Centre on Appropriate Technologies for Environmental Management in Developing Countries) of the University of Brescia (Italy), which collaborates with NGOs, Universities and other research centres in the elaboration and implementation of cooperation projects in developing countries since 2000, has always sought to put into practice five sustainability elements of the solutions implemented to solve environmental problems: (1) technical sustainability, in terms of use of local material and human resources and in terms of adopt appropriate technologies with an affordable and simple operation and maintenance need, (2) economical sustainability, which means the adoption of technologies or facilities with low costs of investment and operation, trying to create local trade/business opportunities that can guarantee a self-reliance, (3) organizational and institutional sustainability, in terms of acceptance by the local Institutions (from the lowest to the highest) and in terms of create a strong partnership between the local stakeholders (with a key-role of a local NGO/Association) that can guarantee the continuance of the project after its “official” end, (4) social and cultural sustainability, which means develop projects and implement technologies really felt by the local people and that can rapidly show an improvement in the everyday life and/or in the health status, and (5) environmental (and health) sustainability, in terms of minimise the use of natural resources by acting on the reuse or recovery of waste or other resources and in terms of avoid any kind of environmental impact (possibly improving, or at least not worsening, the local people health). Moreover, the concept of sustainability clearly requires a long-term view of the infrastructure/facility/technology implemented or of the behaviour change in the lifestyle generated by the project.

On the base of the elements above mentioned, and suggested also in the scientific literature [4, 5, 9, 10, 11, 12], CeTAmb has surveyed two projects on drinking water management: one in Senegal and the other one in Burkina Faso. The sustainability level was evaluated at the end of the project implementation: in the first case study, several deficiencies were arisen regarding material availability and costs, whereas the second case study highlighted successful results in the drinking-water management system.

## THE STUDY AREAS

The evaluation of the sustainability was made on two water supply projects: the first one implemented in Senegal, in collaboration with the Italian NGO G. Tovini Foundation, and the other one in Burkina Faso, in collaboration with the Italian NGO Medicus Mundi Italy (MMI). As follow described, despite the projects implemented were essentially alike, the two contexts were clearly different both for the stakeholders involved into the projects and for the drinking-water sources available and for the kind of water pollution.

### Case study 1: Senegal

In 2008, the G. Tovini Foundation, together with CeTAmb of the University of Brescia, started a cooperation project in order to improve drinking-water quality in the Rural Community of Patar (RCP), in the Diourbel Region (Senegal). The project was developed and implemented in collaboration with the University of Dakar and the Diourbel Hygiene Authority. After a preliminary survey, three different drinking-water sources used by the local people were identified: (1) open dug-wells, (2) protected wells network that extracts water from a shallow aquifer and serves, through a small distribution system, public taps and (3) groundwater distribution system that pumps water to public and household taps. This latter type of source is the most used by the population for water supply but during the preliminary survey, it was also found that concentrations of fluoride exceeded the 1.5 mg/L Guide Value suggested by WHO. As a response, a bone-char-based filtration for fluoride removal was studied, experimented and implemented at household level as this was initially considered as an appropriate solution for fluoride removal due to its simplicity of construction and operation, low cost and good efficiency of fluoride removal.

In addition to the chemical contamination, whichever was the drinking-water source, a microbial growth was detected in both the transport and storage tanks, due to a lack of hygiene in handling the containers. For this reason, disinfection with chlorine was suggested at household level and awareness campaigns for improving hygiene were organised.

In 2011, the same partners decided to elaborate and develop a new project in order to verify and carry on the

activities started previously and to implement a Water Safety Plan (WSP), a plan that aims to ensure the drinking-water quality from the catchment to the point of consumption.

**Case study 2: Burkina Faso**

In 2011, Medicus Mundi Italy, together with CeTAMB of the University of Brescia, began a cooperation project in order to improve drinking-water quality and health conditions of the population of Fingla and Diarra rural villages, in the Béguedo municipality, Centre-East Region (Burkina Faso). This first project in this context was developed and implemented in collaboration with the Burkinabé NGO Dakupa, which works locally since 1997. After a preliminary survey, two main drinking-water sources used by the local people were identified: (1) open dug-wells, and (2) tube wells with hand-pump that are the most used by the people for drinking-water collection. Despite the water quality was acceptable at the source level, a microbial growth in the transport and storage tanks was detected revealing a lack of proper handling and hygiene. On the other hand, chemical contamination was absent.

Due to the microbiological contamination, awareness campaigns to improve hygiene and drinking-water management were led. These represented also the supporting program of the WSP implementation, which was one of the main objectives of the project in order to improve water quality along the supply chain.

**METHODOLOGY OF SUSTAINABILITY'S EVALUATION**

The sustainability's evaluation of both projects was carried out by means of (1) surveys on the field, where the concentrations of the main microbiological and chemical parameters were measured along the supply chain, the level of risk of contamination at the sources was measured through sanitary surveys and direct interviews with local communities and stakeholders were carried out, and above all on the base of (2) a series of questions directly related to the five sustainability elements above mentioned.

**Tab. 1 - List of the sustainability elements and their respective questions.**

<b>Sustainability element</b>	<b>Question</b>
Technical	Are there locally knowledge and technical expertise necessary for the elaboration and development of a WSP? Are there locally knowledge and technical expertise necessary for the management and update of a WSP? Are there locally knowledge and technical expertise necessary for the design and construction of a technology for drinking-water treatment? Are there locally knowledge and technical expertise necessary for the operation and maintenance of a technology for drinking-water treatment? Is there locally the availability of people and material resources for the WSP implementation? Is there locally the availability of people and material resources for the construction and management of the technology used for drinking-water treatment? Is the WSP performing as it was designed to perform? Is the technology used for drinking-water treatment performing as it was designed to perform?
Economical	Is there locally economic availability necessary for the elaboration and development of a WSP? Is there locally economic availability necessary for the management and update of a WSP? Is there locally economic availability necessary for the design and construction of a technology for drinking water treatment? Is there locally economic availability necessary for the operation and maintenance of a technology for drinking water treatment?
Organizational and Institutional	Has the WSP team been adequately trained for the implementation and management of the WSP? Have the managers and operators been adequately trained for the construction, operation and maintenance of the technology used for drinking-water treatment? Are the WSP managers supported by the local community? Are the adopted technology managers supported by the local community? Are the WSP managers supported by the local Institutions (political and technical Institutions)? Are the adopted technology managers supported by the local Institutions (political and technical Institutions)?
Social and Cultural	Has the community been informed about the WSP implementation and its benefits? Has the community been informed about the technology used for drinking-water treatment and its benefits?

Is the community favourable to the WSP implementation?  
 Is the community favourable to the use of a technology for drinking-water treatment?  
 Does the community contribute and encourage the WSP elaboration and implementation?  
 Does the community contribute and encourage the use of the technology for drinking-water treatment?

Environmental and Health	Has the WSP implementation improved local people health?
	Has the WSP implementation permitted to guarantee the drinking-water quality according to the WHO standards?
	Are the adopted technology managers well equipped to assure well-being and health?
	Have adequate measures been adopted in order to safety dispose of any residues produced by the technology for drinking-water treatment?
	Has the WSP implementation prevented the arising of any negative impact on the environment?

As reported in Table 1, each sustainability element was characterised by a series of questions that can be answered with: “absolutely yes” (level of sustainability: 1), “rather yes” (level of sustainability: 0.75), “rather no” (level of sustainability: 0.25), “absolutely no” (level of sustainability: 0) and “not applicable to the project” (in order to elaborate a questionnaire as general as possible and usable also by other researchers, some questions cannot be pertinent for all the projects). This methodology was proposed by Zurbrügg *et al.* [9] but applied for the sustainability’s evaluation of waste management projects. For this reason the questions were elaborated and adapted to water supply projects, in particular projects concerning WSP implementation and drinking-water treatment. This questionnaire was addressed, at the end of each project, to all the people involved in the implementation in order to collect information about the possible reasons of success or failure.

### Case study 1: Senegal

Regarding this case study, the sustainability’s evaluation was carried out during the second project implementation. The first activities were to assess the level of utilisation of the bone-char-based filtration distributed during the first project, to determine the concentration of the main physico-chemical and microbiological parameters, and to interview some local families in order to understand the main practises in terms of drinking-water management, sanitation and hygiene. With this data it has been possible to make a comparison with the previous situation and, thus, to determine the level of sustainability of the first project. On the other hand, the evaluation of the sustainability elements through the use of the questionnaire reported in Table 1 was carried out at the end of the second project, after the implementation of the WSP. The questions were addressed to the 2 volunteers of the G. Tovini Foundation who worked directly on the field, to 4 representatives of the local partners (University of Dakar and Diourbel Hygiene Authority), to the WSP team (formed by 4 managers of the different water sources, by 3 people of the local Institutions and by 5 representatives of the community) and to the most important people of the Rural Community of Patar involved into the projects (the President of the RCP, the President of the women association and the President of the young people association).

### Case study 2: Burkina Faso

In this case, all the sustainability’s evaluation was carried out at the end of the project. A comparison between the situation at the beginning and at the end of the project was done in terms of microbial concentration in all the supply chain, application of the control measures provided by the WSP, and level of drinking-water management, sanitation and hygiene among the community. As for the other case study, the questionnaire for the evaluation of the sustainability elements was addressed to the main people involved into the project: the 2 volunteers of Medicus Mundi Italy, who were working on the field for almost the entire period of the project implementation, the 3 people of the local NGO Dakupa responsible for the project and the team of 7 hygienists of Fingla and Diarra villages that has actively worked on the elaboration and implementation of the WSP.

## RESULTS AND DISCUSSION

The results obtained from the sustainability’s evaluation are provided separately for each case study, in order to clearer present the reasons of success or the elements of failure.

### Case study 1: Senegal

The sustainability’s evaluation of the Senegal case study started from the assessment of the local situation after the implementation of the first project. One of the first activities carried out on the field was the visit of the household bone-char-based filtration systems. It rapidly appeared that none of the 22 filters distributed was in-operation, owing to

the unavailability of bone-char. The further meetings with the people responsible of the drinking-water treatment, the local Institutions and the local partners highlighted the problem of bones supply from the slaughterhouse situated in Dakar (approximately 150 km far from CRP), and which the agreement was taken with. Due to the lack of raw material, the filtration systems and all the equipment for the production of the bone-char were abandoned and subjected to degradation. Probably the absence of a leader local partner (as an NGO can be) caused the interruption in the bones supply and the end of the water treatment. To strengthen this idea was the intervention of the G. Tovini Foundation's volunteers, who restarted the business relation with the slaughterhouse and were able to furnish again the beneficiaries of the bones necessary for the filtration system. The enthusiasm of the owners of the filtration system and the still present ability of the technicians to prepare the bone-char were even more strengthening the idea of a lack of efforts by the local partners.

Regarding the water quality along the supply chain, it was clearly evident from the first analysis how the chemical parameters' concentration was unvaried. On the other hand, results from microbiological analyses provided interesting causes for reflection. High concentrations of *E. coli*, faecal coliforms and faecal streptococci were found in the transport and storage tanks of the families that had not followed the meetings to raise awareness of good hygiene practices, proper methods of drinking water management and attitudes to prevent diseases due to polluted water consumption. Indeed, the lack of hygiene in handling the water was the primary reason of contamination. Conversely, families that had received the bone-char-based filtration system or that had actively participated to the awareness campaigns during the first project showed concentrations of microbes in the different containers lower than the other families. Even the awareness campaigns on the consequences that the consumption of water reached in fluorides can determine to the health were successfully. This assumption was confirmed by the change of water source on the part of the beneficiaries of the filtration system when the bones supply was interrupted. Most of them, in fact, preferred to go farther at the public taps of the protected wells network rather than consume the household tap water from groundwater distribution system.

All these considerations lead to the conclusion that the training part of the population carried out during the first project implementation was extremely useful and sustainable.

Concerning the WSP implementation (WSP that was elaborated for all the three water sources, for the transportation system and for the storage/treatment/consumption step), the sustainability's evaluation was carried out after the end of the second project. In particular, four months later, a survey was conducted in order to assess if the most important control measures adopted for preventing water contamination were put in place. Results showed that nothing was done, above all because local partners (responsible for the WSP implementation and monitoring) did not support the WSP team and the other volunteers, who were motivated to put in place the measures envisaged by the WSP, in order to look for funds (private and/or public) and to mobilize economic and material resources inside the RCP. As for the bones supply, the lack of a leader local partner was probably the cause of this failure.

The last evaluation was carried out by means of the questions related to the five sustainability elements. Figure 1 shows the results obtained for the five elements in function of the different respondent groups. As reported in the previous chapter, at each answer a sustainability value between 1 and 0 was assigned in order to compare the results of the different respondents.

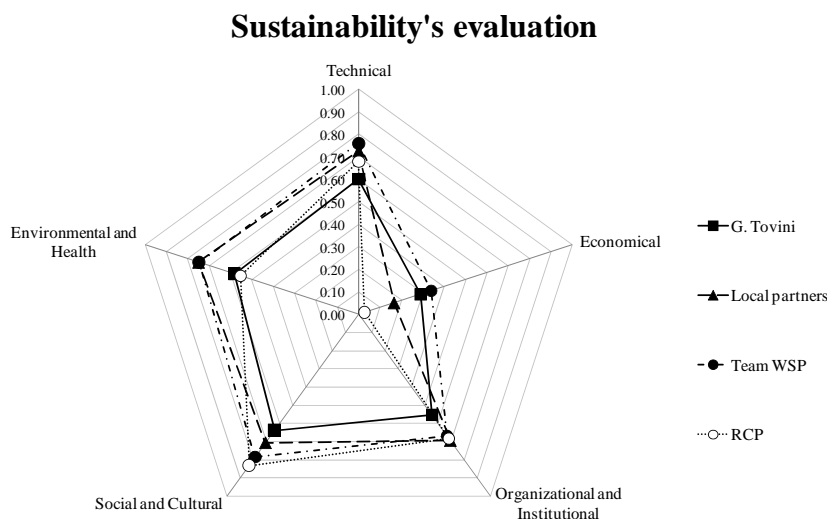

Fig. 1 - Results of the questionnaire for the sustainability's evaluation.

As shown by the graph, the highest average values of sustainability were obtained from the technical and the social-cultural elements, whereas the lowest values were provided by the economical ones. This latter result is mostly due to the absence of funds directly available and suggests the need to find contacts/partnerships that are greatly

important for the self-reliance of the activities/technologies after the end of the project, in order to put in place all the WSP measures. The cost of the bone-char-based filtration system, in fact, was not high so that beneficiaries were also willing to pay in return for a continuous supply of bones. Regarding the higher values assigned by the different groups of respondents to the social and cultural sustainability, it is possible to highlight the correspondence with the behaviour change of the local people in the drinking-water management after the awareness campaigns of the first project. This can be a proof that the population has deeply understood the cooperation project, has accepted it and is supporting it. About the technical sustainability, answers were pretty positive as technical skills for the WSP and the filtration system implementation and management are locally available. The organizational and institutional sustainability was not so high, revealing the absence of a strong support of the activities carried out with the project by local political and technical Institutions. Concerning the environmental and health elements, results were not that high owing to the lack into respect the drinking-water standards. At the point of consumption none of the analysed samples permitted to respect the international standards in terms of microbes and only the beneficiaries of the filtration system can consume drinking-water with fluoride concentration under the limit value.

Despite all the efforts that a lot of people have put in these two projects, many elements of failure have been provided. Probably the main reason was the absence of a strong leader as local partner that could help to mobilize human and material resources and try to find funds for the self-reliance of the project. The activities, in fact, were carried on only during the projects implementation, when an external support in terms of funds and human resources was provided. As also cited in the scientific literature [12], a project that solves a problem but forever links the beneficiary to an external support is a failed project because it does not create real development but rather further dependency. The aim of the international cooperation projects is to increase sustainability, meaning the autonomy of the project and its efficiency.

### Case study 2: Burkina Faso

The sustainability's evaluation of the Burkina Faso case study was assessed at the end of the project implementation. One of the main activities carried out on the two rural villages of Fingla and Diarra was the WSP elaboration, which has been used during its implementation as a tool to heighten public awareness of good practices in water management. For this reason the project's evaluation was mainly focused on the behaviour change in drinking-water management that potentially happened thanks to the WSP implementation. In particular, the microbial concentration of *E. coli* in the different steps of the supply chain was analysed before and after the project implementation (in other words the WSP implementation). Figure 2 shows the results obtained from these analyses. The increasing trend of contamination in the supply chain is clear both before and after the WSP implementation, but the average values obtained at all levels at the end of the project are much lower than the ones obtained at the beginning.

**Fig. 2 - Average *E. coli* concentration in the supply chain before and after the WSP implementation.**

An on field survey was also carried out during the last month of the project implementation, aimed to evaluate the behaviour change of the communities in the drinking-water management. It rapidly appeared how the families that had actively participated at the WSP implementation and at the awareness campaigns on the good hygiene and sanitation practices improved their drinking-water management habits. The results of the interviews to 200 families demonstrated that there has been a significant improvement of the good practices in the drinking-water management (p-value: 10-25) and of the level of knowledge on the methods of diseases transmission and prevention, with particular emphasis on diarrhoeal diseases, (p-value: 10-79) before and after the project implementation. Many efforts have still to be made in

order to apply all the control measures established with the WSP for avoiding the water contamination, but important changes on the everyday life were already put in practice (as demonstrated by the microbiological analyses along the supply chain). The use of the WSP as a tool to raise awareness, the campaigns on good hygiene and sanitation practices and the strong support of the local NGO Dakupa in the project implementation are probably the three most important factors of the project's sustainability.

Even in this case study the sustainability's evaluation was assessed by means of the questions related to the five sustainability elements. Figure 3 shows the results obtained for each element in function of the different respondent groups. As for the previous case study, a score between 0 (not sustainable) and 1 (sustainable) was assigned at each question. The highest values were obtained from the social-cultural and economical elements, in despite of low values provided by environmental-health and organizational-institutional elements. Regarding the economical sustainability, it is possible to highlight that the amount of funds necessary for the WSP elaboration and implementation and for the drinking-water treatment (chlorination) is quite low. This is the reason of the pretty high average result obtained for this sustainability element. As for the Senegal case study, the groups of respondents assigned high values to the social and cultural sustainability; actually, it is possible to notice the correspondence with the behaviour change highlighted by the microbiological analyses and the final survey on the part of the communities, who demonstrated to have deeply understood and accepted the project. Concerning the organizational and institutional sustainability, pretty low values were obtained from the questionnaire, owing to the low support of the local Institutions during the WSP elaboration and implementation. This is due to two reasons: the first one is that the technical local Institution (drinking-water Authority) was not operative during the project implementation (the person in charge changed job before the beginning of the project and a new manager was assigned after the WSP implementation), and the second one was that the political local Institution (the municipality) was under election during the WSP elaboration and implementation (and in that period, opposite political parties were also fighting each other). Concerning the environmental and health elements, results were not that high owing to the lack into respect the drinking-water standards. At the point of consumption none of the analysed samples permitted to respect the international standards in terms of microbiological quality. One of the control measures provided by the WSP was the chlorination treatment at the storage level, but the habits and taste of the water induced great part of the community to not carry out the treatment. The time and the support of the local partner will probably permit to reach this objective in the future. The technical sustainability highlighted a good average value.

Indeed, from one hand there is locally an availability of expertise on the management of both the WSP and the drinking-water treatment, but on the other hand there is a lack of expertise in the WSP elaboration and implementation, due to the use of the WSP development as a tool for raising awareness into the communities on good practices in drinking-water management and to the absence of trained local managers of water supply.

The final assessment of the project has permitted to positively evaluate its sustainability. A lot of efforts were put in place by the local NGO for the success of the project, and this first evaluation has clearly highlighted it.

Fig. 3 - Results of the questionnaire for the sustainability's evaluation.

## CONCLUSIONS

CeTamb has surveyed two different projects on drinking water management. The sustainability level was evaluated at the end of each project implementation, using different methodologies. The main considerations arisen from these two case studies are:

- ✓ In these projects, the sustainability evaluation was carried out at the end of the project activities, but a long-term assessment (after 1, 5 or 10 years) should also be provided in order to really understand the projects effectiveness.
- ✓ The two main tools proposed for the sustainability evaluation are an on field survey and a series of questions directly related to five sustainability elements, but the method of inquiry and data collection might differ from case to case: observations, document analysis, informal interviews to key selected individuals or stakeholders are also other methods to take into account.
- ✓ The questionnaire for the evaluation of the sustainability elements was elaborated and conducted at the end of the project implementation, but if revised can be useful for the evaluation before and during the project activities. Moreover, it is necessary to highlight how the questionnaire was realized in order to be used for the evaluation of projects concerning a WSP implementation and a drinking-water treatment.
- ✓ This questionnaire alone cannot be the only method to investigate the sustainability of a project, but it can provide a general overview of the project from the standpoint of the different stakeholders. Indeed, as shown by the results of the two case studies, the application of the questionnaire alone would not have allowed the understanding of important aspects; on the other hand, it has provided interesting and useful information to confirm what has been provided during the final survey.
- ✓ The presence of a strong local partner (as an NGO) can be a reason of success, as highlighted in these two case studies. The partnership with the NGO Dakupa in Burkina Faso has permitted to easily implement the different activities of the project, and probably to gain the reliance of the local communities into the project, assuring its sustainability.
- ✓ The five sustainability elements proposed in this research are, according to the authors, of extreme importance in order to guarantee the sustainability of an international cooperation project. The lack of one of these elements can be a reason of failure, as the Senegal case study has highlighted owing to the absence of a strong local leader.

## ACKNOWLEDGMENTS

Luca Rondi was conducting these researches as PhD student on “Appropriate Methods and Technologies for International Development Cooperation”, supported by Alberto Archetti Found. The authors wish to thank the NGOs Medicus Mundi Italy and G. Tovini Foundation for technical, economical and organisational support, the NGO Dakupa for the collaboration in the research, the Rotary Club Milano Sempione, the Brescia municipality and FCB Foundation for the economic support. Authors wish also to thank Dr Marianna Bettinzoli, Eng. Chiara A.M. Clemente and Eng. Daniela Palazzini for the collaboration in the research projects. Sabrina Sorlini supervised the paper drafting and the research activities; Luca Rondi was responsible for the paper drafting, and did data collection and analysis.

### ABSTRACT

The paper presents the results of a didactic experience and of a research developed at the Faculty of Engineering of the University of Pavia in the field of the cooperation, focused on the sustainable design approach in the global south.

All the different experiences are based upon a multidisciplinary and holistic design concept as a possible strategy to control both the technical feasibility and the environmental and social sustainability of the intervention. The paper is focused on two different experiences both regarding the health planning sustainable design in Kenya, Africa.

The first one is the results of an International Winter School *BSuR-Building Sustainable (Re)Construction. Innovative design approach for developing countries*, developed on February 2012. The school had been attended by engineers, architects and PhD students of different universities, such as Pavia, Milan, Turin. The project activities consist in frontal and multidisciplinary lectures and in workshop focused on different design topics held by professors and designers with direct experience in collaboration with NGOs and international organizations. Students had to work on real needs, regarding the formulation of workable solutions for the Maternity Unit at the Malindi General Hospital, dealing with realistic data of context, materials and costs.

The second case study concerns the design of a medical dispensary in Chakama, near Tzavo Park. The need to design a first medical support health was expressed by the local diocese and the Hospital San Matteo of Pavia and it's developing under the technical support of the Laboratory STEP, University of Pavia. The main idea is to design and implement a modular, sustainable and expandable unit that could be used as a prototype to be implemented in different territorial contexts, as a possible answer to the needs of the community, settled in an area without care facilities and characterized by an extremely critical of the socio-general health.

### INTRODUCTION

The paper aims to describe two different design activities developed in the last year at the STEP Laboratory within Civil Engineering and Architecture Department of the University of Pavia.

The research team is composed by Prof. Marco Morandotti, who initiated and coordinated the activities, by Prof. Daniela Besana and Eng. Elisa Salvaneschi. This paper contains the results of the joint work of the authors. In particular, the first and second paragraphs are due to Prof. Marco Morandotti, while the third paragraph is written by Prof. Daniela Besana. The common theme of these experiences is the design of two different health care facilities in Central Africa and more specifically in Kenya. In both cases, over to the same geographical location of the projects, the project aims to improve previous conditions of significant distress, by means of a common approach.

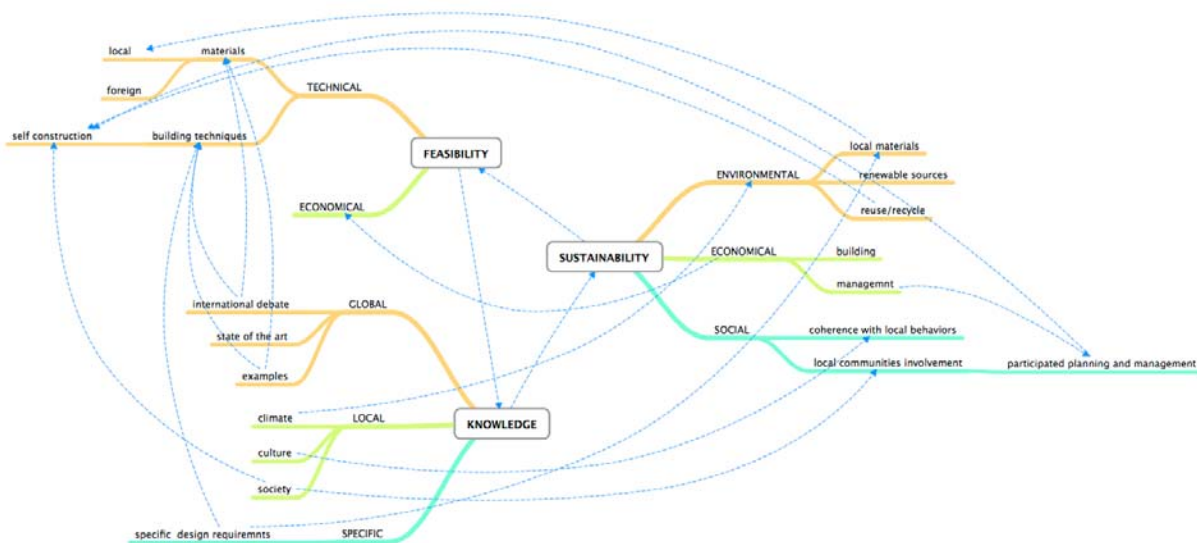

This approach is the product of teaching, research and experimental experience gained in recent years in terms of design in the global south; it is based upon three different pillars: "knowledge", "sustainability" and "feasibility".

"Knowledge" understood as "global", in terms of theoretical debate and international examples of design actually realized, and "local" in the context of a single intervention, in terms of anthropological, cultural, environmental and climatic study. It is evident that at these two basic levels of knowledge, a specific one must be added, relative to the understanding of the requirements related to the design function, especially, if particularly complex, as in the case healthcare construction.

"Sustainability" of the intervention must be considered in its three basic dimensions. The strictly environmental one, declined in this context as a possible developing use of renewable and low-impact energy sources, but also for example the possibility of using recycled materials, or, where it is possible, traditional building techniques and materials locally available. The economic sustainability, understood not only as the ability to acquire the resources necessary to carry out the work, but more generally, with a view life-cycle oriented, such as long-term economic sustainability. It means not only to verify the feasibility of the work, but its maintainability in use and its right management over time. The third dimension of sustainability - the so-called "social" - is also central, because it takes into account, both the coherence and consistency of the project with the typological and spatial patterns specific to the local context and, on

the other hand, involves the local community in the design process, and certainly in the management phase of the intervention. Only one project that is perceived by the local community not only as a satisfaction of a specific need, but also as an expression of a system of relations compatible with the existing social structures, can be perceived as being part of the community.

The “feasibility” of the work is finally the third key element of our approach. This is an essential component of any design activity and a specificity of the scientific-disciplinary research team. This implies not only economic feasibility, closely linked to the economic dimension of sustainability of the project, but also the technical feasibility of the work itself. It means to verify the design project ideas to the feasibility of the technological solutions, regarding both techniques and materials. Specifically, in developing countries, this technological dimension of the project plays a relevant role to ensure the design feasibility starting from technical and local possible solutions. Not so simply to verify the general feasibility of a design idea, but that it is in the specific context without generating technological dependencies, through the use of “alien” materials and technologies and therefore difficult to control during the construction and especially the management of the work (Fig. 1).

**Fig. 1-** Theoretical approach to the project design.

**Hospital design between didactic activities and applied research. A case study in Malindi, Kenya.**

In February 2012, the first edition of the winter school “Building Sustainable (Re)construction – B.Su.r” has been held, thanks to a grant of the University of Pavia (Director Marco Morandotti; Scientific Coordinator Daniela Besana; Organizing secretariat Elisa Salvaneschi; Tutor Elisa Salvaneschi, Paolo Baldini).

The objective of the school, through the projects developed and in the hope of a second phase of work, is to identify and concretely to experience an operating scientific and cultural path will lead to greater awareness of the objectives of sharing, coherence, consistency and quality in the project design.

The two weeks long full time school has been attended by 22 students from five Italian universities, aimed to apply a coherent design approach in developing countries. The didactic approach was oriented to mix theoretical lectures from teachers and experts with experimental design activities focused on the topic of health design. Participants have been divided into five mixed groups and every one developed a different design proposal.

Since the beginning it was established that the school would have stressed a real case study, not only an academic simulation. Therefore participants have been asked to develop design ideas dealing with a real physical context, moving from real users’ requirements and in the perspective of building’s feasibility.

Prof. Giovan Battista Parigi, coordinator of the Centre for the International Cooperation of San Matteo Hospital in Pavia, helped us in establishing a contact with the Malindi District Hospital (MDH) management office. Due to MDH involvement in an international cooperation project by San Matteo Hospital since few years the new action has been integrated into a consolidated relationship framework. The cooperation between our technical unit and local doctors and managers clarified the general local scenario in terms of functional needs and human available resources to be involved in the new structure.

Hospital design in developing countries shall consider economic and financial sustainability as well as climate adequacy and technological feasibility.

The hospital is located in south Malindi and is articulated in several pavilions built almost casually along the time in a wide area. Many of them are connected by a covered path slightly elevated respect other public open spaces. Existing pavilions are pretty simple as regards morphological and technological aspects. One of them has been recently upgraded as a new High Dependency Unit, as like as both existing emergency unit and the building hosting two surgery theatres has been renovated.

The existing Maternity Unit is one of the most stressed concerning its carrying capacity and probably one of the most under-dimensioned structures. The set of functional requirements for an effective Maternity Unit in relation to actual and expected trends have been stated as following:

- 20 Antenatal beds
- 15 Postnatal beds
- 10/15 cradles
- 10 labour beds
- 8 delivery rooms
- service rooms (staff's dressing room, storages, waiting room, services, sluices...)

The existing unit offers just two delivery rooms and four labour beds; has poor typological, functional and typological quality and is affected by several conservation issues. Moreover its location makes it impossible to plan any kind of dimensional growth of the existing structure. Therefore it seemed necessary to plan a completely new Maternity Unit, designed according to updated health criteria, in a more comfortable area of the hospital, suitable to become in the near future another entrance to the complex.

Before the opening of the school a booklet concerning local history and culture as well most relevant climate parameters has been prepared by the scientific staff of the school and distributed to participants.

A relatively wet belt extends along the entire Indian Ocean coast of Africa. The main rains come between late March and early June with the rainfall decreasing from August. Some rain occurs between October and November but from December, rainfall decreases rapidly once again to a minimum during January and February. Annual total rainfall ranges from 508 mm in the drier, northern hinterland to over 1,016 mm in the wetter areas south of Malindi. Relative humidity is comparatively high all the year round, reaching its peak during the wet months of April to July. However, there is a marked diurnal change particularly in Mombasa where it is around 60-70% during the afternoon, rising to 92-94% during the night and in the early morning. The windiest time of the year at the Kenya Coast is during the Southeast Monsoon from May to September, while the calmest months are March and November when the winds are also more variable in direction. Wind records show a consistent daily pattern whereby wind strength (in knots) drops during the night. The strongest winds are likely to be experienced in August.

Information concerning materials and techniques available in Malindi region has been shared among the participants, in order to base any design idea on a reliable technological background. The local prevalent construction material in the so called "coral block" which is a limestone coming from ancient coral reef material, nowadays available through superficial outcrops that can be quarried. It is quite easily shaped in square blocks of different dimensions and mostly used both as continuous structures element both as non structural block in most relevant buildings provided with concrete frame. Roof structure are mostly built by means of sheet steel but traditional constructive techniques are mostly based upon typical wooden structures, such as Makuti. It is an handcraft procedure mostly based upon craftsmanship experience without any formal design. Many of these wooden structures may become really relevant in dimensions, and are kind of trusses with external finishing in fastened leaves. This allows relevant roof slope and considerable maximum height. This kind of technological solution is really adequate to local climate due to the fact that allows a natural ascendant movement of warm air under the roof itself. Unfortunately it needs continuous maintenance and is highly vulnerable to fire. In recent years the realization of this type of coverage is for touristic building (Fig. 2).

The requirements defined by the management of the Hospital have been verified by means of a preliminary design idea, developed by Paolo Baldini as degree thesis, which become a kind of functional and dimensional benchmark solution for the participants of the school. Due to its early preliminary stage it was not impossible to define a kind of contractual construction budget, but it was necessary test a sort of general compatibility assessment between requirements, available area and sustainable economic funding. The idea was to develop a quite simple building according to a "T" shape, by means of three modular elements each assuming a well defined function: pre-natal, natal and post natal.

During the two weeks training five different ideas have been developed. Each of them answered to the general requirements, but according to pretty different typological and morphological solutions. Some design solutions focused on a "comb" shape either with one or two connection paths along the perpendicular elements. The second solution allows a clearer separation between the internal fluxes of users but it necessary requires wider internal surfaces and also a higher number of nurses. Someone else provided a central court, according to a somehow common morphological solution, in order to define a semi-public sheltered space dedicated to inpatients and sometimes to relatives. Someone finally imagined a plate typology, maybe more rigidly defined by pure volumes, maybe more dynamically shaped by means of a number of internal patios.

Many students focused their own design strategies on local climate, by means both of the orientation of the building and of its specific dimensions in order to favour natural cross ventilation phenomena. Specific structures, like wind towers, have been provided in order to enhance this natural climate behaviour also underlying a relevant morphological role. Other students tried to enhance the performances of traditional technologies, introducing a kind of steel reinforced masonry moving from local and available materials. Such idea needs a scientific experimental support that cannot be provided during a two weeks long initiative. However it introduces an experimental dimension that could be deepened in future (Fig. 3).

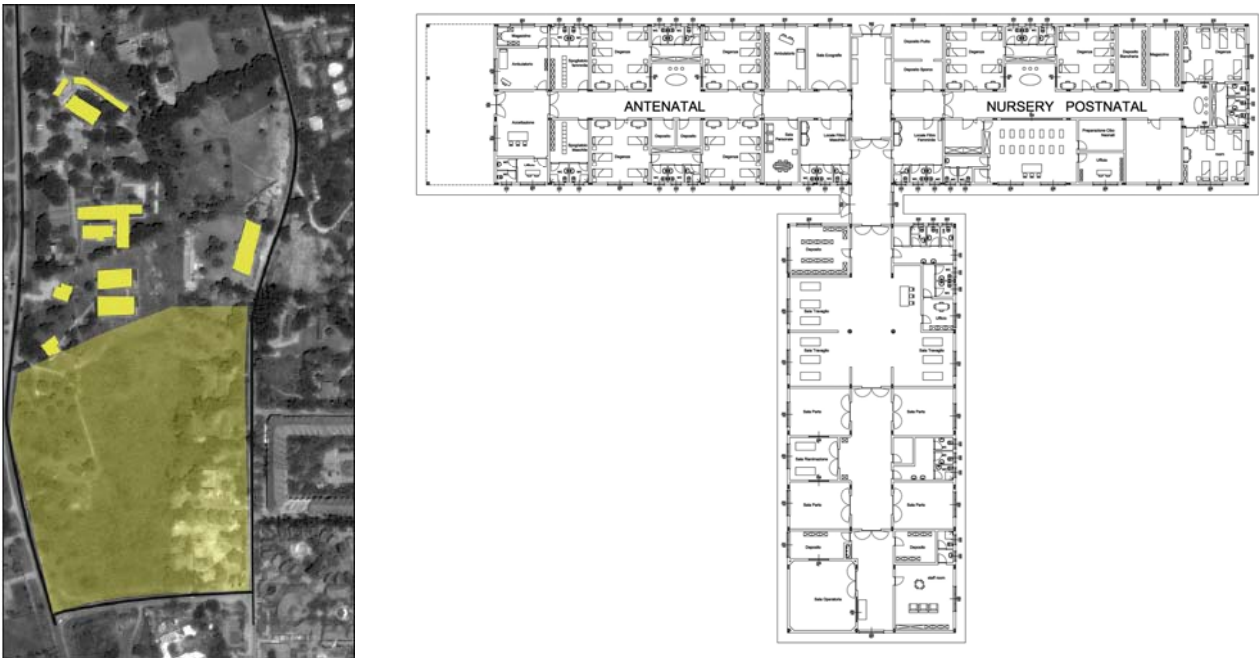

Fig.2 - Masterplan of Malindi General Hospital and preliminary design idea developed by P. Baldini.

Fig. 3 - Some of the design ideas for the maternity unit in Malindi.

All the developed designs have been analysed by means of a specific multilevel tool aimed to evaluate the internal coherence level of each solution in the following topics:

- building/environment adequacy
- morphological adequacy
- functional adequacy
- technological coherence
- health requirements fulfilment
- building coherence with local communities expectations

Design solutions have been illustrated to the local authorities and to the hospital management in March 2012. A joint discussion about the different ideas proposed was useful not only in order to verify the satisfaction for the efforts produced, but mainly to focus on some functional and technological issues in the perspective of a truly participated design approach.

### Modular and repeatable health units in extreme environments

The second experience concerns the design of a medical dispensary in Kenya, about 70 km west of Malindi, in the direction of the Tzavo park. The project, still under development, started on a proposal from the Policlinico San Matteo of Pavia and the support of the Diocese of Pavia as a result of a specific request by the local diocese.

The project aims to give a response to the needs of Chakama community, living in a village consisting of about 2500 people. The isolation of this village from other settlements made as primary emergency the opportunity to start the construction of a small residential care to become a first aid and health care medical unit. The University of Pavia, through the Laboratory STEP (project team: Marco Morandotti, Daniela Besana, Francesco Maccarone), provided the technical support project for the construction of the dispensary. The main aim of the intervention was therefore to provide small rural dispensaries for local assistance and to address the most serious cases to neighbouring largest hospitals such as the Malindi General Hospital in Malindi.

The village of Chakama is located in a rural area about 70 km west from Malindi, without existing transportation infrastructure and the obvious difficulties of moving during the rainy season, when unpaved paths become impassable. Therefore, for Chakama and other nearby villages, the hospital in Malindi represents the nearest health service. For the geographical and climatic conditions mentioned above, it often becomes impossible to be reached, especially by sick people, because of the almost total absence of private transport and adequate infrastructure.

The health and welfare is certainly a major gap in the Kenyan socio-cultural context also due to the fact that in the last years urbanization is increasing in Kenya at a rapid pace. According to the Government of Kenya statistics, urban centres have increased from 15.1% (1979) to 34.8% of the total population in 2000. More than 70% of the urban population live in slums with limited access to water and sanitation, housing and social services and secure tenure (UN Habitat 2007). For example Kibera is the largest slum in Nairobi, with approximately 800,000 residents. It is clear that within these areas there is no control over living quality standards and also health care facilities.

This aspect is even more dangerous compared with the climatic situation of the Kenyan context and, in particular of neighbouring Malindi. There is a general decline of rainfall in the main rainfall season of March-May. Drought in the long rains season is more frequent and prolonged. On the other hand, there is a general positive trend (more rains) during September to February. This suggests that the "short rains" (October-December) season is extending into what is normally hot and dry period of January and February. This aspect caused another phenomenon that is the problem of desertification. Only 17% is arable while 83% consists of arid and semi-arid lands (ASAL). Due to climate change and other human factors, desertification, the extent of arid and semi-arid land, is increasing. It is clear that this aspect as the main cause it impossible to obtain food from the earth and, in general, all the agricultural products needed to sustain the population. It has been observed that the number of indigenous and important species has dwindled tremendously. The Kenyan coastline is characterized by 4600 hectares of land will be submerged area with a sea level rise of only 0.3 meters.

The water resources are unevenly distributed in both time and space. Climate change will worsen this already precarious situation as it affects the main hydrological components. Finally, serious droughts have occurred in the last four consecutive years. Major rivers show severe reduced volumes during droughts, and many seasonal ones completely dry up. Malaria, cholera, Ebola, Lyme disease, plague, tuberculosis, sleeping sickness, yellow fever, and rift valley fever are some of the diseases that are expected to spread as temperatures rise and precipitation patterns change.

As a result of knowledge of the social and climate context of the project, our first idea was primarily directed to respond to a primary need, the care as a human right. The starting point was therefore a structure that primarily responds to functional needs for the community but, at the same time, could be easily recognized by local communities and repeatable in the African land for a future network of health care in the area. It was therefore attempted to emphasize the sustainable approach, understood in its environmental, economic, social components and real technical and economic feasibility (Fig. 4).

Fig. 4 - General views of the dispensary and, in particular, the red vertical technical wall.

A vertical wall that becomes functionally the implant and technological plug of the entire structure characterizes the morphological layout of the dispensary. It allows dividing the space into two areas: one, more public, just covered by a roof, and the other, more private, reserved for health services. This functional distribution is simple and clear and easily recognizable.

The public space is paved, open but covered by a roof with sunscreen function. Functionally, this space allows the family members of patients to rest in a separate space from the health area and also acts as a waiting place for any patients who require treatment that, through a single entrance at the wall, can enter in the strictly medical area.

The dispensary medical wing consists of modular spaces dedicated to the care and is compatible with different building technologies, according to the final budget.

Once you have crossed the access from the front, there is a clinic for early medical evaluation and triage. Adjacent to it you can go directly to a medication room and first responders. The triage room also leads to a doctor's office and a room for the conservation and storage of medicines. The dispensary is finally equipped with a room and toilets for both doctors and for patients. Typologically the volumes containing the medical functions are standardized by a single over-wooden cover equipped with extruded eaves to limit overheating of the surfaces from solar radiation.

The dividing wall between the two spaces is therefore the plant technological element that lets the building make self-sufficient in the use and management. Into the wall thickness are thus content, as well as stores and warehouses, technical spaces such as tank for collecting rainwater, filter for water purification, the generator and the battery for the domestic hot water and the alternator and batteries for photovoltaic systems (Fig. 5).

Fig. 5 - Functional layout of the dispensary unit.

Designing the dispensary we tried to work on the theme of sustainability both for construction technology used and for the choice of materials.

The ability to use a simple technology without penalizing quality allows the project to be built with local resources and unskilled labour. If the project is conceived as easily accomplished even by the local community, immediately the choice is winner both for a future repeatability of the model realizing a health network spread in the territory and for the ability to provide the community with tools for building independence.

This principle is therefore based on the concept of self-construction in which users are involved in the project. The theme of self-construction presents a number of advantages: it promotes education in the local community and contributes to the work group identity, in which the sharing of effort and, at the same time, the enjoyment of the results obtained is a strong social cohesion. Also the fact of contributing to the building achievement through their own effort, facilitate the acceptance by the population of the final result, and therefore the actual use of the building. Last, but not least, the community acquires techniques and expertise in the work and can use them in the event of further construction needs.

Analogously this occurs also for building materials. Working with materials specific to the location means getting both easy availability and therefore minimum costs and also knowledge regarding using by labour. In fact using sophisticated technologies or imported materials would be senseless because they will increase the cost of construction and especially not make independent the population during the management and use of the building. The materials that are not known by the workers inevitably cause difficulty to the maintenance of the building and dependency of the community by skilled workers.

The project was conceived as a prototype of spatial and functional quality both if it is made with local materials and traditional building technologies but also with recycled materials, commonly discarded materials readily available without costs. The project was therefore designed both with modular proportions of the rooms to avoid getting waste

materials and increasing costs and flexible for the choice of the functions and of construction technology.

Before choosing materials and technology, a research on materials commonly used and found in the territory of Malindi was carried out, as previously discussed.

In general, a concrete framework makes the most common structure typology while the vertical walls are realized with bricks made of coral blocks. Roofs are typically realized with the so-called “makuti” technique. This traditional technique presents a lot of problems linked with safety and maintenance: it must be renovate every five years; it is highly inflammable and in case of fire the temperature can exceed 800°.

Regarding the materials, in Kenya, concrete is the most common material used for construction. It is currently produced in three major factories for both the local and export market. Domestic prices have steadily increased over time. The current price is approximately 450 shillings (about 6 US\$). The high cost of cement coupled with occasional shortages, high transport costs and its unavailability in some remote parts of the country has adversely affected the cost of many cement based building materials like concrete blocks, mass and reinforced concrete, slabs. It is also possible to find concrete blocks either factory or manually produced. They depend on cement and are therefore expensive. They are however the most commonly used walling material for residential properties within Nairobi. A study carried out in 1983 revealed that they were the most expensive input in construction contributing about 26% of the overall materials cost. Natural stone is a cheaper walling material as compared to concrete blocks. It is also commonly used especially in the outskirts of the city or main towns. Finally, the most common roofing materials are tiles and galvanized corrugated iron sheets. Tiles are either clay or concrete.

After this research, we tried to explore the use of recycled material, such as the traditional pallets used for commercial packaging as a building material. It has good properties regarding its behaviour in use and also some geometric characteristics of the joists and their distances very similar to frame structures such as balloon and platform frame. The birth of the pallet is of U.S. origin due to World War II, when Americans discovered that placing the goods on wooden platforms these were more easily transported and handled and they guaranteed protection from wet surfaces. In the 50's in Europe a gradual standardization of wooden pallets EPAL and EUR (800x120mm) begun. In America, the most common is the pallet 40x48 inches (1000x1200mm). As a result of increasing industrial development in the 60s the pallet was stated as an instrument of international exchange of goods between industries in several states. In order to approve its international circulation, the European Community has introduced a legislation (Directive 2000/29 of 5 May 2000), which establishes protection treatments that must be applied during manufacturing, since the wood is a potential vehicle for harmful organisms to plants world. It has been made compulsory a preventive treatment, defined as "fumigation", through the use of chemical products based on methyl bromide, or alternatively HT treatment, consisting in a heat treatment in which the wood is treated in special cells called dryers, the two systems are equivalent, and both recognized as valid for the purposes of Directive ISPM 15 FAO in order to eliminate the parasites that can lead to severe damage to forests (Fig. 6).

Thus, the use of pallet would respond positively to a number of requirements searches in the dispensary project such as the concept of self-construction. Working with light elements and small dimensions means using a simple technology easily learnable by the local community and finally an easy construction phase. Contextually the realization of a structure dry assembled using only mechanical joints and riveted or bolted connections is very important in a context so devoid of water. It also responds positively to the requirements of components manoeuvrability thereby allowing the its handling by a single person and, therefore, making simplified the assembly operations. The requirement of construction durability is satisfied by the material itself because it is a prefabricated element that have already been subjected to treatments that guarantee an acceptable life cycle and controls to be placed on the market. The wooden material is so healthy because it does not emit harmful substances during the operating phase, does not constitute a danger to the health of users. Pallets are exported all over the world because they move with goods, therefore, substantially materials have no cost (if you need to buy them, they have an average price of 6/8 euro each).

After the knowledge of pallets characteristics, a search to find suitable references of architectures or installations produced with the pallet was carried out. A critical analysis showed that in all cases, the pallet has been used vertically as a curtain wall while the structural component was entrusted to a wooden frame due to the balloon frame. The structural function of the pallet was delegated only to its positioning in the horizontal. Aim of the research, endorsed also by other research such as a degree thesis developed by V. Marconcini, was to exploit the versatility of the pallet, but trying to use it in an upright position, verifying its bearing capacity.

In conclusion, the performance characteristics that have accompanied the design choices, still in the initial feasibility study, were mainly anchored to these themes:

- modularity of the structure and its components;
- future expandability in dimension;
- environmental, social and technical sustainable design;
- economic and constructive feasibility;
- architectural and linguistic identity;
- self-sufficient for its use and management;
- self-construction.

### ABSTRACT

Deforestation is one of the most dramatic threats to environmental equilibrium and food safety in many regions of the world, and particularly in sub-Saharan Africa. It is enhanced by many kinds of human activities, among which is the earth brick firing process, that needs large amounts of wood for attaining and maintaining temperatures required during this process. Crude earthen bricks can be used as an alternative for buildings, with environmental benefits; however, the economical and social sustainability of this building technique is linked to the improvement of the brick production technology, based on a deeper knowledge of the local resources. For this reason, a partnership was developed between an Italian University and a Cameroonian one for valorizing crude earth as building material in the Logone valley, located at the border between Chad and Cameroon: this way, the knowledge of the local context owned by the Cameroonian university was an added value to the technical skills of both universities, driving the choices made during the project. The Cameroonian university carried out mainly morphological and geotechnical analyses on soils, in order to choose the best site for brick production in the region; the Italian university designed and followed the realization of a machine for improving brick production. As a result, a pilot plant for crude earth brick production was installed.

### INTRODUCTION

Forests are a crucial factor in preserving the environment vitality and human life: they are the main mean of carbon storing and climate change protection, and preserve biodiversity; furthermore, in many regions forests are designated for soil and water conservation, avalanche control, sand dune stabilization, rain regularization, desertification control and coastal protection [1,2].

Although in the last decade the global deforestation rate has shown signs of decrease, in some regions, such as South America, Africa and Oceania, a net forestry loss was registered, with increasing rate with respect to the previous decade: this is also source of economical and social harms, such as lack of food and wood for domestic use as a consequence of soil deterioration and rain irregularity [1, 3-5].

In particular, since 1990 to 2010 the forest surface has decreased by about 12% in Chad and 18% in Cameroon, mainly due to wood exploitation as fuel, both for domestic and handicraft uses [1]: among these, the use as fuel for earth brick firing is an increasingly important part of the total wood exploitation [6,7]. Different techniques are used in African countries for fired brick production at handicraft level; however, in general they are very inefficient and fuel consuming [7].

Fired earth bricks are replacing the traditional crude earth as building material all over Africa; this trend is due to the fact that fired bricks are more resistant to deterioration by atmospheric agents (mainly rain), but also because crude earth is perceived as “poor” material, in contraposition to the modernity associated to fired earth [8]. However, there are many reasons for valorising the crude earth technology, among which the main is energy saving: producing 1 m<sup>3</sup> of concrete consumes 1.0-1.8 MJ, whereas the same volume of raw earth for building uses only 1% of this quantity of energy [9]. Other benefits of the crude earth technology are: absence of carbon emissions, reduction of environmental impact related to building waste, low cost, raw material availability, richness and variety of the traditional knowledge about this construction technique. However, in order to obtain competitiveness of crude earth as building material, some innovations are necessary for obtaining a good product in terms of durability and reliability, aesthetics and cost.

In this context, a partnership between European and African researchers was established, within the ambit of the VALRENA<sup>1</sup> European project. This project had the aim of promoting the sustainable exploitation of natural resources in the Logone valley, along the frontier between Chad and Cameroon; among the different activities planned in the project, there was the promotion of crude earth as building material, to be achieved by introducing an innovative production technology and setting up a pilot plant.

<sup>1</sup> « Applied research for natural resources valorization and transformation in a process of fight against poverty in Chad and Cameroon »; subvention: FED/2009/217079; project website: [www.valrena.org](http://www.valrena.org).

In particular, as the activity on earthen bricks was concerned, the collaborating partners were the following:

- the Italian NGO ACRA, an organization for rural cooperation in Africa and Latin America;
- the University of Ngaoundéré (Cameroun), in particular the Department of Earth Sciences;
- the University of Brescia (Italy), in particular the Research Centre on Appropriate Technologies for Environmental Management in Developing Countries (CeTAmb), and the Department of Mechanical and Industrial Engineering.

Each partner had a specific role, according to his competence: ACRA was in charge of the local and international coordination and logistics; the University of Ngaoundéré was in charge of the soils analysis and choice of the pilot plant site; the University of Brescia was in charge of the environmental analysis and machinery design. In this paper the main phases of the project implementation and the obtained results are described, with a particular emphasis on the role of each partner. First, a survey on housing and building techniques in use in the Logone valley was carried out, in order to identify features, problems and possibility of improvement in the field of the handicraft earth brick production. Subsequently, an analysis of the morphological and geotechnical characteristics of the local soils was carried out, finalized to evaluate their suitability to brick production and identify the best locations for earth extraction. Then, a new extrusion press for improving crude earth brick production was designed and tested, taking into account the local market features emerged from the survey; the extruded bricks were tested and compared to the local traditional ones. Finally, the new machine was reproduced in a workshop in Cameroon and loaned to a local brick producer, verifying the economical and environmental sustainability.

## SURVEY ON HOUSING AND BUILDING TECHNIQUES IN THE LOGONE VALLEY

The Logone valley (Figure 1) is located across the border between Chad and Cameroon, and is characterized by tropical climate, with seasonal rains and savannah – grassland landscape. The main cities in the region are the capital N'Djamena, Bongor and Mondou on the Chadian side; Yagoua, Maroua, Garoua and Ngaoundéré on the Cameroonian side. In March 2011 and subsequently in March 2012 two surveys were carried out in the region in order to obtain data about local needs related to house building. The surveys were carried out by students and researchers of the Brescia University, in strict coordination with the local staff of ACRA. Several crude and fired brick production sites were found in the region, both at household and handicraft level. Crude bricks are used especially for building houses in rural villages (Figure 2). The production is conditioned by the rainy season, when many crude earth houses are damaged because of a twofold action: the walls are eroded by the impacting drops, and the bottom part of the walls is weakened by the water absorbed from the ground because of flooding. Each year, at the end of the rains, new bricks are purchased at city markets for substituting the damaged ones; somebody makes bricks manually for his own necessity, especially in case of lack of funds.

Fig. 1 - The Logone valley region.

Fig. 2 - House in crude earthen bricks in the Logone valley.

**Fig. 3** - Manual brick forming.

**Fig. 4** - Typical stove brick kiln.

Several manufacturers of fired and crude bricks were visited during the missions, in the regions of N'Djamena, Bongor, Maroua and Yagoua. A single enterprise was also contacted in Maroua producing non fired bricks in sand with about 5-10% cement. Some information about the practice of brick making in the region was collected by means of interviews to local producers, with the aim of depicting the state-of-the-art and understanding the context where the project had to be developed.

In general, the first phase of earth bricks production process does not differ for fired and crude ones: a dough of clay, sand and water, with the addition of vegetable fibres and/or animal dejections is prepared. The percentages of the different components vary according to local soil characteristics, materials availability, manufacturer experience and financial resources. The components are usually mixed on the ground by a shovel, adding water gradually, until sufficient homogeneity is reached; subsequently, the dough is covered by a waterproof plastic film and left for a couple of days, in order to allow uniform water penetration. After that, the dough is formed through wooden moulds giving the typical brick shape, and exposed to sun drying for 3 days (Figure 3). The brick dimension is also a varying parameter, with thickness ranging from 7.5 to 10 cm, width from 15 to 20 cm, length from 30 to 40 cm. After drying, they are ready to use as crude bricks; in case of firing, they are stacked in a typical stove kiln structure (Figure 4), with channels in the bottom region to be filled by solid fuel; other fuel is also put in the gaps between the bricks in the interior stack part, whilst in the exterior part the gaps are filled by dough in order to reduce heat dispersion. The solid fuel is also wetted by liquid fuel (petrol or gasoline) in order to facilitate ignition. Once the fuel is fired up, the combustion is kept for 3 days, with periodical fuel refilling. The production rate varies from 160 to 250 bricks per day, with 3-4 employees.

As production cost and selling price are concerned, different data were found according to the location and brick typology: the selling price of crude bricks ranged from 25 XAF<sup>2</sup> (0,04 EUR) per item in Maroua (CM) to 40 XAF (0,06 EUR) per item in N'Djamena (TD); the fired brick price ranged from 60 XAF (0,09 EUR) per item in Bongor (TD) to 150 XAF (0,23 EUR) in Yagoua (CM); the sand-cement brick price was 175 XAF (0,27 EUR) per item in Maroua. The fuel cost in the production process varied from about 2 XAF (0,003 EUR) per item in the Cameroonian cities up to 17 XAF (0,025 EUR) per item in the Chad capital N'Djamena: this is also due to the fact that in Chad the charcoal production and commerce is forbidden since 2009, and consequently the price of other fuels rose up. In all cases of fired bricks production, the wood cost is most of the total fuel cost (50-80%); other fuels used to integrate the combustion are local tree nuts, animal dejections, petrol and (only in Cameroun) charcoal. The wood consumption of the stove kiln was estimated; the details of the estimation procedure are given in [10]: the result was that the environmental cost of a mean 4 rooms house of 65 m<sup>2</sup> is about 11 m<sup>3</sup> of round-wood forest per house.

These data showed that the crude bricks market should have many chances of expansion, both for economical and environmental reasons, provided that the problems of aesthetics and structural stability are solved. A way for improving the crude brick quality is mechanizing the production process, as the machines can give adequate compaction and regular shape to the bricks; furthermore, binding agents (typically cement or lime) can be added to the dough in order to improve their resistance to water.

An inquiry was also carried out about previous projects aimed at promoting mechanized crude brick production, based on manual presses for brick forming and compacting, with dough containing cement in percentage ranging from 6% to 12%. These projects resulted not economically sustainable, because the production and the number of employees were similar to the case of the traditional procedure, but with higher costs due to the use of cement and to the initial investment for machine purchasing, not adequately compensated by brick quality increment.

## ANALYSIS OF THE LOGONE VALLEY SOILS

The activity of soil analysis in the Logone valley was led by the University of Ngaoundéré, involving students and researchers that extracted 32 soil samples from different clay deposits located on both sides of the Logone valley.

<sup>2</sup> Central Africa CFA Franc; 1 EUR = 655.96 XAF.

They used a Highway auger of 500 mm diameter, up to 6 meters in depth for extracting samples, that were used for morphological and geotechnical characterization of the soils.

### Morphological characterization

In general, the tested clay materials were gathered into four main groups [11,12], based on their appearance:

1. clay materials from vertisols: these soils are located at stream edges in small alluvial ridges depressions (Grand Tougoudé), in the north of the Bongor plain near major flows of flood waters of the Logone, and in the south of Yagoua (Datchéka). They have a depth range of about 3 to 6 m above the water table and are characterized by dark colour, clayey texture, massive structure, deep open superficial desiccation cracks and micro-reliefs (gilgai);
2. clay materials from gley with vertisolic character: this group of soils has been divided into two subgroups: soils with superficial gley characters and typical gley. Soils with superficial gley characters constitute a term of transition between vertisols and typical gley. They are mosaics of soil settling ponds, channels and distributaries in sandy clay materials. They were observed in the north of Pouss, in Guirvidig, in Miogoye Bla, in Tikem, in Kalfou and Lokoro etc.. Typical gley covers an extensive surface area of the Logone valley, notably the lowest part of the floodplain. They are formed from alluvial clays settled in place by the floods of the Logone River and its tributaries. They were observed in Maga, Vélé, Dourang, Binga, Kim etc.;
3. clay materials from pseudogley and gley: they occupy the upper part of the floodplain, and are formed by alluvial clay or sandy clayey materials. They were observed in Bongor and Nahaïna;
4. clay materials from pseudogley: they are present in the upper part of the sequence of clay materials in the valley, and vary from sandy clayey to clay loam deposits. They were observed in Manga, Bongor and Gounou-Gaya.

Globally, the soils of Logone valley are characterized by three main horizons of clay materials: top surface horizons, which are dark grey to brown-grey, sandy clayey to clayey, prismatic and plastic when wet; subsurface horizons, which are grey to yellow-brown, clayey to sandy clayey, plastic, prismatic with presence of slickenside; and deep yellow-brown horizons, sandy clay, massive, somewhat plastic. Samples of soils were collected in different horizons of each representative soil profile for laboratory analyses.

### Geotechnical characterization

Geotechnical analyses were performed in the laboratory of the Local Materials Promotion Authority (MIPROMALO) in Garoua (Cameroon), in order to determine the behaviour of clay materials. These analyses included in particular the measurement of Atterberg plastic and liquid limits  $W_p$  and  $W_l$ , i.e. the water content  $W$  determining the transition respectively from semi-solid to plastic behaviour, and from plastic to liquid behaviour. These limits were determined respectively by the roller method and the Casagrande liquid limit device; subsequently, the plastic index  $I_p$  was obtained as difference between liquid and plastic limit ( $I_p = W_l - W_p$ ). The testing method complied the ASTM standard for this kind of analyses [13].

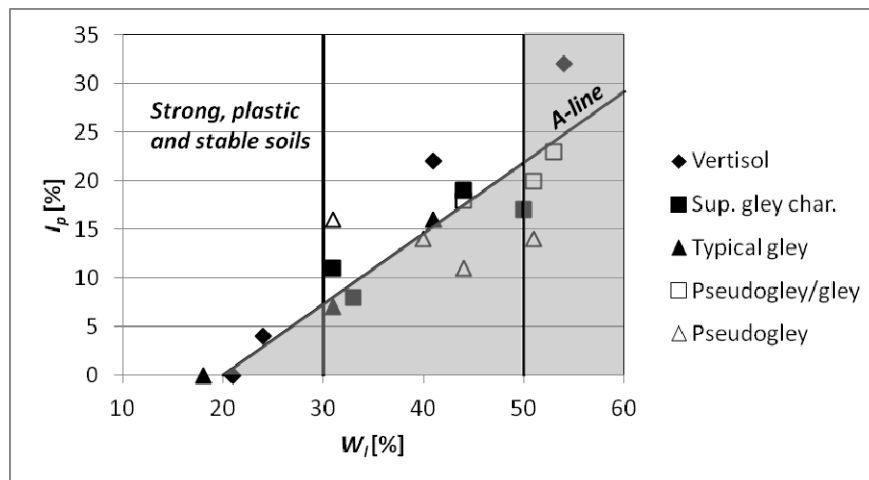

Fig. 5 - Casagrande chart of the soils of the Logone valley.

In [10] the detailed results are given; here the Casagrande chart [14], which summarizes the results by characterizing the different soils depending on  $W$  and  $I_p$  is shown (Figure 5): the area standing above the inclined line (identified as “A-line”) and with  $W_l < 50\%$  identifies the best soils for brick making, because of high strength at dry

state, high plasticity and low dilatancy at wet state. Vertisols and soils with superficial gley characters result in general the best within the analyzed soils: therefore, the region between Yagoua (Cameroon) and Bongor (Chad), where these soils are prevalent, seemed the most appropriate for setting a plant of brick production.

## STUDY OF AN APPROPRIATE TECHNOLOGY FOR BRICKS PRODUCTION

A new press for earthen dough extrusion was designed and prototyped at the University of Brescia [10]. Brick production by extrusion is a continuous process, allowing simultaneous dough feeding, brick compaction and brick removal, without the stops required by block pressing machines; this allows a more efficient and speedy production process, with the same number of employees. The dough has to be inserted manually into the machine; subsequently it is extruded by a piston mechanism, and the extruded matter is cut and removed manually. The piston mechanism is studied in such a way to facilitate dough insertion and brick removal. The machine design was conceived in such a way that the fabrication of most components does not require machining tools with numeric control, so that they can be produced in handicraft workshops of developing countries.

A prototype of the machine was first realized at the University of Brescia, producing bricks of 5 cm in thickness and 10 cm in width, running at about 15 piston cycles per minute, a sustainable speed for feeding and brick removing. The prototype was equipped by electronic instrumentation (inverter, load cell, computer control) in order to measure some running parameters, such as the instantaneous piston velocity, the compression force on the dough, and the consumed energy. Preliminary tests were carried out with non stabilized dough and with the addition of cement as stabilizer, with extrusion pressure ranging from 2 to 8.7 bars, i.e. up to more than 4 times the declared maximum pressure of manual presses: the measured electrical energy consumption for one m<sup>3</sup> of bricks ranged from 80 to 250 kJ/m<sup>3</sup>, and a production of 2-3 bricks per minute was obtained.

The quality of the bricks in terms of structural strength and resistance to water action was tested (see [10] for details).

The structural strength was evaluated by means of compression tests, carried out directly on the extruded bricks. Different specimens were tested: extruded non stabilized bricks, obtained with different pressures on the wet dough, after two weeks drying; stabilized bricks extruded at 8.7 bar, after 28 days drying; fired bricks coming from N'Djamena (Chad).

The following main indications can be obtained by these data:

- the compression strength is higher than the minimum recommended value of 1.7 N/mm<sup>2</sup> [15] for all extruded bricks at pressure exceeding 4 bar; bricks extruded at 2 bar are very close to the minimum required;
- fired bricks in general have lower strength than extruded ones, and do not always satisfy the minimum requirement;
- the effect of the extrusion pressure is determinant up to 4 N/mm<sup>2</sup>; further pressure increments have a limited effect on the brick strength;
- the effect of cement is not determinant.

As the water effect is concerned, two different aspects were considered: the erosion due to raindrops impacting on the walls, and the water absorption from the ground in event of flooding. Erosion was evaluated by means of two kinds of tests, aimed at simulate both beating and moderate rain. The water absorption from the ground was evaluated by means of immersion.

The indications useful for the practice obtained by these results were that extruded non stabilized bricks have good compression strength, as well as an acceptable resistance to rain erosion; on the contrary, their real weakness is the low resistance to water absorption. Therefore, stabilized bricks can be used for building the house parts more exposed to water absorption from the soil, i.e. the floor and the bottom part of walls; non stabilized bricks are suitable for the top part of the walls, which usually is partially protected by the roof.

### Implementation in Cameroon

After the prototype experimentation, the machine was replicated in Cameroon, by the technical and industrial school "Centre Technique de Maroua" (CTM), where workshops equipped by carpentry and machining tools, without numerical control, are present. The construction of the machine was carried out under the supervision of a student of the University of Brescia, who had followed the machine conception. Some changes in the design were introduced: the extruder section was increased up to 10x15 cm, in order to meet the local consuetude, and consequently also the piston diameter was increased; further minor modifications were necessary for fitting materials, components and semis available in situ. All the machine components were manufactured at the CTM, except the electric motor, the gearbox and the control cabinet that were imported from Italy, mainly for logistic and timing requirements rather than for unavailability on site. The final appearance of the machine is shown in Figure 6. Preliminary machine running and brick quality tests were carried out, obtaining results comparable to the ones of the laboratory tests made in Italy.

Fig. 6 - Earthen brick machine constructed in Cameroon.

The machine was loaned to a local producer in the city of Yagoua (Cameroon), chosen because of his experience in fired brick production, for which he had already invested in technical and logistic facilities. He also provided information about transport, manpower and energy cost; his annual production is presently of 12.500 bricks, but this datum is constantly increasing since many years. He quantified in 150 XAF (0,23 EUR) per item the price of his fired bricks.

An approximated simulation of the management of this pilot plant, after conversion from fired to crude bricks production, was carried out (see [10] for details). The initial investment, energy, manpower and transport costs were taken into account; two different scenarios were considered, i.e. production of stabilized and non-stabilized bricks, with adequate contribution margins (30% of the unit cost for stabilized bricks, 15% for non-stabilized bricks). Figure 7 shows the cash flow in the two scenarios, supposing that all the produced bricks are sold: a payback period between 3.5 and 7 years is predicted, depending on the scenario.

Fig. 7 - Cash flow in the simulation of stabilized and non-stabilized earthen bricks.

An evaluation of the Greenhouse Gas (GHG) emission and energy saving due to conversion of fired to crude bricks production was also carried out. As fired bricks are concerned, GHG emissions and energy consumption are due only to brick firing; as crude bricks are concerned, thermal energy consumption and GHG emissions are connected with the production of electric energy and, in case of stabilized bricks, of cement.

Table 1 compares the annual energy consumption and GHG emission related to crude bricks production (both stabilized and non-stabilized) with the same parameters if the same quantity of fired bricks were produced: for both

parameters, a saving higher than 99% is obtained with non-stabilized bricks production, and higher than 90% with stabilized bricks.

**Tab. 1** - Energy consumption and GHG emission in fired and crude brick production.

Scenario	Annual production [metric tons]	Thermal energy consumption [MJ]	GHG emission [kg CO <sub>2</sub> ]
Non-stabilized crude	1356.5	15565.6	1255.2
Stabilized crude	1356.5	369796.7	33390.0
Fired	1356.5	3737102.4	363401.0

## CONCLUSIONS

A partnership between Italian and Cameroonian entities was built for facing the problem of excessive wood consumption for earthen brick firing in the Loagone valley, in Chad and Cameroon. In particular, actions aimed at promoting crude earthen bricks production were made, with different roles of the partners according to their competence.

A survey of the handicraft fired brick production technology diffused in the Logone valley was carried out by the Brescia University, with the support of local staff of the NGO ACRA; the survey was particularly focused on the environmental impact in terms of greenhouse gas emissions and wood-fuel consumption.

The University of Ngaoundéré carried out a morphological and geotechnical characterization of local soils in order to evaluate their suitability to brick production and individuate the best earth fields.

Subsequently, a new machine for brick extrusion was designed and realized in a workshop in Cameroon under the supervision of the Brescia University, optimizing its conception to the technological resources available in situ. Laboratory tests on bricks made by the new machine were carried out, showing that extruded crude bricks have good properties in relation to fired bricks in use in the Logone valley.

Economical and environmental impact analyses allowed predicting a good performance of the machine within ten years, in terms of pay-back period, energy and greenhouse gas emission saving.

## ACKNOWLEDGMENT

This paper has been realized in the framework of ACP Science and Technology Programme, a programme of the ACP Group of States, with the financial assistance of the European Union. The contents of this publication are the sole responsibility of the authors and can under no circumstances be regarded as reflecting the position of the ACP Secretariat and of the European Union.

## ENHANCING ENERGY ACCESS FOR THE POOR: THE ROLE OF APPROPRIATE TECHNOLOGIES IN THE USE OF TRADITIONAL SOLID FUELS

Francesco Vitali\*, Mentore Vaccari\*

\*CeTAmb, Research Centre on Appropriate Technologies for Environmental Management in Developing Countries, University of Brescia, Italy, [cetamb@ing.unibs.it](mailto:cetamb@ing.unibs.it)

### ABSTRACT

The use of traditional solid fuels leads to a number of dramatic impacts not only on the users but also for the environment. Often national household energy policies do not have the capacity to effectively target an adequate diffused energy access, chasing the hope to switch to more modern and clean fuels, like LPG, and missing meeting the financial capacities and the needs of the population. Thus, especially for the weakest income classes, energy poverty seems to be a no-way-out situation. Appropriate technologies play a key role in breaking this vicious circle, providing with the intermediate solutions to escape from this limiting condition. Actually there are many technology options to use traditional fuels more efficiently. The suitability of the existing improved technologies depends on factors such as availability, applicability, acceptability and affordability, including access to finance to cover initial investments. The adoption of improved technologies, which allow using even poor fuels, but in a convenient, cleaner and more efficient manner, appears to be a viable way to walk to reach the goal of minimum energy access for the poor.

The approach adopted in this work is strongly influenced by the above considerations. A specific context, the Logone Valley at the border between Chad and Cameroun, was the one where field observations and activities were implemented. The introduction of improved stove models were studied in order to provide the local population with alternative fuel stove to cover their daily energy needs. Not only technical aspects such as the material availability or the local artisan skills were considered, but also aspects such as the adaptability to local cooking practices, the sustainability and the acceptance by users were addressed.

### INTRODUCTION

Energy is one of the basic requirements of human societies. It is vital for human life and for technological advancement. In general energy can contribute to widening opportunities and empowering people to exercise choices. Energy poverty is related to the absence of sufficient choice in accessing adequate, affordable, high-quality, safe and environmentally benign energy services to support economic and human development [1]. Without access to efficient and affordable energy sources, people living in poor conditions have very limited opportunities for economic and social advancement. The International Energy Agency (IEA) [2] estimates that 1.3 billion people – over 19% of the global population – lack access to electricity and about 2.7 billion people – some 40% of the global population – rely on the traditional use of solid biomass for cooking. This number is higher than previously estimated in 2008 by IEA due to population growth, rising liquid fuel costs and the global economic recession, which have driven a number of people back to using traditional solid biomass.

The use of traditional solid fuels leads to a number of dramatic impacts not only on the users but also for the environment. In order to gather the fuel required for their daily energy needs, householders have to cover every day longer distances (carrying heavy loads) or invest a significant share of their budget to purchase it in the local market. Besides wasting a resource (for which a lot of drudgery or money were spent), the use of solid fuels on open fires or inefficient stoves results in a range of health-damaging pollutant emissions, often under conditions of poor household ventilation [3]. Women and young children, who usually spend many hours close to the smoky source, are the most exposed. Such emissions have also significant global warming effects, due to incomplete combustion of fuel carbon. Moreover, the unsustainable overexploitation of natural resources leads to their faster depletion. Often (where existing) national household energy policies and strategies do not have the capacity to effectively target an adequate diffused energy access, chasing the hope to switch to more modern and clean fuels, like LPG, and missing meeting the financial capacities and the needs of the population. Thus, especially for the weakest income classes, energy poverty seems to be a no-way-out situation: by the one side they have no financial means to step up their own energy condition, accessing the use of more convenient, cleaner and modern fuels; by the other side, the limited energy level provides them with no emancipation means, both to improve their quality of life and to eventually start a small income generating activity.

Appropriate technologies play a key role in breaking this vicious circle, providing with the intermediate solutions to escape from this limiting condition. Actually there are many technology options to use traditional fuels more

efficiently. The suitability of the existing improved technologies depends on factors such as availability, applicability, acceptability and affordability, including access to finance to cover initial investments. The decreasing availability of existing sources of fuel makes switching to modern alternatives a necessity in some places. In some others, the inconsistency of a market not supported by realistic political energy strategies makes unaffordable for most of the people gaining access to more appropriate fuels, getting back to traditional cheaper fuels. According to these aspects, and to the estimated increasing number of people relying on biomass for cooking purposes in the next future, the adoption of improved technologies, which allow to use even poor fuels, but in a convenient, cleaner and more efficient manner, appears to be a viable way to walk to reach the goal of minimum energy access for the poor.

The implementation of appropriate cooking technologies in contexts with limited resources is strictly required in order to give a practical and sustainable response for this issue. In particular this work focuses on a specific region, the Logone Valley at the border between Chad and Cameroun. The research was carried out within the activities of an international development cooperation project (ENV/2006/114-747) implemented by the Italian NGO ACRA and funded by the European Community. Given the local background and the relative constraints, the challenge was to find the appropriate solutions, under a technical point of view, for the reduction of wood consumption. The main part of the project focused on the protection of natural resources, in particular through the creation of community-based committees for the protection of the local forests. Among the project activities, one addressed the decrease of the consumption of the main household fuel, charcoal, which was produced locally from very low efficient carbonization processes. The research, subject of this work, was developed in parallel with the project activities in order to identify a pool of appropriate energy technologies to target the objective of fuel use reduction at household level. The challenging research question that drove this work is: "Which cooking technology is appropriate for household energy access in the Logone Valley?" This work looked by the one side to the most recent findings and interests of the international research community, trying to the other side to conjugate them in the most appropriate way with the local constraints given by the peculiarity of the implementation context. Both technology and impact related aspects were taken into account in order to give an overall assessment of the cooking technologies studied.

## **STUDY AREA**

A specific context, the Logone Valley at the border between Chad and Cameroun, was the one where field observations and activities were implemented. The research leans on the activities of an international development cooperation project (ENV/2006/114-747) implemented by the Italian NGO ACRA and funded by the EU. At the beginning of the project (2008), in the intervention region charcoal and wood were the traditional fuels for household energy supply. Only in urban areas some high income families used to cook with LPG gas. Charcoal production and sale have been forbidden by the Chadian national government since 2009. This had a shocking effect on local wood prices that more than doubled, from 15 CFA francs /kg in 2008 to 35 CFA francs /kg in 2010. The project aimed at the reduction of wood consumption at household level. The dissemination of low-technology but high-efficiency models was implemented according to the socio-economic conditions of the local people (minimal investment capacity due to the very low level of income) and of the skills and the tools available for small local workshops (in particular the lack of electricity impacting in basic manufacturing capabilities).

## **MATERIALS AND METHODS**

A number of activities on the field were implemented to gain knowledge about the cooking energy issue in the local context. Among the social research qualitative methods in this research the followings were applied:

- observation of the target groups, villages and project interventions through local field staff was used in order to gain a first impression of energy patterns. Even though not as accurate and representative as structured surveys, observations can be especially useful for preparing further scientific research (e.g. questionnaires) by providing site-specific knowledge [4].
- Focus Group Discussions allowing interviewers to study people in a more natural setting than in a one-to-one interview [4]. This method was used during the workshops organized for local artisans in the production of some models of improved stove to assess their opinions by talking to various people at once in a less forced environment.

Quantitative approaches are concerned to quantify social phenomena by collecting and analysing numerical data in a statistical reliable and valid manner.

- Semi-structured interviews were used in quantitative surveys to obtain comparable information representative for the total target group. Standard questionnaires (IEA, WHO) were adapted to fit objectives of surveys implemented on relevant assessment fields. Random samples were chosen among the population living in the intervention area. Questions were structured in order to avoid bias due to undesired effects on the respondents

such as social-desirability (people tend to answer not according to their own opinion but according to social norms or what the respondent thinks would be the desired answer for the interviewer) and revised after some pilot tests.

Besides information that need to be gathered from interviews or observations, data on particular indicators were provided from local databases, statistics and registers.

### Stove testing

Over the last thirty years there have been many attempts to develop improved stoves, but often they failed due to lacks in quality and performance control. The technical performance of stoves is tested according to internationally agreed test procedures related to energy efficiency, emission control and safe use. Historically the main focus of the performance of an energy system is given to its efficiency, an indicator that expresses the ratio of energy useful to achieve a specific task on the total energy consumed. Thus, such a parameter is too narrow to describe the effectiveness of a stove, as a number of factors beyond the stove design takes influence in similar conditions, like the quality and characteristics of the fuel, the handling of the fuel, the handling of the stove, the management of the cooking process, the environment of cooking.

With focus on relative performances of stoves, the assessment of stove efficiency is circumstantial. A clay stove is perceived as an efficient stove in households with open fire places and as an inefficient stove in households that are using an advanced improved stove. International standards on stove quality have been discussed for many years. While they are desirable to enable a global comparison of stove performances, there is a danger that cheap solutions for the very poor households are abandoned due to their low performance in relation to the global standards, when in fact they could still be a relevant improvement in comparison to the baseline situation of the poorest of the poor. That's why a stratification of quality standards has been developed in the "Lima consensus" reached during the 2011 Forum of the Partnership for Clean Indoor Air. The consensus reached among major stakeholders in standards and testing resolved to adopt a temporary rating system of stove technologies in tiers of performance in the areas of fuel efficiency, indoor air quality, emissions of PM and CO, and safety. Each area has to be ranked separately, reflecting a sequence of evolution from Tier 0 for 'typical unimproved' to Tier 3 'to achieve significant, measurable high goals'. The new protocol should also evaluate particulate composition including black carbon, address batch-feeding stoves that are not well captured by the current protocols.

#### *Water Boiling Test (WBT)*

This laboratory-based test is designed to explore the most basic aspects of stove performance in a controlled environment [5]. A prescribed amount of water is brought to the boil and kept simmering for a given period of time, while the fuel consumption (and recently also the emissions) is measured. As it is a short test, and the results are not highly variable, relatively few tests can give informative and quick feedback. The WBT is a useful tool in the process of stove development or when comparing very different stoves. It allows to accurately spotting the effect of small changes in stove design, fuel quality or other physical variables. It can also be used in field tests to determine whether stoves have been built to match their design criteria on cooking time, fuel use and emissions. It does not reflect field performance because the way typical local dishes are prepared can be very different from just boiling water. Currently revisions of the test protocols are being discussed, but no new protocol has yet been accepted [6].

#### *Controlled Cooking Test (CCT)*

Like the Water Boiling Test, the Controlled Cooking Test measures the fuel consumption of a stove for a specific standardized cooking task typical for a certain region [7]. The CCT can be done either in a laboratory-environment or in the kitchen of a real user while the regular user operates the stove and the tester observes and records all the influencing parameters. The duration of the CCT is determined by the chosen typical cooking task. As well as being closer to day-to-day life, it allows the stove properties to be measured in a reproducible way by minimizing the influence of other factors.

#### *Kitchen performance test (KPT)*

The Kitchen Performance Test is an entirely field-based procedure that evaluates the effect of stove interventions in real-world conditions: the KPT is carried out over several days in the users' households[8]. Fewer parameters are controllable as the tester is not present all the time during the test. It includes quantitative surveys of fuel consumption of the participating household and qualitative surveys of stove performance and acceptability. The KPT is more time-consuming, thus more expensive; however, it is the best way to monitor the stove's real impact on fuel use and cooking behaviour in the participating households. The KPT is increasingly important for projects that want to register for the voluntary carbon market to prove the actual fuel savings realized by the users in their day-to-day cooking [9].

### *Monitoring of impacts and assessment of the appropriateness*

For a “proper” impact assessment it is recommended the use of a shared list of indicators, the conduction of baseline studies before project intervention and impact studies after households got access to a form of modern energy, the use of a theory based approach by applying the result chain for developing the study design, the use of a mixed methods approach. The inclusion of control groups if possible (households which do not have access to modern energy) into the baseline and impact study. In particular the use of mixed methods allows looking at things from multiple points of view (Mikkelsen 2005) capturing different effects of one intervention, assessing in multiple ways the complexity of a system, strengthening the results if these converge, limiting the bias. Quantitative impact evaluation done in experimental or quasi-experimental way is preferable to qualitative assessment.

Impact assessment in different phases of an intervention allows to monitor and to compare the results of the activities with the baseline. These include: income generation from stove production, women engaged in new activities, time and expenses saved, perceived reductions in the levels of indoor air pollution and reduction in the number of accidents. To collect empirical data on the impacts of energy projects, a wide range of methods and approaches is available. These may differ significantly in terms of time, money and expertise needed for implementation (Baker 2000).

Results Based Monitoring (RBM) is an international monitoring standard designed to monitor development results applied regularly to GIZ programmes. Results are defined as development changes that follow directly from an intervention; they can be outputs, outcomes or impacts resulting from a development intervention. RBM is a method to examine the result hypotheses in an empirical and systematic way. The two key results are usually considered to be stoves sales and correct stoves use, since all further outcomes and impacts depend on stoves on the market and their correct use. The stove effects strongly depend on the capacity of the user to achieve maximum reduction of fuel use and emissions. An interesting case is the Participatory Impact Assessment applied by ProBEC (Programme for Biomass Energy Conservation) in selected Sub-Saharan African countries, where local stove artisans conducted impact assessment interviews. This approach to impact assessment requires high involvement by the producers and creates business awareness. The results of an assessment by the manufacturers inevitably cannot be considered neutral.

The data from impact assessment can provide the starting point for an economic evaluation of the project, including a Cost-Benefit-Analysis (CBA) and a Cost-Effectiveness Analysis (CEA). Analyzing both the economic efficiency of the investments and the benefits deriving from energy efficient stoves on a macro and micro level can be helpful for further lobbying, public relations and keeping control of the project. Financial and technical criteria have generally prevailed, while the possibility of using a conceptual framework that encompasses sustainable energy development has often been neglected. In this perspective a multi-criteria approach to decision making appears to be the most appropriate tool to understand all the different perspectives involved (Kahraman and Kaya 2010).

## **RESULTS**

A number of tests were conducted on site to evaluate which stove model, in combination with proper fuel, would be suitable for the dissemination among the local population. Stove models were chosen among traditional and improved stoves already available in the region and tested following international recognized standard protocols (Water Boiling Test and Controlled Cooking Tests). The two models chosen for the dissemination (through the training of local artisan) were the Ceramic and the Centrafrican effective improved cookstoves [10]. Both of them were selected not only for their good (but not “best” compared to advanced improved cookstove) performances, but mainly for the appropriateness to the local context in terms of acceptability by the users and suitability to the local technical manufacturing skills. Result based impact assessment was done by means of a number of surveys both quantitative (Kitchen Performance Test, Indoor Air Pollution monitoring, CO<sub>2</sub> avoided emissions estimations) and qualitative (interviews, observations). Increasing adoption rates (more than 3,500 units sold at March 2011) and appreciation by the users indicate the appropriateness of the stove model proposed by the project to the local context. Fuel consumption reduction (-55% for the Centrafrican ICS in comparison with the traditional three stone fire) and adaptability to the local cooking practices are the main features that the users indicates as strengthens of the technology. These aspects have been fundamental for the successful scaling-up of the Centrafrican stove [11].

A parallel activity done was the experimentation of a new stove design. The input was given by the local availability of a waste biomass, rice husk, which was thought to be recoverable as an alternative fuel to wood for household energy supply. In full collaboration with DIMI a proper stove was designed and tested to recover such a biomass [12]. The crude-earth brick stove is equipped with a chimney and an internal bi-cylindrical metal-net reactor to contain the fuel. Such a lay-out allows a mix of combustion/gasification of the biomass occurring in a completely burning fire, appropriate for cooking tasks. A rigorous Research & Development pathway was implemented in order to investigate in detail the operation of the stove, resulting in a final configuration with very good and reliable performances (average efficiency 18%, low indoor and environmental emission of pollutants). The stove has not been disseminated on site yet. Nevertheless, the design of the prototype was always driven by local inputs. Not only technical aspects such as the material availability or the local artisan skills were considered, but aspects such as the adaptability to local cooking practices, the sustainability and the acceptance by users were addressed. According to the outputs of a

simple economic model elaborated ad hoc, the introduction of the mlc rice husk stove in the cooking energy system of a household resulted economically sustainable. All the scenarios elaborated show how the rice husk stove adoption would reduce significantly the household fuel expenditure, within the limits of the local availability of such a biomass [13]. The use of the technology proposed in combination with improved woodstove would provide householders with an appropriate and convenient cooking technology pool, increasing the opportunities of choice of the preferred energy system for the user. That results even more important considering the increasing wood fuel price observed on site that may affect negatively the advantages related to the use of the only improved wood stoves.

A final multi-criteria analysis assesses the appropriateness of the technologies studied providing with a global overview of the results obtained in different activities [14]. The analysis structure was built in order to point out the best cooking technology for the local context according to the different impacts that such a system is supposed to have on the user. Thus, four main clusters have been investigated, structuring quantifiable indicators for financial, environmental, social and health related impacts of the use of a certain energy technology. The weight systems adopted were chosen in order to consider the features of each technology according primarily to their relevance to the local needs. A sensitiveness analysis taking into account a weight system based on priorities listed by a group of energy experts marked some differences between the point of view on people working in the sector and that one of people supposed to adopt and use daily the technology. A shared and appropriate set of priorities should be achieved by one side through awareness and education of local population on environmental and health protection, so that also negative impacts related to these clusters could be effectively perceived by the direct users. By the other side friendly usage, adaptability to local cooking practices and reliability of fuel and technologies are aspects that should not be neglected but they should drive the design of a new cooking system.

**CONCLUSIONS**

The analysis done in this work allows drafting some general final considerations. The traditional “energy ladder”, like any such general model, is likely to provide only a limited view of reality in actual households (Masera et al 2000). Due to the failures of the linear energy ladder to describe adequately the fuel use dynamics in several cases, a “multiple fuel” model appears more appropriate. The wide range of new cooking technologies available has a great potential to make use of a variety of biomass residues that are difficult to burn cleanly in conventional stoves. In many places in the developing world wood is still the most preferred fuel, due to traditional habits and social rooted practices, even if the physical drudgery and time losses related to the collection activity or the financial impact on household budget is very high, and often increasing day by day. At the same time in the same areas where charcoal and firewood are becoming a scarce and/or an expensive resource, innovative systems, like micro-gasifiers or alternative fuel stoves will be of growing relevance as an option to cleanly burn biomass fuels. Making available these new technologies, promoting the research and finding the more appropriate and local tailored scaling-up strategies could help practically people living in energy poverty to escape from their miserable condition, gaining access to a wider energy technology portfolio. The adoption of a variety of combinations of affordable, reliable, convenient and clean cooking systems based on a multiple-fuel supply, could further protect low income population who are the most exposed to fuel price shocks. That would define a new comprehensive and “higher” first step in the classical view of the energy ladder, defining a new “flatter” energy ladder (Figure 1). Indeed new technologies available may reduce significantly the gap in adequate access to cooking energy between low- and high-income classes and achieve an efficient (not only effective) use of biomass at the level of the more modern fuels.

**Fig. 1** - Definition of a “new” energy ladder. Comparison between the conventional one (on the left) and the one proposed by this work (on the right).

## STUDY AND DESIGN OF A LOW ENVIRONMENTAL AND SOCIAL IMPACT LANDFILLING IN TOGO, ASSAHOUN VILLAGE

Alessandra Bonoli\*, Sara Bellavita\*

\*CODE3, DICAM, University of Bologna

### ABSTRACT

Waste disposal in landfilling, in association with a separate collection of organic and non-organic waste, seems to be the easiest and cheapest urban waste management method, compared to others, for a developing country, as Togo, poor in economic and technological resources. Obviously, a landfill construction requires an accurate environment and economic assessment in order to minimize the impact on the local population. It means to consider local population conditions and behaviors, municipal solid waste fluxes and their characteristics in terms of quality and quantity, climatic conditions, geotechnical and hydrological characteristics of the site and many other environmental and social factors in order to perform an optimal design. But first of all it must be considered the evaluation of economic and technological resources available and the level of information to the population about environmental impacts and health risks related to waste landfilling. The landfill in the village of Assahoun, Togo, conceived by Soutien Planète and developed by CODE3 has been designed in such a way to reduce the negative environmental impacts using appropriate technologies approach with simple solutions by the point of view of construction, management and cooperation between inhabitants and stakeholders. The project has been thought and designed to make waste management and disposal as compatible as possible with environmental and local population requirements, to ensure that it is not just a project, but to make actually possible to its construction. It would be also necessary a recycling perspective of some fractions as paper and cardboard, glass and plastic, organic waste but for the moment it is not possible for the local population to start up a separate collection and an appropriate managing of these materials: that needs a few more years of strong awareness by not only the environmental and humanitarian associations, but also, and especially, by government.

### INTRODUCTION

Togo accuses a real delay in waste management, as almost all the other African states. The current system of waste collection is provided only in the big cities and, in any case, it seems totally inadequate since it based on the payment of a substantial fee that families are always not able to afford.

The consequence is that the poorest households (the biggest slice of the population) and the inhabitants of all villages discharge their waste in illegal way, in dumps, in the sides of roads, in the fields or burn their waste open air (figure 1), creating a polluted and unsanitary atmosphere that can develop diseases, respiratory (pneumonitis is the first cause of infant death) and carcinogenic, encouraging also the proliferation of insects and rodents, which cause severe epidemics (malaria, plague, cholera , etc.). Another important effect of an uncontrolled discharge is represented by the production of leachate inside the landfill, that contaminates soil, subsoil and groundwater with the risk of a whole food chain contamination.

Fig. 1 - Examples of illegal waste burning and dumping [1], [2].

The situation is really critical, but in Togo, there are a multitude of local groups involved in environmental protection who are fighting to improve health and social development of their people.

In collaboration with an African NGO (Soutien Planète) [3], a better waste management disposal for the village of Assahoun (Togo) has been designed. The project for the construction of the landfill takes into account many environmental and social factors in order to guarantee a low environmental impact and a health protection: the minimization and the proper collection and treatment of biogas, produced by anaerobic degradation, and of leachate, produced in the landfill by percolation, in relation with the presence of untreated organic waste.

## SOCIAL AND ENVIRONMENTAL CONTEXT AND ISSUES

The landfill has been designed in collaboration with the Association “Soutien Planète”, that develops project for social, health, education and environmental growth in Assahoun Village, Togo, and for several other villages in the same Region. Assahoun, which is located at about 55 km, in the north-west direction (Figure 2), from the Capital of Togo, Lomé, is a rural village of about 10.000 inhabitants. Its economy is principally based on agriculture, that satisfies the local needs and also guarantees an interesting exportation activity. About the 43% of the region surface is dedicated to agriculture.

Another natural resource is represented by forests, that occupy about 16% of the national area. However forests up to now show a strong degradation due to the irrational exploitation of the recent past, with an impoverishment of the finest woods and a consequent lowering of their economic value.

Therefore, preserve and restore the ecosystem balance appears a crucial challenge for that area, not only for health and environment, but also by economic point of view.

Fig. 2 - Geographical location of Assahoun (Lomé Region, Togo) [3].

Up to now, no funds have been allocated for municipal solid waste management and for a landfill construction. Due the absence of a public integrated waste management, of course an uncontrolled disposal occurs: people burns waste at home or discharges waste directly on village streets, during the days of the public market, as it can be shown in figure 3.

The consequence is a very high level of pollution for the whole environmental system: air, soil, surface water and groundwater. In particular, water pollution represents a very alarming issue because of the contamination also in many domestic wells, compromising the quality of drinking water and water for agriculture, with a high risk for human health and food supply. During our study the level of pollution has been tested through water chemical analysis. The results confirm the presence of pathogens and of heavy metals in 4 wells located at different distances from the uncontrolled discharging site.

## THE LANDFILL DESIGN

The main parameters that have to be considered for a correct design are: climate conditions, waste composition, waste quality and quantity, pre-selection possibility, site selection, landfill configuration and sizing, surface water management systems, background water and leachate drainage and treatment system, daily covering, final covering and dump closure. In the following each parameter considered [2].

Fig. 3 - The uncontrolled waste discharging on the Assahoun streets.

### Climate Conditions and Hydrologic Balance

In figure 4, meteoric precipitations in Togo are shown, in a period of ten years (2000 – 2009), while table 1 reports mean value of meteoric precipitations and of the temperature per year. Of course these meteoric data are necessary for the hydrological balance calculation.

Source : Direction de la Météorologie Nationale

Fig. 4 - Rainfall and rainwater levels (period 2000-2009). [source: Direction de la Météorologie Nationale, Togo].

Tab. 1 - Average Precipitations and Temperature (By Direction de la Météorologie Nationale, 2010).

Month	Jan	Feb	Mar	Apr	May	June	July	Aug	Sept	Oct	Nov	Dec
Precipitations (mm)	8	25	50	90	146	243	90	32	86	86	60	60
Average Temperature	27	30	30	30	29	27	27	27	27	28	30	29

Referring to these data and using a simple equation, the hydrological balance can be calculated in order to define the total amount of leachate that can be drained from landfill. Where:

L = total leachate amount  
 P = precipitations  
 R = runoff  
 E = Evaporation  
 T = Transpiration

In that way we are able to calculate the hydrological balance for each year. The total volume of leachate has been calculated considering a green covering on the landfill surface. In table 2 it can be defined the amount of leachate per month, naming as P\* the value  $P^* = P - (R+E+T)$  and considering a landfill surface area of 1200 m<sup>2</sup>.

**Tab. 2 - Water amount per month inner landfill.**

Month	Jan	Feb	Mar	Apr	May	June	July	Aug	Sept	Oct	Nov	Dec
P* (mm)	5.4	16.0	35.7	72.5	120.0	225.0	84.8	30.1	78.1	65.4	43.2	40.8
Leachate (m <sup>3</sup> /month)	6.5	19.2	42.8	87.0	144.0	270.0	101.7	36.2	93.7	78.4	51.8	49.0

### Urban Waste characteristics

Specific data of the Assahoun village about urban waste production were unavailable and very difficult to find. Therefore data of the near city of Kora have been used. The biggest amount of waste percentage is constituted by organic waste (about 25%) and sand (40%). The other fractions: plastics (5%), paper (2%), other inert materials and glass (16%).

The presence of fine and extra fine sand represents a peculiarity in this urban waste production related with the presence of unpaved roads. In fact, roads cleaning activity produces a lot of powder that is collected together with the other waste.

Through a pre-selection treatment it's possible to separate organic and sand from the other fractions, by screening, with the following several advantages:

- reduction of the total amount of municipal solid waste destined to landfilling;
- minimization of biogas and leachate production;
- local reduction of subsidence and settlement.

By an economic point of view, it is preferable to adopt a separate collection for the best selection of wet organic waste and undifferentiated dry fraction, while screening may be useful for the separation from solid waste going to landfill of the particles having a very small size, fine and extra-fine sand.

### Site Selection

Thanks to the excellent relationship established among the members of the association and the leaders of the village of Assahoun it has been possible to carry out a screening of potential sites that could be used for landfill construction.

The main parameters required for the screening were:

- distance from town and houses;
- absence of surface waters (river, streams and lakes);
- absence of seismic activities;
- presence of a basic layer characterized by very small values of permeability (hypotheses to be tested through geotechnical investigations );
- presence of groundwater at a high depth.

### Landfill design

The project of the landfill has been characterized by the following options (see Figures 5 and 6).

*Shape and surface:* an appropriate site for the landfill will occupy an area of about 2.400 m<sup>2</sup>, having a regular rectangular shape.

*Slope:* the excavation will be done with a maximum slope of 12% in the width direction of the ground, having a minimum depth of about 5 m (from the bottom in correspondence with the lowest point).

*Embankments and side wall:* the perimeter walls will be supported by retaining walls filled with concrete bricks around the perimeter of the excavation. The concrete masonry allows for easy installation and it is preferable because of the lower cost of the used materials. By an environmental point of view it would be better a reinforced soil slopes construction, but it represents a too expensive option.

**Fig. 5 - Landfill plan.**

**Fig. 6 - Section A-A.**

*Access ramps and steps for filling and maintenance:* the access ramps are designed plan to use bricks filled with concrete. Decks, designed for the passage of vehicles and personnel for maintenance and daily waste discharge, will be constructed using teak wood, which is present near the area. Teak wood can be reused when the landfill will close. In that way it's possible to reduce the impact derived from deforestation and in this issue the same Association organizes every year some days of labor camps for the reforestation of wetlands. At the landfill perimeter lateral drain channels will implement for rain water runoff to prevent any infiltration.

*Impermeabilization:* the internal surfaces and the bottom of the basin will be impermeabilized through additives (sikalite) to prevent infiltration of rainwater and leachate.

*Volume waste storage and life of the landfill:* given the lack of data relating to the information on the type of waste the following assumptions have been done (referring to statistical data of the State of Nigeria):

- Municipal Solid Waste Total volume = 460 m<sup>3</sup>/year
- Landfill life time = 4.63 years  $\approx$  5 years

*Daily cover:* it must be provided in order to avoid the dispersion of waste because of the wind action and to protect the area from the presence of insects and animals. In the design it was therefore chosen to perform the daily covering using the same compost produced by organic waste treatment. It seems to be the best solution not only by an economic point of view but also by a sustainable and appropriate approach.

*Final Cover:* In figure 7 the final Section A-A showing cover and waste layers draft in closed landfill configuration. Final cover has a strong importance for recovery and requalification of the site. It's also useful to prevent rainwater filtration and to encourage a vegetation growth. For these reasons, it has been designed a traditional barrier, as it's shown in Figure 8, composed by:

- a) a surface vegetation cover: it allows to minimize wind erosion, to maximize evapotranspiration and to protect underlying sectors from thermal excursion.
- b) A protection layer (30 cm): it creates a physical separation between waste and plant roots protecting at the same time underlying levels by wetting/drying phenomena. Compost has been recommended.
- c) A drainage layer (thickness 20 cm): it's fundamental for the removal of rainwater, with a consequent reduction of leachate production.
- d) A waterproof barrier: the use of a geo membrane (thickness 12 mm) has been recommended in order to avoid stability issues: it's not subject to heavy loads and rupture risk is negligible. In addition, its flexibility allows to adapt to waste movements and it's easily repairable.
- e) Foundation (20 cm): this is the leveled base layer for the correct other upper strata laying.

Fig. 8 – Final Cover design.

## CONCLUSIONS

As almost of the other African states, also Togo accuses a real delay in waste management.

Waste disposal in landfilling, in association with a separate collection of organic and non-organic waste, seems to be the easiest and cheapest urban waste management method, compared to others, and the best appropriate technology for a country, as Togo, poor in economic and technological resources.

First of all it must be considered the evaluation of economic and technological resources available in the site and the level of information to the population about environmental impacts and health risks related to waste landfilling.

The landfill in the village of Assahoun, Togo, conceived by Soutien Planète and developed by CODE3 has been designed to reduce negative environmental impacts and using an appropriate technologies approach with simple solutions by the point of view of construction, management and cooperation. The project has been thought and designed to make waste management and disposal as more compatible as possible with environmental and local population requirements, to ensure that it is not just a project, but to make actually possible its construction.

The project seems to be a good answer to the actual needs of Assahoun population both by environment and social point of view in the relation with the available human and economic local resources.

Assahoun landfill, together with the related correct municipal solid waste management, is actually only at a planning stage, but the hope is that it will be really constructed in a near future. That will be possible of course only if a strong awareness of local population needs in terms of environmental and health saving issues will be arisen not only by humanitarian associations, but also, and especially, by the Togo government.

# EMERGENCY vs DEVELOPMENT. THE ARCHITECTURAL PROJECT WITHIN DEVELOPMENT COOPERATION

Francesca De Filippi\*, Alessio Battistella°

\* DIST, Politecnico di Torino, Italy, [francesca.defilippi@polito.it](mailto:francesca.defilippi@polito.it)

°Arcò (Architettura e Cooperazione), [a.battistella@ar-co.org](mailto:a.battistella@ar-co.org)

## ABSTRACT

The aim of Panel was to take stock of the role that architecture holds in international cooperation. It is an environment in which construction keeps a central position, investing, every year all over the world, enormous economical resources and intensively increasing the amount of buildings; but to date it seems to not notice the difference existing between the action of building and the one of doing architecture, completely ignoring a research over the issues of sustainability, comfort and shape quality.

The panel drives to pinpoint different possible ways to overcome the categories that have always characterized the cooperation interventions: emergency, transition and development, in order to identify transversal paths in which architectural quality would established the direction to follow. To succeed in this intent, three reflection spheres were proposed to identify fragilities and opportunities that should be the starting point to renew the role of architecture within the international cooperation.

## EMERGENCY VS DEVELOPMENT

The steady reduction of the economic resources invested in international cooperation during the last years had gradually faced the shift of efforts exclusively towards “emergency” contexts, neglecting an approach linked to the “development” of the interested areas.

**Is it possible to reach a convergence between those two spheres?**

**How to do “development” with the “emergency” intervention timing?**

*The paper of Camillo Magni (Politecnico di Milano and Architetti Senza Frontiere, Italy) focuses on the issue of “quality” in architecture, specifically in the Humanitarian Aid field, where quality seems to be considered not essential, but rather a “surplus” if compared with more urgent needs. Most of the cooperation's projects take place in emergency situation, nevertheless in extremely poor conditions. The paper is meant to reflect on aspects influencing quality in architecture in a development cooperation scenario and on how a different design approach may affect the final result.*

*The paper of Elisa Salvaneschi and Marco Morandotti (University of Pavia, Italy), titled “Sustainability of post-disaster reconstruction processes: a proposal of methodology for the assessment”, presents the results of a PhD research carried out in the University of Pavia Civil Engineering and Architecture Department.*

*The research starts from the assumption that although both literature and the humanitarian field recognize two dimensions - emergency response and development processes – in aid interventions in the Global South, this distinction is appropriate for the first phase of post-disaster emergency, but not for the processes of reconstruction.*

*In the Authors' viewpoint the processes of reconstruction are the connection point between the processes of emergence and the development within the cooperation.*

*The paper introduces a method that could allow to evaluate the actual appropriateness, sustainability and development of the emergency response and development processes, through a comparison between indicators linked to the pre-disaster housing stock and to the reconstruction. The cross between the parameters of the housing system and those relating to the environmental, social and economic systems, makes it possible to include the interactions between external factors and the project into the process.*

## THE ARCHITECTURAL PROJECT IN COOPERATION, FUNDING PROSEDURES

Procedures linked to architectural projects' funding often follow unexpected practices.

Either they are financed before the fulfilment of the design phase, without knowing what is actually going to be built, or the design phase is not considered as a propaedeutic and necessary moment for the realization, acknowledging as payable only the Project Manager, who should then start building without having in hand an Executive Project.

This Panel aims to tackle and to improve the procedures heading for the acknowledgement of the *project* value as

an essential moment also in emergency contexts.

*Humanitarian emergency is an area where design does not seem to play a role. The aim of the paper presented by Riccardo Vannucci (FAREstudio, Italy) is to analyse if and under which circumstances such a condition can be reversed, in the perspective of affirming appropriate shelter as a human right, and consequently design as one of the tool that can contribute to such appropriateness. The Author's viewpoint, after several experiences in the international cooperation for development, is the conviction that discipline and profession require a thorough, responsible consideration about principles and practices that counteract the current trend to reduce design, and architecture in a peculiar way, to a commodity.*

*The proposed strategy is therefore to get involved with radical environments such as refugee camps and to actively experience conditions and strategies for a responsible presence. The result is inevitably contradictory and stresses once again the relevance of external factors, mainly procurement strategies, over technical ones, whereas the most important contribution by the profession, and discipline, is an appropriate balance between typological and technological innovation.*

## APPROACHES TO THE ARCHITECTURAL PROJECT

With a great simplification effort there could be defined two main approaches to the architectural project in the international cooperation sphere:

- vernacular which aims to the recover and development of local materials and techniques with a low technological content;
- prefabricated which aims to a quick solution of the issue, delivering on the site elements already-made elsewhere.

This Panel aims to highlight the points of strength and of weakness of both those approaches through excellence practices.

*The paper of Roberto Pennacchio, Roberta Nicchia et al. (Archintorno, Italy) describes the strengths and weaknesses of the “vernacular” vs. “prefabricated” approach through the analysis of the three experiences carried out by Archintorno in Mexico in a developing cooperation framework.*

*Archintorno is a no-profit organization promoting development cooperation projects with indigenous communities in the Mexican State of Oaxaca since 2005. These initiatives involve academia, local authorities, CBOs and professionals (in and outside Italy) and are based on the Design-Build Studio format, that foresees the direct involvement of university students in the design and building process.*

*The paper argues about the impact of a building project on the local community in terms of economic, socio-cultural aspects, as well as its effects on the environment and promotes a “vernacular-oriented” approach which is, in the Authors' opinion, more consistent with the local context.*

## ARCHITECTURE QUALITY OF COOPERATION PROJECTS

Camillo Magni\*

\* DASTU, Politecnico di Milano, Italy, [camillo.magni@polimi.it](mailto:camillo.magni@polimi.it)  
Presidente Architetti senza Frontiere Italia

### ABSTRACT

Most of the cooperation's projects happen in emergency situation and extremely poor conditions, both aspects that influence characteristics of quality in architecture. Many think that quality is an expendable "surplus" compare to more immediate needs. This theoretical contribution is meant to be a reflection about aspects that influence quality characters of an architectural project in a scenario of cooperation and about how (subject) influence the final result.

### ARE QUALITY ASPECTS NECESSARY FOR INTERNATIONAL COOPERATION PROJECTS?

This question puts the attention on the subject of the quality as a supplementary aspect. As if to say: quality is an important characteristic but not equally essential, and cooperation projects in emergency environment need to focus on the needful and developing essentials. It is obvious that the quality moves to the background.

This common thought is spread and supported by many. I would like to discuss some theories to show the misjudgment of the position and support that quality is an innate and necessary aspect of every process.

Emergency and quality can coexist together. There are many examples in which it is possible to find this process. As architects we can easily refer to the origin of the Modern Movement (Modernist architecture) that choose the theme of the public housing as the most fertile field to experiment new expressive languages, constructive processes and distribution to reinvent the house. Thus it offered appropriate answers to the lack of dwellings that afflicted Europe during the industrial development. The need of houses became the perfect occasion to experiment new housing codes and new quality forms. This also happened during the post-war reconstruction era and in many other emergency occasions.

If we agree on this prerequisite, the issue puts two others questions: who produces quality and how can we reach it? Giancarlo de Carlo, in a short paper published on Domus in 2004 [1], claimed that there are three main actors involved in a construction process: the architect, the builders and the client. None of those three is the only subject in charge of taking care of the quality aspects. On the other hand it is possible to reach the quality when a thin tension, meant to realize a correct, appropriate and real building, is established among the three actors. Quality is a far aim to converge on and it can be reached only through the effort of whoever involved. The architect by himself is not able to do it as well as the builders or the client by their own would fail. This assumption of De Carlo is, in my opinion, right and correct and it clarify which are the subject called to realize high quality project.

It has left to point out the most relevant aspect: how to reach the quality in a project. (Unfortunately) architecture is not a gastronomic dish that can define a recipe, identify ingredients and a sequence of actions in order to achieve a good result. Recipes in architecture are not possible because we do not operate in terms of deterministic processes where a sequence of actions defines the achievement of an aim. Nevertheless it is possible to identify conditions in which it is easier to operate in a *status of quality*.

The first one is that quality is the common goal recognized by all the subjects involved where it is necessary to overtake that short-sighted vision that considers emergency as an alien environment from quality reflections. This is the most significant aspect: to put the architectonic quality as a main target into cooperation projects. If this prerequisite, namely this common and shared effort, does not exist, it would be very difficult to achieve the status of quality. This is the most significant aspect, the others are consequences.

Gino Strada, talking about politics in the NGO Emergency, talks about "*the right to beauty*". Beauty and esthetic quality of spaces have to be a right for everybody and they have to be offered as expression of democracy and equality. As beauty is offered to western countries citizens, it is necessary to offer it also to those citizens who live in contexts where we operate, even though this means emergency and poverty conditions. When respecting this configuration, we can say that we are operating in an egalitarian condition.

Therefore architecture quality becomes a tool to show a different approach to cooperation.

French president Francois Mitterand, in the occasion of the opening of big public building, claimed that architecture is the society image. Bruno Zevi as well reported it on the third edition of "*Storia dell'architettura italiana*" (Italian architecture history [2]) to denounce the parallelism between strong quality limits and the cultural fall of the whole Country. As an analogy we could say that an architectural project represents in physical form the quality of the cooperation project itself as well as the quality of the subjects involved, the payees and the development processes

stimulated. Quality resides in this relation: a well done architectural form corresponds to a positive process of local development.

A last note: among all the tools that are able to stimulate this approach, I want you to pay attention on economic aspects too. The actors that control the budgets in development cooperation initiatives have more strength (and responsibility) on the projects' result. For this reason national, regional and European calls for funding for cooperation projects should have specific evaluation parameters of quality about architectural aspects, asking to include professional figures as architects (if there is a intervention of construction). If the funding authorities, both public and private, include in the result of the call also the quality evaluation of the architectural projects, operators would be relentlessly obliged to dedicate more efforts to those aspects. As if to say it would be preferred to see again what already happened in between 1990 and 2000 when the new sensitiveness on environmental sustainability has been mainstreamed throughout all institutions. For these reasons it is necessary to interact with the funding authorities in order to spread a greater sensitiveness addressing architectonic quality.

## A METHODOLOGICAL PROPOSAL FOR THE ASSESSMENT OF THE SUSTAINABILITY OF POST-DISASTER RECONSTRUCTION PROCESSES

Elisa Salvaneschi\*, Marco Morandotti°

\*University of Pavia, Italy, [elisa.salvaneschi@unipv.it](mailto:elisa.salvaneschi@unipv.it)

°University of Pavia, Italy, [marco.morandotti@unipv.it](mailto:marco.morandotti@unipv.it)

### ABSTRACT

Literature and several cooperation experiences are used to divide the interventions in the Global South context into two categories: emergency response and development processes. If this division is appropriate for the first phase of post-disaster emergency, it is not so evident for the processes of reconstruction. In recent years we have observed an increase in disasters: they are considered natural but they actually reveal anthropic causes. These phenomena have shown how this clear division is not recognizable: when does the emergency phase end? When does the situation of temporary nature end, one which necessarily follows an event that involves “a serious rupture of the normal functions of a community or society, which causes an impact and loss of life, material and economic spread, to which the affected communities’ capabilities with their own resources are unable to manage”(UNSDRR)? The answer is not obvious and leads back to the dimension of reconstruction, i.e. the moment when a new process of development starts. We can therefore conclude that the processes of reconstruction are the connection point between the processes of emergence and the development within the cooperation.

Starting from these considerations, the PhD research presented here focuses on the study of a proposal for a methodology that would allow to evaluate the actual appropriateness, sustainability and development of these processes, thanks to a comparison between the indicators linked to the pre-disaster housing stock and those linked to the reconstruction ones. This comparison analyses in detail the dimensions of the home, from the physical and spatial to the social perception, allowing the assessment of the effective delta positive or negative in housing conditions. The cross between the parameters of the housing system and those relating to the environmental, social and economic systems, makes it possible to include into the process the interactions between external factors and the element of the project, which are inevitably affected.

### RECONSTRUCTION: BETWEEN EMERGENCY AND DEVELOPMENT

This paper presents the results of PhD research carried out at the University of Pavia, in the Civil Engineering and Architecture Department. This work tried to investigate systematically the post emergency dwelling in developing countries in order to identify a possible methodology of intervention. Not only can this methodology regard technical and building features but it also defines the quality of life and dwelling.

This field of research – reconstruction dwelling in post-natural disaster in developing countries - was chosen on the basis of some reflections.

First of all the anthropic components in the occurrence of the disaster, called “natural”: “it’s appropriate to consider disaster not as natural but as a function of development. A disaster is recognisable as consequence of there being insufficient development of a means to avoiding a human crisis, or as an aspect of development itself having been the cause of crisis.” [1] Collins' words are among the most meaningful in terms of disaster: there are no natural disasters: there are potentially dangerous natural events (called hazards) and if they occur in a context that presents anthropic vulnerable features, they become disasters. Therefore if we consider natural disasters a result of anthropic vulnerability, we can understand the importance of reducing the degree of exposure to the risk of housing. Also, if we consider that many natural hazards repeat themselves over time in a cyclic way, [2] the importance of the reconstruction processes appears obvious.

Secondly, the increase in the number of natural disasters and the number of victims, in particular in developing countries: several studies show that the number and frequency of natural disasters have increased in the last decade; this is caused by factors such as the increase of global population and the exploitation of resources. It’s also possible to underline that most natural disasters occur in developing countries. The reason is once again due to these communities' higher vulnerability to phenomena such as earthquakes, tsunamis or floods: this is a result of an inadequate knowledge of these phenomena, a lack of sustainable planning by governments and a lack of quality control of the construction. It is to be noted that in these contexts almost all houses are self-made with traditional techniques that, although in several cases respond very well in terms of comfort, are not suitable to resist in cases of exceptional phenomena.

Thirdly, in the process management and participation, the problem of reconstruction is due to two issues: on the

one hand the quantitative dimension and logistics, on the other hand the qualitative dimension which implies the need to rebuild not only a series of building objects, but also a human and social dimension of the space. It is therefore necessary to lead an evaluation in three areas: context analysis to establish the opportunities and risks of the place taking into consideration the impact of the disaster, pre-existing socio-economic conflict, political situation and the actors involved, in order to effectively coordinate the actions and to determine the potential and limitations related to housing, both in terms of materials and construction techniques and in terms of the social and cultural patterns. The approach of reconstruction is a fundamental issue for the success or failure of the process: this statement is even more poignant if we take into account the construction methods used in the Global South, where 80% of houses are self-constructed in formal market (but mostly informal). It is understandable that a process of reconstruction involving external actors may be difficult to understand and accept by part of the communities. Shilderman's considerations [4] are remarkable in that he defines the approaches to reconstruction between donor, organizations and beneficiaries as gradual transition from actions completely fixed (donors decide and donors provide) and interventions managed from below (users decide and users provide). The changing in the construction model is linked with another critical issue connected to housing. In contexts where the house has a symbolic and very strong cultural tradition linked to the social community, the model in which the same construction is carried out by the inhabitants in a process of self-construction changes in the reconstruction phase. This situation may generate a new vulnerability: on the one hand it reduces the environmental vulnerability of the building, on the other hand it creates a social disadvantage that can lead in extreme cases to the abandonment of the rebuilt housing units.

Fig. 1 - Graphic of disaster and development link [3].

Fourth, on emergency versus development: when a natural disaster happens it is usual to divide the following period into 3 phases<sup>1</sup> - emergency, transitional and reconstruction - each one characterized by very different needs. This diversity together with the frequent dilation over time, sometimes even years, increases the complexity of the process of reconstruction. It is evident that if the affected communities live in emergency shelters for years, without regular economic activities, suppressed by the presence of the delivery of humanitarian aid, the return to a non-emergency dwelling can be very difficult. The statement "reconstruction is an opportunity to plan for the future and preserve the past"[5] expresses the need to conceive of the overlap between the different phases in order to immediately pursue a plan for long-term reconstruction.

Finally, in terms of sense of belonging and vulnerability reduction, the disaster highlights the vulnerability of a community to an environmental risk. The reconstruction process should not therefore recreate the same conditions of risk. While in theory it seems easily to make effective choices, in practice it is extremely complicated, particularly in those cases when the reduction of vulnerability means to alter the social mechanisms or cultural relations between the

<sup>1</sup> The division was established in three phases during the International Conference on Disaster Area Housing held in Istanbul in 1977. With reference to the definitions given in that occasion it is considered:

- emergency - immediate impact with the effects of the disaster and its housing problems in terms of shelter and refuge;
- transitional - rehabilitation between emergency and permanent reconstruction identified in a period ranging from a few months to years during which every effort is addressed to provide a minimum of environmental conditions for human activities and to build temporary housing needed until the end of permanent buildings;
- reconstruction - complex of legislative, economic, financial, production and constructive processes aimed to prepare the conditions for performing the operations to return to normal life.

settlement and the territory. In fact, the communities develop a strong sense of belonging to the place where they are settled. This space, defined by SM Low spatializing culture [6] - the link between man-place [7]- is destroyed by disaster and it isn't possible to rebuild it through a process exclusively focused on the reduction of physical vulnerability.

For these reasons it is crucial to supply a methodology for the design of post-emergency housing that could support the various organizations belonging to the sector.

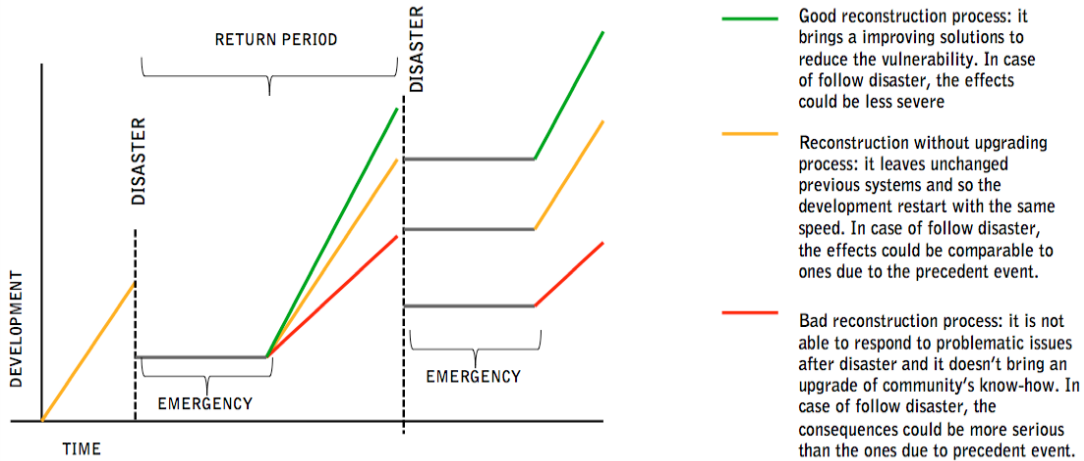

Fig. 2 - Qualitative graphic of possible scenarios post disasters.

**RESEARCH AIM**

The result gained through the evaluation is an assessment of the quality of the reconstruction of houses. The judgment is not absolute but compared with the pre-existing condition. This result is achieved through a comparative evaluation between the pre-existing housing system and the system established in the reconstruction process, by filling in tables of indicators to which a weight and a score comparable have been assigned. The score is determined by overcoming or less of a defined threshold, or by a satisfaction of a minimum level or by direct comparison with the value attributed to an indicator in the pre-disaster system. Furthermore, the evaluation of parameters related to the context, through a matrix of interaction, allows to establish that the different indicators suffer from the environmental ones. The research result is an assessment tool called ReHASTool where, by inserting values for the different indicators, users obtain an assessment of the reconstruction project.

**ReHASTool frame**

The Tool is divided into charts that are progressively filled in by the user and it automatically gives the scores back for each parameter, according to formulas set in the development of the methodology.

It's possible to identify 5 phases that correspond to 5 charts.

**Phase 0|** Description: in this phase we collect general information about the case to be evaluated, in order to contextualize the intervention and to have useful data in the hypothetical formation of a database.

Input: location, disaster information, number of people involved and extent of damage to housing structures, description of the intervention program, the organizations involved, timing of delivery and costs.

Output: insertion of case studies into the database using an identification code; if a disaster or location already exist in the designed database, there is a recovery of data relating to Environment.

Fig. 3 - Graphic connections and weights of indicators in ReHASTool method. Source: Authors.

**Phase 1| Environment:** in this phase data are collected relating to the environmental parameters that will be used to cross the data relating to the housing system. The parameters characterize indicators divided into five categories included in clusters (Vulnerability, Environment, Resources, Development, Society) that describe the context of the intervention in the environmental, social, and economic areas.

Input: enter the requested data in the chart; if a context already exists in the database, there is a recovery of data on the environmental, social and economic areas.

Output: a score is assigned to each parameter, ranging from zero to one; in case of data recovery, user checks the correctness of the information.

**Phase 2| Pre-disaster housing features:** at this stage data are collected relating to the parameters identified in the pre-existing housing system. At this stage the main features of traditional local dwelling are outlined, from the point of view of technology, materials, settlements and culture. They will be used in comparison with the reconstruction system.

Input: enter the requested data in the chart; if context already exists in the database, there is a recovery of data on housing.

Output: a score (variable between zero and one) is assigned to each parameter; in the case of recovery in data, the user controls the accuracy of information; the scores obtained are crossed in the matrix to the scores assigned to the parameters of the environment in order to determine the positive or negative influence of the environmental conditions on the parameters of the pre-existing system.

**Phase 3| Post-disaster housing system:** in this phase data relating to identified parameters of housing system are collected. In this phase the characters and factors describing the housing reconstruction project emerge.

Input: enter the requested data in the chart;

Output: a score (variable between zero and one) is assigned to each parameter and the scores thus obtained are crossed in the matrix to the scores assigned to the parameters of the environment in order to determine the positive or negative influence of the environmental conditions on the parameters of the system.

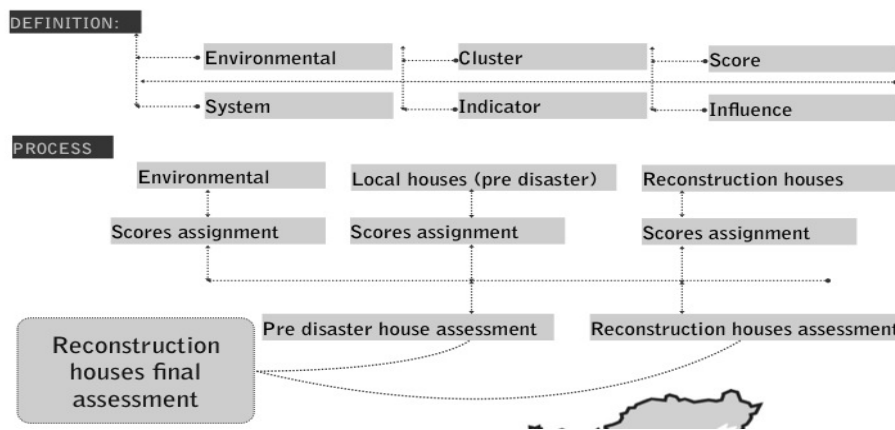

Fig. 4 - Conceptual scheme of assessment process.

Reconstruction Housing Assessment Tool					POST-TSUNAMI SAFER HOUSE	
INDICATOR					Mitigation Techniques	1 1 2
PARAMETER					Presence of mitigation techniques	
DY 11 STATIC	Overview				Use of technical solutions for the reduction of vulnerability static building to particular stresses due to the presence of sources of attracting risk	
	Influences Notes				E 1 1 1 - E 1 1 2 - E 1 2 1 - E 1 2 2 - E 2 1 1 - E 2 3 3	
	References				Examples of such solution techniques can be anchoring coverage of the wind stress in areas subject to typhoons and hurricanes, brackets armor to increase the resistance to seismic actions in areas subject to this risk, etc ...	
	Unit					
	Cod.	Tipology	Value	Weight	Score	
1 1 2	Rating	S	1,5		1	
Score with influences						3
Final Score						4,5

Fig. 5 - Extract of ReHAsTool.

**Phase 4| Assessment:** the final stage of the procedure focuses on the comparison between scores on the traditional housing system and the reconstruction one, through a matrix of intersection. The scores awarded in zero or one allow for a direct comparison-and-objective assessment: if the score obtained from the reconstruction parameter is higher than the score in the traditional system, the assessment is positive, and the program returns “+” as result; if the scores of the parameter are equal in both the pre- and post-disaster housing condition, the program returns “+” as result, if the

score relating to the pre-existing condition is higher than that concerning the reconstruction, the program returns “-”.

Input: automatic insertion of the final scores of pre- and post-disaster.

Output: overall assessment is obtained by counting positive and negative scores; the process is judged positive if the number of positive scores is higher than the negative ones; a partial assessment is possible if the user analyses the parameters judged negative.

## INDICATORS FEATURES

The methodology is based on the evaluation of a set of indicators divided into clusters - vulnerability, environment, and settlement, building, quality space, development - and categories. Each cluster refers to a specific area in order to have a comprehensive and detailed overview of all the aspects that are considered significant. In the definition of individual indicators the following selection criteria were considered (Bell, Morse, 1999)[8]:

- relevance: relevance to the scope of the system to be described and consistency with the environment to which the indicator refer;
- representativeness: ability to represent clearly and effectively the problems that affect the system to which the indicator refers;
- availability: availability of data for the calculation of simple indicators must be understood in an objective and unique way;
- comparability: indicators should be compared with those related to the same field;
- objectivity must be able to be evaluated with agreed criteria and objective.

## Case studies<sup>2</sup>

To test the validity of the tool and its real applicability, we applied the method of assessment to two different cases of housing reconstruction in Sri Lanka. The case of Sri Lanka can be considered exemplary and suitable for the purposes of this study because it occurred a sufficient amount of time ago so that we can assess the a-posteriori processes of reconstruction, on projects that have already been made and therefore can also show all the difficulties encountered in the construction process. Moreover, the 2004 tsunami can be considered one of the most significant media event in recent years: the magnitude of the effects of the wave, the vastness of the areas involved and the possibility to have news and real-time footage involved the public and opened a reflection on the power of the media to direct information; that exposure acted as a second-order effect, although a wider dissemination of information about rebuilding provided an easier retrieval of data (both environmental and economic) at the level of reconstruction projects.

Within the same context, two different reconstruction housing units are considered, made by two different stakeholders in the same geographical area, in order to compare not only the single housing project with the traditional pre-existing model, but also two different design solutions for the reconstruction, thus highlighting the different approaches and their criticality.

Both projects for post-tsunami housing units were built, the first in the district of Kalutara and the second in the district of Galle. The two districts are part of the south western region of Sri Lanka that has similar characteristics, both in terms of geography and of social and economic aspects; this aspect allowed for the comparison between the evaluations of the two reconstruction projects, carried out under similar conditions.

The data used for the evaluation of the projects were taken from publications and reports by the Department of Statistics of the Government of Sri Lanka; some data were then calculated on the basis of information obtained from these sources, because it wasn't possible to collect direct experimental data.

## OUTCOME OF THE ASSESSMENT

The outcome of the assessment was positive in both cases: this result was certainly influenced by the positive scores of environmental parameters. In recent years Sri Lanka has pursued a development policy that have earned a positive trend for a reduction in poverty, unemployment and illiteracy, and special attention was given to environmental protection; in addition to this a promotion of use of renewable and sustainable resources has been improved, as well as a system for the mitigation of environmental risks.

These data confirmed the weight and importance of the environment, in all its complexity, in the processes of reconstruction.

---

<sup>2</sup> It is to be noted that the data used for the evaluation are taken from indirect sources, because we didn't have the possibility to go on site to direct the collection of information. We think, however, that the data are reliable and that in order to test the operation of the instrument there is a significant loss of value in the results obtained.

## Specific analysis of the results of the assessments of the two projects

### House, Kalutara district

The housing unit made for the reconstruction is better than the traditional buildings for what concerns the vulnerability of static construction. Compared to traditional houses, the project saw an increase in population density and does not propose the same typological model of traditional houses; the morphology of the patio home, in addition to socio-cultural aspects, shows advantages in terms of thermal comfort, allowing ventilation and cooling of the rooms of the house. These aspects, in the type designed for the reconstruction, have not been considered. In fact the settlement model and the choice of materials used reduce the internal comfort, especially for what concerns ventilation and cooling, which is especially important in hot humid areas as Sri Lanka. Furthermore, the typological solution does not allow for a growth of starting unit and the outside space cannot act as a pivot of domestic activities as happens in the solution to central patio of traditional housing. The project was penalized by the use of non-local materials, data that also influence the scores for the indicators related to industries and local materials. The reconstruction project resulted in a significant improvement due to the involvement and training of the local community in the construction phase; it should be noted, however, that the high cost of the housing unit, compared to an indicative value of the possible cost of a traditional house, turns out to be eight times more.

Fig. 6, 7 - Bar and radar graphics result by assessment of I case study.

### House, Galle district

Architectural barriers, due to the presence of access steps; the solution of having a floor up from the ground, however, due to the choice to reduce the effects of environmental risks, facilitates the drainage in the case of floods. The field of the settlement is certainly the most affected by environmental parameters, as already mentioned, these parameters result broadly positive. Besides, the assessment of the construction cluster is positive, resulting in an improvement over traditional solutions as regards the presence of foundations. The housing unit built in the reconstruction has a very positive assessment, both as regards the aspects of comfort and those of internal space; this allows to establish that in this case the reconstruction process should significantly improve the qualitative standard of dwelling. It is highlighted that the lack of use of local materials is worsening compared to traditional buildings, it should be noted that the choice of this design rose from the desire to create a structure that could increase its resistance in the event of flooding.

### Comparison of the two projects

Carrying out two assessments of the projects reported, we wanted to compare the results obtained in both cases. Whereas the data of environmental indicators were similar in terms of geographical location, environmental, social, political and economic factors, the two projects are equal for most of the indicators scores, even if it can be seen that the project carried out in the district of Galle looks better in the aspects of:

- mitigation: the project in Galle was designed in order to build a housing unit that would make it less vulnerable to major environmental hazards in the area; for this purpose a structure of four bearing blocks was studied, which in case of flooding would not constitute an obstacle to the flow of water. In addition the house is built on a raised platform, solution that promotes drainage of the ground.
- Recognisability to morphological character: the solution implemented in the district of Galle is the closest to

the typological traditional plant, in which the central area is the hub for domestic activities; in the reconstruction project this space is covered unlike to what happens in traditional housing, but it is permeable to air and light thanks to curtain walls in panels made of intertwined vegetable fibres; more private rooms are arranged in the structural cores, so that they also have a spatial distribution function in addition to their static and mitigation one.

- Interior comfort: the walls in vegetable fibres in the district of Galle allow for increased ventilation and cooling compared to a closer solution designed in a project in the Kitaluwa district. In addition, the first solution also has positive implications regarding the indicators relating to the use of local and recyclable materials that in the second case study turn out to be negative.

Finally, the analysis of the results of the two cases shows that at the same environmental conditions, the design solutions could reach the quality objectives housing to a different extent.

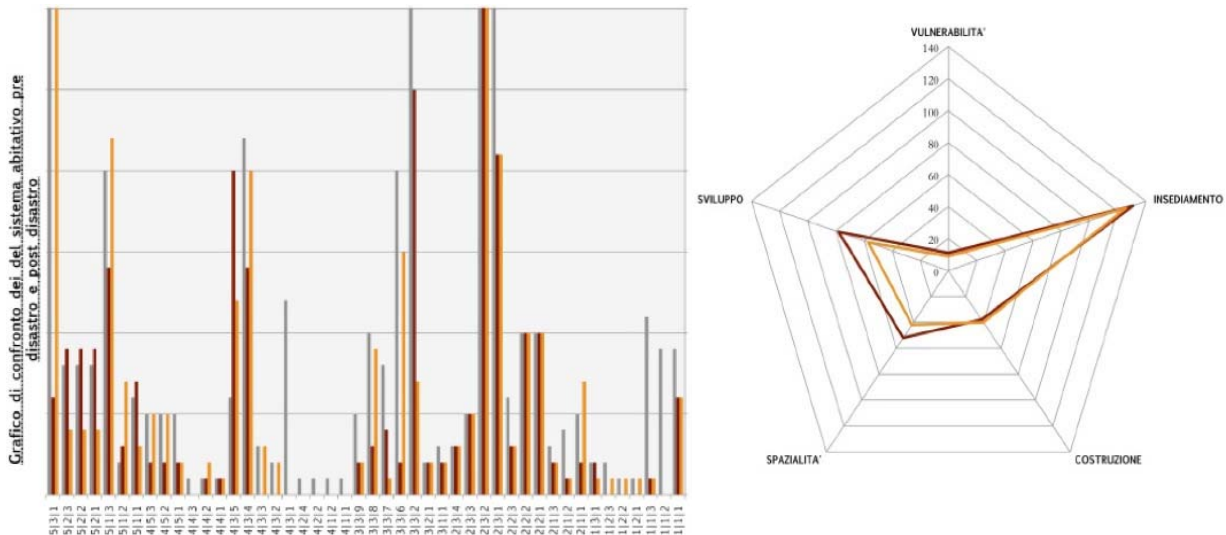

Fig. 8, 9 - Bar and radar graphics result by assessment of II case study.

CONCLUSIONS

The research focused on the development of a proposed assessment strategy of the home in the process of reconstruction, which could take into consideration the complexity of this field. In this sense, the methodology is structured on the comparison of a significant set of indicators, whose values are reported both in parameters of housing conditions before disaster, and post-disaster reconstruction project.

Fig. 10, 11 - Bar and radar graphics result by comparison of two case study.

During the design of the ReHAsTool methodology, we tried to establish a set of relevant and effective indicators and judging criteria as objective as possible; it is clear that in this process it is easy to find the risk of attributing a

subjective character both to the choice of the indicators and to that of the criteria. In this sense, that a comparison and interaction with other subjects from different disciplines would be appropriate and useful, in order to enhance the accuracy of indicators and decrease the subjective interference within the design of the instrument.

The results obtained at the end of the PhD research were:

- critical and theoretical basis on the several topic linked with the reconstruction processes;
- the design of an assessment tool, ReHAsTool, tested with two case studies related to housing reconstruction projects in Sri Lanka.

The critical aspects of the work are:

- subjectivity in the choice of indicators and evaluation criteria;
- the application of the assessment to case studies involving a single context;
- lack of access to direct experimental data for evaluation.

A possible development can be identified in:

- evaluation of further case studies;
- use by stakeholders of the tool in the design of post-disaster housing units in order to test the validity and usefulness in the case of application with experimental data;
- implementation of the indicators through questionnaires proposed to the communities affected by the post-disaster reconstruction processes in order to check and change indicators also according to the perception of the beneficiaries;
- extrapolation of statistical data and general principles on the processes of post disaster housing;
- development of an open source, upgrading database of projects and assessments.

## DEVELOPING EMERGENCY

Riccardo Vannucci\*

\*FAREstudio, [r.vannucci@faresstudio.it](mailto:r.vannucci@faresstudio.it)

### ABSTRACT

After several experiences in the international cooperation for development, FAREstudio is carrying on an attempt to extend its action to humanitarian emergency, an area where design does not seem to play a role. The aim is to verify if and under which circumstances such a condition can be reversed, in the perspective to affirm appropriate shelter as a human right, and consequently design as one of the tool that can contribute to such appropriateness. Our interest stems from the conviction that discipline and profession require a thorough, responsible consideration about principles and practices that counteract the current trend to reduce design, and architecture in a peculiar way, to a commodity. The strategy is therefore to get involved with radical environments such as refugee camps and to actively experience conditions and strategies for a responsible presence. The result is inevitably contradictory and stresses once again the relevance of external factors, mainly procurement strategies, over technical ones, whereas the most important contribution by the profession, and discipline, is an appropriate balance between typological and technological innovation.

### DEVELOPMENT, EMERGENCY AND CONSTRUCTION

In the last years FAREstudio, architectural design firm based in Rome, has been involved in various projects, mainly located in Africa, related to the domain of international (cooperation for) development. The concept of development is quite controversial but hereafter it will be intended as generically as possible. Nevertheless, or because of that, the substance is that under the name of 'development aid' there is a flow of material and immaterial resources from western, affluent economies (countries) toward poor economies (countries). Construction (production of buildings) is often part of this flow, whereas, depending on circumstances, it represents the main outcome of cooperation itself or the by-product of it, an inevitable step in order to supply other services and/or goods. Despite noteworthy exceptions, the contribution of architects, designers and other building industry professionals to development is still unclear or simply unknown, in general considered not relevant and/or superfluous.

This is not equivalent to say that designers and the like are not hired or employed by UN Agencies, international institutions, NGOs: in general terms, however, the impression is that construction is regarded as a sort of annoying and uncomfortable obligation the donors tolerate in order to carry on their 'main' activity, either reduce poverty, or carry on communities empowerment, fight gender discrimination, etc. Basically more a cost than an investment. A sensation confirmed by the discrepancy between involved resources and discussion about results, an issue to be included within the overall debate concerning aid effectiveness.

Whereas the initial action of FAREstudio in the realm of development has occurred nearly by accident, recently the attention has widened to include humanitarian emergency, an even less documented field of action as far as architects, designers etc. are concerned. Humanitarian aid, that takes place in the case of emergencies due to natural or man-made disasters, is conventionally distinguished from development aid.

### WHY

The reasons why the office is working in the development and emergency, the two extremes of international cooperation, include:

- there is a tendency to marginalize architects, to reduce their social, cultural, economic relevance: how to resist and react to exclusion? Various are the symptoms, and the reasons, of such phenomenon: fragmentation and/or lack of competences, self-referentialism, virtualization, narcissism, dependence;
- architects control a very limited portion of built environment, and this portion is possibly decreasing: to operate (or do not) in condition of (relative) scarcity and for (apparently) social objectives can be regarded as a strategy to restate a position that after post-modern has become nearly redundant and unnecessary;
- in other words, to observe the world from regions where apparently architecture has no place constitutes an effective way to reflect on the sense and future of the discipline (or the lack/inadequacy of it);
- in fact, particularly humanitarian emergencies and poverty, quite often combined, constitute a condition where essential issues related to social, economic, political, cultural responsibilities of those in charge of

construction, shape and management of built and natural environments, are exposed in their full range of interpretations and implications.

In very simple terms, it is important, literally vital, to investigate how a function for architects (values, sense, recognition) can be defined and possibly fostered. If the ability to play a significant role has to be expanded rather than reduced those domains where architects normally are not present must be explored, and in case 'colonized': the circumstance that most human settlements reflects prevailing conditions against demand – that is, availability of land, materials and other resources - rather than deliberate choices should be regarded as the prevalent condition of human beings, and as such this form an immense, potential field of action. This is what can be defined systematic scarcity, not related to circumstantial conditions, but substantial and endemic. Needless to say, it is a political category.

The framework in which FAREstudio operates does not refer to neutral humanitarian activism, does not stem from the worn out mythology of the architectural hero: the action is oriented, and responds to a set of ethical assumptions but its main aim is very practical, to neutralize the tendency to reduce design to a commodity, for which there is demand, but which is supplied without qualitative differentiation. In this context, independency (that has nothing to do with individualism and solipsism) might be outlined as the main ambition to be pursued. Above all, we are part of a system with its own rules and strategies, interests and finalities.

### FROM CURIOSITY TO PRACTICE: CBF AND BEYOND

The involvement with international cooperation started from an opportunity FAREstudio had a few years ago, when we designed and realized a small complex in the outskirts of Ouagadougou, capital city of Burkina Faso (fig.1). The building – The 'Centre pour le bien-être des femmes' (CBF) - has been quite successful and inevitably oriented the office in the search of new opportunities so to investigate the topic in a more systematic way. Soon after the completion of the building, however, we had very clear a fact: the CBF, developed by the Italian NGO AIDOS, as part of its campaign to fight Female Genital Mutilation practices, had been produced under very peculiar, and possibly unrepeatable, circumstances.

Fig. 1 - Centre pour le bien-être des femmes (CBF), Ouagadougou, Burkina Faso (source: FAREstudio\_2008).

Donors were very discreet, AIDOS is a very dynamic, a-bureaucratic, self-determining entity, connections with local partners very well managed, Burkina Faso is a very safe country: a scenario quite unique, as we would have learnt soon.

That experience offered the opportunity to look into international cooperation for development as an economic realm, an expanding sector that undeniably has the connotation of a market. This fact is inherent to the nearly unanimous attitude of those institutions and organizations that define the policy of procurement: to act in fair, transparent, accountable way but assuming the market as the only possible reference, to the point to presuppose the free, competitive market itself as a goal to be achieved. What is true for the production applies to the services as well, including design. And therefore the access to the market of professional services is regulated by conventional criteria

such as past record, experience, available resources, etc. (with the exception of volunteerism, depending on circumstances more or less skilled). One of the ambiguities of the political economy of generosity (or political stability) that recalls the traditional vagueness of architects as social actors, compressed between building industry and power.

International cooperation for development as part of the broader socially engaged design is getting more and more fashionable, with its own niche-stars, dedicated channel of information and promotion (images more than real facts and figures, and a certain degree of inevitable rhetoric) but regardless of growing exposure and attention, it is quite evident that the few examples of buildings that achieve remarkable architectural quality (recognized as such via their presence in the media) originates in very specific conditions (small scale projects, direct involvement of the architect with the promoter, particular relationship between the architect and a community ). Big names of cooperation, those who actually handle the mass of production, are not represented in the atlas of best practices. Possibly this has to do with the reluctance to identify design as a priority, itself a by-product of a general tendency to *realpolitik*: good design is often critical of the existing, and this conflicts with the attitude, understandable, to limit the occasion of clash in areas not deemed essential or even potentially dangerous in terms of cultural confrontation (quite a risk, for construction).

## A STRATEGY

A strategy of investigation, based on three major aspects, has therefore been set up in order to lead FAREstudio's action: 1) Design in poor contexts/countries (low-cost design): low-cost design constitutes a valid proposition under all economic circumstances, not necessarily those defining 'poor' countries. But the need for cost-effective and comparatively result-rich strategies is magnified in poor countries. In terms of design theory and practice there are at least three design perspectives worth investigating: a) a perspective centred on 'process'; b) a perspective informed by 'typological innovation'; and c) a perspective defined by 'technological robustness'; 2) Design with international organizations: international organizations form their own market, impose their own priorities and define a specific work environment for design consultants and professionals. The definition of an effective design strategy under the circumstances created by supranational funding bodies and sponsors could benefit from the analysis of the parameters and protocols imposed on designers, the evaluation of their correspondence to broader official policies and missions, and the assessment of the building experiences produced under the various programs. Overall, there is an interest in addressing the specific role of design in cooperation, which remains, in spite or because of its largely humanitarian bent, ambiguous and largely unexplored, particularly now that architectural culture has come to encompass some of its efforts; 3) Design for capacity building: particularly related to the context of developing economies (but possibly worth discussing and applicable to the building sectors of advanced economies), the ability of design to act as a trigger for building local technical capacity in the area of intervention can be a crucial tool for industrial development. Researching and practicing in this context requires touching on several issues that do not often occupy centre stage in architectural design education: 1) the integration of design and manufacture through supply chain analysis, and consideration of their implications on design as practice; 2) the ability of the building industry to support and disseminate design decisions made on specific projects; 3) the elaboration of specific media and codes for knowledge-transfer and sharing; 4) the standardization of technologies, components and assemblies.

Quite an ambitious program for a small scale architectural office, that brought with it two major practical actions: on one side to test the reality of UN Agencies and on the other to experience the most extreme of operational environment, humanitarian emergency.

## CENTRAL AFRICAN REPUBLIC: THE FIGHT FOR BUILDING

Among the post-CBF projects, the most interesting is located in Central African Republic, where FAREstudio has been hired by a UN Agency to design a training centre for former child soldiers (fig. 2), part of a program aimed at facilitating sedentarization of people in rural areas. In comparison with what has been done in similar projects already realized (usually a series of isolated buildings scattered here and there in the bush) we decided to go for a single building based on the repetition of the same spatial/constructive module. The aim is to stress the sense of community, despite all the resistance from the paramilitary corps supposed to run the place. The same module is also used for the sanitation block, a separate volume where all function related to water, sanitation, hygiene (WASH) are concentrated.

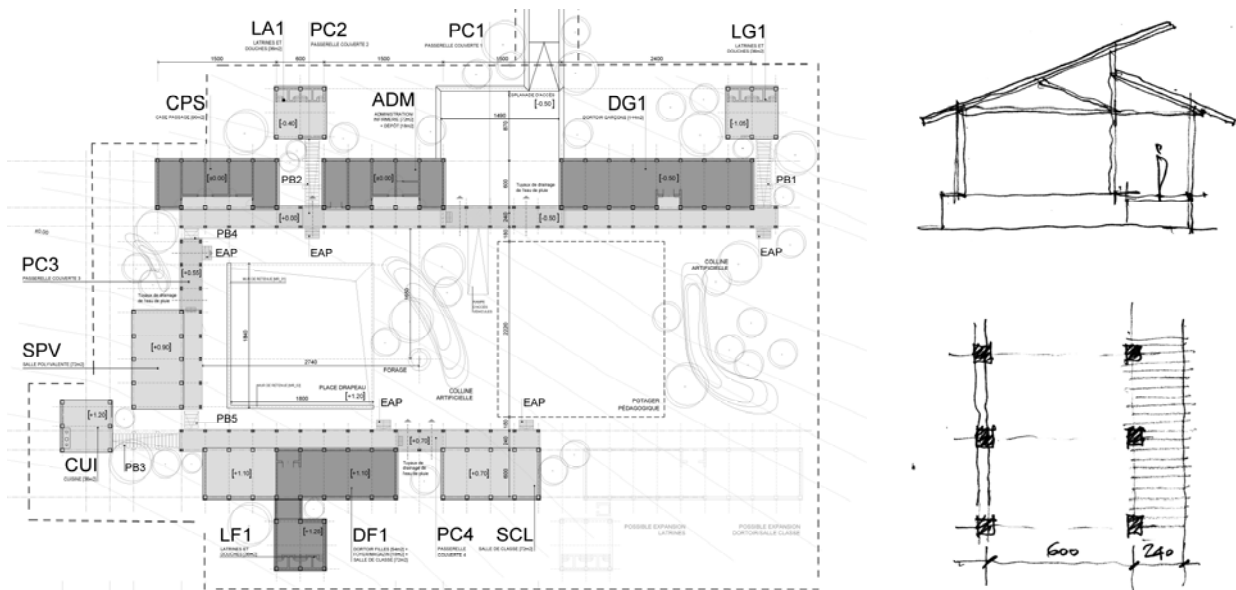

Fig. 2 - Training Centre, Sassari, Central African Republic.

The story of the project is a collection of many of the occurrences that negatively affect international cooperation, at least in our direct knowledge, a culmination of similar conditions already experienced elsewhere. The process of project definition has been long and complex, with systematic difficulty in getting proper feedback from local stakeholders, due to objective complexity of communication. Program was very undefined, data concerning available materials very incomplete and controversial, and formality of procurement procedure very rigid. Unpredictability of economic aspects of the project is an additional issue of its own, largely referable to the perverse combination of underdeveloped market and influence on that market of the international cooperation itself. The explicit adoption of an innovative approach has not always been welcome by the system, in particular locally: building industry, usually quite conservative and rigid, in these circumstances is coupled by the resistance opposed by those in charge for decisions, by definition aligned on unadventurous attitudes. Despite all that, and with the decisive support of the few more open to experiment, the design has finally been completed and the construction has started in a very remote area toward the Chad's border.

Unfortunately, when the political and military situation of the country started to collapse at the beginning of 2013 due to rebels advance toward the capital, the construction site has been abandoned (fig. 3) and till now there are no news of what happened. The area is not reachable and the international organizations are still in a sort of cautious stand-by, after a drastic reduction in staff.

Fig. 3 - Training Centre, Sassari, Central African Republic (source: FAREstudio\_2012).

## THAT IS NO COUNTRY FOR ARCHITECTS

As anticipated, in the meanwhile the office decided to go radical and get involved also in emergency. By doing that a sort of taboo has been broken (the two domains, development and emergency, are regarded as very different, matters for specialists). In this case FAREstudio's position has been different from what occurred in the past: in fact FAREstudio has been appointed by a UN's Implementing Partner, and therefore committed to the concrete realization of something designed by others, in theory, at least.

The first experience has turned out as the most frustrating. Eight months have been spent in some refugee camps in South Sudan; the office, formally engaged as 'urban expert', should have been in charge of technical support for sanitation, planning implementation, sheltering. However the reality has been dramatically affected by overall unbearable conditions and practically just a minimal part of what planned has been achieved. The availability, and affordability of nearly everything was problematic, and logistic did simply result not possible. The scale and magnitude of disaster was out of control, and not always those in charge are fit and/or ready for the task. In addition, the logic of market does not operate just on goods: it applies to implementation as a service as well, and therefore organizations compete one each other in order to get programs awarded, often underestimating real implications of the situation or taking excessive risks. As a consequence, even if coordination and integration of various subjects is among the priorities of camp management, there is evidence that Implementing Partners with different profiles, diverse ability, dissimilar power, experience a form of Darwinism that is not exactly in line with the ethical considerations that should direct the harmonized action in a refugee camp.

Fig. 4 - Latrine Construction, Nyeel Refugee Camp, South Sudan (*source: FAREstudio\_2013*).

## FROM TENT TO BOX, AND BACK: BRINGING SHADE ONCE AGAIN

In Jordan, we have been involved with a program of summarization: at the Al Zaatri camp some 25,000 prefabricated shelters have been supplied by various countries of the Gulf. Supplied means donated, but fabrication has been carried on locally. Despite that Jordan industrial system is reasonably developed, production has occurred too rapidly to be properly handled. As a consequence the shelter are in general very poor in terms of quality. The real problem, however, has not to do just with the low quality of the manufacture but with the use of it: the prefabricated shelter is normally adopted for very temporary settlement of particular categories of people (mainly workers) and it is supposed to be provided with A/C and power.

In Al Zaatri environmental conditions are very harsh. The area is arid, hot in summer and cool in winter, with heavy precipitations. The shelter has no A/C equipment and in any case there would not be power to run it. So, as a consequence it should be equipped for summer (summerization), and winter (winterization). A situation quite common for tents, that implies, if not correctly dealt with, unbearable conditions for the refugees, but, even when faced, rarely is effective, and often results in a waste of money. In the case of the summerization, the initial request/suggestion to the Implementing Partners by UN experts responsible for management was for a roofing system. The NGOs were supposed to come out with a proposal (with the idea that the most suitable scheme, if feasible, would have been put in place by the 'winning' NGO with all the related 'commercial' implications) and here is where FARE studio entered the scene. It must be stressed that the process initiated at the beginning of May, with no clear perception of the available budget (and

a similarly patent underestimation of the scale of the operation), the only reference being a winterization project carried on six months earlier, with doubtful effects, by a ‘competitor’ NGO.

While the roofing option was under scrutiny, the office was more and more unconvinced that roofing would have been the best choice; in FARE studio’s perception a veranda would have been much more effective. The main problem of the prefabricated shelter, apart from the mentioned technological limits, is the absolute inconsistency with the reality of a Muslim society: there is no consideration at all of the privacy as unquestionable factor of cultural identity, not only from outside but also within the family itself. Furthermore, camp planning is very rigid, following standard procedures, and because of that, the prevailing layout arrangement is bizarrely resembling a suburban model where the shelter sits in the middle of a 8.00x10.00 meter plot, forming a low density undistinguished fabric. Unfortunately this pattern, combined with the spatial poverty of the shelter, produces an environment that is absolutely alienating, and dramatically distant from the setting the refugees come from (often of rural, traditional background). Therefore there is a constant reconfiguration of the shelter, by widespread use of recycled building materials (for those who can afford them) or also misuse of plastic tents (or leftover of, that strangely are not returned to camp management when the family is assigned a shelter. Another strategy of adaptation is the officially not allowed relocation of the shelter by using gas bottles as wheels so to form clusters, to recreate a more human space.

The veranda would have gone in the same direction, with one third of the cost of the roof. The creation of an outdoor space is essential for the family. The geometry and assortment of the proposed kit would have produced several different configurations, facilitating those operations that the refugees are already carrying autonomously. In any case the two options would have been installed by the refugees themselves, while the NGO would have provided the raw materials and assistance. The main challenge of the project rested on its feasibility. In order to handle the logistic of the project, the selection of materials has been based on availability on local market and ease of assembly; for this reason agricultural fabric, water pipes, exhausted tires, ropes and metal hooks have been used, while a workshop would have been installed at the camp [employing refugees on the base of the cash-for-work principle] so to carry on storing, preliminary manufacture, instruction and distribution of the components.

Both the proposals have been tested through prototypes (fig.5 and 6), and the experience fully documented so to get a comparative picture of used resources and time of installation.

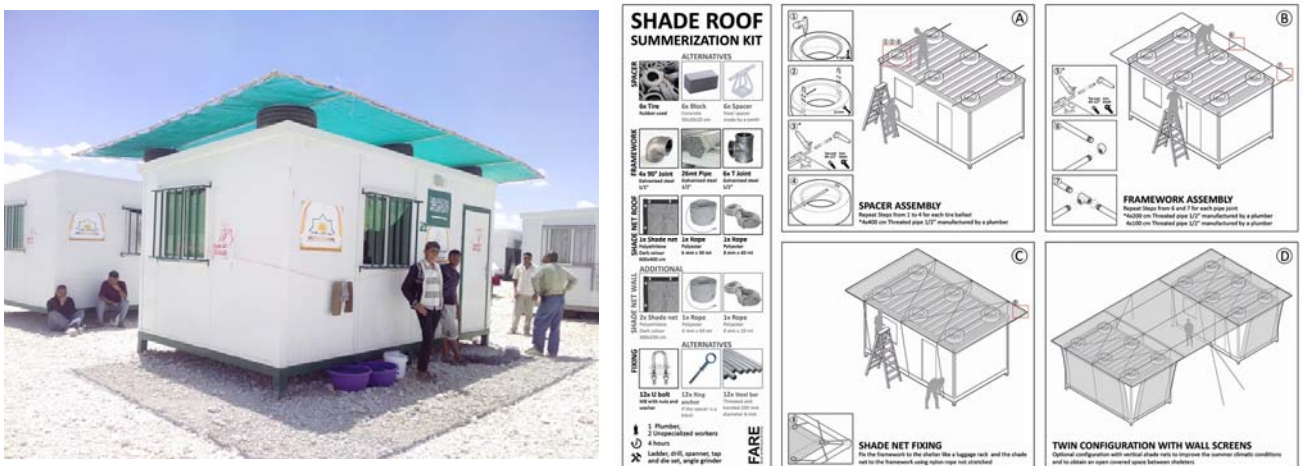

Fig. 5 - Zaatari Refugee Camp, Jordan, Roofing option (source: FAREstudio\_2013).

Fig. 6 - Zaatari Refugee Camp, Jordan, Veranda option (source: FAREstudio\_2013).

For a long period of time the proposal has been discussed with UN Agencies Representative, various experts, other NGOs in the attempt to set a feasible scenario: several NGOs have been asked to join to form a team, where each NGO would have been involved in relation to its peculiar ability (distribution, procurement, presence in the camp). As part of the process, focus groups with refugees have been carried on in order to collect their opinions about the summarization (and they quite clearly preferred the veranda for the same reasons that outlined above).

Unfortunately, at the end both the proposals have been shelved due to lack of time (all started too late in the season) and cost.

The only practical, unsatisfactory result is that the veranda has been utilized by UNICEF to shade external areas in some of the schools of the camp.

## MAURITANIA: CASTLE OF SAND?

In Mauritania FAREstudio has been required to implement a 66 classroom program for the MBerra refugee camp. In this case the model, a simple hangar with a steel and timber structural frame mounted on a concrete slab, completed by a corrugated iron roof and PVC as enclosure, had already been defined by Mauritanian authorities, and basically accepted by UNICEF and UNHCR. There were no drawings but simply a very schematic Bill of Quantities for a total estimated cost of 3,300 USD.

The reference was a combination of the typical UNICEF prime intervention tent and the traditional Mauritanian tent (fig.7), both with major limitations: the UNICEF tent performs very badly in windy conditions (absolutely usual in the area), the traditional tent is not intended for didactic purposes.

Moreover, the proposed materials (corrugated iron roof and PVC) quite obviously would have produced a 'building' absolutely not durable and above all unbearable for the users, kids and teachers. In addition, the model would have had a pole in the middle of the space and the incidence of transportation cost (the camp is in a very remote location) is huge: enough arguments to suggest the opportunity for a different approach.

**Fig. 7** - MBerra Refugee Camp (*source: FAREstudio\_2013*).

The office decided then, in accordance with the UN Implementing Partner it was working with, to propose an alternative based on a very straightforward assumption: since transport is so expensive and sand so available, it has been proposed to use sandbag technique, a definitely labour intensive solution that permits again the application of the cash-for-work principle).

The use of bag filled with sand as masonry, plastered on chicken wire armature, is widely used in varies areas of the world, and it can be regarded as a consolidated technique nowadays, and has been introduced locally as a response to a specific need. The wall is combined with a double layer roof, where the corrugated iron is replaced by pvc truck cover installed on a series of metal trusses based on a typology used in the area (fig. 8).

A tender has been prepared on the base of the proposal, with the clause to produce a prototype in order to optimize production and familiarize the workers with the system. Cost of the building, after tender, turned out as 2,400 USD, an issue that will prove controversial.

**Fig. 8** - Classroom, MBerra Refugee Camp (*source: FAREstudio\_2013*).

The prototype has been discussed with all those involved, from UN Agencies (UNHCR and UNICEF) to refugee leaders. After initial suspect and some stoppages, the result has been positively considered and officially adopted (fig.9). It is remarkable that the host community and the refugee leaders, once experienced the thermal performance of the prototype, have been enquiring about the possibility to adapt the technique to other building types.

Regarding the cost, pricing is not exactly an easy exercise in such environment, but the real issue raised once the contractor realized that his profit (largely based on transported materials) was dramatically reducing in comparison with the 'conventional' model. At that point a confrontation has started and after some form of resistance not to say sabotage, the contractor has been substantially sided by FAREstudio [it means by the UN Agency Implementing Partner] in a sort of unusual, hybrid Construction Management formula.

The program is currently under construction and by the end of November a first series of 66 hangars should be ready.

**Fig. 9** - Classroom, MBerra Refugee Camp (*source: FAREstudio\_2013*).

## CONCLUSIONS

Generally speaking, and not only in poor countries, current production of built environment based on conventional building industry is very rigid and conservative; in the case of international cooperation major institutions, despite relevant expenditure, regard the respect of local practice as part of an overall strategy of controlled impact on beneficiary communities. In addition, particularly as far as emergency is concerned, there is a vast technical literature, easily available, but its application seems to be difficult, as if something in the passage from theory to practice goes lost. All this defines a very stiff environment, apparently quite reluctant to experiment and innovation. Nevertheless, despite failures and disappointments, FAREstudio has experienced the possibility to force the conventional limits of professional position from the person responsible for implementation to promotion of alternatives based on design, to the point of collecting a few findings that could be interesting to assume as starting points for a further discussion:

- innovation should be pursued as a primary aim, particularly taking into account that building in international cooperation refers often to public buildings or public use of buildings; innovation it is not a simple pursue of newness, it is aimed at relating a project to its context so to ameliorate it;
- innovation, however, must realistically consider the very context in which the project is located (socially, economically, geographically) so to be feasible: under this point of view, typology seems usually more promising than technology as area where locate innovation, and both can find inspiration in traditional production, at least at level of principles rather than forms;
- as a combination of the previous points, the production of prototypes to be easily replicated must be favored, so to maximize investment in design (and quality control); this does not refer to universal solutions, but models with a broad range of applications, that realistically recognizes the issue of inadequacy/scarcity of that specific intellectual and practical resource that we commonly call (quality) design.

Finally the association between research and production is totally useless if not supported by effective communication, so to activate sharing and dissemination. Cultural mediation is an expression of effective communication, a specific contribution architects should bring to the process of shaping a built environment that responds appropriately to needs and aspirations of those who inhabit it.

Obviously FAREstudio's work in the international cooperation is hardly understandable as architecture, and might produce embarrassment and/or scepticism to use it to support ideological considerations; however it is precisely the work for international cooperation that can be used to draw some general indications: it offers [imposes] the chance to reintegrate a process [design and building] that otherwise seems oriented to disintegration. It is a good opportunity for architects to restore their [traditional?] multi-disciplinary approach, an essential attitude in order to achieve real and comprehensive sustainability. In addition it is a unique opportunity for practical action, with exceptional potential for social relevance; last but not least, it is a formidable exercise in realness and concreteness, the opposite to current abstraction and insignificance that affects wide regions of the profession.

## VERNACULAR APPROACH TO ARCHITECTURAL DESIGN IN A DEVELOPMENT COOPERATION EXPERIENCE WITH MEXICAN INDIGENOUS COMMUNITIES

### ABSTRACT

Archintorno is a non-profit organization of young architects based in Naples, that has been promoting initiatives of development cooperation with indigenous communities in the Mexican State of Oaxaca since 2005. These initiatives involve universities, associations, local governments, and professionals in and outside Italy and rely on a didactic format, internationally known as Design-Build Studio, that includes the direct involvement of students from the Schools of Architecture and Engineering in designing and creating buildings in the developing contexts.

Our projects aim at using local materials and resources through low-cost, repeatable technologies, that are also consistent with local climate, social, and cultural context. Decisions on how to realize the projects are the result of a careful, shared analysis of lifestyles, housing culture, and local construction techniques. The cultural exchange between students and local populations is another relevant factor playing a major role in these projects. Therefore, in the context of the current debate about different approaches to architectural design in international cooperation, the experience of Archintorno is in close continuity with the local vernacular culture.

This article describes the strengths and weaknesses of the proposed approach through the analysis of the three cooperation experiences of Archintorno in Mexico. The topics discussed cover forms of participation and capacity building, project impact on the local community in terms of economic, socio-cultural, as well as environmental and landscape aspects, in addition to the transposal of technological and architectural innovations and may represent a starting point for discussion within the context of the community operating in this field.

### INTRODUCTION

Although the use of prefabricated elements in architectural design in developing contexts of international cooperation is relatively common, differences between a design approach based on the principles of vernacular architecture and another approach based on prefabrication appear to be quite significant. Rudofsky uses the words “anonymous, spontaneous, indigenous, rural” [1] to describe the term “vernacular”. According to P. Oliver vernacular architectures are “related to their environments contexts and available resources, they are customarily-owner or community built, utilizing traditional technologies. All forms of vernacular architecture are built to meet specific needs, accommodating the values, economies and ways of life of the cultures that produces them.” [2]

Thus, a vernacular design approach relies on: i) the use of local materials and resources; ii) the development of technologies related to the local building tradition, where the technological rate must be consistent with and can be supported and reproduced by the culture and society representing the target of the cooperation project; iii) the participation of local beneficiaries into the process. Despite the figure of the architect denies one of the fundamental conditions of vernacular architecture: “the architecture of the people, and by the people, but not for the people” [3], this approach leads to the development of principles of the vernacular architecture, and tends to establish a direct comparison and a constant collaboration between the professional designer and the recipients, based on the principles of local building culture. Technologies developed in this context by relying on local resources, allow to invest a main part of the financial resources of the cooperation project in the territory and in the development of the local community, but they are also the result of time invested in partnership.

Although not excluding to start from the context analysis and its needs, a design approach based on prefabrication focuses on industrial materials prefabricated elsewhere and transported to the project site, on a fast and easy assembly, on modularity and the serial nature of the elements production and of assembly operations. Serial production allows to reduce manufacturing costs through industrial processes, while increasing those of materials transport; the speed of assembly allows to reduce the time of construction by lowering labor costs and that of the staff in field mission, but limits also significantly investment in the area and participation of local people in the process. In the absence of local producers of the resources used and without an external intervention, the use of materials not locally available makes

difficult to replicate used technologies locally, so that this approach seems to be more suitable to an emergency context than to development processes in marginal contexts.

Based on a strong credo that an approach to design linked to the development of vernacular technologies through the use of local resources may be the right way to ensure sustainability, both in economic and cultural terms [2], the association Archintorno has worked to the implementation of cooperation projects with rural indigenous communities of the Mexican State of Oaxaca from 2005. Indigenous communities of Oaxaca are deeply surrounded by nature and often marginalized due to difficult access for the mountain nature. Due to this isolation from urban contexts, they maintained a traditional socio-political organization of the community, and mainly saved traditional forms of life-style and of settlement. [4]

Despite these indigenous roots still being very strong, the community suffered a deep and quick transformation over the years. Communities are excluded from production processes of urban areas, country policies, and from the processes of society renewal and the processes of cultural and socio-economic contamination, associated to the migration phenomena directed towards the main cities of the same Country and to the United States, are now evident. [5]

These processes supported the diffusion of new lifestyles and aspirations of “modernity” among the people, that are now also evident from the building environment; industrial prefabricated materials and related construction techniques gradually complimented local natural materials and vernacular forms of settlement as an emancipation signs in most of the wealthy families (fig 1).

Archintorno’s projects focus on a didactic model called Design – Build Studio where students are responsible for implementing architectural projects from design to construction, [6], by recovering principles of local vernacular architectural tradition, that is revisited through a contemporary approach appropriate to the climate, and by using available resources [7], so that the local community exerts a central role in the whole process. With the support of the local non-governmental organization (NGO) CAMPO a.c., we developed three projects in Mexico, through processes strongly linked to the local vernacular tradition: a community center in Santacruz Tepetotutla in 2006 [4] (fig. 2), a community center San Pedro Tlatepusco in 2010 (fig. 3), and Micro-Regional Centre of Technological Innovation in the Liberal Pensamiento 2012 [7] (fig. 4). This allowed us to analyze different aspects of architectural design related to this type of approach and their implications on the whole cooperation project, and at the same time left questions open about the forms of participation, the socio-economic impacts on the community and the transposal of technologies proposed in a territorial development perspective.

## A DESIGN BUILD STUDIO METHODOLOGY

Although based on Design-Build Studio model, the methodology developed by the Archintorno, was gradually enhanced by including additional phases and revised according to the considerations produced by the direct experiences themselves. This methodology consists of five main activities:

- a preliminary, on-field investigation;
- design workshops;
- construction workshops;
- a household survey aimed at understanding local lifestyles and housing cultures;
- exhibitions, publications and video-documentary about the project.

Particularly in the second step, Faculties of Architecture and Engineering providing the participating students have been involved in the development of the didactic process through the years: the TU of Berlin, who’s “Mexiko Proyekt” was our inspiring model and the Faculty of Architecture of “Federico II” University of Naples in 2006 and 2010, the CRD-PVS of Polytechnic of Turin and the taller Max Cetto of UNAM of Mexico City in 2012. The whole process relies on inclusive and shared strategies allowing a continuous debate among the actors involved in the same project at different levels. The process starts up with a preliminary survey, aimed at collecting all the useful elements for the development of the project and at promoting a very primary exchange of expectations, ideas and arrangements with the community. Since our work mainly focuses on community building, all the inhabitants of the village, or at least part of them, are involved in the project.

The following visit to the village allows us to introduce Archintorno to the local community and to establish cooperative agreements among the actors involved in the project, thus each partner may be able to give its contribution according to its own skills and resources, and to share and define the architectural program with the community too. Beside this aspect, the survey focuses on local materials and resources, construction technologies, building types, habitat and lifestyle, geographic, climatic and socio-economic information in the village.

During the design workshop, students starts their work analyzing the data collected: they study all aspects of vernacular architecture, and examine issues detected in construction techniques in order to find adequate technological solutions. Students work on several project proposals and submit them to the community that chooses the most appropriate one. The chosen project is discussed in assembly with the community and it can be integrated with its suggestions and proposals. Once architectural design is revisited, workshop focuses on structural details of the project

and on quantifying construction materials and costs. Once executive planning is completed, we are ready to begin construction.

**Fig. 1** - Vernacular and industrial materials.

**Fig. 2** - The Community Center in Santacruz.

**Fig. 3** - The Community Center in S. Pedro in Pensamiento Liberal settlement.

The Community hosts students for the period of works (2-3 months). We share work and everyday life in that months and it is an important experience that allow us to empower our relation with the communities [4].

On building site, we contract a local mason and carpenter with the didactic role to guide the students in all construction process. They have the key role to share their knowledge on local vernacular construction techniques with students, and at the same time they have the opportunity to get closer to the new techniques proposed in design. The result is a learning by doing process where every labors, students and inhabitants can share their work experience, learning by the others at the same time.

For our last project in Pensamiento Liberal Mexicano, we decided to complement the preliminary investigation with a household survey, to deeply understand the habitat transformation dynamics. A semi-structured interview with the households was made to better determine the people lifestyle and the relation with the use of spaces in the house. The choice of the research themes reflects the holistic hypothesis, according to which all the different aspects of the life of the individuals influence the architecture of the housing compound and of the territory [3], [7].

Students interview the local inhabitants with a set of pre-defined questions, open questions and make a graphic and photographic documentation of the housing compound. These activities allow us an intimate contact with people, and constitutes an important data base to document their culture and for following projects of the association in that area. As the very last step, together with the students, we provide a set of documentation tools (videos, publishing, exhibitions) to promote the whole experience. These tools are also a further chance to think back to all the projects activities, to detect the weak aspects of the common work and to reflect upon possible improvements.

## VERNACULAR DESIGN APPROACH ASPECTS IN ARCHINTORNO EXPERIENCE

### Habitat, and life style analysis

Human beings is the product of a cultural process that took place over the time and in different places; communities (from the small village to the great countries) through its institutions, are guarantors of this historical continuity that allows to preserve a system of values and a collective identity; this give rise to habits, lifestyles, and generally all human activities leading to social structures and its relationship with the physical environment. For this reason intervening in marginalized communities to lay the foundations for new forms of self-development, is an extremely delicate operation that may often create deep fractures in the social cohesion of the community. This task requires a holistic approach in the cooperation project which provides continuity with the economic and social processes of the place. Our local partner, the NGO CAMPO that works for over 30 years for the self-determination of indigenous communities in the region of Oaxaca is our primary guarantor of this. However, the role of Archintorno cannot be solved in the simple execution of a request of the community filtered through the work of the NGO involved. At each step of the process, from the preparation of the project until the implementation stage there is the attempt to understand the socio-cultural implications of each action. The vernacular approach, compared to the prefabricated one, allows to have the flexibility to adapt to the contributions that result from an ever deeper knowledge of the place and its dynamics, throughout the process.

Since the beginning, during the investigation, our approach is based on two basic assumptions: the communion of intent with the community and the knowledge of the socio-cultural and climatic dynamics of the place. Both elements play a fundamental role in the design of the building, helping to define the factors to guide students in the project proposals and the executive planning. Agreements made with the community through the confrontation with local institutions has in fact the dual aim of engaging, through a choice collectively shared, the entire community in the process, and, at the same time, understanding the real resources available to the community to ponder design choices

and technology solutions. In these terms, for example, in San Pedro Tlapeusco, wood was not only a local resource to be used but also the impervious way to reach the chapensis pine cutting area, the local people strain of loading wood on their shoulders to carry them downstream and finally the work to convert it in construction elements with a rudimentary equipment. Accordingly, the technological choices must achieve a balance between the pieces size and quantity to be used, always trying to understand and imagine how each action will be put into practice in that context. Knowing the context, thus, becomes an important factor to start the design process.

The investigation is based on two related factors: observation and listening; observation of the physical and architectural characteristics of environment and the understanding of the social and cultural dynamics of the community through people's tales: in a design logic strongly linked to the territory, to detect the various technological changes in local architectures without knowing the related manufacturing processes and their implications in the economy of the community, is not enough.

In the same way to measure the composition and shape of the spaces without understanding the different socio-economic and environmental factors involved (fig. 5) is not enough. For example, the dislocation of different function of the house in the open-aired compound detected by the observation of the place, in the case of the project in Santa Cruz, led naively to the idea of connecting the two floors trough an external path.

Following a specific request of the community we modified the project adding an internal staircase offering the users a covered connection to the second floor. In that case greater attention was paid to socio-economic factors of the observed articulation of spaces, partially underestimating climatic aspects. Participation of community, made possible to find appropriate design and technological solution that could satisfy both aspects.

**Technical and knowledge interchange through the participation process**

One of the principles on which all three projects were developed lies in the aim of creating a common path between the actors involved in each stage of the process. So the value of the construction phase does not reside only in the construction of a physical space, but also in the creation of a exchanging processes which foster this dialogue through the networking of experiences and skills: the construction phase has an educational value not only for the participating students, but also for the community members involved. The whole process is the result of expertise exchange among architects, local workers and students during the period of construction, through the involvement of some members of the community as actors of the construction process; this interaction is significantly facilitated by the use of local resources and the development of techniques arising from the local culture, previously studied. This allows us to confront each other on the basis of a common vocabulary that establishes a form of communication among the actors involved. So the heritage of this operation becomes, a linguistic enrichment that can produce new forms of local architectural expression, new skills and the awareness of their resources' potential.

An example that clarifies this approach is related to the process by which the wooden structure (present in all three projects) was designed, considering the related implications in the later step of the construction. Starting confronting with the community, we defined the basic size of wooden pieces to compose the whole structure, according to the material local production processes; these elements are then assembled in the final design in order to enhance both structural and environmental performances, considering at the same time, construction processes that local workforce could manage.

**Fig. 4 -** Micro-Regional Innovation Center in compound in Pensamiento.

**Fig. 5 -** Investigation sketch of a Santacruz Tepetotutla project.

**Fig. 6 -** Sketches of implementation made in Pensamiento Liberal Mexicano.

In this way, during the construction step there is the concrete possibility to perform a knowledge exchange: the local labor force, able to interact immediately in the building process, can pass down to the students their technical knowledge about the manufacturing of elements and the basic assembly operations; at the same time it is easy to introduce and discuss with them new technological solutions, leading to an enrichment of local know-how. A community resource, in primitive forms becomes the easiest vehicle of communication.

This form of collaboration also takes place through the community involvement in design choices: in fact the development of the project proposal always goes through a comparison with the community that in many cases led to substantial changes in the project. It is the case of the addition of the aforementioned internal staircase as well as the implementation of the roof overhang in order to better protect the rear façade in the project for SantaCruz (fig. 6), or the

spatial changes which took place in the project for Pensamiento Liberal. In this second case, after a meeting with representatives of the cooperative, the need to protect one side of the building particularly exposed to rain and wind, led to the displacement of the external staircase and the redefinition of the interior spaces and of the access paths of the original proposal.

This process of mutual exchange, is particularly useful also in the construction phase in order to design a dynamic process able of dealing with unexpected accidents that we often encountered in marginalized contexts such as those of the villages: many detailed solutions are in fact the result of economic technological and logistics constraints often overcome thanks to the local actor knowledge or arising out of the interpretation of habits and local techniques experienced in everyday life (fig. 7). That is why we could recover archaic technologies deemed by the locals, initially not taken into account; developed within a different technological system, they can be part of the collective knowledge asset again.

### **Technological Improvement: construction costs, modularity, reproducibility, maintainability**

The design approach followed by Archintorno, which starts from the reinterpretation of vernacular techniques through the use of local materials and resources, allows to work on technologies reproducible by local people, trying to get good performance of climatic comfort, reducing at the same time construction costs particularly related to the transport of materials and energy costs related to construction. This kind of approach also aims to the not negligible goal, to develop compatible low-cost technologies and in continuity with the tradition and expertise of local people, so as to tend to a self-development model, enabling the community the complete process management, maintainability and repeatability of the technologies used, once exhausted our presence on site, and allows us to invest large part of the project resources within the community.

In our experience, it was not always possible to carry out such a linear process, often the circumstances have led to trade-offs in an effort to better use the available resources in a climate of full participation with the community. The trend of rural communities to prefer the use of industrial materials, often seen as synonymous of advanced technology and progress, also has in some cases affected our choices. For the project of the Community Center in Santacruz Tepetotutla for example, the village asked for a an entirely concrete structure, also to take advantage of the foundation and vertical structures already carried out in the previous years and of the materials already purchased, despite the aim of the association was an architecture in full harmony with the local environment, making the most of local materials. We came to a compromise and obtained the upper floor to be made entirely of wood, taking advantage of local knowledge in manufacturing the material, so we proposed a wood structure revisiting local vernacular constructive principles, but offering greater rigidity and a better control of heat transmission from the roof.

Construction costs – Still in Santacruz, wood of community property, was made available to the project for free, and the expedient was repeated in the other two projects, the attempt to promote the use of such an important local resource, has enabled us also to invest in the local labor to cut wood and technological solutions for the improvement of thermal comfort of the building. Despite this, the rather consistent use of industrial materials affected the costs related to the transport of materials, although coming from the nearby city of Oaxaca, resulting in a significant portion of the total budget of the project. In our last experience in Pensamiento Liberal, instead, it was possible to use almost entirely local materials such as wood, stone, earth, reducing the use of cement and other industrial materials to the minimum. Materials used for construction, were extracted directly from the village territory, minimizing transport distances, and then transferred in the yard area using community property means, greatly reducing costs and also allowing us to distribute most of the funds inside the community itself.

Modularity - In this approach, modularity recognizable both in the individual designed building elements size, as in the size of the structures, meets the need to make the most of available resources. So the wooden structures are always designed with elements according with the cuts to be performed and transportable by the community and with the resources available on site, the size and frequency of the structures are designed according to the size of the available elements that will be used to complete it, as triplay, wood boards, etc. (fig. 8, fig. 9). The load-bearing earth wall structure size of Micro-Regional Centre of Technological Innovation of Pensamiento Liberal was modulated on those of the formwork provided by the supporting local NGO. So the project becomes a non-stop adaptation process, in which choices are revised several times until all resources are used to the best.

Reproducibility - Although the reproducibility of proposed technologies is one of the strengths of the vernacular approach to design in developing contexts, it could be a not so trivial target to be achieved; the involvement of local residents and craftsmen in the construction process, the use of local materials and technologies developed on vernacular architecture principles, is enough to determine the reproducibility of the building? Actually construction methods and processes, as the economic component play a key role in this case. For the earthen load-bearing walls in the Pensamiento Liberal project we choose to use the technique of mechanized Pisé (fig. 10) , using a compressor and pneumatic pistons (fig. 11) to speed up compaction and taking advantage of the abundant workforce of students for the preparation of earth. But as far as the large number of students employed in the construction can be replaced by the villagers themselves, the use of mechanical means, out of the reach of communities and the impact of fuel costs for their functioning, make the process quite hard to replicate. The structures of the wooden roof, proposed in all the three projects, as far as offering innovative technological solutions than those normally used in the local context, employ a quantity of timber that remain sustainable in cooperation project context with the whole community, but that it becomes

economically hardly accessible for individual locals who want to propose them for their homes.

Maintainability - Despite the many questions raised on the actual reproducibility of the process, the attention paid in the design phase to the use of local materials associated with the sporadic use of elements prefabricated in the surroundings, as well as the involvement of local labor in the construction process, offers the community the ability to manage the maintenance of the property, ensuring its survival over time.

**Time of construction: social impact and resources management**

Obviously this kind of design approach requires to spend a relatively long time on field in the construction phase, comparing it with a design approach relying on prefabrication. This is partly because of its educational nature, in part because the production chain of the materials used for construction is fully dealt with in place, in part, for the long and difficult management processes of local resources by the authorities of the community and its marginality degree. Before they are put in place, materials are extracted, cut on the territory belonging to the village and then manufactured on the building site through processes often not mechanized, by students and local inhabitants who develop a relationship apprentice - teacher in both phases. This process not only creates a natural daily slowdown in site work, but can cause not negligible unexpected situations. In San Pedro Tlatepusco, because of the particular marginality of the village, the wood needed for the construction was cut at high altitude, left to dry there and gradually brought to the site by the locals on their shoulders, through paths made impervious by the weather. This situation has strongly influenced the development of the construction site and more than once we risked to have to stop it, due to lack of material. A long execution time, can have a significant impact on the territory and a high cost of management for the host community mainly because of the persistence of a large group of students on site. But at the same time allow a stimulant meeting of cultures, as previously described. During the 2-3 months of construction, the community is sometimes forced to change in part at their own daily life and work pace and is called to a considerable financial effort to provide for the maintenance of the guests. The choice of the ways in which these processes shall take place affect as much on the quality of integration between students and local residents, as the possibility for the community to continue to carry out part of their daily activities during the period of construction.

In San Pedro Tlatepusco, families turned hosting small groups of students for daily meals, so as not to impact too much on their family life rhythm; this solution however allows less control on the quality of food and wasn't replicated in the other two projects, also for communities choice. In Pensamiento Liberal, the women of the cooperative have turned in a single common kitchen providing meals to all students for the entire duration of the project, spending almost their entire day in this task. The attention with which these issues are examined at the moment to arrange with the community, as well as the manner and timing of the management of local resources through the authorities of the village are crucial for the success of the project.

**Fig. 7** - Detailed solution of windows in Santacruz Tepetotutla project.

**Fig. 8** - The modular wooden structure in Pensamiento.

**Fig. 9** - Wooden roof structure module based on Tejamanil dimension.

**Fig. 10** - Mechanized process of compaction of rammed earth walls in Pensamiento Liberal.

**Fig. 11** - Compaction with pneumatic piston.

It's a complex but necessary task of cooperation, discussed at the moment to make arrangements with the community, which helps address the design foreseeing times and tools for implementation of the different phases of construction. In the case of Pensamiento Liberal, the cooperative had several difficulties in obtaining permits for cutting wood needed for the project by the competent Community authorities, so that the wood hadn't time enough to dry out completely and his manufacturing was very difficult. This generated a delay that led us to ask the community one more week to finish the work; the proposal was accepted with great difficulty since sowing time was approaching and the locals needed to work the field to obtain food for the following months.

## CONCLUSIONS

In most indigenous villages of Mexico, vernacular settlement patterns and architectures evolved over centuries and still represent the majority of the built environment. Nevertheless they are disappearing fast, since housing typologies inspired by Western models and industrial materials started to be introduced within the communities. This phenomenon happens not only because of the spontaneous action of the socio-economic "elites", that even in these small communities do exist (generally local traders), for whom concrete prefabricated houses are more "modern", "safe" and represent their aspiration to an "urban" lifestyle. The adoption of "industrial" pre-packaged housing typologies is also often promoted by the Mexican government and international NGOs operating in these villages, without taking care of the relation of the proposed constructions to the characteristics of the place and of the community that lives it, with the result of producing a growing homologation of the living environments. Therefore, it is possible to observe a growing trend of substitution of vernacular settlement patterns with "modern" and "industrial" housing typologies, inspired by Western cultural models, with the risk of providing settlement solutions that are inadequate to local contexts and to loose vernacular traditions, which are a precious world heritage of urban diversity, material cultures and skills.

The above presented analysis of the Design-Build Studios carried on by Archintorno, in collaboration with Italian and Mexican universities and local NGOs, in three indigenous villages of the Mexican state of Oaxaca, allows us to propose some conclusions in relation to appropriate approach to be adopted when dealing with architectural design and construction within development cooperation programs.

In spite of the previously analyzed weaknesses of the proposed approach, the valorization of the vernacular housing and building traditions represents for us, as international architects invited by local communities to contribute to give shape to their built environment, the best way to interact with local material cultures and to avoid the risk of proposing housing models originally developed for Western, industrialized countries and passively inferred to southern, tropical, rural contexts.

It is not excluded that a design approach based on prefabricated materials, in these contexts, can pay attention to local indigenous dwelling types and patterns and in some cases, not only in other regions of the southern hemisphere, this kind of technology has been shown to meet local thermal comfort needs. But the use of prefabricated materials produced in Western countries, through these technologies, generates costs, including environmental, associated with the transport of materials unsustainable both globally and for the communities. Furthermore, technologies used are impossible to reproduce and maintain over time for the communities themselves.

On the contrary, vernacular settlements are regional and cultural. Furthermore, the widespread use of local, natural building materials (earth, wood, straw, stones etc.) and building technologies is affordable even by local subsistence economies and enhances cultural heritage and traditional abilities of local manpower. Moreover natural material demonstrated to be very appropriate from an environmental point of view and in relation to their "lifecycle assessment", but also in relation to their performances in terms of climate control and to the provision of indoor comfort in tropical countries.

Enhancing vernacular tradition offers the opportunity to experiment with housing typologies, building technologies and construction processes that are more appropriate to local housing culture and endogenous resources. But also in the forms of design inspired by vernacular architecture, the use of prefabricated materials, even if reduced, today it is often rather widespread. So what's the line? it is possible to think in a hybrid approach that, while starting from the vernacular architecture principles, paying attention to local housing needs and climatic conditions, and making extensive use of local natural materials, can also take advantage of prefabricated elements, on condition that they are produced or producible in the region? May be possible in this way, to ensure reproducibility, maintainability of the building and, at the same time, create the basis for a real participation of the community in the productive processes and development of the society, without recourse to materials, technologies and models designed and coming from the so-called first world countries?

The suggestion that comes out from our experience is to find inspiration in the vernacular tradition in order to avoid the indiscriminate proposition of Western housing and construction models. The proposed strategy is to reinterpret the vernacular tradition by culturally appropriate means, focusing on the introduction of culturally and economically compatible changes. This strategy can only be possible if it is based on the full involvement of the local communities at each step of the decision-making process.

## COMMUNITY DEVELOPMENT AND PSYCHO-SOCIAL INTERVENTION

Alfredo Mela\*, Norma De Piccoli°

\*Interuniversity Department of Regional and Urban Studies and Planning, Politecnico di Torino, Italy -

[alfredo.mela@polito.it](mailto:alfredo.mela@polito.it)

°Department of Psychology, University of Turin, Italy - [norma.deplicoli@unito.it](mailto:norma.deplicoli@unito.it)

International and university cooperation is based, among others, on developing a psycho-social intervention referred to some methodological and epistemological approaches and to some ethical principles driving the community development.

The themes here proposed, therefore, are related to cooperation projects aimed at community development.

We are interested to present a reflection moving from cooperation projects aimed to the improvement of mental health, to the stimulation of citizens' participation aimed at improving the quality of life, defending human rights and strengthening the resilience at an individual, group and community level.

Experiences carried out will be here documented with the purpose to develop reflections on theoretical approaches and methodologies that guide the cooperation in this field, as well as on the ways each project has established the relationship between universities from different countries and between universities and governments, institutions, public and private organizations, NGOs, communities, local and international networks. Particular attention has been paid to the study of the forms of participatory action research, implemented within the framework of cooperation initiatives aimed at enhancing the role of local cultures and knowledge. The focus of the communications here presented is to highlight the impact of these forms of cooperation both on contexts of the global South and on developed countries affected by the consequences of economic crisis.

According to the picture that emerged it is possible to highlight both the different approaches between the cooperation projects in the field of psycho-social intervention and to show the presence of many common aspects; specifically, these experiences emphasize the importance of these forms of cooperation and the amplitude of the effects they may have both on the contexts in which they are carried out, as well on scientific research.

## INTERNATIONAL COOPERATION IN THE FIELD OF HIGHER EDUCATION: THE TEMPUS PROGRAMME

Norma De Piccoli\*, Silvia Gattino\*, Cristina Mosso\*

\*Department of Psychology, University of Turin, Italy -  
[norma.deplicoli@unito.it](mailto:norma.deplicoli@unito.it), [silvia.gattino@unito.it](mailto:silvia.gattino@unito.it), [cristina.mosso@unito.it](mailto:cristina.mosso@unito.it)

### ABSTRACT

Tempus is the European Union's programme that supports the modernisation of universities in the partner countries and contributes to the creation of an area of cooperation in the field of higher education between the EU and Partner Countries neighbouring the EU. This programme promotes voluntary convergence towards European policy developments in higher education, as it has been outlined by the Lisbon agenda and the Bologna Process. Main specific objectives of Tempus are: – to overcome inter-country fragmentation in the area of higher education and inter-institutional fragmentation in the countries themselves; – to enhance interdisciplinarity and transdisciplinarity; – to enhance the employability of university graduates; – to make the European Higher Education Area more visible and attractive to the world; – to enhance mutual understanding between peoples and cultures of the EU and the Partner Countries. Those aims are reported in the documents of Conference of Rectors of Italian Universities, which promotes the involvement of universities in the National Tempus program. This paper deals with one of our direct experience in Tempus program. In this work we propose some considerations on the cultural transformation that undergoes a scientific theory when it is transferred and applied in non-Western socio-cultural contexts. If the scientific disciplines have, among others, the function of promoting the wellbeing of community, there must be also an exchange and encounter between cultures, which would enable to overcome a Western-centric perspective. In this way the scientific disciplines can arise according to an emic approach. That does not mean to call into question decades of theories that are milestones of scientific knowledge, but foreshadows an adaptation of the theoretical models to the specific social, cultural and ethical background. In this way, even a university cooperation project – as is the Tempus programme – takes the form of a community development project.

The community development is both a process and a product, both a practice of intervention and an ethical guiding principle from which derives this practice of intervention; it refers to a programme of approaches, methods and techniques that combine external assistance with locally organized self-determination. It involves citizens as individuals and as groups, institutions and political leaders. The community development focuses on people's participation and initiative of the community as the primary tool for change [1].

The benefits of community development come through local people changing attitudes, mobilising existing skills, improving networks, thinking differently about problems, and using community assets in new ways. The community development process is rooted within the context of the physical and social environment of the community [2]. The peculiar feature of this approach is the active involvement of groups and individuals targeted by the intervention. These subjects are supported by professionals, but the role of the experts is, in some respects, marginal, as it is important that individuals/groups themselves determine their own transformative process. External facilitators and people resource work *with* community people, rather than working *for* them. They have a responsibility to challenge and suggest, without making or influencing common decision-making. According to this approach, therefore, participation and sharing are both guiding principles and goals to achieve [3]. The marginal role of the expert has also the function to avoid a sort of scientific-cultural hegemony: the power of the expert is reduced in favour of the power of the community [4]. Based on these characteristics, community development is located in the middle of two actions: social planning and social action. Social planning is an action controlled by professionals, according to a top-down approach; social action, in contrast, is based on self organization of the community according to a bottom-up process. Community development often requires the creation of networks, built through the work and support of the experts, who believe that direct involvement of the people to whom the intervention is targeted to is essential in planning, in improving empowerment and in bringing about significant changes in the community. The advantage of using this approach is that it is easier to meet the real needs of the community, since it is listened to when decisions are made and, at the same time, do not get lost in the vagueness of a superficial and undirected work. The key for community development is facilitating a community in applying the principles to guide a flexible series of actions that are appropriate for the situation of that specific community. The community development approach considers limiting the pre-packaged interventions and argues how the community has in itself the opportunity and the capacity to propose innovative and effective solutions.

According to this approach, therefore, the expert is a connector resource and he/she is also the one who leads the

people or the community towards change. As we learn from one of the fathers of social psychology, Kurt Lewin, the process of change involves three steps: *unfreezing*, *changing*, *freezing*. The first stage involves the *unfreezing* of the status quo and, as many people will naturally resist any change, the goal during the unfreezing stage is to create an awareness of how the status quo is not convenient. The *changing* step is marked by the implementation of the change. It's the time that most people struggle with the new reality. It is a time marked by uncertainty and fear, making it the hardest step to overcome. During the changing step people begin to learn the new behaviours, processes and ways of thinking. Finally, the *freezing* stage is marked by the stabilization of the new state after the change. This step is especially important to ensure that people do not revert back to their old ways of thinking or doing prior to the implementation of the change. Efforts must be made to guarantee that the change is not rejected. An expert, having an external point of view, may help in addressing these steps, because he/she may help those involved in them to be aware of the limitations of the current situation and may promote the foreshadowing of alternative strategies. However, without the cooperation of the people directly involved in this process, the change would not be possible. These are the key elements of community development. Furthermore, the community development, as it has been defined, is also based on an *emic* approach rather than of an *etic* one. Emic and etic refer to different method used by human scientists in attempting to understand human behaviours in societal context. As pointed out by Morris and colleagues [5], these two perspectives have equally long pedigrees in social sciences. The emic perspective follows in the tradition of psychological studies of folk beliefs, whose origins date to Wundt [6], and in cultural anthropologists' striving to understand culture from "the native's" point of view, as proposed by Malinowski [7]. The etic or outside perspective follows in the tradition of behaviourist psychology, see Skinner [8], and anthropological approaches that link cultural practices to external, antecedent factors, such as economic or ecological conditions, that may not be salient to cultural insiders, see Harris [9]. Specifically, the emic approach deals with the study of culture from an "internal" point of view, trying to overcome the dualism of nature/culture, positing a close interdependence between biological and cultural level. This approach requires to adopt the social actor's point of view, their beliefs and their values. Furthermore, since each culture has its own characteristics and constitutes a totality, the emic approach attempts to identify culture-specific aspects of concepts and behaviour, which cannot be comparable across all cultures. In contrast, etic approach provides an external point of view to the study of culture, and refers to a kind of universalistic vision that implicitly assumes the existence of the dichotomy nature/culture. The etic approach attempts to identify universal aspects of human behaviour and seeks to find universal processes that transcend cultural differences or to produce new theories that can be utilized across cultures [10], in other words, an etic account attempts to be culturally neutral.

Even though emic and etic present two different perspectives and the separation between these two approaches persists, currently a perspective that considers them to be complementary and attempts to integrate these two methods is arising [11]. This occurs in particular in the field of research dealing with the characteristics of human nature, as well as the form and the function of the social systems.

## THE TEMPUS PROGRAM: A PARTICULAR CASE OF COMMUNITY DEVELOPMENT

The theme of community development in its various aspects, as well as the question of culture, plays a key role even in the frame of international cooperation. International cooperation is effective only if the experts involved take the role of facilitators who are able to activate resources and skills existing in the context. Otherwise, the risk is to transform a cooperation project in a colonization process.

Based on these premises, we propose to think at the issues highlighted as essential even in the case of international cooperation in the field of higher education. We refer to the TEMPUS programme. TEMPUS is the European Union's program that supports the modernisation of higher education and creates an area of co-operation in countries surrounding the EU. This programme promotes voluntary convergence towards European policy developments in higher education, as it has been outlined by the Lisbon agenda and the Bologna Process. Since 1990, the Tempus Programme has played a major role in supporting the development of higher education in the EU's neighbouring countries in North Africa and the Middle East, in Central and Eastern Europe, the Western Balkans and Central Asia with a total of 29 Partner Countries participating in the programme. Nowadays it has a key role to play in helping the modernisation of education institutions and systems and in creating an open space for enhanced cooperation with the EU. It is also instrumental in promoting not only bilateral cooperation between individual countries but also co-operation at regional level (see Education, Audiovisual & Culture Executive Agency's – EACE – documents). Tempus funds two types of actions: *Joint Projects* and *Structural Measures*. The *Joint Projects* are partnership projects between higher education institutions in the EU and partner countries. They can develop, modernise and disseminate new curricula, teaching methods or materials, as well as boosting quality assurance and management of higher education institutions. Aim of *Structural Measures* is to develop and reform higher education institutions and systems in partner countries; to enhance their quality and relevance, and to increase convergence with EU developments.

Specifically, our experience refers to the project *Tempus LMPSM – Licence Master Psychologie Sociale Migrants*. The general objectives of this project are to promote the social psychology for providing support and integration for migrants; to provide professional orientation of educational programmes in psychological colleges/universities in order to develop quantitative and qualitative help to migrants. These aims are defined by the absence of social psychologists able to help migrant groups at breakneck speed to make up the need in human resources, conditioned by the new social

policy of each of the four regions liable to strong migration (Kazakhstan, Ukraine, Siberia and The Far East of Russia).

Starting from the basic elements of the TEMPUS programme, there are some questions on which, in our opinion, it is worth pondering. What does it mean to finance the modernisation of the university? How to create an area of co-operation in higher education? How to achieve this cooperation? What skills should be transferred?

Perhaps, it may be easier to answer these questions when referring to technical-scientific training, rather than when it refers to scientific-humanistic one. Whereas the international scientific community has already defined how to better operate, in the case of university scientific-humanistic courses there are some questions that remain still open. In addition to ethical issues, which we referred above, there is an epistemological question: As the humanities express the universal laws and how the theories of reference of the humanities are culturally situated? This question specifically involves some disciplines, such as sociology and psychology, because, as stated Mazzara [12], the relationship between cultural dynamics and the psychological processes constitutes one of the fundamental themes of the humanities, and specifically one of the areas most qualifying which provides a disciplinary definition of social psychology. Specifically, we agree that for social psychology the cultural approach should not be considered as a possible theoretical option or one of the possible fields of application, but as a constitutive aspect of this discipline. As the aim of social psychology is to study the intersection between the psychological and the social needs, conceptualizing the mind as a socio-cultural product is probably the most effective way to overcome the antinomy between the individual and society.

Consistently we need to ask how to act within a project of international cooperation in the field of education. An aspect that should be taken into account is that it is a partnership of equals with theoretical knowledge to be transferred between colleagues. However, those colleagues live and work in different social and cultural contexts (countries of Western Europe vs. Former Soviet countries, vs. Maghreb countries, and so on) and cultural and social dimensions are crucial elements always to be taken into consideration, in order to the collaboration being effective. This kind of cooperation can be effective and useful only if those who have the task of disseminating specific skills and knowledge offer their expertise and make it available to those who are recipients of the intervention. This means that an ecological approach is needed to “export” theoretical knowledge and practical skills. This is especially important when social workers must be trained or when the Bachelor’s degree programmes and/or Master’s degree programmes must be created, as these social workers and these graduates will carry out interventions in *their* social contexts. This does not mean denying the objectives that the Tempus programme wants to achieve (to enhance the interdisciplinarity and trans-disciplinarity), but rather thinking in terms of community development as it has been defined above, trying to integrate the aims and working methods of the international scientific community with the aims, needs and the specific working methods of the local communities. In this way, the local communities would take the role of real partners.

## AFRICAN CINEMA AS INSTRUMENT AND OPPORTUNITY IN INTER-ACADEMIC COOPERATION: A PROJECT IN NGOZI (BURUNDI)

Emanuela Gamberoni\*

\*Dipartimento Tempo, Spazio, Immagine, Società (TeSIS), University of Verona, Italy, [emanuela.gamberoni@univr.it](mailto:emanuela.gamberoni@univr.it)

### ABSTRACT

Since 2001, the University of Verona has been involved in an agreement with the University of Ngozi, North Burundi, foreseeing the participation of thirty-four Verona University professors in teaching activities in the Nursing course - Institute Universitaire des Sciences de la Santé (IUSS). In addition to this, in 2008 the Italian partnership financed the building of a didactic center composed of classrooms, library, informatics rooms and laboratories. In 2012, the spatial availability of this didactic center and the socio-cultural needs expressed by the students, led to the idea of organizing an African cinema festival. The most relevant objectives of this event are to promote awareness of the rich African film production in a context where there are no cinemas or, where present, are very expensive and to start a multipurpose use of the center not only for the students but also for the whole territory. To reach these aims a network among Burundian filmmakers, the organizers of the Festival de Film et du Audiovisuel du Burundi (FESTICAB), the students and the Rector of the University of Ngozi, the director of the IUSS, the organizers of the Festival del Cinema Africano of Verona and Belgian cinema experts, African students and professors of the University of Verona has been developed. The set of participants collaborates in verifying and sharing the available knowledge and the whole interaction process triggers changes in all members of the network and in their specific context. The open and shared methodological approach presents a particular value in the involvement of the Burundian students from the early stages of the films selection. This creates an important opportunity for dialogue among them on issues still difficult to deal with, because of the recent ethnic war and its consequences on communities and territory.

### CONTEXT OF ACTION

This paper deals with a new project stemming from a long-term established cooperation program between the Universities of Verona (Italy) and Ngozi (Burundi). For its peculiarity and aims, the project presented here is independent of the already existing cooperation program and may be considered as a co-managed attempt to start a cultural process that could benefit both society and territory<sup>1</sup>. The general purpose consists in promoting the use of the didactic center in Ngozi as a resource for the local community through a festival of the African cinema<sup>2</sup>.

Ngozi (population: 21,506 [1]) is the capital city of the homonymous province located in the North of Burundi, 140 km far from the capital Bujumbura. The province population in 2008 reached 661,310 inhabitants [1], 8.2% of the total Burundian population of 8,038,618 inhabitants [1]<sup>3</sup>. The region of Ngozi is 5.6% of the total country area (25,950 km<sup>2</sup>). The territory is a tableland with mean altitude of 1,700 meters above sea level. The economy is based on agriculture, particularly extensive cultivation of both coffee and tea.

Ngozi and Burundi are in conditions of poverty and poor quality of life, partly due to a long-lasting strong political instability. After gaining the independence in 1962, the country experienced recurring ethnical conflicts. The recent history is marked by a military coup d'état (1993) leading to another ethnic war that ended in 2005 with the elections of a new President, later re-elected in 2010<sup>4</sup>.

The country is in 178th place (out of 186) on the Human Development Index (HDI), meaning a very low human development rank [2]. It suffers particularly in the fields of health and education. The primary education is compulsory and free since 2008 and has made advances in the recent years [3].

The University of Ngozi was opened in 1999. It is composed of six Faculties (Agronomy, Economy and Law, Engineering, Informatics, Literature and Human Sciences, Medicine) and the Institute Universitaire des Sciences de la Santé (IUSS). Several courses started, although the problem was and still is the lack of professors. They usually are

<sup>1</sup> A detailed picture on these themes is provided by E. Bignante, E. Dansero and C. Scarpocchi, *Geografia e Cooperazione allo Sviluppo. Temi e prospettive per un approccio territoriale*, FrancoAngeli, Milano, 2008.

<sup>2</sup> The author of the present paper was involved from the beginning in the development of the project to pay attention to African territory and its cultural production – such as cinema – and to the relationship between space and local community, in a geographical perspective.

<sup>3</sup> The most recent estimate (July 2013) of total Burundian population is 10,888,321 ([www.cia.gov/library/publications/the-world-factbook/geos/by.html](http://www.cia.gov/library/publications/the-world-factbook/geos/by.html)).

<sup>4</sup> For an analysis of the interaction between Burundian institutions and ethnic conflict see: L. Ndikumana, *Institutional Failure and Ethnic Conflicts in Burundi*, *African Studies Review*, vol. 41, pp. 29-47, 1998.

non-Burundian and move among different universities to give their lessons, rendering the costs almost unbearable.

Moreover some courses remain without teachers and the quality of the whole didactic system is negatively affected. In 2001, the Rector of the University of Ngozi approached some European Medical Schools for a partnership in the realization of the Nursing course. The Verona Medical School answered positively and in 2003, following verification of the local conditions, an agreement was signed between the Universities of Ngozi and Verona. According to this agreement, each academic year, at scheduled time frames, approximately thirty to forty Verona professors visit the IUSS to give their courses and verify competences.

In 2008 a didactic center (Centre d'Etudes Medicales) was built, thanks to contributions of the Zanotto and Cariverona Foundations (Verona) in collaboration with the Italian partner. This didactic structure, provided with all necessary for attending lessons and learning, hosts the IUSS, which is entirely managed by Burundian people under the responsibility of the IUSS director. In the beginning, this center was not much frequented by the students except for the lessons. In the last two years their presence has increased a lot in the library and in the informatics room (the number of computers increased from 20 in 2009 to 70 in 2013) and now, students remain at the center until late in the evening (closing time is at 8 pm) and also during the weekends<sup>5</sup>. Meanwhile, they developed a need to use the center also for other purposes, not only for the study.

A context analysis led to the elaboration of a proposal on African cinema. There is an established practice, started in Fall 2011, to show a film every Friday, after the end of lessons, from 6 pm to 8 pm. A guy who collaborates in helping students in the informatics room organizes the "IUSS Friday cinema". The film selection is based on which DVD could be recovered at the moment, often very commercial ones. This event is also open to the town people and the audience is composed of both students and inhabitants. The need for a cinema is real for the following reasons: the only cinema in the country, the Ciné Caméo, is placed in the capital Bujumbura, in the Asiatic quarter, and screens all the latest blockbusters for 2,000 FBu (1 euro = 1,400 FBu)<sup>6</sup>. The film projections organized monthly by the Centre Culturel Français are proposed only in Bujumbura, too.

The situation of the cinema in Burundi (well known to be problematic in the whole Continent) is worse than that of other East African Community countries. For example Ruanda, which also faced an ethnic war, now has some cinemas both in the capital Kigali and in other towns like Butare and Gitarama. Moreover in Kigali a 3D multiplex cinema in a commercial center (Kigali City Tower) has been recently opened. Nevertheless, the ticket prices remain very high and unaffordable for the great part of the population.

The awareness of how cinema could be a cultural means, as well as much more, began to spread among Burundian society and institutions<sup>7</sup>. Cinema itself is a cultural wealth that should be endorsed by each country. However, in the rare cinemas of the African towns one could find mostly Western broadcastings and no local productions.

It can be noted that African cinema is often unavailable to Africans. African cinema production is very interesting as witnessed by several African cinema festivals occurring all over the world [4].

From 2009 Burundi as well has a cinematographic festival called Festival International du Cinema et de l'Audiovisuel du Burundi, FESTICAB, which is held in Bujumbura and headed by the film director Léonce Ngabo. The audience increased from 2,000 to approximately 20,000 spectators from the first to the last edition, respectively. During the FESTICAB, projections took place in centers such as the Centre Jeunes Kamenge, Institut Français du Burundi, Université du Burundi, Hotel Club du Lac Tanganyika, Cinema des Anges-Ruyigi, Alliance Française-Gitega and the Université de Ngozi. Here, five short and two full-length films were presented. The admittance was free of charge and the participation of the Ngozi population this year was very high (E. Gamberoni, personal communication), thus underlying the need felt by the whole citizenship for such initiatives. Among the activities related to the FESTICAB there is also the *cinéma mobile* that takes place in the surroundings of Bujumbura. However, the rest of the country lacks any of such initiatives.

A movie may contain several meanings and potentialities. It is a "life story [... and a] narration of an intense richness and cultural force" of the African continent [5]. In addition, the films are investigation fields from different points of view. A productive line of research addresses the relation between cinema and territory [6]. Movies were reported to be geographic documents, geographic agents and geographic narrations [7]. Being set in a territory, a film represents that place and highlights the relations between people and environment.

Finally, the meaning of territory is wider than that of landscape or setting, and finds its essence with the presence of the characters that exploit it, lived in it, use it and are continuously in contact/conflict with it [5-7]. The interesting topic of the geographic narration is that it does not only increase the knowledge of a territory, but helps in asking questions on the originality and uniqueness of the human presence, relations and actions in that geographic context [7].

Moreover, it is known that the use of films in education and training is now highly widespread [8-10] and it could promote therapeutic goals in psychotherapeutic treatments [11].

<sup>5</sup> In the academic year 2012/2013 the Ngozi University students are almost 2,000 and 12% of them attend courses at the IUSS.

<sup>6</sup> It is very expensive considering that a local worker daily salary is about 1,700 FBu.

<sup>7</sup> See: <http://africalia.be/coprodac/pays>.

## AIMS AND METHODOLOGICAL APPROACH

Considering the reasons given above, cinema could be involved as a positive force in the Burundian society that needs places and occasions for dialogue and exchange of opinions.

In this sense, the idea of organizing a festival of African cinema by the IUSS developed with the following specific aims: i) to increase the knowledge on the production of African cinema with relevance also on local Burundian activity, ii) to widen the functions of the didactic center not only as a place related to learning/studying/teaching but also as a socio-cultural place, iii) to give the students an opportunity to exchanging ideas and discussing themes considered still difficult to deal with in the current Burundian society, iv) to offer an opportunity of participating in a film festival to people not living in Bujumbura, thus rendering “central” what is peripheral.

The method used is participant-based and foresees the creation of a coordination network and the proposal of a films list (step 1), the selection of movies (step 2), the occurrence of the festival (step 3) and the results evaluation (step 4).

The films selection is one of the characterizing aspects of this project. In fact, the students identify a little group of them (the committee) with the task of assisting to all films listed, performing the choice and proposing the order of the movies to be presented at the festival. The discussion is centered on the following points: structure (figures of speech, use of the language), intrigue of the plot with questions/issues targeted, meaningful sequences, most interesting scene/character, significant messages and reasons for conveying them to all students.

Furthermore, this approach gives the special opportunity to the students of facing themes that are still awkward for the majority of the Burundian society. Peace and reconciliation are in fact compelling needs for the country, as underlined by the theme of the 5th edition (2013) of FESTICAB: *The Cinema at the Service of Peace and Development*.

There will also be a chance for some appointed students to guide the discussion during the festival and learn how to face a debate with a wide and heterogeneous audience having different ideas.

## WHAT HAPPENED: STEPS 1 AND 2

The project has already started at the beginning of the academic year 2012/2013. The first steps of the pathway - developed until now - are here presented.

### *Step 1: creation of a coordination network and of a films list (September-December 2012)*

At first, an interconnected network among various actors was created. It is composed by the *délégués*<sup>8</sup> of the students of Ngozi and some professors of Verona, the Rector of the University of Ngozi and the director of the IUSS, the African students of the School of Medicine that study in Verona, the Burundian and Belgian organizers of the FESTICAB and some Burundian film directors, in particular Léonce Ngabo, and the organizers of the Festival del Cinema Africano of Verona (fig. 1).

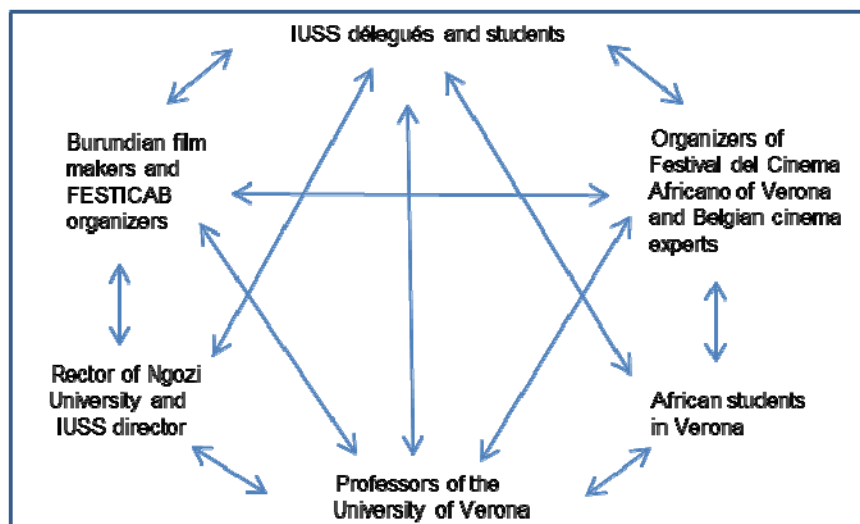

Fig. 1 - Network of the project's actors.

The peculiarity of this network is the strict interrelation and cooperation among the involved partners in each decision. Initially, a selection of possible films was discussed. Given the high production and the good quality of the

<sup>8</sup> The spokesmen for each class.

Sub-Saharan African cinema, the network decided to address the festival to it. However, one limitation was the language. Since English is still not known widely, the assortment was limited to those films that either speak French or, at least, carry subtitles in French. Eleven titles were thus identified, based on the following features to ensure variety: different genres, availability of retrieval, works known as outstanding in the Sub-Saharan francophone filmography, various issues of the most important African directors. Then, cards were prepared to document the richness and uniqueness of each film. It was particularly important and most welcome that Léonce Ngabo assured to present his masterpiece *La Mère et l'Ange* (2008) on the first woman who admitted to be HIV-positive in Burundi.

The network decided about the general organization of the festival: an opening ceremony with the Rector and Léonce Ngabo, dance and drum students groups, two weeks for showing six different films in total, a show every other day, in the afternoon in the lecture room of the didactic center. Some experts of African cinema will present the films and their consequences on society and territory; the students committee members will introduce and explain the reasons for the selection of the movies. On Sunday, in the big lecture room of the University, the event will be open for the entire town population.

### *Step 2: selection of movies (February 2013)*

The Verona professors that came to Ngozi in February 2013 to give their courses, jump-started the cinema project.

The students selected the committee for choosing and scheduling five titles among the eleven proposed.<sup>9</sup>

They analyzed the films in the afternoon each day after the lessons for approximately two weeks. After each movie, they discussed its theme, style and significance. The last was the most important topic from a territorial, social and psychological point of view, because it gave them the opportunity to talk about their lives, their families and their country, still difficult themes to deal with in the Burundian society, particularly among young generations.

At the end, there was a final meeting to discuss the five films selected and decide the order of presentation. The titles chosen and the sequence proposed were: *Le Ballon d'Or* (C. Doukouré, 1994), *Daratt* (M. S. Haroun, 2006), *Delwende* (S. P. Yameogo, 2005), *Bamako* (A. Sissako, 2006), *Africa Paradis* (S. Amoussou, 2006).

The motivations expressed by the students committee were very interesting, reflecting the needs of young generations of the local society, as already mentioned.

This is the final declaration of the students committee: “*Le Ballon d'Or* is a movie of hope and social redemption, it tells how dreams could come true. So it is a good choice to start the festival. Moreover it is cheerful, joyful and involves the game of football so loved by many young Burundians. The second choice is *Daratt*. It is a hard one and offers the opportunity to talk about revenge, hate, forgiveness and reconciliation. This film is very important for our growth and gives us the possibility to express our ideas after the dark years of ethnic war. If we do not start to talk about these issues and to forgive, we can't afford to take on the destinies of our country with peacefulness and responsibility. The third selected film is *Delwende* that deals with witchcraft from two points of view: the role of the woman and the related prejudices on one hand, and the ignorance due to lack of knowledge on the other hand. Then we choose *Bamako* that develops the interesting question on the role and responsibility of the international organizations in Africa. To conclude the film festival we propose *Africa Paradis*, an imaginary reversal of Africa and Europe relationship, an interesting challenge either for Africans or for their attitude towards Europeans. Its message is positive regarding the possibilities for Burundian young people to build a better country”.

## CONCLUSIONS AND PERSPECTIVES

The project is still in progress and the festival is scheduled for February 2014 (steps 3 and 4).

Up to now, some important results have been obtained: i) all Burundian partners have become first players in the project; ii) the response and participation of the students, especially those taking part in the committee, was high. Notably, the moment of the selection of the films for the festival turned out to be one of the original aspects of the project: open discussions on movies, on the plot and on the relapse on their own life, on their family and on the town, allowed students to talk and take position, to express opinions on issues considered taboo in Burundian society. The choice of a film may be seen as the first act of responsibility that overcomes ethnic and ideological barriers and could be considered as a sort of “training” in the growth of an individual belonging to a community. In addition, this activity enhances the African cinema for Africans by Africans; iii) the didactic center, built to host educational and didactic activities, will widen its areas of action to become a place for multipurpose use that serves the community of Ngozi in addition to being a resource for the exclusive use of the students. The cultural new side of the didactic center could be the starting point for other activities together with local associations for the benefit of the population<sup>10</sup>. This project in fact represents an opportunity for establishing new connections between places and groups (the latter distinguished by

<sup>9</sup> The committee is composed by eight students belonging to different classes, two of the first year, four of the second year, one of the third year and one of the fourth year. Some of them are the already assessed *délégués*.

<sup>10</sup> For example an interest was shown by a women association acting for the development of the conditions of youth and women, whose president is the director of the IUSS, Anne-Marie Boyayo.

age, gender, ethnic background etc.), in a society strongly marked by past conflicts. It may develop in the future beyond its core by opening interactions with other groups in Ngozi: associations, theatre companies, non-governmental organizations, structures bound to the missionary world or organizations acting in health and primary education fields.

The cooperation between Italian and Burundian Universities in this project is an undeniable chance to open and support the interaction among all the network students carrying multiple thoughts, feelings, needs and stories, mediated by their own background and by their possible migration experience. These aspects, regarding the main actors involved (i.e. the students), are also referred to all partners: the project is “the place” where ideas, stimuli and different opinions are shared. Thus, one of its peculiarities is the possibility of triggering changes in all members of the network and in their context.

## APPRECIATIVE INQUIRY IN SAINT MARTIN: EXPLORING THE POTENTIAL FOR CHANGE

Manuel Marrese\*

\*University of Trento, Italy, [manuel.marrese@studenti.unitn.it](mailto:manuel.marrese@studenti.unitn.it)

### ABSTRACT

The paper presents a participatory action-research carried out in Saint Martin CSA, a grass-root organization that operates around Nyahururu, Kenya in the field of social development. The research-method adopted is Appreciative Inquiry, a strength-based collaborative approach to organizational and societal change, which is used to explore the extent to which a participatory approach can promote empowerment in the community. Saint Martin is a grass-root organization that has embraced in full the participatory approach, as it clearly emerges from its motto “Only through community”, which points to the fact that any decision taken by Saint Martin is to be agreed upon within the community since it is the community who will take care of its implementation. In fact, community-based development is about giving the ownership of a project to people in the community, and that can only be possible if the community has taken part to the decision-making process. Too often that is not the case due to a development discourse that leaves the local people at the margins of the development process on the assumption that there is nothing they can contribute to. Appreciative Inquiry steps in the debate by promoting a radical paradigm shift, whereby the focus of the analysis is on strengths, rather than weaknesses, and the idea is that by investigating the moments when an organization or a community has achieved its best and work on those moments of excellence to build a positive image for the future better results can be achieved. Such approach is considered necessary in development practice since it appears to be a good strategy to involve local communities, having them contributing with their knowledge and expertise in the decision-making process, this way accelerating the process of change that ultimately leads to empowerment in the community and the promotion of sustainable development.

### RESEARCH QUESTION

The research explores the potential for change of participatory approaches to development and investigates the extent to which they succeed in being means of emancipation and contribute effectively to empower people in the community. The generative question guiding the inquiry during the field research in Saint Martin was the following: *how can a group of people get the best out of communities by inviting people to flourish, take care of others and contribute to the promotion of a society where talents are appreciated and empowered?* It is evident the link between the research question and the vision of Saint Martin, which is part of the reason why it has been chosen to be the case-study of the research. This question seeks to contribute to the debate about participation in development, by finding out when and how participatory approaches are successful in empowering people in the community.

The paper suggests to identify the potential for change of participatory approaches to development through the analysis of a case-study, Saint Martin, and the contribution that appreciative inquiry can offer to accelerate change. It first presents Saint Martin, exploring the extent to which the organization is able to truly involve people in the community in its decision-making process and activate the talents and resources on the ground in order to build together strategies of action for change. Then it looks at Appreciative Inquiry as a possible strategy to accelerate the process of change in Saint Martin and favor the kind of attitude that is deemed necessary for a truly participatory approach to unfold in order to empower the community and deliver sustainable development.

### SAINT MARTIN CSA

Saint Martin is a religious grass-root organization that engages people in the community in the elaboration of strategies of action to support vulnerable groups in the society. The organization is located in Nyahururu, a town two hundred kilometers north of Nairobi, while the majority of its activities takes place in the local communities in the surroundings. Saint Martin’s target area, in fact, covers a vast territory spread over three Counties, namely Nyandarua, Laikipia and Baringo, that despite neighboring each other have different profiles in terms of social, economic, cultural, traditional and demographic realities. The population of the three Counties settled in the area in the 1960’s from other parts of the country, thus being very heterogeneous, and diversity has largely been a source of conflict rather than of strength. At the moment Saint Martin is present on these territories with more than 1,300 volunteers at the community

level and about 100 volunteers at the management level; staff members are 85. Numbers give an immediate sense of the importance of volunteers in the organization, who are the ones who take the lead in initiating and implementing activities in the communities, and contribute through the decision-making process to bring the voice of the marginalized within the organization.

Over the years, Saint Martin has developed five community programs to address the major challenges emerging from vulnerable groups in the society. What is interesting to know about these programs is the approach developed by Saint Martin in order to carry out its activities in the community, which is radically different from the one of mainstream development agencies, and represents a peculiar characteristic of the organization. The programs deal with some of the basic needs of the area and are the following: Community Program for People with Disabilities, Community Program for Street and Needy Children, Community Program of Active Non Violence and Human Rights, Community Program of HIV/AIDS, Alcohol and Drug Abuse, Community Program for Savings and Microcredit. The programs of the organization are not something that emerged all at one time, but are the result of the encounters between people in Saint Martin and the community.

Another important characteristic of Saint Martin is the departments, which are there to support the programs in carrying out their activities. There is, for instance, a Training and Facilitation Department that is in charge of all trainings within the organization, ensuring that the approach is well understood by staff members and supporting them as they go out in the community and meet people to elaborate strategies of action for change. The number of volunteers has grown over time, as the approach of the organization got diffused throughout the target area, and now counts on a vast network of people who are to be considered the backbone of Saint Martin. The organization as well developed gradually, and its structure is constantly rethought and rearranged in order to better fit with the mission of the organization, that is about ensuring integral human development for all through community's full involvement and care for vulnerable groups of people. Saint Martin's approach is perhaps the most interesting and innovative aspect of the organization, which opens to possibilities for change and offers many insights as to how to proceed in the search for better strategies of action. It seems interesting to present a story and start from there to explore the characteristics of its approach.

"John, Kuria and Kamau are three orphans whose mother died of AIDS. They were left behind in a one-roomed grass-thatched house, built by the grandparents, which was in a sorry state. Kuria, who had just joined secondary school when his mother died, dropped out soon after for lack of school fees. Every day became a struggle to make sure there was something to eat. Wambui, a Saint Martin volunteer from the area, learned about the perils of the family and took up the case. She asked the local administration to convene a community meeting to discuss the plight of the orphans. With the help of Saint Martin social worker, she talked in this meeting about the need for solidarity and she moved the community into action. As a result, a fund-raising was organized and different resources were donated in the form of food, clothes, building material and money. A decent house was built for the orphans and Kuria's fees balance in school was cleared. The community also provided a piece of land and labor, which was supplemented with seed and fertilizer through Saint Martin and this ensured that the orphans would not go without food. Finally, the volunteer approached the school administration asking them to consider Kuria for school bursaries and to give him manual jobs during school holidays to supplement his school fees. The orphans have now become the responsibility of the community and are well provided and cared for. They are no longer in a desperate condition, because they know they have neighbors who care" [1].

This story points out some characteristics of Saint Martin's approach, which is particularly interesting for the attitude it proposes towards change: it is a rather slow process, that is centered on the active participation of the community which is seen as the real agent of change, the one to sit and find the way out of the pressing issues on the ground. Saint Martin is there to accompany the community in this process, facilitating the active involvement and mobilization of people; it works on existing talents and resources to build capacity and develop the potential for change that is there but often times finds no expression.

## **ONLY THROUGH COMMUNITY**

According to Saint Martin's approach, it is the members of the community the ones who take the lead in strategies of action for change. This represents the practical realization of the motto of the organization, *only through community*. Whatever the issue on the ground is, the way in which Saint Martin addresses it starts from an active engagement of the community; more on that, it is people in the community, most of the times community volunteers, that engage Saint Martin in issues and activities that are deemed necessary from their point of view. The identification of what is the pressing issue and what are the strategies to be put in place to address it comes from people in the community, with Saint Martin simply facilitating the process and nurturing the active engagement of people.

If it is the case of orphans of HIV/AIDS infected people, as in the case of the story briefly presented, first of all the very identification of the case comes from the community: there is already a degree of activation in bringing the issue to light and start evaluating the possible strategies of action. In situation like the one described Saint Martin stresses the need to address it as much as possible at the local level by involving everyone. The orphans are not the real focus of action for Saint Martin, which addresses primarily the other members of the community and works on them in order to

promote change by activating the resources on the ground. Solutions are always looked for in the community, and this represents a big difference from the mainstream understanding of development and social change.

The focus on the people in the community as the agents of change, directly engaged in the formulation of strategies of action, is premised on a strong belief that animates Saint Martin and puts it in close relationship with action research: it is the belief in the potentiality of people. Without a radical and profound conception of life grounded in the belief that people have the potential for change in themselves, which leads to question how to activate and unleash such potential, there can be no true and effective empowerment. Talents and resources are to be found first and foremost within the community: for people in Saint Martin this is a founding principle which entails the mobilization of local resources through the active engagement of all stakeholders to foster a slow, endogenous, thus sustainable process of change.

The story previously told is once again illuminating in pointing out how solutions must be looked for and can be found within the community: neighbors had the capacity to mobilize the necessary resources to give a future to those orphans who seemed to have little hope of survival. Building relationships of neighborhood, then, is something that no external donor can contribute for; as a matter of fact, what happens is that most of the time, by eradicating the problem and removing it from the community, outsiders are responsible of eroding those relationships of neighborhood. However, in this case it seems that an important aspect for the growth and development of these children is the very fact of having neighbors around who care and consider them part of the community, rather than apart from the community. The integral human development goes also through non-material aspects that an approach like Saint Martin's greatly considers, as opposed to others.

Another peculiar characteristic of Saint Martin's approach is well synthesized in the expression capacity-building, which represents the real essence of the organization and captures more than any other its mission. Saint Martin takes part to the process of change within local communities by identifying the potential strengths, talents and abilities on the ground and contributing to the development and growth of those strengths through trainings aimed at capacity-build people in the community. Trainings are implemented following the principles of adult education.

First of all, they are learner-centered: the starting point is the strengths, abilities and expertise of the learners, who are given full expression and become the point of departure to develop specific trainings based on the real needs of the group. Centering the activity on the personal experience of participants and begin by working on that has proved to be a much more effective strategy of learning. While traditional trainings are content-centered, having a one-direction information flow, participatory trainings emphasize a process of self-discovery, whereby the learner explores his/her own capacities matured through experience and develops abilities and skills to solve the issues that he/she is confronted with. The capacity-building process is completely centered on the learner, given the fact that in the end what really counts for a successful training is the learner's own motivation.

Saint Martin has adopted in full the participatory training method, realizing the potential for change that such approach gives compared to more traditional didactic methods. Its adoption represents a logical consequence derived from the assumption that people have within themselves the abilities, talents and resources to bring about change and it is working on those abilities that genuine processes of transformation can be put in place. These participatory trainings serve also as a way to establish a relationship with a group of people which can become the basis for didactic trainings, when they are needed. The point is that didactic and technical trainings cannot be the only way in which people are engaged, otherwise in the long-run they produce a gradual disempowerment of the community, which becomes more and more dependent on external assistance. What Saint Martin suggests is an attitude change concerning the kind of relationship to establish with people in the community. It is not denied the necessity to develop professional and technical skills, but these need to be located within a broader context where the central role is played by local communities. One way of doing it is by recognizing and appreciating the resources, expertise, abilities and talents that are present on the ground, and participatory trainings are an effective method to do so.

Furthermore Saint Martin's organizational structure is very interesting and innovative as well, demonstrating how participation is not only words on paper, but represents a concrete working practice. A real bottom-up approach needs to give the means and spaces for people to express and voice their concerns and desires, and take an active part within the decision-making process. Volunteers are in Saint Martin the backbone of the organization, the ones who take the lead in initiatives in the community, and therefore deserve to play an important role in the organization.

The decision-making process in Saint Martin sees a flow which moves from the community to the administration in a way that guarantees the active participation of people in the community. One communicative level is the one taking place between members of the community, community volunteers and staff from Saint Martin: these are the people who interact the most and know what are the challenges and pressing issues on the ground. It is among these people that the right attitude is necessary in order to make sure that the potentiality from the community emerges and is developed over time. Staff members have the important task of facilitating this process of self-discovery and growth, together with accompanying and nurturing transformation in the community.

Once such attitude is there, then it becomes easy to see how staff can act as the medium between the community and the organization to favor the information flow by which people come to collaborate to the decision-making process of Saint Martin. It seems necessary to highlight the fact that organizational modifications need always to be accompanied by an attitudinal predisposition, which guarantees that procedures effectively achieve results, so to avoid that become mere bureaucratic steps with no substance. This aspect is fully acknowledged by people working in Saint Martin, who know well the importance of continuous critical self-reflection as a way to keep track of where they are and how close they are to people in the community.

## HOW TO ACCELERATE CHANGE DYNAMICS?

It is interesting to see how new strategies can be developed to promote the kind of attitude previously mentioned and accelerate the process of change in order to be more effective and deliver better results. In this light appreciative inquiry is presented as a possible strategy to adopt in Saint Martin in order to find new and better ways of engaging the community. Saint Martin is valuable in its attempt to work on attitude change and the development of self-critical reflection as a way to promote change within people, starting from the staff members and moving out to the community: that is the way to take seriously the call to address people in the community as the real agents of change and organize the whole action plan around this powerful premise. To this extent appreciative inquiry is proposed as an innovative evolution in the field of participatory approaches to development for the beneficial effects it can produce in an organization like Saint Martin.

Appreciative inquiry could accelerate change dynamics by acting on the positive core of the organization and develop from there better strategies of action for change that engage more deeply people in the community. Appreciative inquiry is, in fact, first and foremost an approach that aims at stimulating change within communities and organizations by working on the way people come to understand and act upon reality. It is not so much about collecting information, but it is rather a form of inquiry mainly focused on stimulating people to see things in a different perspective: it could be argued that the real goal of appreciative inquiry is attitude change, through which people are invited to realize the potential they have and use it proactively to build strategies of action for change. It is therefore evident the beneficial effect that appreciative inquiry might generate in an organization like Saint Martin, since it seems to have the tools to act on it and bring about the kind of change that is needed in so to contribute to realize in full the vision and mission of the organization.

One of the major reasons why appreciative inquiry seems to be an effective strategy for Saint Martin and community development is to be found in the answer it gives to the challenges presented by mainstream development practices. It is well known the fact that the development discourse is still embedded in the belief that external agents and professionals are the ones entitled to investigate reality, identify the needs and formulate action plans to meet those needs. External donors are the ones who finance the process, which is set up in a totally deficit-based approach: that is to say, the action plan starts from the identification of what the problems are in a given community and moves to the formulation of the strategies to put in place to tackle those problems.

The long-term effects of this approach to development appear to be far less positive than expected. Focusing on what is missing and perpetrating the idea that solutions come from abroad are two of the major reasons that led the development project as a whole to fail. It did produce some results, and the most evident seems to be the disempowerment of people and communities, which have been left in a state of dependency and lack of confidence in their own capabilities. The development discourse has been seen by critical authors such as post-colonial thinkers as the continuation of the colonial project through different means [2]. Colonial or not, the development project has surely diminished the capacity of local people to activate and address autonomously the issues they were confronted with, mainly as a consequence of the dependency syndrome generated through the extensive use of external assistance. It is in order to answer such an approach to development and social change that appreciative inquiry steps in suggesting a radical paradigm shift and a viable alternative strategy of action.

## APPRECIATIVE INQUIRY: TAKING A POSITIVE STANCE TO RESEARCH

Appreciative inquiry is one approach within the family of action research and is here analyzed for its capacity to foster processes of change. It is grounded in an innovative understanding of change dynamics, and the way of engaging people in processes of transformation is also worth been analyzed for its promising results. The peculiar characteristic of appreciative inquiry in its strategy for change management is the constant exploration of what gives life to human systems when they function at their best. The underlying assumption guiding appreciative inquiry is that by revealing and bringing to light that positive core of strengths which people tend to keep hidden, underutilized, then the potential for change is unleashed and positive energy is released for both personal and organizational transformation. When the positive core is set in motion, then people are empowered to create ascending spirals of co-operative action [3].

Appreciative inquiry is first of all a peculiar form of inquiry: its original message is ‘an invitation to re-awaken a “spirit of inquiry” - a sense of wonder, curiosity and surprise - in our pursuits of knowledge creation about the social world’ [4]. The entire cycle of knowledge production and more broadly change management is to be guided by a sincere curiosity and sense of wonder about the possibilities for change that are present in any group of people. The positive stance taken by appreciative inquiry is then implemented by working on these strengths as a way to foster change. Within the field of action research, appreciative inquiry is an approach that explores alternative possibilities for our shared and organized existence, and it does so by instilling in participants the desire to see things anew, from a different perspective, in ways that inspire thought and action in the world. It is an asset-based approach, grounded in the belief that people have within themselves the strengths to achieve empowering ways of being in the world, and the kind of process suggested is one that investigates and develops the best of what is in organizations in order to promote social change.

Appreciative inquiry is primarily an answer to the deficit-based approach and it is grounded on a very different conception of social change according to which “organizations move toward what they study” [5]. If a group of people starts focusing on all the lacks and deficiencies that impede concrete change to take place, it is very likely that those analyses of what lacks will severely influence the possibilities for change, and compromise the ability of the people involved to achieve any kind of improvement. When the focus is put on the positive core and on what gives strength to an organization, then the strategies for change will emerge much more easily and produce positive effects on the people involved.

Organizational and societal change is looked at by appreciative inquiry in a radical different way from dominant development discourse. Instead of having problems as the focus of analysis, people first discover what is working particularly well in their organization or community; instead of analyzing possible causes of problems, they envision what it might be like if “the best of what is” occurred more frequently [6]. The desired future is something to be co-constructed by participants on the base of what already exists. Appreciative inquiry challenges the common assumption of problem-solving approaches that organizations improve when identify and remove their problems, and argues in favor of an approach where improvement is the result of a focus on strengths, capacities and abilities. As Banaga put it, ‘appreciative inquiry does not turn a blind eye on negative situations or deficit-oriented realities in organizations; it does not substitute a rosy and romantic picture for an objective and realistic one. It accepts these realities for what they are [...] and intentionally shifts the focus of the inquiry and intervention to those realities that are sources of vitality’ [7].

Appreciative inquiry represents within the broad spectrum of action research practices an attempt at “discovering, understanding and fostering innovations in social-organizational arrangements and processes” [8]. It is in line with social constructivism, and can be seen as a possible answer to Gergen’s daring invitation [9] to bring back to life the “generative capacity” of social science research, which regards the ability to challenge the status quo and open up new possibilities for thought and action. Generative theorizing, according to Gergen, opens to the possibility for social transformation, by ‘telling it as it might become’ rather than ‘telling it like it is’ [10]. Appreciative inquiry shares with action research the combination of research and action, inquiry and intervention, whereby knowledge is generated and immediately tested for its transformative potential. What it adds to this notion of action and reflection is the creative element, according to which knowledge can empower those to strive for change by generating a theory that is closer to a vision of the desired future than a representation of the existing; and this with the ultimate goal of overcoming reality and nurturing social change. Appreciative inquiry is then defined for its transformative and emancipatory intent, in the constant search for ways to activate people and unleash the potential for change.

The core principles and assumptions of appreciative inquiry have been clearly influenced by social constructivism. Based on that theory, and research studies from other fields, Cooperrider and others developed the following five core principles for the practice of appreciative inquiry [11]:

- *Constructivist Principle*. Related to the notion that multiple realities exist based on perceptions and shared understandings, this principle suggests that what is known about an organization and the organization’s actual destiny are interwoven.
- *Principle of Simultaneity*. Because reality is an evolving social construction, it is possible through inquiry to influence the reality an organization creates for itself. Inquiry and change are simultaneous and “inquiry is intervention”. Thus, the nature of the inquiry itself is critically important where the very first questions we ask set the stage for what people discover and learn and the way they co-construct their future.
- *Poetic Principle*. Because reality is a human construction, an organization is like an open book in which its story is being coauthored continually by its members and those who interact with them. Consequently, members are free to choose which part of the story to study or inquire about its problems and needs, or its moments of creativity and joy, or both.
- *Anticipatory Principle*. This principle postulates that the image an organization has of its future guides the organization’s current behavior. Thus, an organization’s positive images of its future will anticipate, or lead to, positive actions.
- *Positive Principle*. This principle arose from extensive experience with Appreciative Inquiry. Early Appreciative Inquiry practitioners found that the more positive the questions they asked were, the more engaged and excited participants were and the more successful and longer lasting the change effort was. This is in large part because human beings and organizations want to turn toward positive images that give them energy and nourish happiness.

Based on these principles, eight assumptions form the foundation for appreciative inquiry’s processes and methods [12]:

- In every society, organization, or group, something works.
- What we focus on becomes our reality.
- Reality is created in the moment, and there are multiple realities.
- The act of asking questions to an organization or group influences the group in some way.

- People have more confidence and comfort to journey to the future (the unknown) when they carry forward parts of the past (the known).
- If we carry parts of the past forward, they should be what is best about the past.
- It is important to value differences.
- The language we use creates our reality.

These principles and assumptions underlie both the philosophy of appreciative inquiry and the ways in which it is conducted. At this point it is interesting to conclude the journey into appreciative inquiry by looking at how it is conducted in practice, and the most common model for doing it is the 4-D cycle, which refers to the four steps to go through: 1) discovery of the best of what is, 2) dream to imagine what could be, 3) design what will be, and 4) destiny, to enact change learning to become what we most hope for.

The discovery phase seeks to find and highlight the life-generative moments of an organization, when people felt most engaged and motivated, ‘the best of what is’ at any given situation. Those moments are analyzed in order to promote learning within the organization by sharing stories about times when and how people were able to give their best, what were the contributing factors that made that possible. It is during this phase that the sense of wonder and curiosity comes forth, and it is essential to instill in people an attitude to look at their own situation anew, and to develop a sort of positive thinking related to the past experiences that can guide for future actions.

The second phase entails the dream about what could be. The identification of the most positive past experiences inevitably leads to think about the future in a renewed way, and imagine new possibilities for the way ahead. One important element of appreciative inquiry is that in this phase the dream is rooted in the past experience, from which it takes the lead, and is not just wishful thinking about how people would like to see their future. The dream phase serves to practice that invitation to generative theorizing whereby a group of people imagines a desired future that tells how things could and should be.

The third phase is to design the future, and make the abstract formulation of the dream phase closer to the ground, by exemplifying the strategy to follow in order to achieve the goals set in the previous phase. In fact, once the desires and hopes have been articulated, it is necessary to find out what are the social and organizational adjustments that can help bringing the dream to life. It is a future built on dialogue among the parties, where the common mobilization to achieve the goals set in the dream phase are the premise for a future action plan.

The fourth and final phase, destiny, represents the way in which the action plan takes form in practice. It needs to be understood in the most innovative and creative way possible, where the only important element to keep in mind is the active engagement of people that struggle to move closer to the ideal: how to do it is not prescribed in any manual. The confidence in achieving the goals is given by the fact that they are grounded in past experience and moments of excellence. It is this important element of appreciative inquiry, which matches a visionary aspect with a very concrete basis that makes it a compelling and innovative strategy to bring about transformation by challenging the status quo and grounding change in viable strategies of action.

## **CONCLUSION: IMPACT, SUSTAINABILITY AND THE POTENTIAL FOR CHANGE**

In the concluding remarks Saint Martin and appreciative inquiry are brought back together in order to address the extent to which appreciative inquiry can contribute to promote the kind of attitude that is deemed necessary to achieve sustainable development and social change. The contribution of appreciative inquiry to Saint Martin, and to participatory approaches to development, is to be seen primarily as a radical answer to what Elliott defines “the culture of cynicism” [13]. It is a different way of referring to the problem-oriented attitude towards reality that is so much overwhelming in the development discourse. Saint Martin is to a certain extent affected by this problem-oriented attitude, which impedes the unfolding of that alternative approach put forward in the vision and mission of the organization.

One could find many arguments to support the idea that every situation is surrounded by limits of any kind; when the context is that of a village in the periphery of an African country, and the people are affected by a disability or HIV infection, then it is also easier to put forward the limits and give reasons for hopelessness and despair. On a different ground, there is plenty of elements to show how structures of power are there to limit the potential for change at any given moment, by infringing in people’s freedom to voice concerns and formulate plans for the future. If one asks to raise the positive in such a context, most of the times he or she is confronted with a reality that abound of problems and power constraints of any kind.

It is exactly there that appreciative inquiry steps in, suggesting an unconditional focus on the positive as the only possible way to promote social change and achieve sustainable development. It does so by challenging the prevailing culture of cynicism primarily because it brings about a destructive attitude that becomes self-feeding and self-justifying. Reporting the existence of structures of power that impede the expression and activation of marginalized groups as the reason why it is not possible to envision a process of change is a self-realizing prophecy: challenges and structures of power are not justified by their very existence and it is the purpose of appreciative inquiry, and whichever attempts at bringing about change, to challenge such ideas. If one stops at the existing as everything that is possible and denies the possibility for alternative ways of being in the world, then it is evident that realizing change is nothing more than

wishful thinking. Appreciative inquiry embraces in full the call of social constructivism for generative theory and the need to move beyond the existing for new and better ways of being in the world.

Similarly, the questions of impact and sustainability are convincingly addressed by the participatory approaches to development presented in this paper. It can be argued, in fact, that when people are effectively engaged in the construction of strategies of action for change, then the question of sustainability is immediately addressed by the very simple fact that people participate. Participation, in fact, can be seen as the answer to the question of sustainability, insofar as it is a true and effective form of participation. Saint Martin is to this extent an outstanding example of how an organization can engage a community in an endogenous process of change, by working on the resources and talents on the ground to bring about change and promote sustainable development. The question of impact can as well be addressed within the framework of a truly participatory approach: in fact, when people are the real agents of change, driving the process, then the question of impact becomes to a certain extent less relevant. If it is people that have decided over their own future, then the impact of their actions is everything that the community could have achieved, and if it is a lot or a little, that is all that could have been done at that given moment.

In conclusion, it is my strong belief that as long as organizations like Saint Martin will continue in the ongoing search for new and better strategies of being in the world, and accompany communities in this process by making use of practices such as action research and appreciative inquiry, then there is a lot to expect from participatory approaches to development as to the potential for change they can offer for empowerment and emancipation.

### ABSTRACT

The paper addresses the problem of cooperation in the field of community psychology, focusing especially on the intervention in communities affected by the consequences of traumatic events. It starts from some reflections on the meaning of community intervention, focusing on critical approaches and in particular on Latin American contributions, which emphasize the need for an active role of the community in a process of participated action research. It is then introduced the theme of trauma and the paper highlights the differences between possible approaches to work on it: especially those that depend on the choice of relying on the idea of "resilience" rather than on that of "vulnerability" or the choice to intervene only on the individual trauma rather than face even their collective effects. Eventually the role of memory is taken into consideration; its reconstruction, through a narrative approach, is seen as a fundamental process for maintaining the identity and reconstructing the meaning of the personal as well as collective tragic experiences. Finally, some considerations are made on the conditions that make possible a work of this kind as part of a cooperation program involving external researchers, along with key members of the community.

### INTRODUCCIÓN

Esta ponencia deriva de una experiencia de intervención en psicología comunitaria que estamos llevando a cabo desde hace algunos años con la Asociación "Psicologi nel Mondo - Torino" (Psicólogos en el Mundo), a través de un programa de colaboración entre la Universidad Politécnica de Turín y la Universidad Luterana Salvadoreña, en una comunidad rural de El Salvador, Santa Marta, especialmente afectada por las consecuencias de la guerra civil de 1980-1992. Este artículo, sin embargo, no se refiere directamente a la intervención que se está desarrollando en ese contexto específico, sino sugiere algunas consideraciones de carácter más general, que también tengan en cuenta otras experiencias y reflexiones teóricas sobre el significado del trabajo del trauma de la guerra en los programas de cooperación, y sobre todo los que consideran la elaboración de la memoria y de los recuerdos – a nivel individual y colectivo – como una parte esencial de un proyecto de investigación y acción enfocado en el desarrollo comunitario.

Por lo tanto, el artículo comienza con un análisis de las posibles concepciones del trabajo psicológico de comunidad en el marco de la cooperación, con el fin de concentrarse luego en el tema del trauma y de sus consecuencias a nivel individual y colectivo. La intervención sobre el trauma implica la necesidad de abordar la reconstrucción de la memoria colectiva y sus vínculos con los recuerdos que reflejan las vivencias de cada persona. Esto se explica en la parte final del artículo, que también lleva a una reflexión sobre las condiciones en las que este trabajo se puede lograr, y destaca la necesidad de una atención constante a los procesos de transferencia y contratransferencia.

### DESARROLLO DE COMUNIDAD Y PSICOLOGÍA

Como es bien conocido, la psicología comunitaria es un campo de estudio de origen relativamente reciente [1]; no obstante, es posible identificar diferentes direcciones, que se distinguen no sólo por la interpretación ofrecida por algunos conceptos de base, sino también por la función atribuida a la intervención psicológica. En este artículo vamos a poner especial atención a las interpretaciones críticas de la psicología comunitaria, y en especial a las que están más presentes en el ámbito de América Latina.

En los programas de investigación y las acciones que se inspiran en estas interpretaciones está destacado notablemente el hecho de que la comunidad no puede ser concebida como un mero lugar donde se lleva a cabo una serie de actividades sobre temas psicológicos o psicosociales, o como un área de influencia donde se puede localizar a los "beneficiarios" de una intervención. Por tanto, la comunidad no es sólo un marco genérico, o el objeto de un proyecto, sino es ante todo un verdadero sujeto de la intervención misma. "Esto supone una característica, la primera y primordial, la esencial de la psicología comunitaria: lo comunitario incluye el *rol activo de la comunidad, su participación*. Y no sólo como invitada, o como espectadora aceptada o receptora de beneficios, sino como agente activo con voz, voto y veto" [2]. Esto no eclipsa el rol de los psicólogos, ni la distinción de su papel del de otros sujetos,

ni tampoco la importancia de la metodología y las técnicas de intervención que son típicas de la disciplina psicológica. La tarea de los expertos, sin embargo, es básicamente la de un catalizador de procesos, y se debe actuar mediante la estimulación de los recursos y la misma energía que la comunidad y a tiene y, cuando sea necesario, favoreciendo la adquisición de nuevos recursos y el desarrollo de nuevas habilidades, a través de un proceso que parte de la comunidad y cuyos efectos recaen sobre ella [3].

En el último cuarto del siglo pasado, en América Latina se han desarrollado tres diferentes escuelas de pensamiento en el contexto de la psicología social. Ellas sugieren visiones distintas acerca de qué hacer, cómo hacerlo y cómo pensarse el contexto de la psicología, a partir de los desafíos que enfrenta el continente en ese período de la historia y tratando de responder a los problemas que se refieren a cada país. Según Montero [2], estas son la Psicología Social Comunitaria, la Psicología Social Crítica y la Psicología Social de la Liberación. La principal fuente de inspiración de este último, Martín Baró, el jesuita español asesinado en 1989 por escuadrones de la muerte durante la guerra civil en El Salvador, sostiene que la psicología siempre ha sido clara acerca de la liberación personal, es decir, la necesidad de que las personas adquieran control sobre sus vidas y sean capaces de orientar su propia vida hacia los objetivos que se propongan como importantes, sin mecanismos inconscientes o experiencias conscientes que les impidan alcanzar sus metas existenciales y felicidad personal. Por el contrario, hasta ahora se ha expresado de una manera mucho menos clara, en "la íntima relación entre desalienación personal y desalienación social, entre control individual y poder colectivo, entre liberación de cada persona y la liberación de su todo un pueblo. Más aún, con frecuencia la Psicología ha contribuido a oscurecer la relación entre enajenación personal y opresión social, como si la patología de las personas fuera algo ajeno a la historia y a la sociedad y como si el sentido de los trastornos comportamentales se agotara en el plan individual" [4] (p. 26). Entonces, la psicología de la liberación debe adoptar una nueva perspectiva y una nueva práctica. Desde la nueva perspectiva es necesario ponerse en el lugar de las personas con problemas más graves, por lo que no debe hacerse una psicología "para", sino una psicología "con" y "desde el punto de vista de" estas personas y de los grupos sociales a los cuales pertenecen. Obviamente, esto no significa necesariamente alejarse de las teorías y paradigmas anteriores, sino relativizarlos y revisarlos críticamente.

En nuestra opinión, estas referencias conceptuales pueden tener un papel fundamental en el trabajo comunitario en el marco de la cooperación universitaria, aunque, por supuesto, deben ser reinterpretadas cada vez teniendo en cuenta las necesidades del contexto espacio-temporal y cultural en lo que se está trabajando. La cooperación universitaria, en particular, implica al mismo tiempo de comprometerse en la investigación y la acción, pero ni la una ni la otra pueden dar resultados positivos para el desarrollo de una comunidad si esta no está disponible para participar activamente en el proceso, favoreciendo no solo la movilización de su propia capacidad de obrar, sino también de los conocimientos que posee. Por otro lado, sino sucede esta hibridación entre el conocimiento a disposición de todas las partes cooperantes, apenas la realización de un proyecto podrá contribuir de manera importante en el desarrollo de la ciencia misma, por lo menos en un ámbito como la psicología de comunidad, en el cual la investigación no puede limitarse a la consideración de los contextos en los que se ejerce como campo de aplicación de teorías generales, sino que debe ser capaz de entenderlos en su especificidad y contribuir a su transformación.

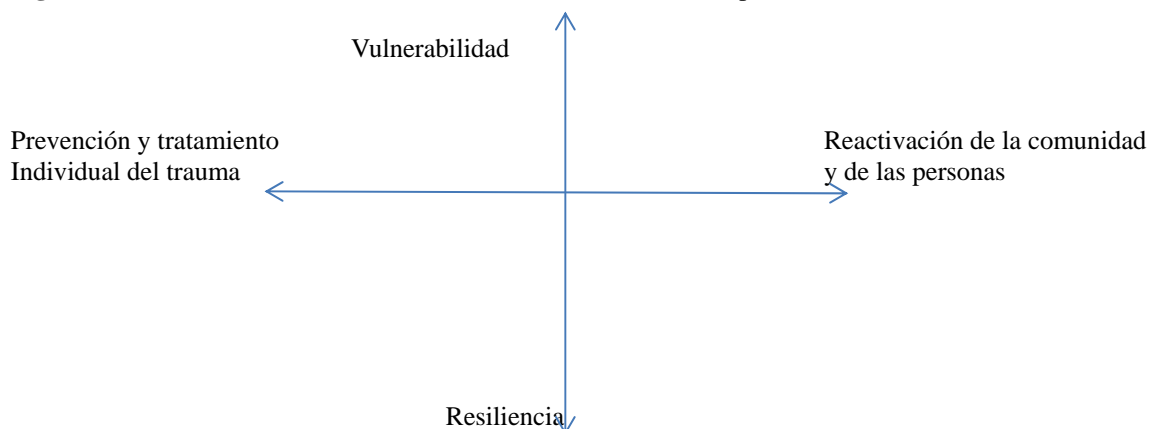

## TRAUMA Y RESILIENCIA

En muchos aspectos, las consideraciones anteriores se hacen a ún más importantes cuando la cooperación involucra un área afectada por acontecimientos traumáticos que pueden tener consecuencias durante un largo período sobre el individuo y la comunidad misma, tales como desastres naturales, conflictos sociales, guerras, dictaduras violentas. Después de los eventos de esta naturaleza a menudo se activan, en contextos que han sido afectados, proyectos de cooperación internacional que, en muchos casos, también incluyen la dimensión psico-social. Estos proyectos pueden ser activados en la fase de emergencia (por ejemplo, en campos de refugiados, de acuerdo con la lógica de las líneas definidas por el Comité Permanente entre Organismos IASC), o en una etapa posterior, a menudo en dirección a personas o grupos especialmente afectados por los acontecimientos. Más raramente operan después de mucho tiempo, es decir, en una etapa en la que el legado de los hechos (y el mismo trauma) puede ser transmitido a través de las generaciones, entrelazándose con varios factores que influyen en el desarrollo de la comunidad sin tener ninguna relación con aquellos eventos negativos.

Los proyectos en cuestión se distinguen, - así como en relación con la distancia temporal de los acontecimientos y por supuesto la naturaleza de éstos, el contexto socio-político, el contexto espacial y cultural en el que se llevaron a cabo - también por el enfoque que siguen. A este respecto, por razones de síntesis que imponen una fuerte esquematización de un marco de posibilidad es mucho más articulado, podríamos proponer una clasificación de los enfoques basada en un doble eje. El primer eje se refiere a la finalidad de la intervención y distingue las dirigidas únicamente a los sujetos individuales - cuya lógica esencial es la prevención en una etapa temprana o el posterior tratamiento del trauma - de las destinadas a la reactivación de las comunidades afectadas y, en su interior, de los sujetos más expuestos a un trauma. Un segundo eje se refiere a los enfoques conceptuales de la intervención y distingue los que ponen al centro la idea de "vulnerabilidad" de los que se basan en la de "resiliencia". En el primer caso, el proyecto sirve para cubrir el déficit de la comunidad, trabajando sólo hacia las personas más vulnerables; en el segundo caso, se supone que la comunidad cuenta con recursos para hacer frente a sus propios problemas: por lo tanto, es necesaria la identificación de estos recursos para fortalecerlos y activarlos.

En la intersección de los dos ejes se forman cuatro cuadrantes, que corresponden a diferentes modelos ideales de la intervención, es decir diferentes modos de referencia a la psicología de comunidad y de relación entre la cooperación y la comunidad afectada (ver fig. 1).

**Fig. 1** – Modelos ideales de intervención en comunidades afectadas por eventos traumáticos.

El cuadrante en la parte superior izquierda se refiere a enfoques centrados únicamente en la determinación de los sujetos que se consideran particularmente vulnerables y en la aplicación a los mismos de los modelos de intervención para prevenir o tratar los síntomas relacionados con los efectos de un trauma (TEPT), tales como los incluidos en las clasificaciones recientemente reformuladas en el DSM V. En este enfoque, la dimensión comunitaria está ausente, mientras que la relación entre cooperantes y "beneficiarios" se inspira en la que prevalece en el campo bio-médico y no requiere otro que la aceptación de una terapia (por ejemplo, el método EMDR o los de inspiración conductista).

En el cuadrante inferior izquierdo entra en juego la idea de la resiliencia, pero sólo en la dimensión individual. Las personas objeto de la intervención, en este caso, son vistas como sujetos activos, con características que promueven la transformación adaptativa. Necesita basarse en estas características, para fortalecerlas y romper los factores de bloqueo que impiden que se expresen. También en este modelo de intervención la relación entre la cooperación y las partes interesadas se basa en la que se pone entre el médico y el paciente; sin embargo centrar la atención en la identificación de factores de resiliencia, como la autoestima, la capacidad de adaptación, el sentido de la pertenencia, valores y creencias, no permite de separar claramente la dimensión individual de la relacional, comunitaria y socio-cultural.

En el cuadrante superior derecho la dimensión comunitaria se considera de manera explícita, pero la intervención sigue interesada principalmente en los sujetos (individuales o colectivos) con vulnerabilidad más fuerte - como las mujeres víctimas de violaciones sistemáticas, los huérfanos, los niños soldados, los discapacitados, los grupos minoritarios víctimas de violencia - y tiene el propósito de proporcionarles un apoyo que mitigue el déficit. En cualquier caso, en este enfoque es imposible no tener en cuenta las reacciones activas del entorno social en el respeto de dichos sujetos o grupos (por ejemplo, la voluntad de superar las razones de estigmatización en contra de tipos particulares de víctimas) y, por lo tanto, la cooperación no puede hacer menos de relacionarse con la comunidad misma.

Por último, en el cuadrante inferior derecho el trabajo sobre las consecuencias de los acontecimientos potencialmente traumáticos está diseñado como una actividad de investigación y acción que se realizará en el marco de una relación conjunta entre la comunidad y los voluntarios; pero esta condición no impide - sino que implica - una diferenciación en los papeles de las dos partes, así como la presencia de distintas funciones dentro de la misma comunidad. El objetivo es la elaboración del trauma a través del fortalecimiento de la capacidad de resiliencia y empoderamiento (individual, de grupo, colectivo), como parte de un proyecto global de desarrollo comunitario que, por otra parte, no excluye la posibilidad de centrarse más específicamente en los sujetos más desfavorecidos, fomentando su activación e inclusión en una red de relaciones comunitarias. También se excluye cualquier posible distinción entre "cooperantes" y "beneficiarios" por lo que se refiere a los resultados del proyecto: estos se consideran de interés común, tanto en términos de crecimiento del conocimiento, como en la experimentación de líneas de acción.

## MEMORIA COLECTIVA Y TRAUMA

En las páginas siguientes, vamos a discutir algunas cuestiones más específicas desde la perspectiva del último cuadrante. Esto es, de hecho, el enfoque que estamos tratando de seguir en la intervención de la psicología comunitaria que estamos haciendo en Santa Marta. Cabe señalar, sin embargo, que este enfoque requiere condiciones de arranque que no se pueden encontrar en cualquier contexto: necesita que exista un acuerdo con la comunidad - o por lo menos con algunos miembros importantes - para que el trabajo sobre el trauma pueda ser hecho de forma participativa. Si no se dan estas condiciones, independientemente de las opciones culturales de los cooperantes es posible que sea útil trabajar sobre el trauma de acuerdo a otras perspectivas.

En cualquier caso, cuando se actúa con una comunidad que sufre los efectos de un trauma, un aspecto esencial es el trabajo sobre la memoria, tanto individual como colectiva. La memoria colectiva es un objeto de estudio interdisciplinario que involucra muchos campos de las ciencias sociales: en particular, la sociología, la psicología, los estudios culturales e históricos. Para proporcionar una definición concisa, se podría decir que se trata de un conocimiento compartido ampliamente - dentro de un grupo, una comunidad o una sociedad nacional entera - de sucesos pasados que no se han experimentado solo de manera individual, sino que también han sido reconstruidos a través de funciones de comunicación social [5]. Este procesamiento, así como el almacenamiento o el reprocesamiento posterior, se lleva a cabo a través de múltiples canales que pueden tener diferentes grados de institucionalización y formalización.

El desarrollo de una memoria colectiva ampliamente compartida y reflejada en los relatos de diferentes tipos (de los de la reconstrucción histórica hasta aquellos que se expresan en la vida cotidiana y en presentaciones fuera de la comunidad) tiene un papel esencial en el mantenimiento de una identidad comunitaria, así como para la elaboración de las memorias individuales de los trágicos acontecimientos que experimentaron los individuos o sus familias. En este sentido juega un papel importante para la salud mental de los individuos y de la comunidad en su conjunto. Sin embargo, la creación de una memoria colectiva implica una selección de los eventos que necesita recordar o también olvidar [6], así como su organización en una secuencia que les confiere un sentido [7].

Este proceso no está exento de elementos de tensión y conflicto, ni al interior de la comunidad misma, ni tampoco en relación con el contexto más amplio en el que la comunidad está incluida. Esto depende del hecho de que la memoria colectiva no sólo da importancia y estructura al pasado, sino que también lo conecta a los problemas actuales; por lo tanto, además de un valor de identidad tiene inevitablemente también un valor social y político porque favorece la reproducción o, al contrario, la transformación de jerarquías y relaciones de poder entre los individuos o los grupos sociales.

Esto es particularmente cierto cuando se trata de la memoria de la guerra o la opresión de la dictadura, en todos los casos en que sea posible - a pesar de todas las complejidades y ambigüedades que siempre acompañan a cada evento como estos - establecer una distinción entre víctimas y responsables de los eventos. Por parte de las víctimas, la memoria y el reconocimiento del sufrimiento implica la capacidad de expresar la propia experiencia, cuya negación es una negación de la identidad personal y colectiva. Por parte de los autores de la violencia, el olvido (a menudo presentado como un requisito de la pacificación) es esencial con el fin de ocultar sus responsabilidades y mantener una posición de poder.

Pero incluso para las víctimas puede ser difícil de participar en la construcción de la memoria colectiva y, sobre todo, construir un puente, en la narración, entre su propia experiencia y la colectiva. De hecho, la experiencia traumática produce efectos de "sideración", de desestructuración psíquica y devastación de los puntos de referencia del sujeto, que implican la incapacidad para salir de la percepción de la imposibilidad de comunicarlo que se ha sufrido y dar un sentido a esos hechos de manera que puedan conectarse a la vida presente, y también la dificultad para salir de una memoria basada únicamente en la repetición obsesiva y retraumatizante de esos eventos. Y estos efectos se reflejan a nivel comunitario en la ruptura de los lazos relacionales entre sujetos y en la dificultad en el diseñar un posible futuro juntos. Además, tienden a convertir la experiencia en un doloroso secreto que hace difíciles las relaciones familiares y prolonga los efectos del trauma también hacia la próxima generación. A partir de las ideas de Freud, en el psicoanálisis han sido especialmente las investigaciones de Abraham y Torok sobre el duelo, la "cripta" y el "fantasma" [8] que han llamado la atención sobre la transmisión del trauma en la familia, especialmente en la relación entre padres e hijos. Las situaciones de la vida que no han podido ser procesadas siguen siendo una fuente de sufrimiento mental: en lugar de ser incorporadas por el mecanismo de la introyección y armoniosamente integradas en la personalidad, se enquistan en "criptas" psíquicas, que mantienen su propia existencia condenada a un secreto que también afecta la esfera de las relaciones afectivas más estrechas.

Por estarazón, en muchas experiencias de trabajo en contextos afectados por guerras y conflictos violentos se ha hecho un trabajo de apoyo psicosocial [9] [10], que muchas veces se enfoca en la reconstrucción de la memoria colectiva a través de la narración de las vivencias del sufrimiento. Como veremos, hay diferentes métodos para realizar esta tarea; en especial en las intervenciones destinadas a la reconstrucción de las relaciones comunitarias este trabajo se lleva a cabo en pequeños grupos, acompañados de uno o más psicólogos que faciliten la actividad de narración y ayuden a las personas a expresarse en formas que no dan lugar a una reaparición del trauma.

## EL PAPEL DE LA COOPERACIÓN

¿Bajo qué condiciones y con qué límites puede ser eficaz, en estas situaciones, un trabajo sobre la memoria desde la perspectiva de una intervención de la psicología comunitaria, llevado a cabo en un marco que moviliza a expertos de otros países? Una respuesta general a esta pregunta es difícil porque - a pesar de las similitudes - cada situación tiene una fuerte especificidad y también porque, en lo que concierne a nosotros, nuestra experiencia se enfoca de manera directa sobre un solo contexto.

Sin embargo, se puede desarrollar aquí algunas reflexiones basadas en esta experiencia que, como se ha mencionado, se refiere a un apoyo para la elaboración de un trauma de la guerra civil, como parte de un trabajo comunitario que

también involucra a muchas otras áreas de intervención (por ejemplo, sobre las relaciones mamás-bebés, la condición de los niños con necesidades especiales, la inclusión en el ámbito escolar, la prevención de la violencia juvenil).

Un primer aspecto se refiere precisamente a esta pluralidad de áreas de trabajo: nos parece importante que la demanda de apoyo en los temas del trauma de la guerra se haya manifestado en el contexto de una relación de cooperación con objetivos diferentes y complementarios, que pueden resumirse en la idea de un desarrollo de la comunidad, que incluya la dimensión del bienestar psicológico y de la salud mental. Una relación que ya ha creado lazos de confianza, la reflexión y la acción conjunta, sobre todo con algunos de los líderes de la comunidad y con los trabajadores más cercanos a los problemas de salud mental.

Nos parece significativo que por parte de estos líderes y trabajadores ha surgido por la primera vez la idea de realizar un trabajo de grupo, basado en la narración y la escucha de sus vivencias durante la guerra; entonces con ellos empezamos los grupos haciendo uso de un método definido sobre la base de la literatura relevante, pero adaptado a las condiciones concretas del contexto. Ahora esta actividad se ha desarrollado con otros grupos y también incluye la participación activa de dos estudiantes salvadoreños de pregrado en psicología y una colaboración con el IDHUCA (Instituto de Derechos Humanos de la Universidad Centroamericana José Simeón Cañas de San Salvador), que participan en la recolección de pruebas de crímenes de guerra, en vista de la reunión de un Tribunal de Justicia Restaurativa.

Una segunda cuestión se refiere a la necesidad de realizar un trabajo como este con una atención constante a la dinámica de la transferencia y, lo más importante, de la contratransferencia, es decir, las reacciones de los investigadores / cooperantes frente a la comunidad y las personas que forman parte de esta. De hecho, la dinámica de la contratransferencia no concierne sólo la relación entre analista y paciente, sino como fue demostrado por Devereux [11] - abarcando el campo de las ciencias sociales. En el caso de la investigación - acción sobre los temas del trauma de guerra esta dinámica implica diferentes aspectos de las reacciones de los cooperantes frente a la comunidad, a saber: 1) los que dependen de la identidad de cada investigador singular y están vinculados a su personalidad y su historia, 2) los que se refieren a la identidad colectiva de los investigadores, a los sistemas de referencia cultural y social de la cooperación, y 3) los que están relacionados con la teoría e ideología [12].

Cada uno de estos aspectos merece ser objeto de una reflexión constante por parte de los investigadores. En parte, esto se puede hacer a través de la misma discusión en el grupo de trabajo y de la relación con algunas de las figuras clave de la comunidad; en parte, también deberíamos equivar la intervención de expertos que desempeñan un papel de supervisión, a un mejor si estos expertos no sólo provienen del entorno cultural de los investigadores, sino también de las universidades más cercanas a la propia comunidad. El carácter de la cooperación interuniversitaria puede facilitar este tipo de relación.

Una tercera cuestión concierne el propósito y la metodología de los grupos de narración. En las experiencias llevadas a cabo a nivel internacional existen varios métodos: la elección de uno de ellos depende de las condiciones en que el trabajo de la narración se desarrolla, las opciones culturales de los investigadores y de los mismos modelos ideales de intervención que se ha discutido anteriormente. Por ejemplo, uno de los métodos que se utilizan con mayor frecuencia en los casos en que la intervención se centra únicamente en los sujetos individuales y propone para reducir rápidamente la presencia de los síntomas de estrés post-traumático, la "terapia de exposición narrativa" [13], u otros métodos que recaen en el contexto de los enfoques conductual-cognitivos. Otros trabajos se acercan al método de la terapia narrativa de M. White y D. Epston, de inspiración constructivista, que tiene como objetivo la reestructuración de las construcciones de las personas sobre su experiencia para facilitarle otras más útiles [14]. También existen métodos de psicoterapia de grupo de orientación psicoanalítica. Esta metodología consiste en trabajar con grupos de personas con experiencias similares, lo que les permite reelaborar sus experiencias traumáticas, a partir no sólo de sus propias interpretaciones, sino también de las llevadas a cabo por otras personas del grupo [15]. También hay experiencias en las que el trabajo de narración en grupo es realizado por un equipo que incluye a expertos de diversas especialidades [16]. De todos modos, la psicoterapia de grupo ha demostrado ser eficaz en víctimas de trauma también porque uno de los principales efectos que puede producir la reestructuración de las relaciones interpersonales, que han sido afectadas por el trauma.

Nuestro enfoque tiende a acercarse a este modo de actuar. Nuestro trabajo, de hecho, no se sitúa en una situación de emergencia ni es sólo enfocado en la rehabilitación sobre el daño psicológico que la violencia ha provocado en las personas. Se encuentra, más bien, desde una perspectiva psicosocial, que parte de una situación afectada por el trauma de la guerra para ayudar a superar los efectos que bloquean las relaciones interpersonales y comunitarias. El objetivo es involucrar a la comunidad en un proceso de crecimiento colectivo, en el que incluso cada persona pueda encontrar su propio papel activo.

## CONCLUSIONES

Las reflexiones llevadas a cabo muestran que, en el caso de una intervención realizada con una distancia de los acontecimientos potenciales causantes de traumas, el trabajo del trauma no se puede separar de un compromiso más general para apoyar el desarrollo de la comunidad. Esto implica un programa de investigación y acción, donde es

esencial crear un estrecho vínculo entre investigadores / trabajadores de ayuda humanitaria y la propia comunidad, que de este modo viene a asumir un papel activo y no sólo el de destinatario de la intervención.

También significa que el propósito del proyecto es estimular los recursos a escala individual y comunitaria, para fomentar la dinámica de un fortalecimiento cada vez mayor de la resiliencia, en lugar de centrarse únicamente en el cuidado de los sujetos más vulnerables, considerándolos implícitamente como un “objetivo” separado del resto de la comunidad. El marco de la cooperación universitaria, con el establecimiento de relaciones de intercambio entre investigadores extranjeros, expertos locales y la comunidad misma, puede crear condiciones favorables para un proyecto de este tipo, siempre que exista una atención constante a la dinámica de la contratransferencia en toda su complejidad.

## PLANS AND PROJECTS “BEYOND THE BOUNDARIES”: SUBJECTS, KNOWLEDGE AND TOOLS

Daniela De Leo\*

\*Sapienza University of Rome, Italy - [daniela.deleo@uniroma1.it](mailto:daniela.deleo@uniroma1.it)

This panel proposed a disciplinary look at theoretical reflections and case studies useful to think about the role of the universities according to the specific perspectives of urban planning courses and curricula within the decentralized cooperation initiatives around the world. The focus is based on changes in knowledge and skills “required to” and “produced by” the universities, within a large numbers of international experiences, where researchers are more “service providers” or a kind of “problem solver” (on demand) rather than subjects able to develop a supportive expert knowledge to do better in the cities and territories beyond the national boundaries. In fact, in a context of fewer resources available, a lot of Italian universities have been involved within international cooperation projects, but with a very low ability to reflect on practices and translate these experiences in common knowledge to better carry out our work as planners (reading, interpreting and regulation of urban and territorial transformations) in fragile contexts (or in developing or emerging regions as well). Thus, the panel has been configured as a space to present and discuss researches and studies in order to enhance and connect projects and theoretical reflections on:

- interventions in the international arena, in which specific experts skills were able to support processes and projects helpful to regain a more appropriate role in society and in the public debate;
- strengthening the framework of the knowledge and skills of the Italian schools of planning resulting from the comparison and/or contamination with international experience also to reshape the national formative offers.

Therefore, the aim is to verify the ability to deal with the internationalization of the practices and training that pass through the decentralized cooperation projects, by coming to terms with the continuous redefinition – within the practices – of the “disciplinary boundaries” and the professionalisms.

### THE GENERAL FRAMEWORK

Within a conference that has been focused on the discussion of the relationship between international cooperation and Universities, according to the different perspectives offered by the different panels, our panel has been defined as a challenging question on what we define the characteristics of the schools and the knowledge of the “Italian urban planning” involved in international initiatives and projects and, in particular, those of cooperation for/to the development. The aim it has been to explore and put under observation the role of planning as an opportunity to act reconfiguration of the development, of the cultural heritage, and more in general, the improving the quality of life in cities and territories.

The proposed and discussed ideas are located into a perspective that argues the need and the opportunity to try to restore the centrality of power and the technical components within the public institutions, looking with some suspicion to the international cooperation 'as a profession', and, therefore, critically observing the action of international agencies or NGOs specializing in this activities.

In fact, often with more financial resources and a focus full-time on this or that area compare to the Universities, the NGOs or International Agencies, by their own nature and mission, frequently tend to favour instead of deal with the roots of the more relevant issues. Even so, inevitably, the resolution of concrete problems would undermine, in a sense, the very reasons for their existence in life and their professionalism.

The Universities, however, according to their different goals and objectives, have the opportunity to play a positive role in terms of training and, most importantly, of sharing of research tools and appropriate response to the specific context. Moreover the Universities also have an interest in maintaining relations of exchange and interaction of long-term, but also to expand and accumulate situated knowledge and experimentations.

In this sense, the cooperation projects may be more appropriately used to let us know and, therefore, make known, even neighbouring areas “unknown”, obscured by a system of cultural hegemony and domination by the media, mirroring the strong existing asymmetries of power, and, therefore, inevitably influential on the persistence of the condition of discomfort, isolation and subordination. In addition, the enormous amount of scattered projects, often without an examination of the real needs and without any form of coordination among different donors, with the simultaneous arrival of large amounts of money, put the political and the technical component into an often opportunistic condition, which threatens to take away their sense of commitment and accountability towards public affairs.

In many parts of the world, the mass of projects with no results and no measurable effects, despite the money

invested – according to the well-known law of the evaluation on the “efficiency of expenditure” and not on the “effectiveness of the results” – tends to amplify, at the end, the feeling of uncertainty, in particular, those of the local planners and their difficulty to imagine and shape the future in their “space”.

Even considering that, as it has been said it is actually much easier for international cooperation to provide support in terms of humanitarian aid, rather than instruments of regulation or for the strengthening of institutions (despite the abundance of funded institutional capacity building projects), it contributes, not rarely, to the reproduction of dangerous processes of de-politicization of the questions, making in fact, the project target, “the people” declassified (maximum) to the role of victims.

The comparisons with the experiences and reflections proposed highlighted the importance of the international project to:

- the engage with the community of practice, starting from inside the institutions;
- the development of a way of thinking and acting jointly, between exterior and interior, strongly anchored to the local level;
- a critical approach to the theories of planning for the most optimal use in their practices;
- a simultaneous attention to training and parallel adaptation and development of the research agenda informed of the work context.

At the same time, it is perhaps possible to consider the opportunity of working within the experiences of this kind also in order to understand how to adapt, develop and make better use of our tools of the trade “at home”, even in situations more difficult and extreme.

These reflections, in fact, offer us the opportunity to understand, from a different perspective, such as our work and our commitment can be useful, since it allowing us to orient the direction and redefining new priorities in research agendas.

## CONTRIBUTIONS

The panel has been organized to discuss two main focuses:

- a) educational training, research and roles of urban planners;
- b) tools and policies for the development of techniques, resources and social actors.

Contributions came from the Universities of Trento, Florence, Camerino and Rome. In particular, Alberti, Bindo, Gialanella's paper presents the results of an exploratory investigation into the relationships International cooperation in the European Universities with other foreign countries.

Roberta Nicchia's paper describes that, in the last ten years, the University of Trento has been involved in a decentralized cooperation programme that promotes cultural, technical and administrative exchange between the Provinces of Trento and Sofala, Mozambique. The contribution focuses on the spatial planning activity in Mozambican rural towns, resulting from the cooperation of the different actors belonging to the programme. The focus is on the introduction of culturally-compatible changes and, therefore, on the full involvement of the population in the decision-making process.

From the University of Florence, Loda and Tartaglia's paper illustrates the results of the collaborative relationship between the University of Florence and the University, the Department for Urban Development and the Municipal Council of Herat, aimed at the formulation of a new strategic Masterplan (SMP) for the city of Herat. In particular the paper illustrates the systematic programme of analysis undertaken to construct an updated information base on current socio-demographic and territorial situation of the urban area, and some findings testifying the deep changes that have been taking place in the last decades. Moreover, the paper offers with a more detailed description of the analysis process and the proposed strategic actions about the transportation urban system.

Pierantoni, Camaioni and Sargolini's paper explained that UNICAM has developed a system to support the decision-making process through the definition of a valuation model tested on seven regions: the Autonomous Province of South Tyrol, National Park Gesäuse region Mostviertel (Austria), District of Maramures (Romania), Region of Kosice (Slovakia), North Hungary (Hungary), District of Rzeszow (Poland). The model plays with three roles: 1) critical analysis of the transport model in place; 2) critical analysis of the status and potential of the territories; 3) project of new scenarios for a more sustainable transport system.

Again, from the Sapienza University, the Montella's paper analyses the results of the report and identifies the role of the MUST-Millennium University Studio Team and the role of the University of Sapienza University within a specific project of international cooperation, proposing an open debate on the ranking of Italian universities at a time of economic crisis and cuts the funds of international cooperation. The essay examines the activity of the High Level Course on the Millennium Development Goals, with particular attention to the third edition of the courses taken as the final result, an analysis report on a cooperation project between UN-HABITAT and Homa Bay, a small town on the Kenyan shores of Lake Victoria.

And, moreover, the Scacchi paper reflect on the Habana Vieja, the largest historic centre of colonial type stored in Latin America and even today retains its traditional urban footprint, harmonious juxtaposition of different architectural styles, Declared by UNESCO “World Heritage” in 1982. Through this paper she analyse the work of recovering the historical centre of Habana, officially launched in 1994 through the Master Plan entrusted “Historian of the Oficina de la Ciudad de La Habana” with the Spanish Agency for International Cooperation, the Government Local, universities and associations for international cooperation. Twenty years after the start of this project is to assess whether it was put into play an effective movement of regeneration, having produced processes of participation and human resource development and economic premises, or if the risk was to be alone “staged” for tourists, rearranging some houses and central services attractive major, “just as they once were” only to recall nostalgically the past and recreate “typical situations”, imposed by mass tourism.

## CONCLUSIONS

The papers and the discussion helped us to reflect on the specific role and contribution that we can provide as Italian scholars, teachers, planners, especially in a general widening of the boundaries of our activities, but also considering the wider basin of provenance of our students from all around the world.

In particular, the different experiences have provided some guidance on “how” the Italian planning practices can say something to the rest of the world. Not as “success stories *tout court*” or formalized mechanisms to export “to colonize the world” within an exhaustive list of given questions and answers, but as special skill, often artisan, to be able “to do well despite everything”, to work on rough ridges keeping open the reflection on their own limitations rather than on its own merits and solid certainties.

In this sense, the utility of the Italian experiences would lie more in the general attitude into a “critical exercise”, rather than in the “translation” of “given answers”. Providing, in this way, an operational contribution versus the spread provision of “manuals” with the usual neo-colonial approaches: problems at the South, and solutions from the North.

But, of course, to activate this important changing, we should begin to do not disperse the stories and feedbacks on the work we are developing around the world, giving us the opportunity for discussion and debate to expand our schools, while we are trying to make a contribution to their schools, to their territories and in their institutions.

## UNA EXPLORACIÓN DE LOS CURRÍCULOS DE LAS ESCUELAS EUROPEAS DE PLANEAMIENTO EN EL ÁMBITO DE LA PLANIFICACIÓN DESCENTRALIZADA

### ABSTRACT

Esta ponencia quiere presentar los primeros resultados de un trabajo de investigación exploratorio sobre las relaciones de cooperación internacional en las universidades europeas con países extranjeros. Se ha querido estudiar en detalle las actividades fomentadas en este sentido por las escuelas de regional and urban planning. Se ha utilizado la lista de Universidades que mantienen relaciones con la Facultad de Arquitectura de la "Sapienza" a través del programa Erasmus para realizar una selección preliminar. A partir de la información publicada en las páginas webs de estas universidades, se escogieron las que se han mostrado especialmente activas en favorecer experiencias de cooperación, y sobre estas se ha desarrollado un trabajo de investigación más detallado. La metodología utilizada ha requerido una exploración más escrupulosa de las experiencias propuestas, a través de la interacción directa con las escuelas seleccionadas (solicitud de más informaciones y envío de encuestas). El análisis se ha desarrollado a partir de varias preguntas de investigación: ¿Cuáles han sido las modalidades privilegiadas de intercambio? (¿Estudio teórico? ¿Workshop? ¿Proyecto?) ¿En qué momento de la carrera se proponen? (¿En los últimos cursos? ¿En los primeros? ¿En asignaturas obligatorias u optativas?) ¿Cómo se estructura la colaboración entre países? En esta ponencia se presentará el trabajo de sistematización de las informaciones sobre las principales experiencias de cooperación en las escuelas europeas de planning, pero cabe señalar que el objetivo final de la investigación será comprender si es posible reproducir dichas experiencias las en la formación básica del planner.

### MARCO TEORICO

Para hacer frente a un panorama laboral cada vez más globalizado y orientado hacia la internacionalización, la capacidad profesional necesaria hoy en día, tanto en el ámbito laboral como en el científico, parece necesitar de un enfoque basado en la observación de las diferentes áreas geopolíticas y en la interpretación del escenario global. Varios institutos, escuela y universidades en los últimos años han trabajado para añadir conocimiento de las principales tendencias políticas y económicas que tienen lugar en contextos internacionales, facilitando extremadamente el intercambio cultural y la colaboración entre especialistas y estudiantes de diferentes disciplinas. Muestra de ello son los muchos programas que fomentan el intercambio y la movilidad internacional, surgidos principalmente de acuerdos institucionales de cooperación entre países europeos y del extranjero.

La intención de investigar acerca de la formación que en este campo se ofrece en las universidades europeas surgió de la observación de estas dinámicas, y de la constatación de la necesidad de fortalecer la competencia de algunas figuras profesionales que están llamadas a trabajar en un contexto internacional. Esta investigación permitirá conocer las posibilidades de proporcionar en la educación universitaria herramientas útiles para afrontar contextos internacionales tanto en la actividad profesional como en la investigadora.

En particular, se decidió indagar acerca de la formación del planner europeo, que parece necesitar cada vez más de nuevas habilidades, métodos y herramientas para garantizar un enfoque proyectual adecuado a contextos internacionales. Se puede deducir, en efecto, que además de la formación básica de un planner serían necesarias asignaturas adicionales dirigidas a introducir al alumno en el trabajo en el extranjero.

La universidad parece tener la responsabilidad inicial en la formación del planner europeo, que necesita de nuevas herramientas y capacidades cada vez más dirigidas hacia un panorama que va más allá de su lugar de procedencia. De hecho, en las escuelas de arquitectura en Europa asumen cada vez más relevancia los proyectos desarrollados en ámbito internacional, hasta estructurar master y cursos de postgrado que incluyen en sus programas actividades de intercambio y planificación en países extranjeros.

Se observa en los últimos años una atención especial a la creación de asignaturas que tienen como objetivo el conocimiento y la comprensión de los escenarios internacionales, tanto de los países en desarrollo, de los emergentes y de los desarrollados. Esta orientación nos lleva a reflexionar sobre la utilidad que este enfoque podría tener para que la formación del planner sea más completa, ya que de esta manera se ve obligado a desarrollar capacidades críticas y de acción en contextos distintos al suyo, donde necesita diferentes herramientas y modos de intervención.

Si en la formación del planner tiene tanta relevancia esta orientación internacional, ¿por qué no estructurar también

los programas de grado con este enfoque? ¿Por qué no introducir dentro de los planes de estudio asignaturas específicas que traten el tema de la internacionalización directamente en los proyectos?

La investigación realizada se mueve en la intención de encontrar elementos que ayuden a reflexionar sobre la figura del planner en un ámbito internacional y cómo se provee su formación en las universidades europeas.

## OBJETIVOS

La Universidad se puede considerar a todos los efectos el lugar donde empieza la formación del planner, el lugar donde el estudiante puede desarrollar sus propias capacidades y aprender nuevos conocimientos que le permitan confrontarse con las exigencias del mundo laboral. Por otra parte, hoy en día, el mundo del trabajo, cada vez más globalizado, pone al planner más a menudo en la situación de enfrentarse con realidades territoriales muy diferentes de las de su país de procedencia y/o de formación.

A partir de este escenario, en este artículo se presentan los primeros resultados de una investigación que quiere reflexionar sobre el papel que las universidades, tal y como están estructuradas hoy en día, tienen en preparar al planner para esta emergente demanda laboral. Con este objetivo se ha analizado la estructura de la oferta académica en las escuelas de planificación urbana y territorial en Europa para destacar principalmente el siguiente par de aspectos.

El primer aspecto se refiere a la naturaleza del intercambio. En este sentido la investigación trata de entender cuando se prefieren experiencias de corta duración (como por ejemplo los workshop) y cuando, por el contrario, el intercambio es parte integrante de una asignatura cuatrimestral o anual. También se analiza si se propone una experiencia proyectual o solo se llega a un conocimiento teórico. Además se distingue entre que estas experiencias estén estructuradas dentro de los planes de estudio o se propongan como optativas fuera de la oferta académica obligatoria. En este sentido resulta importante analizar, además, en qué momento del plan de estudios se proponen estas experiencias de intercambio. Para completar el marco cognitivo se quiere conocer también cuáles son los temas que normalmente son objeto de estudio en estas experiencias.

El segundo aspecto analizado se refiere a la naturaleza institucional del intercambio. A través de la investigación propuesta en este artículo se quieren identificar los países que proponen más experiencias de intercambio dentro del plan de estudio. El análisis quiere también identificar los canales que más a menudo se activan para poder realizar el intercambio a la hora de estructurar la colaboración con una universidad extra-europea. En concreto se quiere estudiar si existen proyectos de intercambio estructurados o sólo se proponen experiencias aisladas. El objetivo de esta fase de análisis es delinear la naturaleza del intercambio, poniendo el énfasis sobre todo en la identificación de los actores y de las instituciones más sensibles a las experiencias de cooperación y de intercambio con países fuera de la Unión Europea.

## METODOLOGÍA

La investigación se llevó a cabo a nivel europeo, mediante la selección de las escuelas de planificación que se mostraron ser particularmente activas en la promoción de intercambios internacionales.

Para una primera selección de Universidades, se ha tenido en cuenta la lista de las universidades que, en el año académico 2012/2013, han firmado el programa Erasmus con la facultad de Arquitectura de la Universidad "Sapienza" de Roma. Se decidió empezar por las universidades que participan al programa Erasmus porque creemos que el hecho de firmar lo que puede considerarse como el programa de intercambio por excelencia en el ámbito de la enseñanza universitaria europea, puede considerarse una señal de apertura a los intercambios internacionales. Además, esta investigación comienza por la Facultad de Arquitectura porque, por lo menos en Italia, es el principal centro de formación de los planners del futuro. Para fases sucesivas de la investigación, podría ser interesante analizar también las experiencias llevadas a cabo en las facultades de geografía o asignaturas experimentales de economía y planificación.

El objetivo final de esta investigación es conocer las experiencias realizadas en distintos países de la Unión Europea para ayudar a mejorar la formación de los planners y que pueden ser reproducidas en los planes de estudio de las universidades, especialmente de las italianas de las que forma parte este grupo de investigación. Por esta razón, para esta primera fase de trabajo no se ha incluido el estudio de la situación en Italia, centrándose primero en el análisis de los mecanismos que favorecen las experiencias de cooperación internacional en las universidades de los otros países europeos.

### Investigación preliminar y selección de las escuelas de planning

La exploración de las actividades de cooperación internacional dentro de los planes de estudio de las universidades europeas se ha llevado a cabo a través de tres fases de investigación.

A través de la primera fase han sido seleccionadas, entre las escuelas de arquitectura en la lista, aquellas donde la formación del arquitecto se inclina hacia la dimensión urbana y territorial más que en los aspectos tecnológicos, constructivos y de diseño. Este primer estudio se llevó a cabo exclusivamente con la información disponible en las páginas web de las universidades.

Después de seleccionar las escuelas que pueden ser consideradas como responsables de la formación de los planners

Europeos, se ha empezado por el análisis detallado de los planes de estudio ofrecidos. En esta fase, hemos tratado de averiguar el interés de algunas universidades sobre los países exteriores a Europa. Se ha intentado examinar si la familiaridad histórica y cultural (véase, por ejemplo, las antiguas colonias) o de idioma facilita las relaciones entre países europeos y extra-europeos. Este trabajo ha sido necesario para descubrir el perfil de los países que prestan más atención a la formación de sus estudiantes desde un punto de vista internacional. En el estudio de las experiencias propuestas también se ha hecho una primera distinción entre preparación teórica y práctica, llevando a cabo un análisis detallado de aquellas donde efectivamente se ponga el estudiante en las condiciones de experimentar lo que significa hacer proyectos en contextos fuera de Europa. También se han estudiado las páginas web de las oficinas de las “Relaciones Internacionales” de las universidades, para obtener informaciones sobre la posible ubicación de dichas experiencias en un proyecto de internacionalización.

En la tercera fase de investigación se han seleccionados cuatro países europeos que han mostrado una mayor apertura a la cooperación internacional con países fuera de Europa: Francia, Alemania, Portugal y España. Después de haber esbozado sumariamente el perfil de las experiencias propuestas en estos países (a través del estudio de los documentos disponibles en la red) se decidió utilizar las encuestas para obtener más informaciones de las experiencias más interesantes.

### Encuestas

Los cuestionarios utilizados para la recogida de información sobre la experiencia de cooperación internacional se han estructurado de acuerdo a la información inicial obtenida en la fase anterior de investigación.

El cuestionario ha sido estructurado para que fuera posible recoger informaciones tanto sobre el tipo de contactos que llevaron a la colaboración entre las dos partes, como sobre el tipo de actividades previstas en el intercambio.

Respecto al primer asunto se ha querido averiguar si las actividades de cooperación surgen de contactos personales o institucionales, y además si la voluntad de intercambio y apertura al exterior depende de los docentes o de acuerdos entre las universidades.

En cuanto al análisis detallado de las actividades previstas en el intercambio se ha tratado de esbozar el tipo de actividad propuesta a los estudiantes, teniendo en cuenta por un lado la relevancia que se da a este tipo de experiencia en los planes de estudio y, por otro, el tipo de conocimientos y experiencias que se consideran como fundamentales para la formación como planner.

Se enviaron cuestionarios a todos los representantes de las actividades de intercambio con países no europeos propuestas en las universidades seleccionadas previamente en Francia, Alemania, España y Portugal. Se decidió consultar directamente los responsables de las asignaturas o workshop con el fin de obtener, de esta manera, la información más específica posible sobre las experiencias seleccionadas.

Se consideró la opción de recoger información adicional sobre las experiencias activadas contactando directamente con los responsables de las áreas internacionales o de cooperación de varias universidades. Sin embargo, este camino ha sido abandonado para esta primera fase dado que en algunas universidades la oficina para la internacionalización es responsable solo de los intercambios Erasmus, mientras que en otras se hace referencia en general a la posibilidad para los estudiantes de hacer prácticas externas de trabajo en el extranjero. Ambas situaciones salen de la oferta académica en las universidades que es el marco donde se quiere mover esta investigación.

## RESULTADOS

Los resultados obtenidos se presentan divididos en dos fases: por un lado la “investigación cognitiva”, basada en el análisis de los programas publicados por las universidades y por otro lado las respuestas a los cuestionarios enviados a los respectivos responsables. Esta segunda fase, pese a que aún no haya producido resultados significativos, consideramos que merece ser explicada con el fin de comenzar a esbozar las líneas futuras de la investigación.

La primera parte de la investigación sirvió para entender cómo la internacionalización es tratada por parte de la oferta educativa. Se observaron varias fórmulas para entrenar al alumno en la labor de realizar proyectos de planificación urbana en el extranjero. Una primera fórmula es facilitar la experiencia de un análisis comparativo internacional mediante, principalmente, la concesión de ayudas y subvenciones para abordar el período de estudio en el extranjero, particularmente para la realización de tesis. Otro caso sería la organización de asignaturas de acuerdo con la especialización de la carrera. En algunos casos, de hecho, se tratan de programas de grado que explícitamente se ocupan de la cooperación internacional al introducir la posibilidad de realizar proyectos en el extranjero. En estos casos, las facultades organizan proyectos, workshop, seminarios dentro del plan de estudios. En particular se organizan workshops los que se propone un proyecto de arquitectura y planeamiento en ubicaciones fuera del país de origen de los alumnos de manera que estos deben realizar estudios específicos previos y recabar las características culturales a través de la estancia directa en el país de acogida. Se prevé, en estos casos, un período de una o más semanas de estudio en el extranjero, preferiblemente en colaboración con la universidad de acogida aprovechando las estructuras que ésta ofrece. Estas experiencias normalmente terminan con la elaboración de un proyecto, que en algunos casos se publican en la prensa o en las páginas web de los departamentos.

Los resultados hasta ahora encontrados llevan a poner de relieve el empeño general e institucional para la

internacionalización de las carreras, aunque, específicamente en los cursos de arquitectura, la decisión de internacionalizar su orientación (salvo casos excepcionales) sigue siendo opcional. El análisis de la formación del planner hasta el momento parece sugerir un escenario poco homogéneo, variando en función de las decisiones tomadas por las distintas escuelas de arquitectura o las personales de cada estudiante.

**Francia**

En Francia se examinaron 16 universidades, de las cuales dos fueron descartadas por estar especializadas respectivamente en diseño y restauración. De otras cuatro no ha sido posible obtener información sobre sus planes de estudio. De las diez escuelas de arquitectura que quedaron, en ocho se encontró cierto interés por la dimensión internacional de la educación teniendo en cuenta que se ofrecen asignaturas (teóricas y/o proyecto) o workshop donde es posible confrontarse con el extranjero. Centrándose sólo en los intercambios de carácter proyectual con países no europeos, se ha llevado a cabo un estudio exhaustivo de cinco universidades<sup>1</sup>.

Las experiencias de proyectos de cooperación internacional examinadas fueron más de 20, casi todas propuestas entre el cuarto y el quinto año de la carrera. Casi todas están incluidas en el plan de estudios, pero se puede argumentar razonablemente que la información sobre workshop y otras experiencias extracurriculares no incluidas en el plan de estudios es más difícil de encontrar en la red. Algunas universidades ofrecen en los últimos dos años de estudio una especialización completamente dedicada a proyectos y planificación más allá de sus fronteras. En Versalles también es posible lograr la doble titulación franco-china en arquitectura.

De hecho, los intercambios con los Países asiáticos, parecen ser especialmente fomentados en las universidades francesas. Cinco asignaturas proponen intercambios con China y Japón, dos con ciudades de India y dos con ciudades de Camboya y Tailandia. Como se puede ver en la siguiente tabla se detectan otros intercambios con ciudades de América Latina (3), con Palestina (1) Uzbekistán (1) y Marrueco (1). En general, podemos ver que hay una tendencia a establecer relaciones sobre todo con los países emergentes o en desarrollo.

**Tab. 1 – Países involucrados en intercambios internacionales con las universidades francesas examinadas.**

Países involucrados	Numero de intercambios
INDIA	2
AMERICA LATINA	3
ASIA	5
CAMBOYA - SiemReap	1
TAILANDIA - Bangkok	1
PALESTINA	1
MARRUECOS - Casablanca	1
UZBEKISTAN - Tachkent	1
Indefinidos	2

A partir de las descripciones de las asignaturas consultadas en internet se ha observado que la fórmula más frecuente que se propone es la de un viaje de inspección en el país donde se propone el proyecto al comienzo de la asignatura (el periodo de la estancia es variable y no siempre se expresa) mientras que el desarrollo del proyecto propuesto casi siempre se lleva a cabo en la universidad de origen. Sólo en casos raros se fomentan periodos más largos de tiempo en el extranjero y que el intercambio sea bilateral.

Para la segunda fase de la investigación, el envío de cuestionarios, de las más de 20 asignaturas y workshop examinados se ha podido establecer contacto con doce representantes. Por desgracia, y probablemente debido al periodo en que se realizó la investigación (cerca de las vacaciones de verano), contestaron únicamente 4 representantes<sup>2</sup>. De las respuestas recibidas a través de los cuestionarios se observó que los promotores del intercambio provienen tanto de las universidades francesas como de las extranjeras. La iniciativa, casi siempre (3 respuestas de 4), parte de un programa universitario ya estructurado y con financiación. La experimentación en los proyectos se lleva a cabo tanto en el campo de la arquitectura como en el de la planificación urbana, y, en cualquier caso, dentro de los dos últimos años de la carrera. Las experiencias de intercambio para los cuatro casos analizados implican dos semanas de estancia en el extranjero durante el semestre académico. Sólo en el caso del intercambio entre Versalles y Kyoto el acuerdo es bilateral, y se prevé una estancia de cuatro semanas de los estudiantes japoneses en Francia (dos semanas de proyectos y dos de viajes). Gracias a las respuestas obtenidas, se puede decir que las experiencias de intercambio están bien consolidadas: se desarrollan desde hace varios años<sup>3</sup> y, en general, se espera que se realicen también en el próximo curso académico.

Como conclusión del análisis hasta aquí desarrollado se puede decir que las facultades de arquitectura francesas parecen estar particularmente atentas a la formación de sus estudiantes en los ejercicios de proyecto más allá de sus

<sup>1</sup>L'École Nationale Supérieure d'Architecture de Paris La Villette, l'École de Architecture de Paris Belleville, l'École Supérieure d'Architecture Paris Malaquais, l'École d'Architecture de Saint-Etienne e l'École d'Architecture de Versailles.

<sup>2</sup>Tres son universidades de Versalles y una de Malaquais (Paris).

<sup>3</sup>A parte el caso de la asignatura que prevé un intercambio entre Versalles y Casablanca, pero sin embargo, según la opinión del representante es parte de la tradición de la Universidad de Versalles.

fronteras. La formación comienza a través de cursos de inglés y de asignaturas impartidas en este idioma desde los primeros años de la carrera para, posteriormente, concretarse de manera práctica en los últimos dos años en los que son bastante comunes asignaturas teóricas sobre aspectos particulares de la historia y de la construcción de países extranjeros, además de intercambios para la experimentación de técnicas de proyecto. Cabe señalar que el apoyo por parte de la estructura académica francesa a la cooperación internacional también es subrayada por el apoyo financiero que ofrece a los estudiantes para participar en estas iniciativas.

### Alemania

La investigación llevada a cabo en las universidades alemanas ha permitido, hasta ahora, identificar algunas facultades activas en los intercambios internacionales en el campo de la planificación urbana. La mayoría de las escuelas alemanas tiene programas de estudios que prestan mucha atención a la arquitectura de los países europeos, pero algunas se distinguen por la presencia en los planes de estudio de actividades internacionales, es decir que promueven intercambios de carácter cultural tanto unilateral como bilateral con países no europeos. El intercambio se lleva a cabo a través de la formulación de proyectos de arquitectura en asignaturas obligatorias o en workshop opcionales que se llevan a cabo en parte o en su totalidad en el país extranjero que participa en el intercambio.

Cabe señalar que la introducción de asignaturas de “proyecto internacional” directamente en el plan de estudio se lleva a cabo sólo en los casos de grados orientados al desarrollo de la formación específica en contextos internacionales. En particular, estamos analizando algunas facultades de arquitectura, como la de Darmstadt, la “Technische Universität Darmstadt”, donde se organizan asignaturas para la cooperación internacional pero no se incluyen necesariamente períodos de formación en el extranjero, y la Facultad de Arquitectura de Frankfurt am Main “Fachhochschule Frankfurt Am Main” donde se alienta el intercambio con Nepal, Australia y Sudáfrica mediante la organización de workshop de una duración de dos semanas o más.

La búsqueda se llevará a cabo por otras facultades de arquitectura si se detectara la presencia de cursos de planificación estructurados para fomentar intercambios con países no europeos.

### España

El primer estudio exploratorio realizado en los programas de estudio que se ofrecen en las facultades de arquitectura de España ha puesto de relieve una atención generalizada hacia la tecnológica y la construcción del proyecto, que parece prevalecer en la enseñanza de la planificación. El análisis de los detalles de las asignaturas de planeamiento y urbanismo propuestos también demuestra que en la mayoría de los casos, la atención se centra principalmente en el estudio de las dinámicas del territorio español: de los programas de las asignaturas que se han encontrado en la red, surge que la atención se centra principalmente en el estudio detallado y en el análisis de la legislación propia de cada región, la Ley del Suelo de cada Comunidad Autónoma, y de los diferentes niveles de planificación especificados en dichas leyes.

En este marco representa una excepción la facultad de arquitectura de la Universidad privada Camilo José Cela de Madrid. En este caso se utilizan los workshop para introducir actividades de carácter internacional en el plan de estudio. Dentro de las asignaturas semestrales de proyectos se prevén workshop que duran unos pocos días y que ofrecen la posibilidad de una colaboración con profesores de otras nacionalidades.

En general, sin embargo, la investigación hasta ahora no ha detectado la presencia de cursos donde se prevea un período de permanencia obligatoria en el extranjero. En el análisis de las asignaturas de carácter teórico, sin embargo, sí que aparece una sensibilidad diferente y cierta apertura al conocimiento de realidades fuera de las fronteras españolas. Dentro de estas asignaturas, de hecho, se observa con frecuencia la inclusión de reflexiones teóricas sobre la historia de la arquitectura y del urbanismo, en todo el continente americano. El interés, sin embargo, no parece materializarse (por lo menos según las informaciones disponibles en la red) en experimentos de carácter proyectual.

### Portugal

La investigación realizada sobre las universidades en Portugal señaló, en primera instancia, que, además de las facultades de arquitectura y de diseño también es posible detectar la presencia de muchas universidades que ofrecen grados completamente dedicados a la planificación urbana y territorial.

Entre las muchas universidades detectadas en el territorio portugués sin duda destacan la Universidad de Porto, que ofrece una carrera en “Planeamiento y Proyecto Urbano”, y la Universidad de Lisboa, donde además del master en “Planeamiento do Território” propuesto dentro de la Facultad de Arquitectura también encontramos el Instituto de Geografía y Ordenamiento del Territorio. En estas facultades las actividades de carácter internacional destaca particularmente el trabajo sobre cuestiones relacionadas con la realidad de los países africanos.

En el caso del Instituto de Geografía de Lisboa, este interés se encuentra en las asignaturas obligatorias y en las opcionales. En el primer caso, además de una base teórica se fomentan períodos de estudio en el extranjero, aunque no está clara la modalidad de intercambio y el tiempo que el estudiante puede pasar en el país extranjero. En el caso de las asignaturas opcionales, sin embargo, surge un enfoque sobre todo teórico, y el objetivo declarado es entender y analizar el proceso de planificación en África, pero también en este caso no se explicita si existe la oportunidad de pasar un

período en el país estudiado o no<sup>4</sup>.

En una fase posterior de la investigación se continuará con la investigación para tratar de esclarecer de qué manera se da a los estudiantes la oportunidad de pasar un período de estudio en las áreas estudiadas.

## CONCLUSIONES Y PERSPECTIVAS DE TRABAJO

De la investigación llevada a cabo hasta ahora se deduce una gran atención general, por parte de las universidades europeas examinadas, para las realidades fuera de sus fronteras. Se encontró, sin embargo, que cada país formaliza este interés de manera diferente. Sin duda, esta primera investigación sugiere que la Francia es el país donde las experiencias de cooperación internacional, especialmente con los países no europeos, están más estructuradas y generalizadas. Debe señalarse que la investigación sobre las universidades francesas ha sido facilitada por el hecho de que es posible consultar directamente en las páginas web prácticamente todos los detalles de las asignaturas. Pero obviando esa facilidad para el investigador, la semejanza en la estructura propuesta para el intercambio en casi todas las universidades francesas (asignaturas semestrales y visita de dos semanas en el extranjero), sugiere una voluntad compartida y, probablemente, gestionada a nivel nacional.

La primera fase del estudio presentada en este trabajo deja abiertas muchas líneas de investigación. En primer lugar sería interesante comprender (tal vez a través de cuestionarios específicos enviados a las oficinas internacionales) si en los países no analizados en esta fase es inexistente el interés a experimentar lo que significa desarrollar un proyecto en el extranjero o si, por el contrario, simplemente no se publicitan en las páginas web de las universidades. La misma investigación podría llevarse a cabo para aquellas universidades de los países examinados en las que, en esta primera fase, no se ha encontrado información sobre la realización de experiencias internacionales. En ambos casos, tal vez sería oportuno reflexionar sobre las motivaciones culturales que justifican la apertura o no al extranjero. ¿Por qué un país está más interesado en la formación de sus planners desde un punto de vista internacional? ¿Se puede hablar de un interés en fortalecer los conocimientos adquiridos por el alumno? ¿Es un interés dictado por acuerdos a nivel nacional con otros países? Y la falta de interés, ¿puede ser un indicio de una visión miope de lo que son hoy los horizontes de un planner? ¿O simplemente es un síntoma de un deseo de especializarlos estudiantes desde el punto de vista técnico y teórico dejando la experimentación práctica al mundo laboral?

Otra aproximación se podría llevar a cabo sobre el sistema de cooperación internacional en el ámbito universitario en su conjunto. A través de un análisis más detallado de los primeros datos obtenidos en esta investigación podría ser posible entender cuál es la fórmula preferida y considerada más efectiva para la adquisición de las habilidades necesarias por parte del alumno. También será fundamental entender realmente lo que se aprende de las experiencias de intercambio. ¿Cuáles son las expectativas? ¿Las experiencias de cooperación llevan a oportunidades reales de empleo para los estudiantes? ¿Cómo el intercambio afecta la manera de hacer proyectos en el país europeo que lo propone? ¿Y cómo afecta al país extra-europeo? ¿La presencia de los intercambios favorece una afluencia de planners y arquitectos europeos en las áreas extra-europeas? En resumen, ¿cuál es el valor añadido de un programa de formación que toma la decisión de invertir en la cooperación internacional?

---

<sup>4</sup>En la Guía académica de la asignatura “Planeamiento Urbano em África” (disponible en la red) solo se habla de “conducir una investigación empírica sobre los procesos de urbanización en los PALOP”.

## **SPATIAL PLANNING IN PREDOMINANTLY VERNACULAR SETTLEMENTS. THE CASE OF AFRICAN RURAL TOWNS.**

Roberta Nicchia\*

\*DICAM - Dipartimento di Ingegneria Civile Ambientale e Meccanica, University of Trento, Italy -  
[nicchia@ing.unitn.it](mailto:nicchia@ing.unitn.it)

### **ABSTRACT**

In the last ten years, the University of Trento has been involved in a decentralized cooperation programme that promotes cultural, technical and administrative exchange between the Provinces of Trento and Sofala, Mozambique. This contribution focuses on the spatial planning activity in Mozambican rural towns, resulting from the cooperation of the different actors belonging to the programme. African rural towns are essentially towns of farmers in which the development of strictly “urban” activities and functions are found in a society whose features are typically “rural”. Vernacular settlements and traditional housing typologies are still widely dominant in the landscape. Nevertheless, “urban” and “modern” settlement patterns and housing models are being imported.

The paper investigates the dialectic relationship between vernacular traditions and modernization, which expresses in a complex mixture of traditional and modern elements. Main research methodology was a household survey led in Sena, a small town situated in the rural Mozambique. Furthermore, some suggestions are provided, which aim to support a spatial planning process that is culturally appropriate and responds to the specific characteristics of this particular typology of human settlement. The central strategy is the enhancement of vernacular settlement patterns and housing typologies and their integration with emerging urban features. Two main reasons determined the choice of this strategy: the preservation of the traditional forms of spatial organization is essential to support the survival strategies of most of the population; protecting and reinterpreting the vernacular tradition by culturally appropriate means is a useful strategy to avoid the indiscriminate colonization of western models. The focus is on the introduction of culturally-compatible changes and, therefore, on the full involvement of the population in the decision-making process.

### **INTRODUCTION**

Small towns of sub-Saharan Africa are experiencing a very rapid demographic growth, which in some cases can lead to the doubling of the population within a few years. The search for adequate policy responses and actions related to the management of urban growth is actually one of the main declared objectives of the national governments of Third World countries, as well as of international organizations. Nevertheless, up to now urban development research and projects have centred mainly on megacities, while small towns almost completely lack planning on how to accommodate people moving from the surrounding rural areas and how to provide them with services [1]. Ordinary management of or - at best - upgrading already-existing urban contexts are generally the objectives of local administrations, for whom planning the urban growth represents an unattainable goal, due to the lack of financial resources and technical capacities.

Local administrations, international aid agencies and NGOs operating in small towns of Africa propose generally only small-scale interventions (urban projects) or sectoral programs (i.e. infrastructural improvement, site-and-services, slum upgrading and - only seldom - public housing provision), rather than a consistent and organic activity of urban planning. Furthermore, these sectoral programs are not always present: they generally follow environmental, political or socio-economic disasters. Therefore, they are often “emergency programs” through which a considerable amount of money is used to resettle the population affected by floods, civil wars, droughts and famine. To cope with the problem of housing big numbers of people in a short time, international aid organizations and national and local governments often adopt foreign-designed, mass-produced and pre-packaged housing solutions [2].

Resettlement programs, as well as other sectoral interventions, are generally designed for major urban centres of the Third World and then automatically transferred to small and intermediate towns without any attention to the specificities of these typologies of human settlements. If these programs demonstrated to be inadequate even for those centres for which they were expressly formulated [3][4][5], they are far less suitable to the small towns. These settlements are generally planned on a two-dimensional grid, which is applied on the territory without considering the often-complex morphology of the place and existing natural elements (i.e. vegetation and water bodies). In the landscape there is no centre, neither reference points nor signs remarking identity or educating to beauty or pleasure. The grid is generally designed by a regular, perpendicular road network and is composed by the obsessive repetition of

the same module: a small housing plot provided with basic services (generally just a “wet core”) and, sometimes, one small house for the whole family. This typology of housing policy and programs refer generally to cultural models that were originally developed for Western, industrialized countries and are passively inferred to southern, tropical, rural contexts. General assumptions and blanket solutions to housing needs are likely to suffer from being out of place or even face total rejection. These pre-packaged housing models pay no attention to local housing cultures, indigenous dwelling types and patterns, and ignore the environmental context of the proposed architectures. Therefore, accustomed to a different relationship between internal and external space than that of a conventional Western house, a people may experience a disconcerting loss of “environmental control”, which comes with being unable to relocate or alter the dwelling to suit specific social or climatic conditions, as they have been accustomed to do. To live in a Western-styled house requires the fragmentation of personal spaces and the adoption, at least in part, of the lifeways of another culture; though to adopt them may mean the loss of cultural and personal identity. As a result, individuals find themselves physically and psychologically uncomfortable in modern structures. In particular, it is generally not taken into account the design of spaces able to host large family structures (often polygamous) and to integrate different activities within the plot (living, cultivating, livestock holding, handicraft goods producing, domestic selling etc.), that are the base of most subsistence strategies of poor people of the Third World [6].

Furthermore, houses are often built with industrial materials. The widespread use of concrete, steel, prefabricated elements and other “modern” materials and building technologies has demonstrated not to be affordable by local economies and to cause also the loss of cultural heritage and traditional abilities of local manpower. Furthermore, in contrast with various traditional architectural forms and locally available materials, modern technologies are less appropriate also from an environmental point of view, as they produce a less-balanced relationship between the building and its environment. This consideration is not only valid in relation to the "lifecycle assessment" of industrialized vs. traditional constructing technologies, but also in relation to their performances in terms of climate control and to the provision of indoor comfort in tropical countries [7].

## **RESEARCH CONTEXT, OBJECTIVES AND METHODOLOGY**

Small towns in Sub-Saharan Africa are essentially towns of farmers, in which “modern” administrative functions, provision of infrastructures and services, and development of strictly “urban” economic activities are found in a society whose features are typically “rural”. This occurs also in Mozambique, where processes like globalization of the economy, modernization of transport and communication infrastructures, rapid urbanization, and administrative decentralization are deeply transforming both the physical structure of the *vilas rurales* (literally “rural towns”) and their socio-economic and cultural characteristics. Therefore, African rural towns present a hybrid settlement pattern, in which urban and rural characteristics melt together. Rur-urbanization can be explained as a process of population growth and of strengthening the urban features of the small towns, while preserving relevant rural characteristics [8].

These rural characteristics, in fact, are not residual, but instead represent a structural component of the rural towns that strongly influences local economies, lifestyles and also physical settlements. This dialectic in relation to the rural-urban polarity is absolutely dynamic, since it changes constantly as a consequence of the relevant globalization processes that small towns are experiencing.

It can be affirmed that vernacular settlements and traditional housing typologies are still widely dominant in the landscape of African rural towns. Nevertheless, “urban” and “modern” settlement patterns and housing models are being imported as a consequence of ongoing global processes. The result is a dialectic relationship between vernacular traditions and modernization that expresses itself in a complex mixture of traditional and modern elements. The aim of the paper is to investigate this topic in relation to a specific context: *vila de Sena*, a small town situated in central Mozambique, along the Zambezi River. Sena belongs to the rural district of Caia, Province of Sofala, where the University of Trento has been involved in the last ten years in different spatial planning activities within a decentralized cooperation programme that promotes cultural, technical and administrative exchange between the Provinces of Trento and Sofala, Mozambique. Analysing the evolution of vernacular tradition towards “modern” housing typologies allows to provide some suggestions, which aim to support a spatial planning process that is culturally appropriate and responds to the specific characteristics of this particular typology of human settlement.

Main research methodology is a household survey that was carried out in summer 2008 as part of the drawing up of the Sena master plan. The purpose of that survey was to understand the peculiarity of this town, which showed a complex mix with reference to the urban-rural polarity. The survey was made through a sample of 47 households randomly selected within the administrative boundaries of the town, covering the whole built-up area on the basis of its density. As a research tool, a structured qualitative interview was proposed to each household. Most of the questions required open answers, being more appropriate for the explorative character of the survey, the low educational level of the interviewees and the object of the analysis. Each interview took almost two hours and was made directly at the household. The language used was generally Portuguese: only in some cases local technicians of the Spatial Planning Office had to translate from Chisena. The interview was structured in the following five main topics, each comprising of a set of questions: housing typology; household composition; income and expenditures; access to socio-cultural-recreational services; use of environmental resources. The selected topics were associated with the spatial organisation of the town. The elaboration of the results consisted first of all in the codification procedure, referring answers to

interpretative categories. It was possible, then, to complete the database, and to carry out exploratory data analysis, which allowed households to be classified according to different typologies. The classification of the households was made on the basis of two different, but interdependent, criteria: monetary income and main occupation. According to these criteria households were divided into four typologies, representing different social groups and whose existence depends respectively on: 1) subsistence agricultural activities; 2) both agricultural and non-agricultural subsistence activities; 3) hybrid urban activities; 4) modern activities. Moreover, through the survey it was possible to identify and analyse three different housing typologies emerging in the rural town, as described in the next Section.

## EMERGING HOUSING TYPOLOGIES IN SENA

One of the results of the survey in Sena, was to notice that housing typology is a reliable indicator of the social groups the household belongs to. Three main housing typologies, in fact, were individuated, each corresponding to a different social groups emerging in the rural towns.

### Traditional mudzi

Households that rely almost completely on subsistence agriculture accompanied by odd jobs or other low-income non-farming activities (such as agricultural trade, street trade, handicraft, employment in the construction sector or in international aid), belong to the subsistence sector. Due to the very low monetary income, less than 1 euro per day, the survival of these households crucially depends on the direct and free access to natural resources: land for agriculture, water, firewood, cattle breeding, healing plants, building materials. The housing typology of households belonging to the “subsistence” socio-economic sector, is the traditional *mudzi*: the vernacular housing typology that consists of different small buildings, called *palhotas*, settled around a wide, circular open space (see Figure 1).

Fig. 1 - Graphic and photographic survey of a traditional mudzi.

The settlement grows up progressively together with the family. In the case of a monogamous family structure, the *palhota principal* is reserved to the head of the family, his wife and little children. When children grow up, they move to their own *palhotas*, one for the women and one for men. Generally at the age of fourteen, the now adult son builds his own *guero*, the *palhota* where he will receive his wife once married, according to a patrilineal social organization of the *sena* population. In the case of a polygamous family structure, the head of the household must equitably provide each wife with her own *palhota*.

Indoor spaces are very intimate ones, used just for sleeping and for shielding oneself from sunlight or rain during the day. Moreover, indoor spaces are also used to store agricultural products. For all these reasons, *palhotas* have only small openings to allow the cross-circulation of the air while keeping the interior in shade. All daily activities are conducted outdoors, in the central open space where firewood to cook is placed, cereals and straw dry over a *mesa alta*, guests are received, domestic selling takes place, animals scratch about or are locked inside fences, and children play. It is interesting to notice how each *mudzi* adapts to the family structure and also family's different activities contribute to the personalization of the compound. The central space is generally dominated by big, leafy fruit trees, like *massaniqueras* and *songolas*, under whose shadow most of the domestic activities take place. Nature, in general, is an integral part of the compound, tracing boundaries among different properties and, moreover, is essential in improving the outdoor microclimate.

*Palhotas* have generally very small dimensions (2x3 m, 3x3 m, 3x4 m, 3,5x4,5 m) and the indoor space consists of just one room, without any articulation of the inner space. Sometimes it is possible to find porches surrounding the *palhotas* completely or just on one side. These porches, which can also be closed in by wooden *estacas* or vegetable reeds, provide one of the most-used areas of the compound and it is usual to find householders eating or resting in the shade provided. Porches also have the function of protecting the walls of the building from atmospheric conditions. Latrines are generally to be found, while each compound has a spiral element made of *caniço* (vegetable reeds), that provides a place to shower in privacy. Building techniques commonly used in this housing typology are the vernacular ones. Walls are generally made of earth, according to two main techniques: *tijolo cru* (sun-dried mud bricks, or adobe) and *pauipique* (wood frame, filled with mud and stones). In a few cases it is possible to find walls made of wooden posts covered with *caniço* or *capim* (straw). The roof is always a wooden structure made of thin, circular posts covered with *capim*, and can have two or four pitches.

All families declare that the small buildings had no monetary costs, since the men of the family are normally engaged in collecting building materials (such as mud, wood and straw) freely in nature, in processing them and in building the *palhotas*. The whole family, however, participates in the construction process, sometimes with the help of other relatives and neighbours. More than one interviewed householder underlined the point that children also help as they can, by bringing water for example, because it is important for them to get acquainted to the process in order to be able to build their own *guero* once they become adults. Once the *palhotas* are finished, women are responsible for ordinary management and housing maintenance, such as soaking earthen pavements with a solution to drive insects away, or to add further mud layers to the walls after the rainy season, sometimes decorating them with *matope* of different colours.

### Hybrid mudzi

Households belonging to the social group depending on “hybrid urban activities”, accompany the agricultural activity with a non-fam middle-income activity, in public administration or in the trade sector. In this case we are talking of the sale of agricultural produce or of the handling of a *banca movel* (stall) in the market. In this typology, family-based trade is no longer traditional street commerce but it presents modern characteristics and assets. Motorcycles are bought and trucks are rented to allow transportation of goods, which can be manufactured goods coming from other provinces or other countries. Income ranges from 850 to 5,700 Euros/year. Once more, in this typology there is recourse to natural resources as firewood, but these resources are not collected directly but bought at the central market or from street vendors.

The housing typology that better represents this group of households is what has been here defined as “hybrid *mudzi*” (see Figure 2), that testifies to the higher complexity of this social group, the households of which—as seen—deal with both modern and traditional activities and present a complex mix of urban and rural behaviours. Among households belonging to typology 3, in fact, savings are mostly invested in the improvement of the housing conditions. This means the substitution of some of the traditional *palhotas* with more “modern” constructions. Modern buildings are made of conventional materials (bricks, corrugated iron sheets, cement, mortar and plaster). The result is a hybrid *mudzi*, where the traditional spatial organization of the housing compound shows a mix of traditional and modern constructions. Generally only the main *palhota* is substituted with a modern building, since the construction of a new building is very expensive and skilled manpower must be paid to build the house, due to the lack of knowledge related to “modern” building techniques. Among the surveyed hybrid *mudzi* of this typology, no one was provided with electric energy, but they all had a shower (or rather, a place to have a shower) and a latrine.

### Conventional house

The 8% of the interviewed householders are modern traders and form the socio-economic élite of the town. These households have a much higher income in comparison with the others, which can exceed 28,000 euro/year. Modern trade is endowed with a shop in the central market, or consists of transactions carried out at national or international level given the proximity to Malawi. Transportation means appear as motorcycles and trucks, rented shops and waged employees are associated with this activity. As in the previous typology, there is recourse to both natural resources and manufactured goods. The class of modern traders expresses an aspiration to an urban lifestyle, and this is testified to by the housing typology spontaneously adopted by all households of this class: the “conventional house” (see Figure 3).

This time there is a radical change with respect to the traditional *mudzi*: a new, modern house is built, with a different organization of indoor and outdoor spaces, conventional housing materials, electric energy and so on. The “conventional house” of *Sena* is reminiscent of those that dominate the landscape of the peripheries of Beira and other major cities of Mozambique, in terms of shape and constructing materials. The “conventional” housing typology consists generally of a main building and a kitchen. These two constructions are bigger than the traditional ones and the main building presents a spatial and functional articulation of the inner space. In this typology, in fact, *gueros* do not exist and, when children grow up, they have their own room (one for males and one for females) within their parents’ house. But even if a kitchen is built, households declare that they still prefer to cook open air. The buildings are generally grouped perpendicularly, forming an “L” that creates a rectangular open space in the middle of the plot, which is much smaller than in the *mudzi*. Generally the plot is surrounded with a high, massive wall that has only one access to the main road in order to protect family properties and trade goods, that are often stored in the compound, from robberies. Generally there are no trees or presence of vegetation within the plot. In these housing compounds there is always a latrine and a shower, generally located at the back of the main building, and at least all main buildings are provided with electricity.

Compared to the small, one-room *palhotas* of the *mudzi*, “conventional” buildings are bigger (7x4m, 7x6m) and present also a spatial and functional articulation of the inner space. The roof can have two or three pitches with different inclinations, the latter reflecting the most-used housing model of the periphery of Beira. Furthermore, the buildings of this typology are made up of “conventional” building materials, mostly *tejol quemado* and *chapa*, that is bricks for the walls and corrugated iron sheets to cover the roof. These buildings, which are sometimes also plastered and coloured, are not constructed by the family members any more, as specialized manpower is needed. The costs for the realization of this housing typology are very high. For the main buildings alone in Figure 3, which has a dimension of 7x6 m, the household declared to have paid 45,000 MTn (1,185 euros).

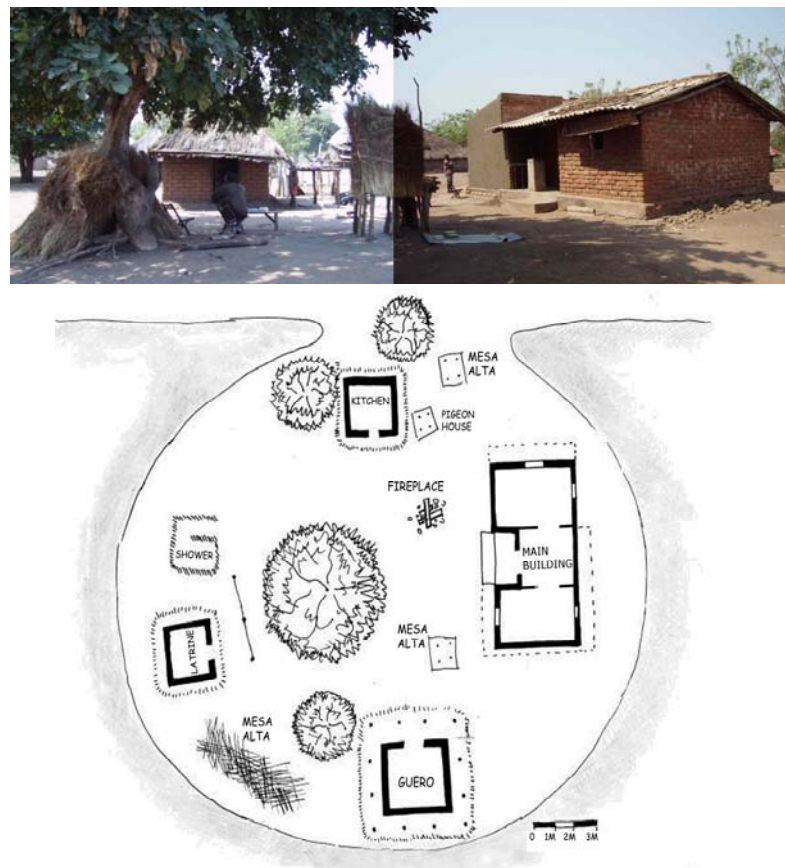

Fig. 2 - Graphic and photographic survey of a “hybrid mudzi”.

Fig. 3 - Graphic and photographic survey of a “conventional” housing compound.

## PERSISTENCE AND TRANSFORMATION OF VERNACULAR HOUSING CULTURE

An important characteristic of the rural town is the persistence of vernacular settlement patterns, housing typologies and building technologies, which are widely dominant in the landscape. Traditional *mudzi*, in fact, constitute the great majority of the built-up area in Sena, are closely related to rural settlements and give to the small town its particular character of being a big rural village.

The vernacular compound is the only affordable option for most of the population, since it is constituted of small buildings made of materials that are freely collected in nature (i.e. mud, wood and straw). A *mudzi*'s spatial relations reflect the socio-economic organization of the *sena* population. Small *palhotas* organized around a big open space are expression of the polygamous structure of the families, which rely on more than one housing unit and the livelihood strategies of which take place prevalently in the compounds outdoor area. Moreover, vernacular building techniques are based on natural materials available *in loco*, which is an advantage from both an economic and an environmental point of view. These constructions, in fact, are “sustainable”, since they use only renewable resources the regeneration capacity of which is not overcome. No energy is employed in the extraction and processing of building elements, such as sun-dried mud bricks and wooden posts, which also do not present the problem of waste disposal, since they can be

completely recycled. Furthermore, vernacular technologies present a better bioclimatic behavior of the building shell in relation to the local tropical climate. The earthen walls and the straw roof, in fact, work as a natural air conditioning system, since they absorb the humidity of the air during the night and the dew at dawn and, when the sun shines on the building, the evaporation considerably reduces the indoor temperature. With respect to the high daily temperatures, both materials (earth and straw) present good insulating properties, while corrugated iron sheets have such a high coefficient of thermal conductivity that one should advise against using them in such climatic conditions. Also nature, that is widely present in vernacular compounds, has the function of improving the outdoor microclimate. Through leaves transpiration and production of shadow, the temperature is mitigated and the humidity of the air is balanced. Finally, vernacular building techniques produce the valorisation of local material culture: local resources, technical skills and housing heritage. They are also simple enough to allow the self-building process that is widely diffused in Sena. This process guarantees the uniqueness of each housing compound, which is personalized according to family needs and tastes. Moreover, self-construction has important social and cultural implications, since it reinforces community linkages through mutual aid and is also an important step in the initiation of the householders to their adult life. Summarizing, vernacular housing typologies combine comfort, aesthetics and functionality, in the respect of the local housing culture.

Anyway, it is evident that the traditional housing culture is evolving towards the model of the “conventional house”. This model, that is considered more “modern” and “comfortable”, is spontaneously adopted by those among the population with a medium or high income, whose aspiration to an “urban” lifestyle it exemplifies. The household survey in Sena highlights how the housing typology can be considered a reliable indicator of the households lifestyle and socio-economic level, as well as of its “urbanity” rate: families belonging to the subsistence sector live in vernacular rural housing compounds (*mudzi*), while households of the capitalist sector invest their savings principally in the improvement of the housing conditions. In some cases, some traditional constructions are substituted with “modern” ones (*hybrid mudzi*), while in the case of the traders, the socio-economic elite of the town, a new modern house is built, which is reminiscent, in terms of shape and building technologies, to those of Mozambique cities peripheries.

Conventional typologies represent a radical change with respect to the local housing culture. In particular, the relationship between indoor and outdoor spaces changes considerably: the indoor surface is between 1.5 and 5mq for each person in the traditional *palhotas* and 10-11 mq for each person in conventional houses, while the outdoor space is strongly reduced in conventional compounds. This is surely related to the fact that families with high income do not need a big outdoor space to carry on subsistence activities.

Through the survey, it was also possible to analyse the subjective perception of households in relation to their housing condition. It emerges clearly that there is a general belief among the population that vernacular housing typologies are synonymous with poverty and all households have the aspiration to improve their housing and living conditions, that for most of them this means building a conventional house. In particular, it is to be noticed how the corrugated iron sheets are generally preferred to straw to cover the roof, in spite of being far more expensive, producing an uncomfortable indoor environment, and being very noisy when it rains. They are still inaccessible to the majority of the population, but from the interviews it comes out that they are preferred not only because they are more durable, but also because they are a symbol of well-being.

It is important to underline that the actual trend is not only determined by the spontaneous action of medium- and high-income social groups, but it is also induced by the resettlement programs, such as the “*Programa de Reassentamento da população afectada pelas cheias 2007*” [9], which actually subsidize and offer technical support only if a “conventional house” is built. This is also contributing to the introduction of the “conventional housing” model in the imagination of the people as synonymous of “modernity”, “comfort” and “well-being”, fomenting its emulation in individual choices.

## CONCLUSIONS

Vernacular settlements and dwellings are regional and cultural and are subject to many influences. Resources, technology, climate, environment, lifestyles, values and meanings all play a part in shaping settlements and dwellings built by the people. The vernacular habitat, then, is the product of the interaction and harmonious fusion of all these tangible and intangible aspects of a community [10]. This holistic approach, spontaneously adopted by the people in their self-building activity, is typical of the vernacular settlements. Addressing the issues of local settlements and architectures that communities developed spontaneously over time is unavoidable for planners dealing with prevalently vernacular contexts, which small towns of Sub-Saharan Africa are.

Vernacular settlement patterns and architectures evolved over millennia and still represent the majority of the built environment among many cultures. Nevertheless they are disappearing fast, since they are being replaced with settlements inspired by Western models. The latter, as seen in previous Sections, are no longer intimately related to the characteristics of the place and of the community that lives it. On the contrary, they are producing a growing homologation of the living environments at global level. The risk of the present trend is not only that of providing settlement solutions that are inadequate to local contexts, but also of losing vernacular traditions, which are a precious world heritage of urban diversity, material cultures and skills.

Nevertheless, in African rural towns there is still a strong connection with traditional values and locally-rooted

ways of life, something that is exemplified by vernacular settlement patterns, housing typologies and building technologies. These constitute the great majority of the built-up area and give to the rural town its particular character of a big rural village. They represent an important cultural heritage that has almost been lost in major urban centres, where settlements and housing typologies have developed instead towards Western models. Even though the adoption of housing typologies and building technologies inappropriate to the local context is not as evident in African small towns as it is in the cities, their early signs should be taken seriously into consideration.

The analysed trend demonstrates the need to govern the rur-urbanization process with adequate integrated policies and a coherent urban planning activity in which the “spatial” component has a strategic importance. The central idea proposed for the spatial planning activity is the enhancement of vernacular settlement patterns and housing typologies and their integration with emerging urban features.

Two main reasons determine the choice of this strategy. First of all, the preservation of the traditional forms of spatial organization is essential to support the survival strategies of most of the population, therefore spatial planning within African rural towns should support “subsistence” settlement patterns. The fact that 70% of the population belongs to the “subsistence” economic sector calls for the deeper comprehension and protection of all those forms of spatial organization of the urban territory that allow the poor households to carry on their different survival strategies. Therefore, protecting “subsistence settlement patterns” could ensure a dignified standard of living to the whole population and avoid the risk of *favelization*, in particular in regards to the newly urbanized households. This risk is particularly high in Sub-Saharan African rural towns, in fact, where demographic growth is generally associated with the phenomenon of “urbanization of poverty”. According to this strategy, promoting housing typologies inspired by local material culture is a central issue in spatial planning and management within the rural towns.

The second reason for enhancing the vernacular tradition through spatial planning is that the existence of large-scale vernacular settlements offers the opportunity to experiment with urban development patterns that are more appropriate to local housing culture and endogenous resources than the “conventional housing” model that is currently being proposed. This planning principle suggests the promotion of housing typologies, building technologies and construction processes that find their inspiration in the vernacular tradition. Protecting and reinterpreting the vernacular tradition by culturally appropriate means, in fact, is a useful strategy to avoid the indiscriminate colonization of Western models. The focus is on the introduction of culturally-compatible changes and, therefore, on the full involvement of the population in the decision-making process.

## DEVELOPING THE NEW STRATEGIC MASTERPLAN FOR HERAT (AFGHANISTAN)<sup>1</sup>

Mirella Loda\*, Mario Tartaglia\*

\*Laboratory for Social Geography (LaGes), Department of History, Archeology, Geography, Arts, and Performing Arts, University of Florence, Italy - [mirella.loda@unifi.it](mailto:mirella.loda@unifi.it), [mario.tartaglia@unifi.it](mailto:mario.tartaglia@unifi.it)

### ABSTRACT

This paper illustrates the results of the collaborative relationship between the University of Florence and the University, the Department for Urban Development and the Municipal Council of Herat, aimed at the formulation of a new strategic Masterplan (SMP) for the city of Herat. In particular the paper illustrates the systematic programme of analysis undertaken to construct an updated information base on current socio-demographic and territorial situation of the urban area, and some findings testifying the deep changes that have been taking place in the last decades. Moreover, the paper deals with a more detailed description of the analysis process and the proposed strategic actions as regards to the transportation urban sub-system.

### INTRODUCTION

This paper illustrates the results of the collaborative relationship between the University of Florence and the University, the Department for Urban Development and the Municipal Council of Herat. This relationship was formally set in motion in 2004 on the initiative of the coordinator of the project, who became aware, while conducting research surveys in Herat, of the absolute lack of recent socio-economic and demographic data relating to the city<sup>2</sup>.

Afghanistan's tribulations and complicated history since the late 1970s have, in fact, resulted in a drastic reduction in room for manoeuvre as far as research is concerned, with a resulting huge gap in knowledge on all aspects that are not strictly military regarding life in the country. By the time the Taleban fell, the country had been deeply transformed; yet it was still a puzzle, not only because of an almost complete lack of reliable data but also because of the difficulty in rebuilding structures capable of managing all the needs of a civil society.

The construction of an updated information base appeared, then, to be of the utmost urgency for Herat, where a tumultuous expansion process of the urban area was underway. This process, begun during the Taleban period because of the relative security of the city, was subsequently accelerated, generating a profound but problematic transformation of the organization and layout of places [1].

Multiple changes occurred in the absence of any updated instruments for governing the territory. The city's urban policies referred to the old Masterplan, devised at central government level in 1963. This plan was based on an orthogonal grid and envisaged such significant expansion that the Ministry of Culture called for a revision, a request which was only partially met in 1978. In the absence of other instruments, this Masterplan, aspiring to western urban models, effectively influenced the city administration in their day-to-day running of the territory. Apart from the fact that such plan had little to do with the local context, it was found, after the fall of the Taleban, to be totally inadequate for tackling the new problems of the area. This had a negative effect both on the results and the image of public action.

These considerations fuelled our conviction that the main priority of this cooperation was to ensure the availability of updated instruments for governing the area, both to deal with the new problems arising from the expansion of the city, and to stabilize Herati society according to more ordered and enduring models of civic togetherness.

Thus, the University of Florence developed a special cooperation project which aimed to offer theoretic, methodological and technical support to local entities engaged in the important role of managing the territory, while at the same time offering training to personnel.

In 2011, with the financial support of the *Direzione Generale per la Cooperazione allo Sviluppo (DGCS)* of the Italian Ministry of Foreign Affairs, the University of Florence, in conjunction with the Department of Urban Development, the University and Municipal Council of Herat, undertook a systematic programme of analysis and planning of the urban area, aimed at the formulation of a new Strategic Masterplan (SMP) for the city of Herat.

As the name suggests, this is a planning approach which, far from being based on a static vision of urban space, is an attempt to harness the most significant aspects of change and development, ensuring, at the same time, the deepest consideration of the specific geographic, cultural and social aspects of the area within a multidisciplinary approach.

<sup>1</sup> This article is a joint project of the authors. The sections "Introduction" and "Socio-demographic aspects and condition of real estate" have been written by Mirella Loda. The section "Transportation issues and strategic actions" has been written by Mario Tartaglia.

<sup>2</sup> The members of the Florentine team are: Mirella Loda (Social Geography/Project coordinator), Gaetano Di Benedetto (Urban Planning), Manfred Hinz (Intercultural Studies), Massimo Preite (Urban Planning), and Mario Tartaglia (Transport Planning).

According to this approach, the first macro-activity of the SMP-project was aimed at analysing the current social and territorial situation of the city. The analysis was based, as far as the scanty existing material permitted, on the perusal of existing literature and documentation. The themes dealt with were the physical environment, economic prospects and cultural heritage. Only for the latter was there already a vast collection of accurate documents, thanks to the hard work carried out in Herat by the Aga Khan Trust for Culture, who courteously allowed us access to their data on material heritage.

For many other areas of city life it was necessary to compile the database through direct surveys. In particular, the following direct surveys were carried out: 1. Household survey, 2. Mobility survey, 3. Traffic survey, 4. Study on the availability and conditions of real estate, 5. Study on property values, 6. Study on urban facilities (schools, hospitals, etc.), 7. Study on urban utilities (power network, water system, etc.), 8. Study on transport infrastructures and services (road, parking, public transport, etc.), and 9. Study on intangible cultural heritage. Moreover a model was developed of the demographic evolution of the city up to the year 2051 and – through photo-interpretation of satellite images – an analysis was carried out on land use in the Herat area.

In the following pages we will confine ourselves to sum up some of the main findings of the surveys on socio-demographic aspects and the condition of real estate and to illustrate data and planning proposals related to mobility and traffic. A complete description of the research findings and of the planning proposals of the SMP is contained in [2].

## SOCIO-DEMOGRAPHIC ASPECTS AND CONDITION OF REAL ESTATE

The household survey was conducted between October 2010 and February 2011 on a random sample of 3,083 households and 22,102 individuals (51.3% male, 48.7% female). On the basis of the collected data, the total population living in the 12 Herati districts can be estimated at about 493,600 inhabitants. In 1979 Herat had 140,300 inhabitants, a figure that testifies to the city's intensive growth in the last decades.

The Herati population is very young (like that of other Afghan cities). The distribution of the population according to age shows that 68% of the dwellers are under 26, while the percentage of older people is only 3%. As a consequence, a high rate of population growth is predictable in the next two-three decades. The gender-based age pyramid shows that in Herat genders are more evenly balanced than in other Asian countries. These statistics would seem to exclude the widespread practice of selective abortion as in China and India, where selective abortion still results in a lower proportion of women over the whole population (e.g. in 2001 in India 927 girls were born for every 1000 boys).

In Herat a fast-growing population lives in a relatively small space. Therefore, the density rate is very high – just shy of 84 inhabitants/ha. This figure is high even compared to crowded Asian cities like Shanghai, and especially considering that Herat's city centre is characterized by low buildings with max. 1-2 storeys.

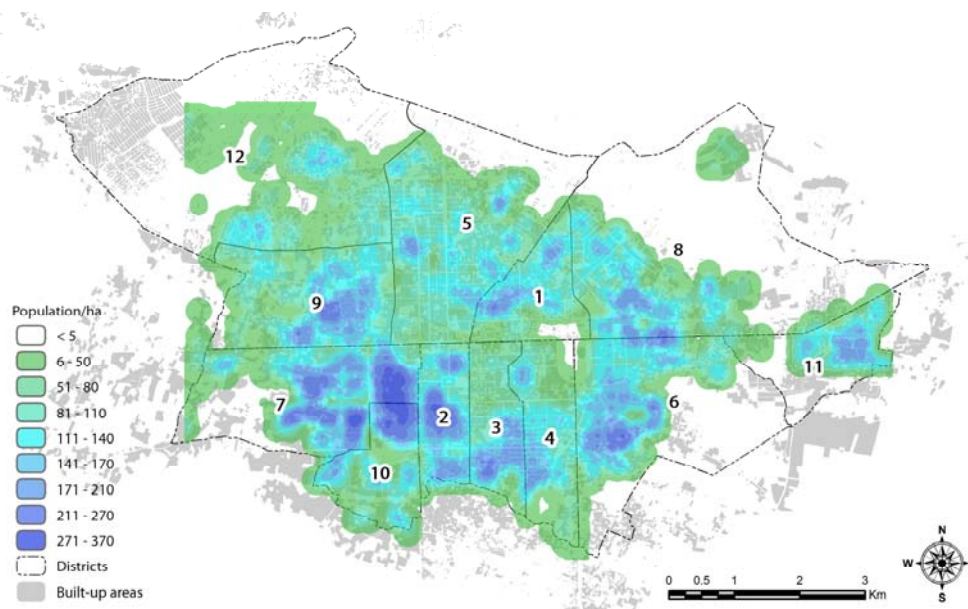

Fig. 1 - Population density in Herat, year 2011. North-Western area of District 12 not represented  
(Source: our processing of the Household survey data, 2011).

The distribution of population in the urban area is obviously not homogeneous (Fig. 1). Areas with very high population density (blue areas) are located especially in the old city (up to 200 inhabitants/ha), in the adjacent neighbourhood to the north-west, and also in the newly developing urban areas.

On average, Herati households consist of 7.1 individuals. The figure is impressive when compared with western societies (for example the Italian figure in 2010 was 2.4). In the majority of cases (85%), the household comprises two generations; in one out of eight households three generations live together in the same unit (extended families). One-generation families are extremely rare. No clear tendency to separate generations has been observed. In 1/3 of cases, collateral branches of the family live under the same roof. The tendency of different family branches to become independent will greatly contribute to improving the housing demand in the future.

There are no clear distribution patterns according to household size in the urban area. Families with more than 8 members are distributed fairly regularly throughout the whole urban area. The relatively high presence of families with more than 10 members in wealthy districts shows that large household size is not correlated to low income and poverty. On the contrary, the extended family proves to be still deeply rooted in local culture.

The average monthly income per capita is 1,530 Afghans (roughly 29\$)<sup>3</sup>. However, the average value conceals huge differences in family income. Almost 1/4 of Herati families can be considered wealthy, because their members each have a monthly income of more than 1,900 Afghans. One fifth of Herati families are very poor, because their members have a monthly income equal to half the average value (18\$) or even less.

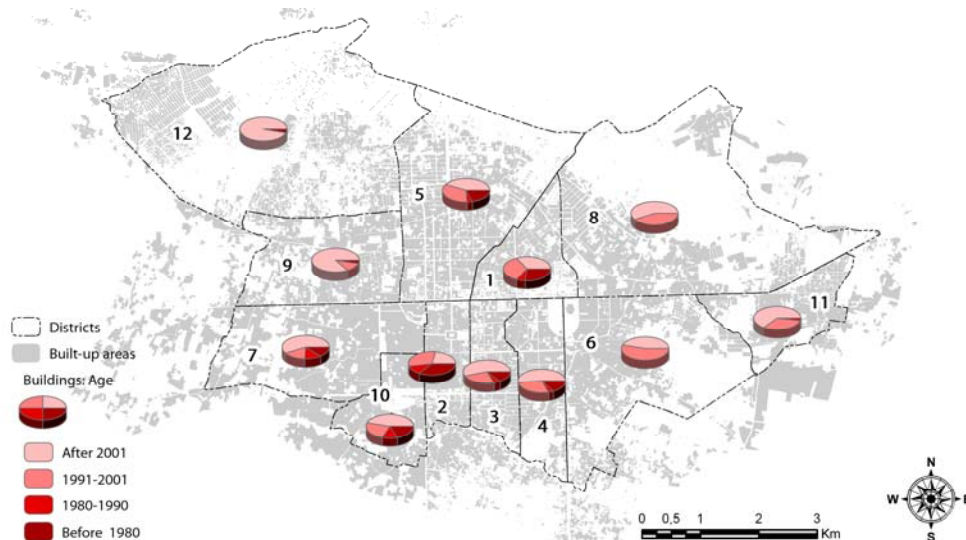

For more than 2/3 of Herati families the main source of income is labour or clerical work. Entrepreneurial activities are the main source of income for one family out of five. The percentage of families living on yields or annuities is very low (2.3%). Due to the high number of students and housewives, a low percentage of people at an active age (15-65) contribute to the family income.

It is very interesting to note how the occupational structure varies according to gender. Despite the fact that women represent more or less 50% of the student population (figure that testifies a great improvement in woman condition compared with the Taliban time), they play a very minor role in economic activities. Very few women embark on a profession after school or university and two out of three become housewives. However, women who enter the work market occupy relatively well-paid and prestigious positions.

A little fewer than 2/3 of households live in a house they fully own; 1/3 of households live in a rented house or are paying off a mortgage. Rented homes are mostly located in the old city and in the area to the north-west.

People express a very high level of satisfaction with regard to their living conditions. Above all, appreciation of their own neighbourhood is extremely high. On average, however, opinions vary according to the different aspects considered. Retail, and above all, religious infrastructures are considered to be highly satisfactory. On the contrary, schools, streets and health infrastructures and services are to some extent in critical condition.

Libraries and parks, followed by sports facilities, are among the amenities that people most miss in their neighbourhood and that would improve the quality of their lives. As expected, opinions regarding missing amenities vary according to age. The under-25s attribute more importance to libraries and sports facilities and less to traditional forms of entertainment like tea-houses. Opinions about missing facilities vary even more according to gender. Women attribute much more importance to sports facilities and to playgrounds for children.

**Fig. 2** - Age of buildings in Herati districts (*Source: our processing of the building survey data, 2012*).

Similarly to what has occurred in the demographic and social sphere, the profound transformation of the city in recent years has also affected its physical size and form, radically altering the urban landscape at a particularly accelerated speed following the fall of the Taleban regime. In order to implement the new Strategic Masterplan of the

<sup>3</sup>According to data of the World Bank, in 2011 the average per capita income (at nominal values) in Afghanistan was 400\$. The latest National Risk and Vulnerability Assessment-NRVA survey (Spring 2007) indicates that 42% of the population lives below the poverty line.

city, it was thus indispensable to carry out a survey on the extent and conditions of real estate. The survey was carried out between October 2011 and January 2012.

On the basis of the findings, the number of buildings in the city can be estimated at 54,841. It can be seen from Fig. 2 that a very large portion of the existing real estate was built recently: 54% of the total has, in fact, been built in the last 10 years. The pre-conflict buildings which, in this context, can be defined as 'historical', are concentrated in the centre of the city.

The urban landscape is still characterized by fairly low buildings: more than half have only one floor (above ground) and only one sixth have three or more floors. In accordance with traditional architecture, one sixth of buildings have a habitable basement which is useful during the very hot and very cold seasons.

Traditional one-storey or, at the most, two-storey houses still characterize in particular the historical quadrilateral; buildings in modernist style, again with one or two storeys, can be found especially in the area of 1940s urban expansion to the east of the city centre. Buildings with several storeys, recently built according to international styles are mainly to be found in the outer limits, particularly to the north west of the centre, while in district 12 (where the percentage of buildings erected since 2001 is as high as 96%) there is the highest percentage of buildings with three or more storeys. This building type is very common also in many interstitial spaces in almost all districts, occupying spaces which were previously empty, or substituting ancient buildings. One of the features which most characterize the new buildings is the sloping roof, in line with a widely imitated European taste and far removed from traditional architectural styles.

With regard to basic utilities, the condition of buildings, while showing a vast improvement in recent years, is still problematic. Almost all buildings are connected to the electric grid but blackouts occur because of insufficient capacity. In addition, just under two thirds of buildings receive water from the public aqueduct, while more than half still get their water from the well. As regards wastewater, only in 12% of cases does this flow into septic tanks, and in 1.87% of cases into a cesspool, with resulting environmental consequences.

The surveyed buildings generally contain a very limited number of dwellings: more than half include only one, the others from two to four. Overall, it can be estimated that there are 128,145 dwellings in the area of the 12 Herati districts.

The inhabitant/dwelling ratio and inhabitant/room ratios show average occupancy rates which, however, differ greatly according to district. To correctly assess the occupancy rate, it should be borne in mind that the average dwelling size is small: two thirds measure under 100sqm (5% less than 50) for families which are, on average, very large (7.1 individuals).

The collected data regarding the level of satisfaction among inhabitants with regard to their home show that the level of satisfaction is high on the whole, though not as high as that shown for neighbourhood. Overall opinions on homes, as for neighbourhoods, are broken down according to different aspects, but in this case the differences between one aspect and another are more marked.

In the analysis of different aspects, respondents surprisingly express a strong sense of security associated with their own home. It is very interesting that, while in the overall assessment there is a certain gradient in level of satisfaction according to territory– differing according to the aspects considered – there is no territorial gradient in the assessment of security level.

Consistently with the very high level of satisfaction with the neighbourhood, the respondents expressed a high level of appreciation with regard to aspects such as 'position', 'accessibility' and, to a lesser extent, 'equipment'. Rather more critical, instead, is their opinion of the size, state of maintenance and appearance of their home, especially in the south-western quarter of the city.

From a synoptic vision of the territorial gradient, we can see that in the south-east and south-west districts the level of dissatisfaction is much higher than average, signalling particularly critical situations in the urban context as a whole. From all the results, we can deduce that the high degree of neighbourhood satisfaction illustrated above is based first of all on strong feelings of social and ethnic belonging, rather than on the quality of local infrastructures and amenities, or on the quality of the own home. A crucial role is certainly played by a particular form of 'social capital', i.e., by the certainty of being able to count on the support of a wide family and social network in the immediate vicinity, in dealing with an external situation which is problematic in many ways and even threatening. The proximity of numerous relatives is a reality for a large part of the population, with percentages which oscillate between 25% and 40% of the total.

The importance assigned to a parental and social network and a healthy appreciation of the neighbourhood, together with a relatively critical assessment of the characteristics of their own homes would seem to indicate that in the future people will try to improve their living conditions by investing in their home (enlarging, building upwards), rather than moving to other urban areas.

## **TRANSPORTATION ISSUES AND STRATEGIC ACTIONS**

The strategic approach followed for developing the Herat Strategic Masterplan is based on a long-term vision: a sustainable growth for a performing city. The identified values - economic, social, and environmental sustainability – led to the definition of objectives and actions able to realize the shared general vision. Under this perspective, the

planning procedure entailed a sequence of steps, which led from a survey of the existing situation to the identification of the developing scenarios and the main problem areas, right up to the formulation of appropriate action to resolve them.

With regard to the transportation urban sub-system, the surveys mentioned in Section 1 have been realized about daily people trips, traffic flows, urban transport infrastructure (roads, parking, facilities, etc.), and public transport services. The collected pieces of information, joined to the surveyed data about population and other urban issues, allowed to achieve a comprehensive analysis of the current status of the Herat's transport and mobility.

Furthermore, a fundamental step in planning transport structures to ensure a city's efficient and sustainable development is the estimation of demographic changes in the urban population over the same time period as the plan, which in our case is the twenty-year period up to the year 2031.

In order to formulate this estimate and draw future scenarios, a demographic model has been developed, based on the 2011 population survey data and appropriate modeling techniques [2]. Based on the future scenarios outlines, further transportation planning activities, including the identification of objectives and actions, have been performed with a multidisciplinary and shared process integrating all the other planning action lines developed within the Strategic Masterplan.

### **The current status of the Herat transport and mobility**

Situated in the far north west of Afghanistan, Herat has for centuries been an important junction for overland transport [3]. The ancient trade routes of central Asia also passed through, and in particular those which linked eastern Asia with the Middle East and Europe. Nowadays the roads which connect Herat with the surrounding regions still follow the direction of the ancient trade routes (Fig. 3).

Apart from local roads, there is one road which leaves Herat and heads east to Iran, another which goes north to Turkmenistan, the northern half-ring of the so-called Afghan Ring Road in the north-west, the East-West Corridor in the west and finally the southern half-ring of the Ring Road towards Kandahar in the south.

Apart from the two links with Iran and Turkmenistan, these roads lead to the capital Kabul, situated at the opposite end of the country. Until 2011, all the roads connecting Herat with the rest of the country were so severely damaged by war events as to be impracticable. Only since 2002, after the fall of the Taliban regime, the government of Afghanistan has undertaken a vast investment programme for the reconstruction and improvement of the national road system, so that a large part of the road network around Herat has been recently rebuilt or rehabilitated.

Also in the city of Herat, like in the rest of Afghanistan, the maintenance and development of the transport systems have long been disrupted by socio-political events in the country. Nevertheless, in the last century, as Herat's urban fabric developed and changed around the ancient Old City (the original nucleus of the urban area), the road system grew accordingly. As a result of its rapid development in the last ten years, Herat nowadays has a road system which is neither completely homogeneous, nor clearly hierarchical and is not in a good state of repair.

Although some improvements of the city streets have recently been completed, the state of the road network is still quite bad. The major network amounts to a total length of around 410km, while the minor network (roads not suitable for motorized vehicle traffic) covers around 470 km in total.

At present, only some of Herat's streets are surfaced. The percentage of paved streets equals less than 20% of the whole network and less than 40% if we only consider the major network. In addition, the condition of the paved streets is rather poor because of lack of maintenance.

Road signs are generally lacking in the city: many of the urban roads have no vertical signage. Most of the city streets have one carriageway for each direction, and almost all city streets have two-way traffic. In the Old City are the majority of roads one-way, mainly because of their limited width.

The levels of traffic that use the urban network are higher on the main access roads and in the city centre, including the Old City. In the northern part of the city and along the north-south axis which leads to Kandahar, the traffic is swollen by heavy transport vehicles (estimated at over 200 trucks a day) which cross the city along the two roads to Iran and Turkmenistan. This heavy duty traffic is due to the Herat customs house, located to the north-west of the city.

Parking is poorly regulated in Herat: if on the one hand vehicles are frequently parked at the kerb, there is, on the other, a scarcity of proper parking areas, especially in the busiest areas of the city. Street parking is used on most of the city streets, although the parking places do not generally have horizontal signage.

There are not many street areas where parking is prohibited, although there is no street parking where the narrowness of the street does not allow it, such as in the Old City. If the width of the street allows, double and triple parking is a common practice which is preferred to the use of off-road parking areas. A few off-road parking areas are present in the city, in the form of both street level parking and covered parking areas in one- or two-storey buildings.

Public transport has been operating for several decades in Herat city, using different types of vehicle – buses, minibuses, the so-called 'coaches' (large cars not really built for public transport), taxis, rickshaws – run by two different government authorities, both under the auspices of the Ministry of Transport and Civil Aviation.

There are three bus lines, with a distance between 10 and 15 kilometres each, and they all converge at the northern edge of the Old City. The minibus service consist of two lines, just over 10km each, both crossing the narrower streets of the Old City, while coach service is quite spread but mainly converging in the city centre. Taxis run along fixed service lines and offer a better service with regard to the quality of the vehicles, but they are more expensive.

Rickshaws are commercial vehicles which have been modified to take passengers; they offer few comforts and can take up to four people.

The commercial speed of public transport services in Herat is not high. Buses and minibuses travel at a speed of between 10 and 15 km/h and rickshaws around 10km/h. Coaches and taxis are faster, with an average speed between 20 and 40 km/h. The total number of passengers transported every day is around 180,000 broken down as follows: around 6% on buses, 11% on minibuses, 35% on coaches, 27% on taxis and 21% on rickshaws.

The overall conditions of public transport in Herat are not considered to be very good even by the stakeholders who manage the service itself. One of the biggest problems is considered to be the lack of coordination between the two government bodies which superintend the service and between these and the municipality of Herat. Another negative aspect is that routes and stops vary considerably and are not always honoured by the driver, who try to follow easier routes according to traffic conditions. The quality of both public transport stops and vehicles is in most cases inadequate to the needs of an acceptable public service.

A fundamental asset for the long-distance connection of Herat is the airport, situated about 10.5 km south to south-east of the city. Built by the United States in the late 1950s and used for military purposes in the last forty years, only recently the Herat airport has been rebuilt by the Italian cooperation with an extension and a paved runway and, in 2011, the addition of a new international terminal (ISAF, 2011). The airport is currently for mixed civil and military use and it is expected a very fast improvement of flight supply after the airport upgrade to international standards [4].

As regards transport demand, just over half of households in the city of Herat (51.2%) own one or more vehicles. The share of households owning a powered vehicle (car, minibus, motorbikes, rickshaw) is quite low (42.3%). Of the households that do not own any motor vehicle, 9.0% own just a non-powered vehicle (i.e. one or more bicycles) and 48.7% do not own any vehicles at all. Anyway, the most popular means of transport are two-wheeled vehicles, notably motorbikes and bicycles.

The overall number of motorized vehicles (car, rickshaw and minibus) is quite low. The average motor vehicle ownership per 1000 people is about 25. In terms of global outlook, this value can be considered as being very low respect to the top scale reference, the United States ownership rate that equals a little less than one vehicle per inhabitant.

Being the population of Herat more than 493,000 inhabitants, the number of overall daily trips surveyed in the city is about 654,000. In nearly every case, the trips are fully contained within the urban area (95.4% of overall trips).

Mobility mostly concerns young people in the 15-25 age group (39.3%). Trips involving very young people (6-14) are almost 26% of the total daily amount, whereas 26-35 year-olds make less than 15% of the total number of trips. The number of trips of those aged 36-64 is higher (about 19%), while older people do less than 2% of total daily travelling. The mobility of children under 5 is very low (0.4%). Nevertheless, the female mobility pattern by age is very different from the male one. The female share of total mobility is only 25% compared to 75% male share. It is interesting to note that female mobility suddenly decreases after the age of 25: about 86% of female travelling is related to the 0-25 age group, while only 14% of trips concern women who are 25 years old or older, and no daily trips are made by women older than 65 years old.

The most popular transport method by far in Herat is walking: just under 60% of overall trips are made on foot, about 18% by car, 15% by motorbike, less than 4% by bus and less than 4% by bicycle. Non-polluting modes (walking and bicycles) are equal to about 63% of overall mobility. This modal split pattern looks very different from the ones that we find in western countries, where the walking share is noticeably lower and the motorized modes share and the bicycles share are higher.

Most daily travelling is done for purposes closely related to systematic activities: the total of home-work, home-school, and work commuting is almost 90% of all trips. The highest share is for home-work trips (44.8%), followed by home-school trips (34.5%). Travelling for non-systematic purposes, such as medical, leisure, shopping and administrative reasons, amounts to 7.8% of the total. Although the number of daily trips for school purposes is very similar for both men and women, a very small percentage of women travel for work reasons. Travelling for shopping is also mostly done by men, while women make more trips for leisure reasons.

The overall surveyed net generation rate for daily trips in the city of Herat is about 1.3 trips per day per person. It is calculated as the ratio between the overall number of daily trips and the total number of residents. Compared to similar rates registered in some other world cities, it can be considered a very low mobility rate. Benchmark data are not so different between cities, and average at around two trips per day per person. Cities in developed countries have relatively high mobility rates, and it is suggested that a highly-developed transportation system leads to higher trip generation.

## **Future scenarios**

Herat is moving towards rapid and substantial development which could be decisive in regaining its historical role as regional capital and key player in central Asia. As it moves forward, Herat must pay close attention to the transformation of its transport system, which is key to the economic and social growth of any city.

The demographic model developed during the Strategic Masterplan preparation showed that, within the considered timeframe (year 2031) the population will increase by about 130%, i.e. from approx.493 thousand inhabitants to more than 1,130 thousand inhabitants, due to the combined effects of immigration and births.

On the other hand, the urban fabric of the city of Herat cannot absorb an indefinite number of new inhabitants, but has limits to its capacity to absorb demographic growth. This corresponds to a maximum increase of about 210,000 inhabitants in the entire city (including some existing satellite towns bordering on the north side of the urban area), a figure which will be reached by 2021.

Rather than an enlargement of the existing city, the Masterplan undertakes to redevelop and reinforce the urban limits to prevent further overspill into the surrounding farming areas. It is thus proposed that the share of population which surpasses the capacity limit be substantially allocated to three new satellite cities outside the present urban area (Fig. 3). The three satellite cities, each large enough to cater for about 150,000 inhabitants, will be quite separate from the existing city and will not only be endowed with basic urban services, but all necessary facilities, making them real cities to all effects.

The expected demographic fast growth will dramatically increase the number of daily urban trips, while the planned allocation of a large amount of population in the external satellite cities will produce high concentrated traffic flows direct to the existing urban area. The modernization of lifestyles will probably lead to a substantial increase of the motor vehicle ownership rate, with a resulting increase of road traffic and congestion.

At present, the transport system in Herat is not adequate to its growth prospects. Decades of adversity have hampered the construction of new infrastructures and their correct maintenance as well as the establishment of efficient governance systems, resulting in a transport system which is severely and extensively lacking.

Nevertheless, it is expected that the connections with the rest of the country and with other countries will be completely restored in a relatively short time, and some important local project will be realized, such as the bypass road which will unite the two main roads for Kandahar and for Iran in the south-west quadrant (Fig. 3).

Taking into account these forecasted improvements, as well as the urban planning strategies that emerge from the need to allocate a large amount of population in satellite cities protecting the environment around the present urban fabric, and finally the expected changes in the size and distribution of traffic flows, some strategic actions have been proposed in the Herat Strategic Masterplan.

### Strategic actions

The approach adopted by the Herat Strategic Masterplan is founded on the sustainability of social development, economic growth and the environment.

As regard the first issue, the actions envisaged by the Strategic Masterplan must guarantee, as much as possible, that all members of the community, whatever their income, social position, age or gender, have access to transport. Accessibility favours inclusion and social cohesion and is necessary to guarantee that the transport networks can effectively meet the whole mobility demand, with positive repercussions on the optimization of the urban system and its cost-effectiveness. In Herat, this approach requires attention to several specific factors, such as cultural aspects (in particular those connected with gender) and restrictions due to levels of income, which occur in all developing societies but are generally inferior to those in mature economies.

In the second place, the Strategic Masterplan in the transport sector must ensure that in pursuing growth and development, the negative impact on the environment is kept to a minimum, avoiding the risk of impacting negatively on the balance between transport and environment. This kind of risk is generally greater in rapidly developing socio-economic systems like that of Herat, because of a more urgent demand for urbanization processes and the development of infrastructures and technology.

A third significant aspect is the balance between economic investment and the management of transport systems. From international experience it clearly emerges that in general, urban transport systems cannot be financially self-sufficient without some contribution from institutions. On the other hand, the effects of an efficient transport system on a community's economy will normally fully compensate for the financial imbalances of investment and management if the adopted strategy transcends a short-sighted, short-term approach. For this reason, the actions proposed by the Strategic Masterplan must be conceived with a view to the longer term, pursuing the maximization of the overall economic value of the urban system and its positive influence on the social and environmental conditions of the city.

Within this perspective, the actions relating to the transport sector are aimed to four main objectives.

The first objective is the consolidation and the development of Herat's infrastructural and organizational requisites as a key player in central Asia. Although this objective will be supported by the completion of several already envisaged government projects, the Strategic Masterplan indicate some further actions (Fig. 3).

One action is to optimize Herat's capacity to accommodate goods traffic through an area which will function as a logistics centre north-west of the city in proximity to the intersection between the bypass and the road to Iran. The logistics centre could house an intermodal terminal linked up with the soon-to-be-built railway network (see [5] and [6]) and customs house, the latter being currently located outside the municipal area. By locating them together in one site, all the functions connected with the handling of goods will be optimized, and the residential area will be relieved of heavy traffic.

Moreover, it is proposed to create a suitable railway network serving Herat, with connections to Turkmenistan, Iran and the south of Afghanistan through Kandahar (Fig. 3). This railway should also connect the above cited logistic centre of Herat, the industrial area and the airport south to the city.

Finally, these actions should be supported by a substantial development of the airport including the full compatibility with ICAO standards for international traffic, the activation of flights with other countries, a further upgrading of airport facilities and services, the creation of modal connections with urban and rural transport (integration with community transport, creation of interchange car parks), the setup of air cargo links for the transport of goods. All these actions could considerably boost the city's key role, currently penalized by poor existing infrastructures.

The second objective is the strengthening and reorganization of urban transport - through the upgrading or creation of roads and car parks as well as the organization and regulation of mobility and interchange - to ensure that it is adequate to the mobility demand of Herat in terms of quality, transport capacity and management efficiency.

It will be necessary to address the network's current infrastructural inadequacy through actions to improve the physical conditions of the streets: road surfacing, efficient rainwater drainage systems, lighting, improved geometry and street furniture in all main and secondary roads.

It is also of vital importance to work towards the enhanced efficiency of the road network, by drawing up an adequate plan which guarantees optimized use improving the hierarchy of the sub-network of streets by reconnecting them and efficiently defining their sphere of use.

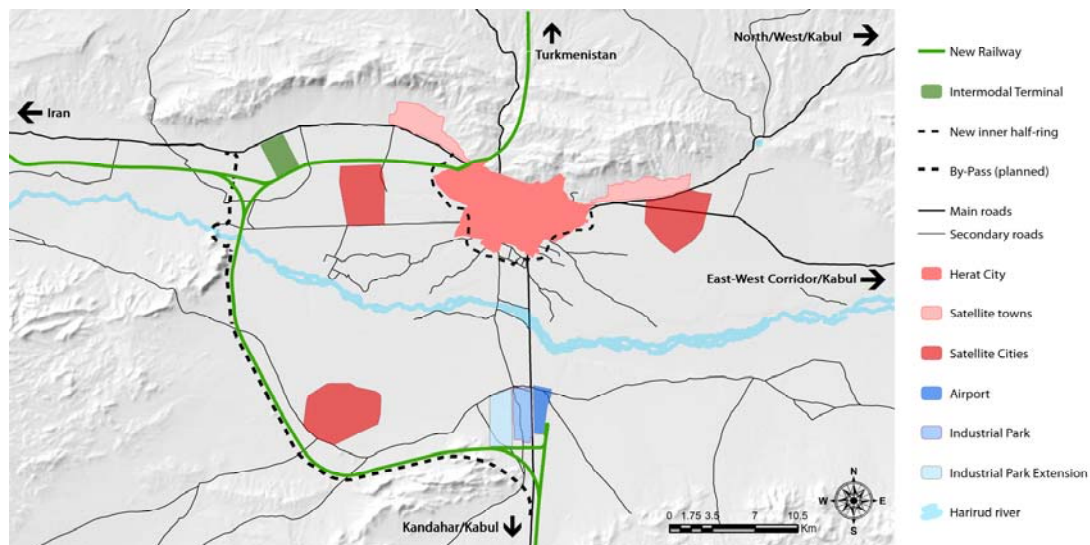

Fig. 3 -The new Herat's transport connections (Source: author's processing).

From this point of view, it appears necessary the creation of a half-ring road which will go from the north west to the east of the city and on to hug the south side of the urban area (Fig. 3). This road will connect extra-urban routes which come from four cardinal points and, being a fast road, will discourage traffic which neither originates nor ends in the city from crossing the urban area. This new inner half-ring, which can be accessed from the radial roads, will allow transit and express traffic to circumnavigate the urban area and avoid the centre of the city. At intersections there will be a public transport service, and the possibility to construct interchange car parks to allow speedy entrance to the city without the use of private cars and the relative problems of finding a car park.

The creation of a new inner half-ring can be accompanied by the targeting of areas of particular historical, social, cultural and environmental value which need to be protected from motorized traffic, the adjustment and improvement of the parking system, the creation of a possible network of cycle lanes to favour non-motorized transport which is more virtuous in terms of energy and the environment, the optimization of urban travel for the transport of goods, the adoption of smart technology solutions and Intelligent Transport Systems for managing traffic.

A third objective is the optimization of the urban public transport. If managed well, public transport is the most efficient type of motorized transport from the point of view of both energy and the environment.

In the city of Herat the rate of public transport use is extremely low, i.e. less than 4% of total trips, and the level of service offered by the public transport system is also proportionally low.

On the other hand, the very high rate of trips on foot, equal to about 60% of total trips and at present bolstered by the low number of private cars in the city, can be considered potential users of public transport. The latter must be compatible with the city's culture, affordable and offer a high level of service, being efficient, organized into main lines, i.e. routes where there is high demand, and lines which feed these routes. In other words, it is necessary to create the conditions to raise the level of public transport in terms of vehicle quality, regularity, speed and route preferentiality.

The level of service offered is, in fact, the main element which attracts transport demand. From the mobility data available and the expected increase in population rates, the mobility demand appears to be compatible with a light rapid transit (LRT) system running on its own tracks, separate from road viability system on a certain number of routes which access the city centre. The planning of such a public transport system needs to be joined to a reorganization of public transport in mixed traffic, that would appear necessary from both a management and functional point of view, and the

establishment of an automatic ticketing system, which is at present not available in Herat, in order to streamline trips and allow economic control of the transport system.

The fourth objective is the establishment of effective urban transport planning and governance through continual sustainable planning processes and the development of the managerial skills of local authorities. The achievement of the objectives of social, economic and environmental sustainability greatly depend on the correct planning and management of integrated multi-mode mobility.

It appears necessary to undertake the development of a sustainable Urban Mobility Plan, or rather a sectorial plan which aims to meet the mobility needs of the city, thus raising the quality of life [7], as well as the development of better skills among local institutions for planning and managing the transport system.

## ACKNOWLEDGMENTS

This research project was supported by the Direzione Generale per la Cooperazione allo Sviluppo of the Italian Ministry for Foreign Affairs.

### ABSTRACT

The South East Europe Transnational Cooperation Programme provides for the improvement of the territorial, economic and social integration process for the development of the South-Eastern Europe. It supports and contributes to the cohesion, stability and competitiveness of the area through the development of transnational partnerships and joint actions on matters of strategic importance, divided into four priorities as follows: innovation and entrepreneurship, environmental preservation and protection, improving accessibility and development of transnational synergies for sustainable development. The research activities on these fields are highlighting the close interaction between the diffusion of innovative interdisciplinary interpretations of the territory, and enabling sustainable forms of development in fragile areas and sensitive environments and landscapes.

The project "Access2Mountain", funded by the EU through the European Regional Development Fund (ERDF), perfectly matches within this strategy. The main objective of the project is to develop a model of sustainable development applied to the mountainous regions of the Eastern Alps and Carpathians, in order to support decision makers for implementing and proposing strategies and innovative modes of transport and sustainable mobility, with the aim of stimulating development of the tourism sector. UNICAM has developed a system to support the decision-making process through the definition of a valuation model tested on seven regions: the Autonomous Province of South Tyrol, National Park Gesäuse region Mostviertel (Austria), District of Maramures (Romania), Region of Kosice (Slovakia), North Hungary (Hungary), District of Rzeszow (Poland).

The model will play three roles: 1, critical analysis of the transport model in place; 2, critical analysis of the status and potential of the territories; 3, project of new scenarios for a more sustainable transport system.

The South East Europe Transnational Cooperation Programme contributes to the integration processes of the non-EU member states and supports projects developed within four Priority Axes, as follows:

**• PRIORITY AXIS 1**  
*FACILITATION OF INNOVATION AND  
ENTREPRENEURSHIP*

- Develop technology and innovation networks in specific fields
- Develop the enabling environment for innovative entrepreneurship
- Enhance the framework conditions and pave the way for innovation

**• PRIORITY AXIS 2**  
*PROTECTION AND IMPROVEMENT  
OF THE ENVIRONMENT*

- Improve integrated water management and flood risk prevention
- Improve prevention of environmental risks
- Promote cooperation in management of natural assets and protected areas
- Promote energy and resource efficiency

**• PRIORITY AXIS 3**  
*IMPROVEMENT OF THE  
ACCESSIBILITY*

- Improve co-ordination in promoting, planning and operation for primary and secondary transportation networks
- Develop strategies to tackle the "digital divide"
- Improve framework conditions for multi-modal platforms

**• PRIORITY AXIS 4**  
*DEVELOPMENT OF  
TRANSNATIONAL SYNERGIES FOR  
SUSTAINABLE  
GROWTH AREAS*

- Tackling crucial problems affecting metropolitan areas and regional systems of settlements
- Promoting a balanced pattern of attractive and accessible growth areas
- Promoting the use of cultural values for development

The SEE Programme aims at developing transnational partnerships in matters of strategic importance, in order to improve the territorial, economic and social integration process and to contribute to the *cohesion, stability* and *competitiveness* of the region. To this end, the programme seeks to realize high quality results, and oriented projects of strategic character which are relevant to the programme area and objectives.

The Alpine and the Carpathian Conventions state sustainable tourism mobility as a challenge and call for cooperation on this topic among the countries of these mountain regions. Actually, sustainable tourist mobility is not well-developed in mountainous regions, especially in South-East Europe, as mountain regions are lacking sufficient sustainable transport facilities and facing major ecological impacts caused by individual vehicles.

Based on this fact, the project "Access2Mountain" was jointly developed under the leadership of the Environment Agency Austria. It aims at achieving *Durable environmentally friendly tourism accessibility* and connection to, between, and in sensitive regions of the Alps and Carpathians, benefiting all (potential) users through visualization of existing problems, awareness raising, development of common knowledge and creation of a monitoring base. In order to make this possible many and different are the objectives of the Programme, as follows:

- *Knowledge Objective* - Knowledge, awareness and capacity basis for transport problems and solutions with soft mobility established in mountain regions on different levels and for potential users.
- *Infrastructure/connection Objective*- Feasibility to increase soft tourist mobility in sensitive mountain regions exemplified in pilot regions; efficient, attractive, and competitive small railways and intermodal transport for tourism development in Alpine and Carpathian areas with similar problems but different backgrounds. Additional benefits for public everyday mobility and in some areas also for environmentally sustainable freight transport.
- *Transnational Mountain Regional Development Objective* - Strengthened peripheral mountain regions through innovative, competitive offers for –and raised income by– tourism, new accessibility possibilities and follow-up investment.
- *Environmental Objective* - Reduction of green house gases, pollutant emissions and segmentation, and thus sustained and improved quality of the environment.
- *Multi-level policy Objective* - Started/strengthened policy dialogue between/on transnational and EU level, policy development for the Carpathians; Strengthened strategic cooperation between two distinct transnational geographic areas and the Alpine and the Carpathian Convention.

With the long-term perspective of increasing sustainable tourist mobility, railway and multimodal connections will be improved and attractive offers created via pre-investment measures, pilot activities and investments. A policy dialogue on the sub-regional and EU-level, feedback loops with the (Interim) Secretariats of the Alpine and Carpathian Convention and the related working groups dealing with transport as well as the development of the Transport Protocol to the Carpathian Convention will ensure political and institutional sustainability of the project and broader dissemination in these two important European mountain ranges.

The project consists of 2 principle parts linked with each other: TRANSPORT & TOURISM.

Within the 8 Work Packages (WPs) every partners faces different issues and competences (Fig. 1), as follows:

*WP 1 - Transnational project and financial management.*

It covers all activities needed to coordinate project implementation, partnership and to fulfill the technical project obligations.

*WP 2 - Communication activities.*

Newsletters, brochures, conferences, and other activities and outputs are planned in order to ensure a coherent dissemination of project outputs, results as well as the publication of any other relevant material to be made available to the broad public.

*WP 3 - Analysis, traffic flow models and follow-up tool.*

This WP will examine the access to project partner regions as well as traffic flows. This shall support the creation of models that help to understand traffic flows in the areas and to what extent road traffic can be shifted to other modes of transport by including the effects of the respective regional pilot activities. The study will include a sensitivity analysis and an analysis of the environmental impacts of emissions caused by road traffic; an evaluation of the different transport routes; an assessment of calculation methods to be given to the regions will be trained to use this tools. First effects of pilot activities will be examined at the end of the project. Findings will be integrated in the final best practice collection of WP 5. The data provides important input for decisions on follow-up measures and investments.

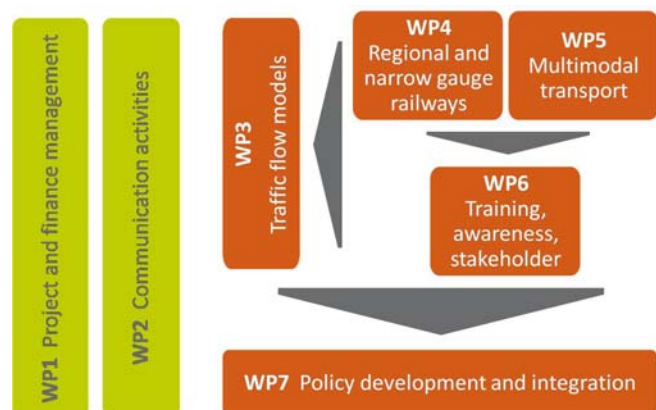

Fig. 1 - Work Plan.

*WP 4 - Regional and narrow gauge railways.*

The objective is to strengthen an efficient railway net in the Alps and the Carpathians with specific focus on small and narrow gauge railways to better use existing infrastructure rather than building new (road) infrastructures and achieving a modal shift for sustainable tourism in regions with natural assets is the objective of WP 4.

A collection of best practice examples on organizational, economic and tourism issues for small and narrow gauge railways in mountain regions, and an elaboration of concepts for "learning railway regions", will be fine-tuned and their implementation supported. The experience gained will be transferred to all partners and be integrated in a final best practice collection.

*WP 5 - Multimodal transport.*

Most common mode of transport to tourism areas in the mountains is individual motor car traffic, causing disturbances and damage. In many mountain regions, there is a lack of awareness and knowledge on how to avoid, respectively steer, individual motorized traffic and offer attractive public transport instead. This results in missing offers that allow or attract tourists to travel to, in or around regions by sustainable transport means. Train infrastructure does not exist in all regions or are badly connected. Additional modes of sustainable transport have to be used for tourists to reach their destinations. Sometimes bus connections for public transport are in place, though most are struggling for economic survival with deteriorating infrastructure and connections for tourism transport. Based on these identified lacks and gaps, this WP foresees a common learning based on existing best practices. This will provide knowledge and visions for starting work in the different pilot activities. Experiences made in the Carpathians and the Alps will be used as recommendations in WP 6.

*WP 6 - Training, awareness raising, stakeholder integration, communication, follow-up.*

Due to experiences of existing studies and projects there is a lack of knowledge on sustainable accessibility and mobility on different levels (destinations, guests, local people, etc.). Activities of this WP focus on the integration of the various target group to ensure the implementation and further work in sustainable mobility.

*WP 7 - Policy development and cooperation.*

Project results will be integrated into the work of the Alpine and Carpathian Conventions with regard to sustainable tourism and mobility. Further cooperation will be established, especially with the transport working group and the permanent committee of the Alpine Convention and the respective Working Groups of the Carpathian Convention dealing with transport and tourism issues, working on thematic protocols in these fields. Results achieved will be decontextualized and put into suitable formats for transfer in the Alps, Carpathians and other mountain regions such as the Balkans by seeking the involvement of UNEP (project partner EURAC) and Fedecrail. The Protocol on Transport to the Carpathian Convention will be developed. Recommendations for EU-policies in the field of sustainable mobility and tourism in mountain regions will be elaborated and adopted at the Final conference of the project.

This paper provides an overview on the Work Project n. 3, coordinated by the University of Camerino.

## **ANALYSIS, TRAFFIC FLOW MODELS AND FOLLOW-UP TOOL**

The main objective of this WP is to identify a sustainable tourist mobility system in mountainous areas, the most fragile and delicate in terms of the landscape, in the Alps and the Carpathians. To this end, the study consists of three parts in a first phase, which then converge in an operating model for decision support:

- the analysis of the current transport system;
- the definition of the landscape characteristics of the model regions;
- the identification of a new model compatible with the landscape fragility in the places of interest.

*Analysis and territorial characterization of the targeted regions and the current state of the transport system. Earliest strategic orientations related to the evaluation of the landscapes and tourist attractiveness.*

In the first phases of the research has been done a targeted request of data to each of the model regions. In addition to the information received, for the establishment of a homogeneous framework of knowledge (Fig. 2), a deep research has been performed on the data sources available on the net and in the literature. In particular were so elaborate some basic summaries of the current state of the different regions in territorial, socio-economic, ecological terms.

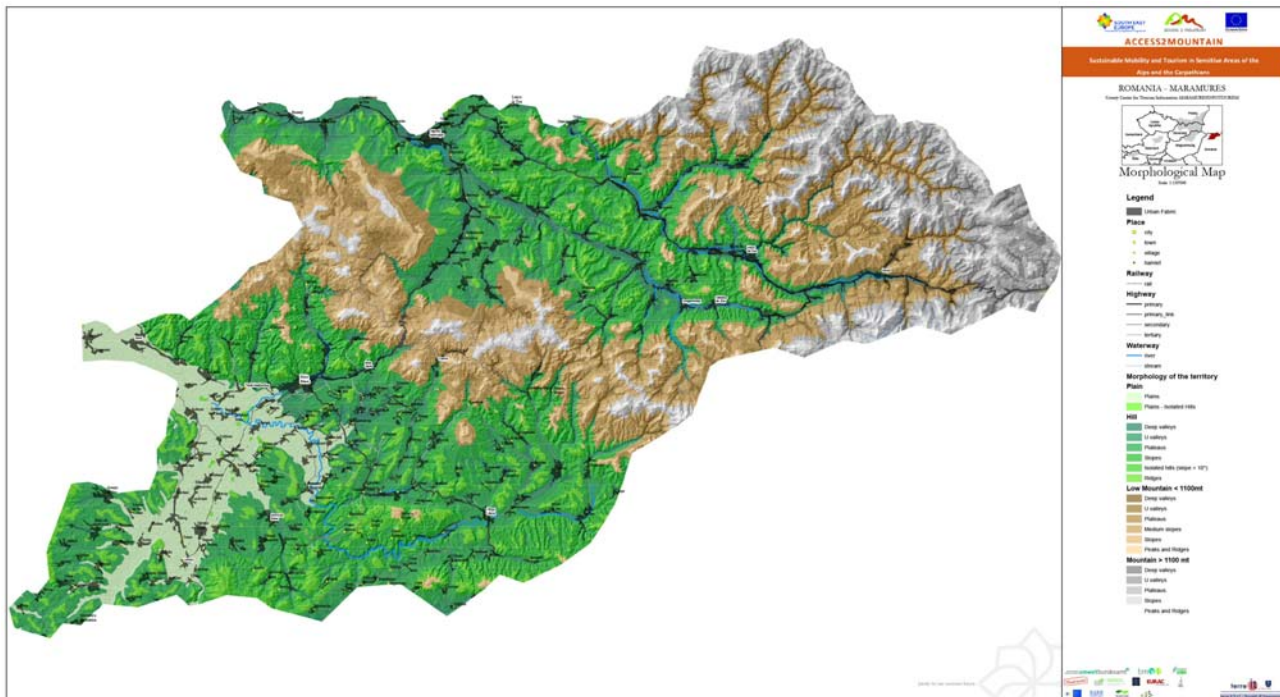

Fig. 2 - Maramures (Romania) |Territorial framework – Elevation analysis.

The study was implemented with the *SWOT analysis* (Strengths, Weaknesses, Opportunities and Threats) provided by the partners. Particular attention has been put on the definition of the landscape characteristics of the model regions. An effective approach to the local realities of interest for the project requires a dynamic and trans-scale consideration of their characters and problems, as well as the potential they present. This pertains to various regions. The notable historical, socio-economic, and environmental differences that are observed between model regions and their surroundings, the ecosystem fragmentation that has been brought about by development over the last century, and above all the largely shared intent to promote appropriate and sustainable forms of development for tourism and tourist mobility, confer a crucial role on the implementation of resources and infrastructures. This carries with it connections and interactions that often cross the confines of the individual resources, running into more or less wide contexts of different nature, and regarding, moreover, their co-evolutionary dynamics.

The first summary exploration of the areas in which current, or potential models of tourist mobility, could not avoid considering sufficiently vast and internally diversified territorial areas, in order to appreciate the different aspects characterizing them [1]: areas in general, with significant coexistence or proximity to natural spaces, different types of urban areas, or rural areas that are more or less affected by productive or touristic developments. The study showed how their spatial dimension can vary, including large forests or grasslands, more or less-protected natural reserves, villages or systems of interconnected villages, valleys crossed by local railways, or large tourist centres such as Tatra or Melk, etc. These areas are designated as “target sites” or observation areas.

Each site or area of observation exhibits within it a relatively large number of heterogeneous components (Fig. 3) that interact among themselves, even more for areas that are historically and biologically complex and diversified, and each component is well-characterized under the structural and functional profile. Because of this, it is important to avoid considering each one (such as large forests or grasslands, serial systems of villages, or cultural goods) as areas of observation rather than simple components.

In any case, however, in order to understand and evaluate what is there or what occurs in such areas, it is necessary to frame the areas in the contexts of interest (Fig. 4), that is, the environments in which relationships of various nature (ecology, landscape, economy, society/culture, etc.) arise and affect the observed area. This obviously does not mean “confined” areas, but areas of different size and those that are largely overlapping.

The reference to contexts opens the way to an effective comparison of model regions. But it is necessary to avoid the temptation to “cover” the entire territory of each model region with contexts. The identification, analysis, and evaluation of contexts (even if they can then assume a more structured character, for example with reference to “landscape areas” foreseen in the Italian Code that are coherent with the concept of landscape sanctioned by the European Convention), in this phase they serve simply to correctly observe the sites in question. It should be noted that correctness is not guaranteed solely by the technical/scientific rigor of the observation, but also by the active participation of local experts and the community, which often boast important “implicit” knowledge of the place.

It is important to note that in this phase, the recognition of both the components through which the observed area speaks and the contexts in which it is framed, can be assimilated in an interactive process that makes use of “probes” - or better, hot spots - in a flexible and dynamic way, on which to begin the necessary close examination without the pretext of completeness or exhaustiveness.

Through direct sampling, landscape features of the various contexts have emerged [2]. When defining the model, it will be necessary to measure the evaluations relative to the different transport systems, both existing and programmed, on the basis of these initial characterizations, with particular attention to:

- the landscape character of the site (protected areas or other areas of natural or landscape value), its fragility, its carrying capacity, and the elements present that detract from the landscape or environment;
- current ways to reach the site, evaluating their possible critical limits;
- intersections and continuity within slow systems at the site in question and fast systems to reach or cross it;
- the contiguity or proximity between the site and other areas with more accentuated transformational dynamics.

The information related to each area of observation are synthesized in maps, several birds-eye view photographs, and the description of the landscape sense of the site, accompanied by explanatory figures and descriptions of the fragility of the sites from the naturalistic point of view.

Fig. 4 - Example of observation areas, Kosice Region, Slovakia.

## CONSTRUCTION OF A MODEL FOR GOVERNANCE DECISION SUPPORT FOR A SUSTAINABLE TRANSPORT SYSTEM

The second phase of the project is still open and ongoing. As follows the methodology of the work for the construction of the model is presented. After a conceptual study of the model, the Maramures Region was selected as case study on which the model is verified operationally.

The A2M is a project aimed at outlining policies and measures for:

- on the one hand, *promoting the economic, social and cultural development* of mountain areas in the Carpathian area (in terms of reducing isolation and marginality, development of tourism and trades, revitalization of the economies and local cultures, etc.);
- on the other, and jointly to the first point, *reducing or minimizing the negative impacts* of traffic, transport infrastructures and the number of tourists, on the sensitive areas, the landscape, the environment and the natural and cultural heritage.

To achieve these goals, the working group has focused the attention on the definition of a *Decision Support System* that is composed of two parts:

1. **Guidelines** and indications for the definition of strategic scenarios useful to the designers in the definition of proposals for access to tourist destinations. The definition and construction of a guiding-vision (map), that focuses on the current state, the ongoing dynamics, trends, and changes of the territory, is the base for the definition of guidelines for the designer and the policy-maker in definition of the first draft proposals of the new organization of flows, focusing on specific crucial interventions that will lead to the implementation of the strategies (increases/decreases of pressures on an area, new accessibilities, infrastructure improvements and upgrades, new innovative forms of transport other than the existing ones).
2. **Model of analysis** of the various proposals that the planners or policy makers will introduce to evaluate the sustainability and environmental compatibility of choices. The model, which is an interactive tool, will never replace the role of responsible autonomy of designers and policymakers, but it will support them during the decision-making process, warning against the possible risks and impacts, potential or latent. It has the

character of extensibility and adaptability, even in the case of any future updates, and provides an explicit interaction between technical procedure and policy makers. The Model will ensure a triple role of:

- critic analysis of the infrastructural system current in place in each region;
- critic analysis of the state of the targeted territories of interest and their potentialities;
- project of improvement of the transportation system.

The UNICAM research group decided to proceed towards the construction of the decision support system by using a System Thinking (ST) approach. This is a rather popular approach for addressing complex processes, including planning. It is often used to supply a set of tools to address social, economic, ecological, and political challenges, aimed at developing effective Decision Support Systems (DSS) to improve policy making. According to ST theory, an independent system is analyzed by taking note of: the whole system, its constituent parts, and their interactions [3].

Such an analysis is expected to identify the specific internal structure of the analyzed system. ST considers that a specific internal structure can be held responsible for regular *patterns of behavior* (POB) characterizing the situation under investigation. ST assumes that similar POB arise in a number of different situations, but they can be linked to specific system structures (which are, in turn, held responsible for the observed POB).

Therefore, ST can be considered as an effective problem-solving method, to be used in complex management situations.

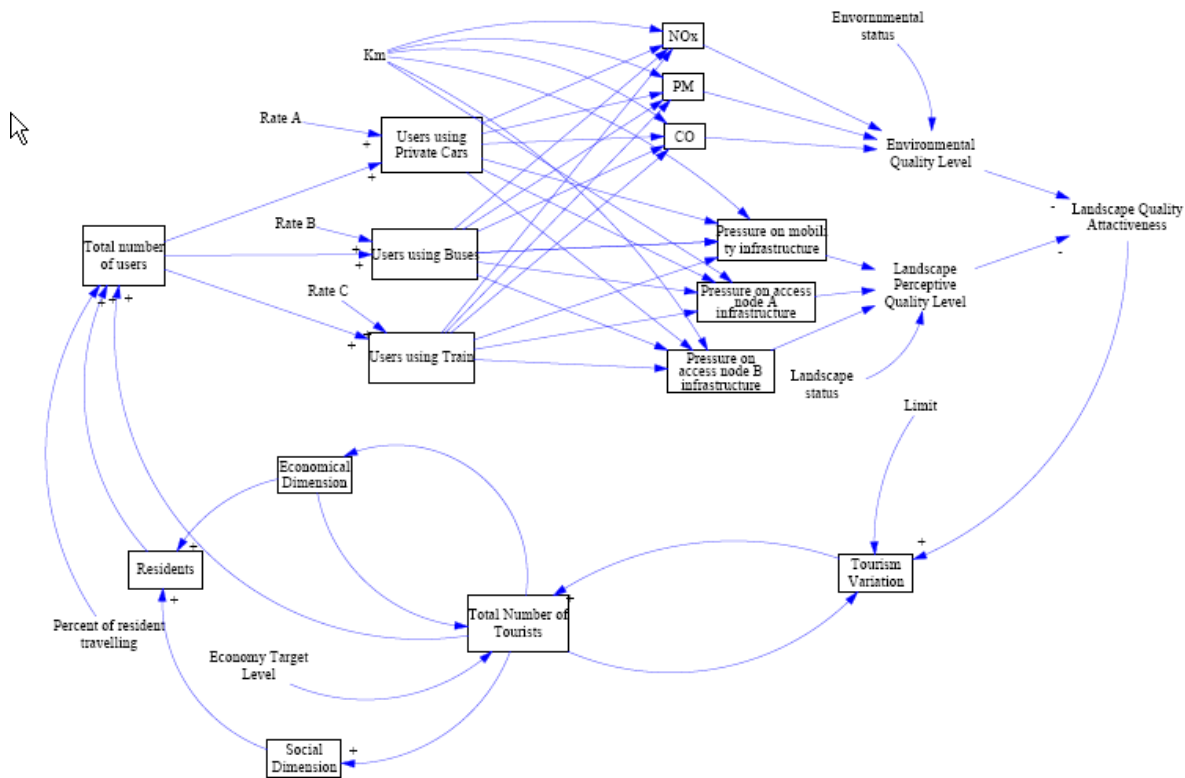

Fig. 5 - Example of the model structure.

The process of Systems Thinking and Modeling (STM) includes the following 5 steps:

1. problem structuring;
2. causal loops modeling;
3. dynamic modeling;
4. scenario planning and modeling;
5. implementation and organizational learning.

The most appropriate instrument used to describe the complex set of relationships among variables in a system is represented by the parts of the systems known as “loop diagrams”, which (when implying both the transmission and the return of information) can be called feedback or causal loops. These diagrams help to represent circular chains of cause and effect that create closed loops within an actual system.

In the case of mountain areas in the Alps and the Carpathians analyzed in the framework of A2M, the work group tried to isolate four domains (Fig. 2) which participate in shaping the overall sustainability performance of the local mobility and tourist system in each region.

## SELECTION OF THOSE SUSTAINABILITY INDICATORS FOR THE EVALUATION OF THE PROPOSAL

Through this model the infrastructure and transport systems can be analyzed and valued, both in place or in project [4]. In both cases the model can be applied on small stretches of infrastructure of variable geometry. Typical information that this decision support system might gather and present includes:

1. *Driving forces* - To achieve the best level of sustainability the model user can act on three levers: the number of users, the different modes of transport, and the spatial distribution of the flows, that requires a constant dialogue between the algorithm and the geographical reference system. The users are divided among tourists and resident users, and the modal splitting includes: car, train, bus, bike, ...
2. *Pressures* - Pressures are deeply related to the modal splitting, and therefore they change according to the typological diversification of the transport modalities. The different pressures are: land consumption, noise, carbon dioxide, nox, particulate, frequency, speed, landscape usage.
3. *Sensitivity Indicators of the territory to the pressures* - The Sensitivity Indicators for a territory crossed by an infrastructure, are defined in both cartographic and numeric manner. They are conditioned and influenced by the landscape and environment character of the current state of the area. The different sets of sensitivity indicators are geo-referenced on **complex base maps**. These maps, through operations of overlaying, allow the operator to obtain a complex and articulated database of risks and impacts (scenario), by using query tools of GIS data (such as the intersection), for each section of an infrastructure.
4. *Impact* - The definition of the impacts of the different pressures on different parts of the territory (which comply with different degrees of fragility and vulnerability to the same pressures) is characterized by the following set of indicators:
  - the ecological balance, the consumption of the essential resources and the physical environment,
  - the human health, the well-being and the quality of life at the individual and collective levels,
  - the quality (identity, legibility, panoramic views) of the landscape and the natural and cultural heritage
  - the local economy of the territory.

### Landscape-related indicators

- *speed impact*: indicator of the impacts of the speed of vehicles on the perception of the landscape by an external user.
- *Noise impact / silence quality*: indicator of the quality of silence. This indicator determines the impact degree generated by the transit of vehicles by road or rail.
- *Crossing speed landscape perception*: indicator of the perception of the landscape depending on the crossing speed.
- *Infrastructure construction quality*: indicator of the quality of the construction of the infrastructure.
- *Landscape capability*: indicator of the ability of a landscape, or part of a landscape, to be modified without negative effects on its own character. This capability can change degree, depending on the type or nature of the changes. The Landscape Capability is specific to a particular type of change or development. The Landscape Capability depends by: i) the Overall Landscape Sensitivity, which is the intrinsic sensitivity of the landscape itself, regardless of the changes that can be made on it; ii) the Landscape Value, which is the value attributed to the landscape by the national and local laws, and the recognized system of values, such as: the silence/quiet, the isolation, the naturalness, the scenic beauty, and the local context [5].

### Environment-related Indicators

The relationship between different categories of indicators is necessary on the evaluation of the impacts of the mobility system on the biodiversity. The first collects those indicators related to the infrastructure and traffic (e.g. structure of the edges of the roadway, traffic volume, etc.); the second, those related to the ecosystems affected by the presence of infrastructure and traffic (e.g. abundance and distribution of species, modality of dispersion etc..) [6].

- *Infrastructure Permeability*, that detects how the infrastructure interferes with the movement of the species. This indicator refers only to the construction aspects of the track and therefore, it does not depend by the use.
- *Noise*, that describes the effects of noise on the different animals communities, even at a certain distance from the source.
- *Speed*, that directly affects the risk of collisions between vehicles and wildlife. A higher speed increases the likelihood of accidents.
- *Frequency*: the traffic volume that directly affects the permeability of the infrastructure, because it is in direct relation with the investment risk of wildlife, and with the escape behavior of the different species.

The ecosystem-related indicators are useful to define the "Sensitivity" of the various parts of the territory to the pressures described above. This sensitivity will then be determined by:

- characteristics of the vegetation communities;
- presence of species/wildlife communities of special conservation interest, and/or particularly vulnerable to the pressures of the infrastructure system (large mammals, birds, amphibians, and reptiles);
- the role of the area in the system of ecological connections for large terrestrial predators (wolf, bear, and lynx);
- presence of areas of particular environmental value and institutionally recognized (AP, Natura2000, UNESCO etc.).

## RESPONSES OF THE DECISION SUPPORT SYSTEM

The answers are nothing more than the various analysis of the proposals that the designer and the decision maker verify in a context of comparative evaluation with the current state of the territory and the other proposals. These proposals become the key variables of the model (or the levers on which to act) and they shall include:

- the intensity of the access flows to the destination areas, or to any sub-areas, or to individual nodes;
- the percent breakdown of flows related to the mode of transport (modal split): individual car, bus, train, bike, and walk;
- the spatial distribution of the flows, for subareas, for types of access nodes, for individual nodes.

The three variables are applied to the three models (interpretation, potential, proactive), on the basis of statistical data both available or estimated (also depending on benchmark). Specifically, for the purposeful model of evaluation of the design hypothesis, even alternatives, the variables could result from the strategic assessment that includes the issues related to variability of tourist attractiveness [7].

In conclusion, the "Decision Support System" (DSS) holds together the *STRATEGIC DIRECTIONS* and the *EVALUATIONS* of the operational model.

This system is configured, in the final version, as a *tool for decision support*, able to interact at different design scales:

- wide area (region or sub-region);
- component (wide agricultural areas, tourist areas, mining areas, etc.);
- sites or structures (bridges, tunnels, etc.), specifically interesting for the Project.

The main function of the DSS is the ability of extracting, in a short time, useful information for the decision-making process from the analysis of a significant amount of data, and providing answers and guidelines for those who must take decisions of a project or, more broadly, of governance.

## BEYOND TOURISM: RECOVERY OF THE HISTORICAL AND ARTISTIC HERITAGE OF HAVANA

Micaela Scacchi\*

\*Department of Planning, Design, Architectural Technology, Sapienza University of Rome, Italy -

### ABSTRACT

Declared by UNESCO “World Heritage” in 1982, The Habana Vieja is the largest historic center of colonial type stored in Latin America and even today retains its traditional urban footprint, harmonious juxtaposition of different architectural styles. Through this paper we want to analyze the work of recovering the historical center of Habana, officially launched in 1994 through the Master Plan entrusted “Historian of the Oficina de la Ciudad de La Habana” with the Spanish Agency for International Cooperation, the Government Local, universities and associations for international cooperation. Twenty years after the start of this project is to assess whether it was put into play an effective movement of regeneration, having produced processes of participation and human resource development and economic premises, or if the risk was to be alone “staged” for tourists, rearranging some houses and central services attractive major, “just as they once were” only to recall nostalgically the past and recreate “typical situations”, imposed by mass tourism. There are many initiatives promoted from Italy, with the aim of creating opportunities for exchange and promotion of local sustainable development. As regards planning are promoted action as land resource management, planning, recovery of the historical-artistic heritage and urban services to enhance the identity of this country and encourage the participation of local communities. The historical, architectural and cultural heritage must be seen not only as “merchandise to show” but as a fundamental element for sustainable development from the perspective of social and environmental as well as economic, intended as a resource to protect and manage flexible and sustainable way to generate new opportunities, jobs and sources of income. If “pilot district”, (near the Plaza de Armas) is promoted restoration in style as a “showcase” for the mass tourists, in other popular and industrial districts (barrios San Isidro, Habana del Este, Marianao, Guanabacoa, and San Miguel del Padron) interesting workshops are promoted redevelopment with the participation of local communities. Cuba is a needy country but with potential and tourism is a key resource, but if it’s not properly channeled, may be detrimental to the identity. It’s important to guide their choices towards sustainable development and to engage in a process of urban regeneration through technical engagement and social participation.

According to Eusebio Leal Spengler, «*Freedom is not possible without Culture*» and it is from this statement that are born the following reflections on the role of universities and research centers in the recovery and development of the city of Havana. The Republic of Cuba has long been included among the priority countries of the Italian Cooperation and currently, as a result of the resumption of bilateral co-operation signed in Rome in 2009 and in 2011, Italy – Cuba relations are also active in the cultural field for the enhancement and development of architectural heritage, with the main goal to reduce poverty and promote the investment of the funds directly to the territory.

In planning, the Directorate General for Development Cooperation of the Italian Ministry of Foreign Affairs (DGCS-MAE), scheduled for the period 2013 to 2015, the Latin America and the Caribbean is allocated 10% of the total funds available. The University Coordination for Development Cooperation (CUCS) is part of this dialogue, and sees the collaboration and support cultural and economic fundamentals of comparison.

Cuba, despite signs of opening of these last years, it remains a needy country but full of potential, for which the tourism has become a fundamental resource that, if it’s not properly channeled, may be detrimental to its identity and increase still further the social and economic hardships. It will be necessary to address the future choices toward the Sustainability, valorizing and stimulating the cultural, environmental and human resources, also through the protection, development and management of the architectural heritage.

Thanks to the feedback received from international cooperation projects, especially in the Capital, there is a cultural movement, artistic and urban planning to ensure new results also in the process of local participation. Given the delicate political and economic situation, the question must be analyzed in a trans-disciplinary and cross-sectoral, with a cultural and organizational process, not easy to implement.

Founded in 1519 by the Spanish conquistador Diego Velázquez de Cuéllar, **San Cristobal de La Habana**, currently covers about 720 Km<sup>2</sup>, is welcomes more than two million inhabitants and is divided into 15 municipalities. Since the 90s of the XXth century, the international tourism recovery in Cuba, has brought considerable urban changes,

which has had to deal with urgent problems: the degradation of historical buildings and settlements; the devastation of particular value natural environments; the crisis of the local culture as a factor of identity; the emergence of social marginalization in so-called "*barrios insalubres*". Thanks to the expertise of Eusebio Leal Spengler was promoted to the "**Plan Maestro**", focused on the redevelopment and preservation of the historic city center, offering culture and tourism as main elements main elements of the process of regeneration and urban development. Leal argues as *«Tourism exists since the time of Erodoto and perhaps even before, from the first human migrations, but tourism always presupposes a comparison, because the tourists want to see, want to have fun, want to spend time in a positive way, and it is therefore important to create suitable spaces. However the city of Havana was not to give tourists their spaces, had to share them. For this I have tried to follow a principle of solidarity: first for us, for the Cubans, then to offer the world our work... We are poor, it is true, but we believe that poverty has dignity when it is accompanied by solidarity.»* [1]

Twenty years (1994-2014) since the General Plan what brought the impressive restoration process and transformation of "**Municipio de La Habana Vieja**", the colonial old town, declared UNESCO World Heritage in 1982, and endowed with an institutional, economic and legal self-employment structures?

Coordinated by the *Oficina of the Historiador de the Ciudad de you Habana*, in collaboration with the *Taller Nacional de Arquitectura y Urbanism*, this retraining has seen to participate of over 80 Countries, different institutions, university faculties, departments and research institutes, through active and interdisciplinary collaboration promoted by the *Agencia Española de Cooperación Internacional*.

The Habana Vieja occupies 50% of the city territory and represents the historical and architectural heritage of the city with a high value. Five centuries of history have characterized the territory compactly, structured by a dense network of palaces, streets, squares and monuments; the architecture reflects periods of great splendor, from the Spanish colonial, from baroque one to the neoclassical, until art déco. [2]

Fig. 1, 2 - View of the "Habana Vieja", from the center to the periphery.

Years of neglect, bad weather, lack of maintenance, deterioration and overcrowding have compromised this heritage, which is then inserted into a restoration program aimed at the promotion of "cultural tourism".

The principal purpose of building renovation was to contribute to the diffusion of the Cuban history and culture *«through the preservation of symbols and material and spiritual expressions of the nationality [...] and of the historical-artistic-cultural memory of the city, above all of its historical center, the largest colonial center of Latin America»*. The process of redevelopment has initially focused "in the pilot block" (Plaza de Armas; Plaza Vieja; San Ignacio, Plaza del Cristo, Amargura, Bernaza, calle Mercaderes ...) through a stylistic restoration of most tourist streets, squares, monuments, religious complexes and buildings with typical *patios*, which accomodate now "cultural case", commercial, reception and catering, granted and managed by Habaguanex S.A. (company of Oficina).

Today, the investment plan for 2009-2015 previews the completion of the process through the consolidation of the most popular "barrios", the main centralities, the administrative offices and production activities and trade. [3]

From the town-planning point of view the financings and the efforts are concentrated on a structural, aesthetic and technological reorganization of the more popular zones; a slow and difficulty process of urban regeneration is begun block of houses by block of houses, also intervening on the residential buildings and on the back-roads, returning public spaces and small gardens, inserting again commercial activity and, so, recreating "pieces of urban life", outside of the more frequent tourist circuits. But the international proposed projects are often difficult to implement, in a territory where a monetary system, tied to mass tourism, with derisive benefits for the population (which has no direct access to convertible currency). The various initiatives of cooperation allow, however, to the Cuban people to activate itself turning passivity into active form, often silent but hard-working.

Many of the initiatives promoted inside of the Cuban territory, is carried out through the "**Program of Human Development at the Local Level of the United Nations (ONU - PDHL/CUBA)**", that has had beginning in 1998, on the base of an agreement between the Cuban government, the Italian government, the UNDP and the UNOSP, and is used in recent years as a frame of reference. [4]

Currently, about a quarter of the historic buildings have been restored, the main squares have been equipped, is revitalizing the waterfront (El Malecón), increased green areas and have created new centers and suburbs to receive the evacuees from the center (Vistamar, Habanamar). However there is still much to do and, currently, the urban plan is oriented toward a Special Plan for Integral Development (PEDI), designed not only for the promotion of tourism, but also to control the urban development of the context. The operational experience, derived from the “Plan Maestro”, have been integrated with a strategic vision of each urban problems.

Fig. 3, 4 - Before and after the building restoration (San Ignacio – Habana Vieja).

The last five years (2008-2013) has seen many projects directed to promote a pragmatic strategy with concrete and multidisciplinary initiatives been born by the interchange of experiences among Italian and Cuban local community, to support of the active processes and democratic development of Cuban society. With the most recent projects it is tried to preserve and activate “the strong identity” of the historical center, not only for the benefit of tourists.

Italian Universities involved (Sapienza of Roma, Florence, Pisa, Venice, Milan Bocconi, Verona, Italy, Matera ...) along with various local authorities, have engaged in more than 50 projects to support the regeneration of the “historic barrios”, for produced innovative perspectives in the service of the residents, as “the hope of rebirth and better quality of life”. [1] You try to regenerate and to address urban and socio-economic development through small-scale projects (residences, schools, health services, cultural centers, small businesses, services related to sustainable tourism ...).

Fig. 5, 6, 7 - Typical local activities in the Habana Vieja.

Fundamental, in addition to the conservation of movable and immovable property, are issues related to the most degraded areas, to their property value and the study of sustainable models of recovery and development.

An important opportunity for international comparison comes from the **Annual Congress of Higher Education (Universidad)**, that promotes the development, collecting testimonies and projects on various topics, including architecture and urban planning, through the delegations of international universities, as well as cultural centers and cooperation. Thanks also to support learning activities and technological integration of *Institute University College de S. Geronimo in Old Havana* (2007-2010), the financing for building works joined the construction of a network for exchange of knowledge and best practices, as well as collaboration through design workshops and dissertations; training on methods and tools relief and filing; on consolidation techniques and models for reuse and tourism management, housing and culture. The main objective is the definition of some methodologies for integral recovery of the housing stock mainly based on few resources and materials available. [5]

Within the various phases of the PDHL/CUBA Program, the main activities concern the following points:

- promotion and intensification of dialogue and debate between the government, local, national and international actors and the local population;
- capacity building and structures of organizational-level cultural actors, technical and financial;
- promoting exchange of experiences, expertise and good practices between Cuban and Italian, European university networks;
- support creative processes and decision-making to preserve the artistic and cultural heritage and recovery of traditional building techniques;
- access to culture and student exchange networks , including through the application of new technologies; the improvement of basic local services, computerization and accessibility to telematic services (GIS enhancement of the historic center; multimedia class “Siena” in *University College of St. Jerome*; support to Gabinete de Archeologia de la Oficina and the Taller Nacional de Arquitectura y Urbanism);
- proposed model of urban planning and construction ( block between the *streets Teniene Rey, Habana , Muralla and Compostela ...* );
- renovation of historic buildings and monuments (*Plaza Jesús María; ex convento di Belén converted into senior center; the historic Cultural Center Union Fraternal...*);
- structural and technological rehabilitation housing projects; networks and restore basic infrastructure and service to both residents and tourists; urban requalification of buildings, streets, squares, green areas, health services, community centers and schools ( *Center Havana , Barrio Colon, San Miguel del Padrón ...* );
- promotion of micro- activities and revival of ancient local handicraft;
- new activities reception and sustainable type catering, respecting the historic center and the identity of persons (*casa particular, paladares*);
- first social housing project in partnership with APPI/PDHL, the Unity Investments Municipal Cadastre (UMIV), the *Oficina del Historiador* and other local institutions ( Community center ... )

Fig. 8, 9 - Municipal Strategic Plan (2005) – Civic participation and design workshop.

In the diagram (Fig. 2) is the process of Municipal Strategic Plan, approved in 2005, to complete the restoration of the most touristic area with the regeneration of degraded “barrios” (in this case the *barrio Jesús María*), around the port and in the suburbs. These blocks, in fact, don't benefit of the financings of urban regeneration promoted by the *Oficina*, but there did many cooperation initiatives. To activate the direct share of the population in this regeneration process is not easy, but the different artistic and techniques initiatives can involve each according to his capacity and possibilities.

In the first phase have been implemented workshops of collective participation that illustrate the main renovation, construction and infrastructural works. Based on the approval of the inhabitants and with the technical contribution, is prepared a map for the evaluation of problems and potential, which are derived from guidelines of the strategic plan.

In the *barrio Jesús María* (28.500 ab.), as in the near *San Isidro* (12.631 ab.) and to *Belén* (14.600 ab.) through a cultural and technical exchanges into the “**Laboratory of Integral Transformation**” were purchased and made available materials building and means for restructuring in auto-recovery of residences; were recovered former convents and disused buildings to provide health care, scholasticism and recreational to the bands weakest (elderly, children, sick); centers of orientation and polyvalent areas are predisposed; cultural workshop are activated and of small business, tied up to the world of art, craftsmanship and urban decorum. [6]

In a context of limited availability of resources, it is worth noting that the Universities of Architecture involved were able to reflect on their role, improving their knowledge of management practices and urban and social development, as well as the construction techniques and the ability to repair and “do not care dissipative” in the yards.

Fig. 10, 11 - Barrio Jesús María - Habana Vieja (the architectural heritage degraded; cultural events).

Another Italian initiative that aims to promote the sustainable development of Havana as opportunities for collaboration and community participation is the “**Project Habana-Ecopolis**”, promoted since 1998, at the national level by a consortium of institutions and Ong, as consultant in urban planning.

In particular is active with an urban rehabilitation process, not only in tourist area but in the poorest and degraded areas on the east side of town. Particularly, the scope of intervention includes territories with evident problems of degrade urban, environmental and social, as the unicipalities of *Centro Habana, Habana de l’Este, Regla, Marianao, Guanabacoa and San Miguel of the Padrón*. The main aim is to promote, with concrete actions, the improvement of living conditions and the diffusion of a great awareness and civic activity, always in the respect of the political and economic context. [7] The specific objectives concern, however, on urban interventions, services and infrastructure; on the natural environment; on the social and economic plan, strengthening the abilities and local tools for analysis, recovery and planning. In this programme the role of local communities is strengthened through the process of planning and administration of identity and local resources as key elements for sustainable development.

The main projects concern on different problem list:

- decentralization of tools and strategies for the future development of the territory;
- the participation of local communities in the urban regeneration; the project is based on the mobilization of territorial values (identity and resources) and subjects that express potential for self-development (*Consejos Populares, neighborhood associations...*);
- decentralization of services of assistance (ambulatory, cafeteria, training centers ...);
- implementation of systems for the protection and preservation of the natural, cultural and architectural heritage;
- enhancement of historical memory and tourism resources for the community (*Community Center of Marianao, meeting space and self-management of cultural, educational and recreational initiatives...*);
- urban regeneration; supply materials and technologies for the adjustment of private residences (the pilot project of the *barrio Colón*);
- decontamination of unhealthy areas and construction of the sewer system (*barrio La Corea ...*);
- education in the management of the environment and natural resources ( implement recycling of wastes, installation of solar photovoltaic and water collection system on the buildings ...);
- promotion of spaces, services and events of a cultural-recreational linked to religious syncretism and the “Cuban soul” (restoration of the *Museum of Guanabacoa, escuela de música y danza; Carnival Habanero y fiestas típicas...*)

Fig. 12, 13 - Project “Habana-Ecopolis” – Marianao (internal restructuring).

Fig. 14, 15 - Project “Habana-Ecopolis” – Marianao (installing solar panels).

Important was the participation of the **International Centre for the Conservation of Architectural Heritage - Italy (CICOP)**, which has coordinated and promoted the information interchange respect to the conservation and management of the historical-artistic, so much in the historical center that in the peripheral zones in the Habana.

It is noted, in particular, the restoration of the *Historical Museum of Guanabacoa*, defined as recovery of a typical example of Cuban architecture, container museum of history and Afro-Cuban culture.

Specialized courses and workshops were organized with the aim of promoting the relationship with the institutions and the local population and stimulate the exchange of professionals and specialists in the field urban and building.

In this way, trying to overcome the conception of the real estate value only for tourism and it motivates people to deepen techniques for sustainable development of their districts. The real estate, which, however is not for sale nor privatized, is seen as an important resource that through a sustainable restoration and management can produce jobs and local wellness. [8]

Fig. 16 - Historical Museum of Guanabacoa; Fig. 17: Barrio La Corea-San Miguel del Padron (urban and social degradation).

In recent years, one of the poles of greater urbanization is the district *La Lisa*, located in the metropolitan area, initially characterized by agricultural farms and family residences, but since 1970 has been turned into a planning laboratory and industrial areas, without adequate infrastructure and services. One of the more peripheral and degraded districts is San Agustín, consists of “*Edificios de microbrigadas*” in Soviet style, no proper infrastructure, services, recreational spaces and connections to the city. [9] Here, a very interesting project is promoted by the “**Laboratory LASA**” (Artistic Laboratory of St. Agustín), created by the artist Candelario, developed with Aurélie Sampeur. Active from 2008 it proposes projects of contextual art in the public space, it’s an open laboratory and self-managed, without owners. Its particularity is the activation on the territory of integrated projects on different topics, from the art to the economy; from the educational system to participation; from the urban decorum to the environment. According to Aurélie Sampeur «*it’s important to identify the cultural and historical-artistic patrimony, so that to preserve it and to transmit it to the future generations as resource...*» [10]

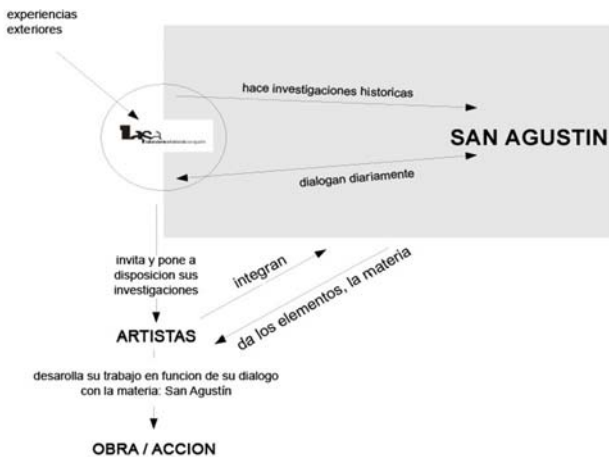

Fig. 18 - Operation scheme laboratory LASA.

Fig. 19 - Urban Regeneration Projects.

The particularity of “LASA” is, in fact, to integrate the knowledge of the urban context and the care of the architecture, public spaces and the environment as a project of Community to promote the upgrading and development of district. The laboratory develops regeneration through permanent and ephemeral works with particular impact on urban and services (building restoration; technology integration; maintenance and illumination roads; green project; artistic works, introducing a transport network with *omnibus*).

Fig. 20 - San Agustín – urban and social decay.

Fig. 21 - Initiatives to involve citizens.

The laboratory is a comparison of the participation and serious commitment, so that the transformations are of high quality, visible and integrated culturally and pragmatically to the context. “LASA” looks for the renewal and transformation of the district, through the overcoming of the economic limits and institutional influence on the arts. It seeks to create new interspace and interpersonal ties, through direct comparison between the artists, the society and the government. Despite the difficulties, the project has received widespread social feedback, and is supported by many international partner Embassies and higher education institutions, both Cuban and Italian (the Instituto Superior Politecnico Jose Antonio Echeverria CUJAE, the Goethe Institute of Havana, the Embassy Italian in Cuba, and the Italian Ministry).

## CONCLUSIONS

In conclusion, addition to projects related to mass tourism, have started minor interventions, “barely visible” but almost necessary for urban quality. The role of Universities of Planning confirmed the responsibility of higher education and the cooperation as an opportunity for real comparison between different disciplines and professionalism.

Through these experiences, it’s evident that this process, started twenty years ago, was not only a “staging” for tourists (partly conscious and sought), but has produce, also thanks to the involvement of Italian consultants, several initiatives aimed, on the one hand to bring funding, projects and a greater awareness among urban residents; on the other to a knowledge and interaction with the versatility and adaptability of culture and technique of Cuban population.

In a country accustomed to a total statism as Cuba, the involvement of the population made it possible to rediscover the rights, and the duties attached to a “sense of identity and community”. Urban regeneration of Habana can, therefore, be understood as a tool for sustainable social development, beyond just financial profit related to mass tourism.

## SAPIENZA MILLENNIUM. PROJECTS AND THOUGHTS. UNIVERSITY OF ROME SAPIENZA AND THE INTERNATIONAL COOPERATION

Maria Grazia Montella\*

\* Sapienza University of Rome, Italy - [mariagrazia.montella@uniroma1.it](mailto:mariagrazia.montella@uniroma1.it)

### ABSTRACT

In January 2007, the University of Rome “Sapienza” is committed, through the enactment of the Charter and the principles of the Declaration of the mission, to forge links with international bodies and national cooperation, serving as a “University of the Millennium”. This is one of the results of a working group set up by the University Council of International Relations, which has recognized the strategic importance of international cooperation for development, understood as the principal form of international relations, in virtue of the ethical and political commitments made by the international community for the reduction of inequalities and for the prevention and resolution of conflicts. Within this overall framework, we analyzed in the essay the activity of the High Level Course on the Millennium Development Goals, with particular attention to the third edition of the courses taken as the final result, an analysis report on a cooperation project between UN-HABITAT and Homa Bay, a small town on the Kenyan shores of Lake Victoria. The report was prepared by an interdisciplinary team of young professionals (Millennium University Studio Team) who, after following the course MDGs, conducted a reality studio for fifteen days in the town of Homa Bay. It is oriented to the analysis of the project LVWATSAN (Lake Victoria Water and Sanitation Programme).

This paper analyzes the results of the report and identifies the role of the MUST team and the role of the Sapienza University within a specific project of international cooperation, proposing an open debate on the ranking of Italian universities at a time of economic crisis and cuts the funds of international cooperation.

### SAPIENZA, MILLENNIUM UNIVERSITY

“Sapienza, University of Rome, adopts the notion of development as a common good based on the ethics of equality. Development must be pursued through programs and interventions that take into account the specific characteristics of individuals and social groups to whom they are addressed”. “Sapienza University of Rome emphasizes the role of research and education in international development cooperation” (Sapienza Università di Roma, 2007). Article I and Article V of the Charter of Principles for International Development Cooperation, issued by Sapienza University in 2007, reflect the increased role played from universities in the world of international cooperation in last ten years. The role of universities as promoters of international trade has a long history that began with the overcoming of national borders through the Erasmus program since 1994 (born in 1987 in fact), then associated with the Lifelong learning program for students and teachers in 2007. One of the first initiatives addressed to the growing internationalization of University Sapienza was the 2005 launch of the first Global Studio in Istanbul, which was followed by two other editions in 2006 and 2007 in Sydney and Johannesburg. The Global Study involved the international participation of students in projects of redevelopment of urban fringe in host countries. Seven years after the signing by the 191 member states of the UN of the Millennium Declaration, Sapienza is committed, through a process of consultation within the University Council of International Relations, to become the Millennium University and thus to subscribe the commitment to pursue the Eight Development Goals in future cooperation projects. The promotion of a network of universities that share the same values and the willingness to give the boost to a course of higher education among different faculties have been the two main and immediate targets that Sapienza is committed to achieve.

The first edition of the *High Learning Course on Millennium Development Goal* was launched in 2009 and has been a good achievement of participants, both of student and professionals at international level. It was the edition of 2011, which actually enshrined the beginning of an official relationship with one of the major international agencies for cooperation UN-HABITAT, the branch of the United Nations dedicated to Human Settlements. The main support of UN-HABITAT has led to the promotion of a *reality field study* in the framework of one of the projects developed in Kenya, in the Nyanza region, in the town of Homa Bay. The study was attended by the group of fifteen young professionals selected at the end of the course.

The project LVWATSAN - Lake Victoria Water and Sanitation Programme - focused on improving infrastructure of solid waste collection and treatment of sewage. The peculiarity of Homa Bay was given from the presence of several international NGOs, including Doctors Without Borders, as well as from UN-HABITAT willingness to engage in an

active way local population, through the establishment of civic volunteer groups, whose main purpose was raising awareness of the population to health issues addressed by the project.

The work of the group MUST (Millennium University Studio Team) lasted for fifteen days and it gave birth to a report of analysis of the project LVWATSAN oriented according to the Eight Millennium Development Goals. More, it was used to identify the activities that, in the project itself, went in the direction of the achievement of the Goals. The work presented at the UN-HABITAT in Nairobi at the end of August 2011 is forthcoming to be published.

## WHICH UNIVERSITY FOR WHICH COOPERATION

On the 3<sup>rd</sup> of December 2008 the General Director of Development Cooperation and eight Italian universities signed a Joint Declaration in order to pursue a common policy of cooperation, based on cooperation between universities and the General Directorate for Development Cooperation of the Ministry of Foreign Affairs of Italy. The innovation compared to previous policies in this field, where there were some universities already engaged in single projects of cooperation with foreign universities, precisely lies in the joint effort played from DGCS and the Coordination of Universities, which together gave birth to a concrete Italian system that can be beneficiary of funds as well as lender itself.

Three networks of universities were created throughout the country in order to more effectively coordinate the work. In each one of these three areas, a university was put in charge of being the coordinator: Politecnico of Milan and University of Pavia for the North region, Sapienza University in Rome for the Centre of Italy and the University of Palermo for the South area. The main advantage of this new organization is a streamlining of the economic and human resources (more universities can collaborate on a single project): thanks to this process the projects and cooperation initiatives promoted by universities in the field of development cooperation are considerably increased compared to usual national trend. In 2009 the project DaBaCU was put in place, coordinated by the Politecnico of Milan: it foresees online databases and web community for the collection and use of data on development cooperation of the Italian universities, and it embodies a useful tool for the promotion of activities of universities as well as seminars and conferences online.

The university is so totally part of international cooperation processes as a main character and as a carrier of concrete initiatives aimed at third countries in training and applied technology. This new role has been rediscovered and formalized also due to the reduction of dedicated funds from the Foreign Ministry for Development Cooperation from 2010 onwards. The 2010 financial law foresaw 210.940 mil of Euros for each one of the years 2011 and 2012, against 326.96 million in the previous one. In the attempt not to lose the wealth of projects and experiences due to that reduction in funds, a new kind of cooperation has been further developed that had not been fully exploited until that time, (the decentralized cooperation), which has seen primarily involved regions and local authorities. In this context, universities have been an added value and the so-called Italian-System has begun to play a significant role.

## GOALPOSTS. SCORING POINTS FOR THE MDGs, 2011

The main target of the MUST group while drafting the final report was to translate into concrete action the commitment of Sapienza towards the Millennium Development Goals (MDGs). In this regard, an agreement was signed for cooperation between UN-HABITAT and Sapienza, in order to contribute to the monitoring of the achievement of the MDGs in the project LVWATSAN, through the participation of young academics and university students of the post-graduate study cycle. In a joint attempt to previous activities the purpose was to try to contribute to the deepening from the Must group on what really was a project of international cooperation and which were the ways of relationship and participation between the population affected by the projects and international bodies as promoters. The goal of primary importance for Sapienza was the creation of a typology of partnership that could be replied between the university, the local population and development agencies, in the view of cooperating on small international projects, in which to enhance the role young professionals graduates and undergraduates.

The choice of the different MDGs around which to build the analysis of the project LVWATSAN and its trend has been carried out based on the specific skills of the MUST group members. The chosen topics were selected as the most relevant to the project and as based on the opportunity of carrying out a concrete analysis through field observation, interviews, focus groups, and documents produced by the local and UN-HABITAT local and national offices.

- Improving income generation activities (MDG1)
- Improving nutrition (MDG1)
- Improving primary education for boys and girls alike (MDG2)
- Improving health conditions for all (MDGs 4, 5, 6)
- Improving access to safe drinking water and sanitation (MDG7)
- Improving environmental conditions (MDG7)
- Developing a LOCAL partnership for development (MDG8)

The preliminary work to the writing of the report was the visiting of two locations near the area of Homa Bay, Kisii and Bondo. The main aim was the understanding of the geographical and human dynamics that had led to the choice of that specific area as a possible beneficiary of a *water and sanitation project*.

Then, ten days were devoted to the observation, to interviews and study of documents relating to the town of Homa Bay and, at the same time, to the drafting of the report, accomplished in the last two days and presented to the UN-HABITAT headquarters in Nairobi on the 17<sup>th</sup> of August 2011.

The peculiarity of the work conducted in Homa Bay is detectable in the *recommendations* of each paragraph and in the main conclusions of the report. Each group has analyzed the actual reality from the point of view of the population and of the concrete effects that the project had produced or was producing, both from the point of view of local officials and national bodies promoters. Some significant differences were mainly detected at the level of the interpretation of the results that the project would have had on the city and its population compared to the funds made available; comments on the sustainability of the project in the long-run and of its effects once it has finished; the deficiency in some cases, of a more structured and integrated overview that did not take into account the most urgent issue to be tackled while forgetting other deemed as complementary; suggestions about the opportunity of any partnership with national and international private entities and the increase of local partnerships, especially among schools and international donors through mechanisms of sponsorship.

### SAPIENZA AND DECENTRALISED COOPERATION: A THOUGHTFUL LOOK

The activities of Sapienza triggered by international projects can be classified particular academic domain theoretical and thoughtful research institutions to and proposals made by the analysis of the role of paper is limited to the project MUST and of the 2011, due to the greater ease information and official data, experience of the writer in the

#### *The timetable*

The duration of the entire been of about a month, of of course and fifteen days of field. The latter was divided preparatory visits in three the area chosen for the Bondo, Homa Bay), in order idea of the system-project and benefits not only to the single major project activities had (Homa Bay) but also in the

The vastness of the project LVWATSAN was not followed from actions particularly diversified and therefore, broadly speaking, in every city the interventions had been more or less the same: the construction of drinking water reservoirs; preparation of drinking water supplies entrusted to groups from the weaker sections of the population; constitution of groups of *microcredit for sanitation* in order to make it easier for the construction of baths in the domestic courts and to improve the cleaning of the daily city market. Probably the need to keep costs down (and, as a consequence, the lack of the opportunity to make the staying of the group MUST last over the fifteen days provided) along with the awareness of wanting to have an overview on the problem that the project faced, led to the reduction of the times which mainly affected on the analysis of the interventions in the town of Homa Bay. The core of the study actually was the writing of the analysis report and of the comments to LVWATSAN within the overall area covered by the project. Although there was an almost complete homogeneity of interventions in different cities, the response of the population had been different. The analysis of the MUST group was intended to rely primarily on qualitative data obtained through interviews and meetings with the inhabitants of the various cities. In Homa Bay there has actually been the opportunity to manage meetings, interviews and visits to projects in a systematic way, but the same not happened in the other two cities. Consequently, the report has been affected by this imbalance, bringing inside more news and commentary on the work of UN-HABITAT in Homa Bay than in Bondo and in Kisii.

#### **How does a university cooperation program arises:**

- 1. The initiative.** An Italian university makes the proposal to a group of other national academic institutions to cooperate on a project.
- 2. The partnership.** The network of Italian universities just created looks for other international partners that deal with similar topics in order to implement a joint program.
- 3. The action.** The result of the partnership is a network of universities that can cooperate. Increasing the number of participants to the partnership, the complexity of the projects will increase.
- 4. The involvement of local communities.** Within the involved countries, the university network looks for other entities that can be co-players in the implementation of the project (local community, NGOs, informal sectors, artisan businesses, etc. (Ministero Affari Esteri, 2012)

in the processes cooperation within that that is the support given from concrete actions project. The Sapienza in this experience of the reality studio of in finding as well as the direct project.

project MUST has which fifteen days *reality studio* in the into three days of different cities in analysis (Kisii, to make clearer the how it should bring city in which the concentrated surrounding areas.

## THE FOLLOW-UP

The work of the group MUST was entirely conducted in close collaboration with the local population, with the referent of Homa Bay of Multi-stakeholder Forum, a body of popular representation created specifically for the LVWATSAN, and with the local representative of the UN-HABITAT to Homa Bay. At the coordination effort and the willingness of these individuals to actively participate in data collection for the report, however, has not been followed by a follow up process of the project MUST either immediately, after finalization of the report (with the presentation at the headquarters of UN-HABITAT in Nairobi), whether as a result. Probably this distance between the strong demand for participation during the work and the lack of feedback, was due to the fact that the whole MUST project was a pilot one, the first of its kind carried out by Sapienza and therefore, with all the disadvantages and the mistakes of the case.

Unfortunately the lack of monitoring of the results and the impact that the analysis conducted by the group had (or had not) about the project and the beneficiary population, could have affected the entire work, dismissing it as a constructive experience for young professionals and researchers who formed the group MUST, but of little relevance to the actual LVWATSAN in itself and for those who work there, whether UN-HABITAT officials or local residents. This situation has produced a feeling of irrelevance of the work processes analyzed and compared with respect to the consequences that the work could have produced to the entire project LVWATSAN. Is it reasonable to think that at least some of the suggestions in the MUST report could be taken into consideration for improvement of the project? It might be possible to operate the micro-changes to a project whose funds were already allocated, whose aims and methods have already been decided? The risk of falling in the self-reference, both for the UN-HABITAT and for Sapienza, is in fact very large. How then overcome such a problem, which could make pointless the duplication of the interesting and potentially valuable experience of MUST?

## SUGGESTIONS (ad maiora semper)

The attempt to answer to the questions posed by the fact that the whole experience MUST should not only be read as a training course for a group of young specialists, but as an experience that has the potential and the force to rise to the role of the driving force behind any virtuous dynamics. Precisely in this regard we will try to understand how the results of the report could have acted on the project, analyzing for each of the seven points, one of the indications suggested by MUST team.

### Improving income generation

The main recommendation that appears in the first point of the report is as follows “*The evolution of the micro-credit for sanitation scheme into a micro-credit for business (as it has already happened in the town of Bondo) deserves attention, for it may be an effective tool for providing the necessary startup capital to a number of individuals and groups. The strengths of this institution so far seem to be: interest rates as low as 1% ; solidarity groups backing the borrower and guaranteeing his/her commitment to repay; some flexibility in repayment schedules; lending of construction materials (not money). The same modality could be applied to a business-oriented scheme*” (MUST, 2011).

The recommendation already contained an example of how it is possible, in the reality of the project, improve the income generation activities through the forms of micro-credit. In the town of Bondo a micro start-up had favored the creation of effective and well organized micro enterprises. Why not replicate the experience in other cities affected by the LVWATSAN? Considering this possibility could become a springboard for a joint development project (parallel or subsequent to LVWATSAN) with the UN or some other entity or with non-governmental organizations dealing with microfinance and development economics.

### Improving nutrition

“*A properly designed and effectively implemented SFP for Shauri Yako Primary School could address some of the nutrition and health problems of its pupils, particularly those belonging to vulnerable households. To this regard, either a regular SFP could be established or a SFP designed to target specifically the orphan pupils with limited financial resources, could be taken into consideration. This could take the form of private funding (regular donations) to support the initiative already taken by the school’s teachers* (MUST, 2011).

Even in this case, the recommendation has originated from an already activated action in a school in Homa Bay, thanks to LVWATSAN. The MUST research showed that the presence of the canteen is an incentive to the increase of the importance of the institution for the parents and how this implies an increase in school attendance and a decrease in the drop-out rate. Aware of the economic difficulties in whom are schools and municipalities, the study MUST proposed to make permanent school feeding programs through mechanisms of donations from private entities.

### **Improving primary education for boys and girls alike**

*“There is also a need to consider low-income children who missed primary education before free education was introduced. Although they are past primary school age by now, there is a need for rehabilitation centres for all children who are willing to learn, regardless of their age and especially if they face particularly severe economic and social conditions.” (MUST, 2011).*

The widest gender issue here was linked to that of equal opportunities in primary education for children. The group that worked on this goal tried to highlight the theme of gender across each of the main areas addressed by the other MUST groups. In this case, therefore, the relevance of the recommendations focuses more on the possibility that there would be, regardless of the success of LVWATSAN, an improving in the processes of schooling and a reduction of the gender gap also through targeted interventions in health (free distribution of hygiene stuff) preventing the dropping out of girls coming from the poorer sections of the population.

### **Improving the health condition for all**

*“Most LVWATSAN interventions are entirely acceptable if seen over a short-term period, but there seems to be a lack of an organic and structural vision. (...) In order to improve the unsatisfactory health situation, strong efforts should be made to implement actions in the field of prevention and information. Specific suggestions that can be offered are the following: school courses on risks and prevention of the most common diseases; Lower health care fees and make drugs affordable for poor people (not necessarily free, but token fees); increase investments in health-related infrastructure; provide grants for specializations in universities, with a compulsory training in local public hospitals; facilitate exchange programmes for doctors(...)” (MUST, 2011).*

This macro-area collects in itself almost all of the operations covered by the LVWATSAN and therefore represents the core of the recommendations made in the MUST report. It shows a lack of orderliness in the project and based on this it propose some on-goings improvements for the boosting of its effects on the target population. Here, too, the proposed interventions are small (establishment of information and prevention programs in schools on the most common diseases in the area, a lowering of the rates of certain medications most frequently used). They are also urged changes in larger scale, probably out of range of a project of the United Nations, but that give us an idea of a more complex planning that, if organized with public institutions, can lead to higher and most concrete results.

### **Improving access to safe drinking water and sanitation**

*“(...)More water tanks could help cope with the lack of water supply; Water kiosks should be always situated in strategic points convenient for the entire community, in order to reduce the distance from the households; The same price should be guaranteed in all water kiosks, and such price should be affordable and not higher than the one local water vendors charge;(...)” (MUST, 2011).*

The fifth objective analysis of this part of the LVWATSAN, considers some weaknesses (e.g. shortage in the supply of water tanks compared to the real needs of the population or the lack of attention to the price of clean water compared to that of sellers of contaminated water, etc ...) and tries to give directives to modify specific aspects in some actions already taken. In summary, do not propose new actions but simply an adjustment of those already in progress or tricks of those still to be made. Over all, a better and more careful management of new points of supply of drinking water, to be located in places easier to reach and lower prices.

### **Improving environmental conditions**

*“The MUST Team feels it is important to ensure the prompt implementation of the environment-related actions in the LVWATSAN project areas. In addition, it offers the following recommendations: promoting tree cultivation to prevent soil erosion; Establishing nurseries in partnership with the local community and schools; promoting the role of CSOs and CBOs” (MUST, 2011).*

In a project like LVWATSAN, based essentially on improving the environmental conditions of the place where it is implemented, there are few observations that it was possible to do in this field. The good work of UN-HABITAT in this area has improved the quality of waste disposal and as a result of the waters of Lake Victoria, the main basin of the resident population.

### **Develop a local partnership for development**

*“The MSF would probably function best as an independent body to ensure that it is able to maintain its independence beyond the life of the LVWATSAN project; work out of its own offices; become more visible and make sure it has mandatory representation from at least 50% of the community groups that exist in the town. Explore opportunities for partnerships between local public organizations and private entities and foundations. Develop partnerships with schools – create activities for pupils to improve participation into political and civic life. Consider a municipal “public space forum” (MUST, 2011).*

From the political point of view, in the broadest sense, the project LVWATSAN was not fully functional. The body that was supposed to represent the population actively involved in the project, MSF (Multi-stakeholder Forum), was underused and unrepresentative. Emptying it of the opportunity to take real action on the project, both in the preparatory phase and in the activity on the field, the whole project failed in its dialogic component. The beneficiaries of LVWATSAN, who were not personally involved in the project (with the construction of toilets, water tanks, etc ...), had no idea what it actually was and how the project could change their lives. The same MSF could encourage mechanisms of partnership with NGOs on the ground and with national private entities, if he had a greater bargaining power than what the project had given him. Exactly these were the observations of MUST, that enticed to develop stronger partnerships using the springboard given by LVWATSAN.

## CONCLUSIONS

The role of the group MUST and its pilot experience was important for two main reasons:

- It gave the input for a greater involvement of Sapienza University in international cooperation projects;
- It pointed out the positives and the negatives of involving young scholars and professionals in the field study experience in contact with the beneficiary population of a project and gave them the opportunity to deal with situations that are, for them, often only theory.

Thanks to the MUST experience, Sapienza can boast a concrete experience of working with an international organization such as UN-HABITAT, which can be used for opening new channels in the future collaborations. The publication of the report *Goalposts Scoring Points for the Millennium Development Goals* is an important initial step for watching Sapienza as the Millennium University actively engaged through paths of interdisciplinary research. The validity of such an experience lies mainly in the opportunity that was given to participants MUST to be actively involved in a project with large flows and to use their professional skills, acquired during their own course of study. What to do to improve and make more effective the action of a second MUST experience? Certainly the mode of interaction and preparation (modular course, written exercises, group choice based on demonstrated competencies) are to be retained, but perhaps it would be advisable to choose a project that is not already fully started. The next challenge may be represented by the inclusion of the MUST group, even as a listener, to an ex ante study of a new cooperation project. Engaging young professionals to the field study (or to a part of it) that precedes the formulation of a cooperation project would be an important step forward in the process of introduction of the university institution within the processes of cooperation, in which it can actually add value. The university research so acquire a new concreteness and would give in exchange for cooperation projects a look at theoretical and introspective, the lack of which is often due to path failures and missed goals.

# Imagining cultures of cooperation: Universities networking to face the new development challenges

## III CUCS Congress Turin, 19-21 September 2013

### PARTICIPATORY DESIGN AND BUILDING WITH INTERNATIONAL STUDENTS AND INDIGENOUS COMMUNITIES OF MEXICO

Alessandra Basile, Roberta Nicchia, Roberto Pennacchio, Andrea Tulusi  
Associazione Archintorno

#### Abstract

Archintorno is a non-profit association formed by young architects with seat in Naples. In the last 7 years it has promoted projects, in which European and Mexican students were directly involved in designing and building architectures that support self-help development programs proposed by indigenous communities of the Oaxaca State, Mexico.

The poster presents three Design-Build Studios, focusing on the complex participatory process that saw international groups of students and indigenous communities as main actors at each step of the projects.

With each community, the process starts with a first survey, where all elements useful for the project's development are collected, and a first exchange of expectations, ideas and arrangements takes place. The latter continues during the architecture design and with the choice by the community of one project among different proposals. After that, during the construction step, technical exchange among the participants is pursued; the attempt is to valorize local building materials, knowledge and expertise - and through this to strengthen the community's self-esteem - and to practically suggest possible improvements in these fields. Moreover, an important goal in this phase is the cultural exchange, which emerges spontaneously thanks to the experience of living and working together for some months. This aspect is also improved through an household survey lead by the students with the families of the host village, in order to understand local lifestyles and housing cultures. Main objectives in each project are to create integrated project and to stimulate networks of cooperation and solidarity on our territory and abroad, by involving different actors: public, private and the various expressions of the civil society.

#### Objectives

promote networking experiences  
 participatory process  
 cultural exchange  
 experimentation  
 valorize vernacular housing and building tradition  
 support communities project

cooperation  
 use local materials  
 create integrated project  
 create appropriate building  
 endorse local culture  
 training students

#### Achieved Results

**Casa Comunitaria/Community House**  
 site: Santa Cruz Tepetotutla, Chinantla Alta  
 request from: community assembly  
 type of intervention: recover foundation, new building  
 year of construction: 2006-2007  
 materials: concrete, wood, metal sheets  
 students involved: 60  
 students participating in the construction: 16  
 local labor involved: 2 carpenter, 1 bricklayer, tequio\*  
 local partner: ONG C.A.M.P.O., AC, Oaxaca, Mexico  
 major funding: Regione Campania, Assessorato all'istruzione, formazione e lavoro, Provincia di Napoli, Assessorato alle Politiche Sociali-Cultura-Pace  
 patronage: Università degli Studi di Napoli Federico II, Ordine APPC di Napoli e Provincia

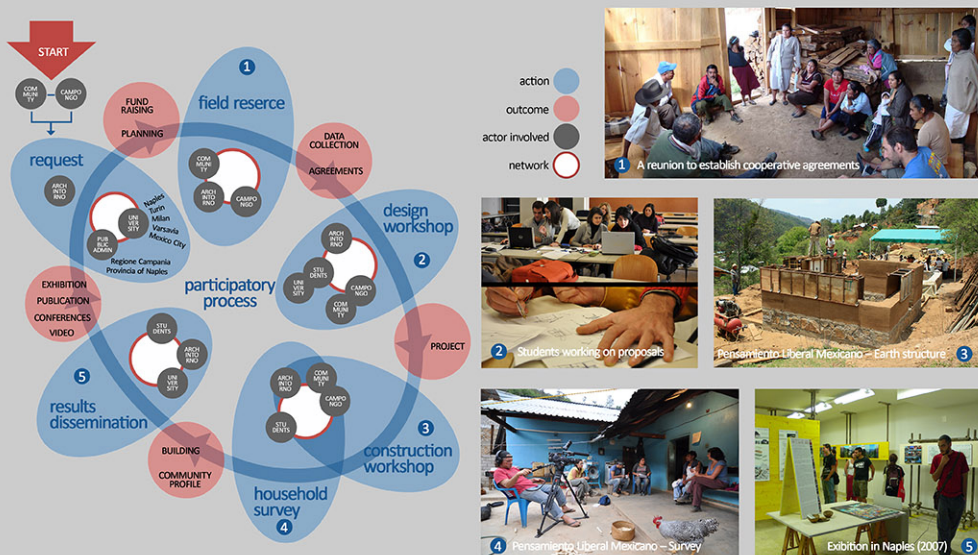

**Casa Comunitaria/Community House**  
 site: San Pedro Tlatepuc, Chinantla Alta  
 request from: community assembly  
 type of intervention: recover existing building, new floor addition  
 year of construction: 2009  
 materials: concrete, wood, metal sheets  
 students involved: 20  
 students participating in the construction: 11  
 local labor involved: 1 carpenter, 1 bricklayer, tequio\*  
 local partner: ONG C.A.M.P.O., AC, Oaxaca, Mexico  
 major funding: Provincia di Napoli, Assessorato alle Politiche Sociali - Cultura - Pace - Politiche giovanili  
 patronage: Università degli Studi di Napoli Federico II, Ordine APPC di Napoli e Provincia, Collegio Architetti e Ingegneri Monza

**Centro Microregionale de Innovación Tecnológica**  
 site: Pensamiento Liberal Mexicano, Valle Central  
 request from: coop. Grupo Mixto Rio Pluma  
 type of intervention: new building  
 year of construction: 2012  
 materials: rammed earth, wood, stones, tejamanil, metal sheets  
 students involved: 26  
 students participating in the construction: 26  
 local labor involved: 1 carpenter, 1 bricklayer, coop.  
 local partner: ONG C.A.M.P.O., AC, Oaxaca, Mexico  
 project partners: CRD-PVS Politecnico di Torino, Taller Max Cetto UNAM, Mexico City, MX  
 local partner: ONG C.A.M.P.O., AC, Oaxaca, Mexico  
 major funding: Taller Max Cetto, Politecnico di Torino

\*Tequio: each family offers some days of free work to its community each year, thus directly participating in the community development and his strengthening fees. The villagers supported students with this form of social work.

#### Methodological approach

#### Conclusion

The result achieved is not only the construction of the houses but is build up a network of relationships too. The active participation of the communities during the whole project process, the enthusiasm of the students and professionals involved, the interest of the Italian administrations and institutions are a strong sign of the value of the experience. The great number of actors participating, as well as their different nature and geographical origin, testifies the multicultural character and the richness of the experience. Regarding this aspect, in the coming years Archintorno aims to expand the network of actors participating in the process, while involving mexican Universities, students and civil society. At the same time, we aim to deeply understand and involve the communities in whole project thanks to the introduction of the household survey, this tool to allow us to build up more solid relationships between communities and us.

# Imagining cultures of cooperation: Universities networking to face the new development challenges

## III CUCS Congress Turin, 19-21 September 2013

### HAITI | 1 | Foyer d'accueil aux enfants démunis d'Haiti

Haiti, Leogane  
2011/2012  
Post-emergency project  
Orphanage facility construction

Architettura Senza Frontiere Piemonte ONLUS

Architettura senza Frontiere Piemonte (Architecture without Borders) is part of ASF onlus Italian Network and ASF International. It handles cooperative projects involved in the protection and the development of architectural and cultural heritage, participation planning, architecture and sustainable technologies, environmental conservation and the protection of civil rights.

As part of the mandate, ASF Piedmont aims to guarantee adequate **shelter for people in need**. In this specific occasion, ASF Piedmont has completed the facility of "Le Foyer d'Accueil aux Enfants Demunis d'Haiti", and that is located in the small city of Leogane.

**Leogane** is a seaside town in the West Department of Haiti about 30 kilometers from the Haitian capital, Port au Prince. On January 12, 2010 Leogane was at the **epicenter of the earthquake** that affected 3 million people, causing the deaths of 222,517 and injuring 300,000. The disaster it destroyed houses, hospitals and schools. In Leogane the earthquake has also destroyed the old structure of the Foyer along with other 19 facilities for children.

The new facility dwells around 30 children, most of whom are under the age of three. Some are orphans, while others need help because their families are without the necessary means to support, instruct and educate. The director and the staff tirelessly work daily at the Foyer.

The reception house for children set in a **rural area** next to Leogane. The building is as simple as its own structure and it is completely designed for children.

The structure is **child friendly**.

The space, bedrooms and bathrooms, are wide and ventilated which ensure a high hygienic standard. While designing this structure we looked for a solution able to respond to:

- seismic forces
- widespread safety problems
- bioclimatic architecture criteria
- self-maintenance of the building

The **construction site** has been a very important experience for local workers to be trained through the direct participation during the implementation of the project.

In these terms it has been crucial for them to be involved during the setting up of laboratories, workshops and in general **technical trainings** that in the end has brought to them an official certificate that proves their new expertise.

In this way the project has been an opportunity to develop local capacity building and will ensure last longing impact of the process through the exchange of professional technical knowledge with the workers and their communities.

The capacity building of worker has had a key role in the project.

**PARTICIPATIVE PROCESS**

**Beneficiaries involved during designing**

**Local community involved in the construction**

**CAPACITY BUILDING**

**Building site school: 15 trained workers**

**ORPHANAGE FACILITIES BUILT**

**30 children and staff accomodated**

## Conclusions are doubts

In any case, even if a project achieve the outcome, it keeps on asking us new questions:  
Is an imported material a sustainable material?  
Should be a sustainable project perfectly and easily replicated by locals?  
Is welfarism a solution?  
Can a cooperation construction project have a key role in the economic development?

### The end of the project is a starting point for new paths.

# Imagining cultures of cooperation: Universities networking to face the new development challenges

III CUCS Congress  
Turin, 19-21 September 2013

## ARGENTINA | Cooperation between Fossano and Rafaela

Argentina, Province of Santa Fe, Rafaela  
2013/2014

Multidisciplinary study on urban upgrading, social housing and urban agriculture

### From past experiences...

The collaboration of ASF Piemonte with the City of Fossano and the Municipalidad de Rafaela began from a partnership between the two cities, the co-operation work is based on a multi-annual program that is implemented through specific projects identified with exchange and comparison.

ASF has worked continuously with the City of Fossano and Municipalidad Rafaela with the following projects:

- o 2010 - participation Competition Europaid 2010, with the project Art Includere.
- o 2011 - Within the project "Municipalidad de Rafaela instruments of environmental sustainability and autonomous management of training automotive sector" of the City of Fossano, supported by Regione Piemonte, ASF oversaw a conference on sustainability and social housing in Rafaela and organized visits and meetings of experiences of social housing in Turin for officers and directors of the Municipalidad de Rafaela.
- o 2011 - With the programme of the Compagnia di San Paolo "Formazione per lo Sviluppo", ASF Piemonte has provided a grant for the training of a technical Municipalidad de Rafaela, who attended the graduate course Habitat, technology and development (HTS), training course of developing countries CRD III level of the Polytechnic of Turin and has done an internship at the City of Fossano. The goal of his training was to study issues related to the environmental rehabilitation of marginal areas, in particular the enhancement of floodable areas forming part of the hydrological system of risk management in the Barrio Barranquitas, a suburb where there are settlements.
- o 2012 - In collaboration with the CRD-PVS, ASF Piemonte has promoted an internship at Municipalidad Rafaela students of the Postgraduate Habitat Technology and Development, who developed a research on the urban regeneration of the Barrio Barranquitas. The presence and work of the students have created the opportunity to present and discuss, with the projects carried out initially in Italy and perfected in Argentina, the themes of urban redevelopment and new types of social housing.

### ..to new proposals

Addressing new research topics through the comparison will help to strengthen relations between governments, improve knowledge, exchange best practices and enable new development projects and co-development.

The presence in the field of students, the different project proposals and comparison with different actors, represents a very effective way to deepen the debate and raise awareness.

Urban regeneration, of social housing and urban agriculture are prominent: problems that this project aims to address with a multidisciplinary research group of the University of Turin (architecture, sociology, economics, agricultural science) facing a specific case study proposed by Municipalidad de Rafaela.

An opportunity made possible by the project UNI.COOP (University of Turin), which offers study grants in projects of development cooperation and that selected the three proposed mobility for the fields of sociology, economics and agricultural science proposals ASF Piemonte.

At the same time, two graduating students of the Faculty of Architecture of the Polytechnic of Turin, ASF members, have obtained the contribution of the Politecnico di Torino for the conduct of the thesis abroad.

All the steps are made in cooperation with local authorities.

Activities in the first phase are: study and analysis of best practices, frameworks and procedures; teamwork between undergraduates and graduates of the various faculties with case study analysis, thematic workshops organized by professors and aimed at specific training for this project.

Field research is going to be developed in Torino, Fossano, and during the staying of three months in Rafaela between October and December 2013.

### IMPROVE URBAN POLICIES THROUGH RESEARCH AND LONG TERM COOPERATION BETWEEN UNIVERSITIES, NGO, LOCAL AUTHORITIES

Multidisciplinary research applied to the Barrio must address the following issues:

- comparative approach and selection of international case studies, identification of best practices: architectural, social, environmental and economic, identification of public policies and housing policies that take into account the feasibility of interventions.
- concept of "productive and self-sustainable community" through the integration of vivienda social, agriculture, enhancement of public space, rationalization of housing development and economic aspects.
- evaluation of alternative forms of financing for redevelopment and urbanization, involving private investment through projects of corporate social responsibility.
- integration in the residential areas of services and productive activities: development of urban agriculture in public areas for urban renewal ("common lands") strengthening of participatory dynamics creation of local economies. Reflections on: mutual trust, willingness to cooperate in the creation of public goods, the ability to create socio-economic networks
- economic sustainability through the analysis of possible funding and procedures such as the DIY so as to facilitate access to the first home.
- architectural project of social housing integrated with private and collective green spaces, manufacturing processes of the artefacts, such as motors of participation and social integration and choice of materials and building technologies, such as opportunities to raise awareness and action for sustainable development.
- improving the energy behavior attention to the local climate and environmental issues, use of locally produced materials.

Polytechnic of Turin Postgraduate course in Habitat, Tecnology and Development

#### Abstract

A project proposal on the city of Quito, Ecuador, has been developed during the Postgraduate Course in "Habitat, Technology and Development" of the Polytechnic of Turin, in collaboration with the Universidad Central de Ecuador (UCE), the Ministerio de Desarrollo Urbano y Vivienda (MIDUVI) and the Distrito Metropolitano de Quito (DMQ). The main purpose is to start out a mutual comparison between different methodological approaches, hoping for a profitable combination of knowledge, appreciating the local strategies. The project started from the need of the Quito Municipality to conceive a new development plan for the southern areas of the capital that refer to the zonal administration of Quitumbe; the aim was to imagine new transformation scenarios according to the DMQ's strategical plan guidelines that hope to schedule a sustainable developing program before 2022 according to the perspective of Buen Vivir, which promotes equity and social inclusion. In the southern areas of Quito it is possible to observe the phenomena of informal settlements connected to problems due to land property. The informal settlements, or "barrios informales", developed without the previous installation of the basic infrastructures and without the related land property document. That happens because the people, settling down in these areas, are hardly capable in getting a house through the legal housing market; however they do refer to illegal landholders also called "traficantes de tierra", thus they pay the land fee without getting any regular property title. Indeed, referring to the city of Quito, we are not dealing with "land invasion", such as in many other South American cities, but with irregular parceling plans. From 2010 the DMQ started a massive process for the regularization of the informal settlements through its special department "Regula tu Barrio", helped by new legislative tools. The result of these dynamics is the suburban sprawl towards the marginal and rural areas frequently bound by ecological and agricultural protection, totally lacking in infrastructures and unsuitable for living. Our project outlines a possible response to the complexity of a such an urban reality, through the characterization of new land property strategies and the redefinition of the informal, regularized or not, occupied areas subject to environmentally restrictions, denominating them "ZEIS", "Zonas Especiales de Interese Agricolo e Social". The expected results deal with the environmental and economical improvement of the periurban scenario, its requalification through the spread of public utilities and the re-thinking of public spaces. The achieved results won't concern only with the increasing knowledge and experiences of the different subjects involved in the project, but also with a more valuable architectural and urban product.

#### Achieved results

The outcome of the project is the investigation, through operative methodology, of key themes about Quito's urban development, shared with many others cities of South America:

- regularization process of the land in informal settlements;
- policy and participatory instruments used by the municipality;
- land policy in Ecuador.

The project not only outlines new scenarios for the urban development of South Quito, but also prepares the ground for a fruitful and continuous collaboration between the involved institutions: Polytechnic of Turin, DMQ, MIDUVI and UCE. Moreover, during the internship in Quito, new themes have been pinpointed and follow-up projects have been outlined, even involving local NGOs and Quito hinterland authorities.

#### Objectives

The general aim of the internship was a student's professional training, which consists in the elaboration of a urban development project in Latin-America. Informal settlements and difficulties in finding official data have been the main challenges to address.

The specific objectives were the following:

- to develop relationship skills with Ministry and Municipality staff in order to elaborate a shared project, strongly related to the local background;
  - to acquire cognitive and methodological tools in order to analyse and compare urban development policies, to integrate the different aim and vision in the design phase
  - to support the creation of information sharing and collaboration between local authorities in Quito and Polytechnic of Turin.
- Building on this network next postgraduate students will be able to elaborate further projects.

#### Methodological approach

The work has been divided into 4 phases:

1. analysis and draft proposal
2. presentation of the proposal to local authorities
3. analysis on site through survey and interviews
4. project re-elaboration and contextualization

1. A draft proposal was developed in two workshops at Polytechnic of Turin during the Postgraduate Course in "Habitat, Technology and Development". The first project proposal was based on the functional and formal definition of the current urban boundary and on micro-actions in South Quito, focused on the requalification of the existing urban frame.

2. The proposal was presented to Quito local authorities that embraced the project. However they asked for further analysis on local policies. The municipality was interested in integrating the proposal into the current local processes. In detail, the DMQ required the elaboration of a pilot project in order to develop a proposal easy to reproduce in further interventions in the framework of South Quito requalification.

3. In order to address this request, a strong collaboration between local urban departments (Urban Planning Department and Quitumbe District Department) University professors and students and inhabitants of the neighbourhoods involved in the project has been set up. From several surveys and interviews with municipality staff a strong link between problems related to the ongoing massive regularization policies and low urban quality of the suburban districts has been identified. These factors contribute to the spread of the informal city which is growing without a plan.

4. After this work on site, a project was developed in order to offer a possible answer to these problems, through a urban planning proposal. The project is based on the identification of special areas within the parts of the city, declared non-residential zones, but occupied by informal settlements and subject to environmentally restrictions. These zones will be characterized by:

1. public utilities and high-quality urban spaces;
2. social housing to support the legal housing market;
3. implementation of land regularization process focused on the sprawl control.

The methodology described above has been integrated with ongoing participatory processes adopted by the municipality. As a result of this approach, inhabitants have been effectively involved, both in the design phase and in the following management of the public spaces.

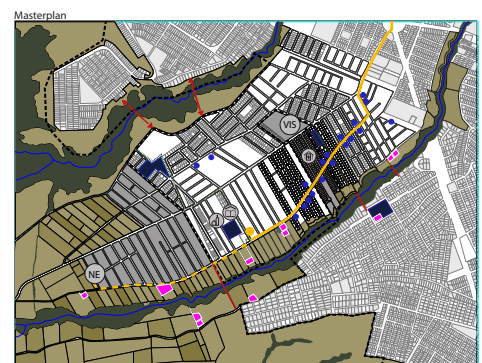

#### Conclusion

The researching and planning work, carried out during these months results in a strategic proposal concerned with urban policies and land property and, through a pilot project, outlines potential urban scenarios of requalification for the marginal areas in the southern districts of Quito; the aim was to suggest repeatable principles that could be also adapted to other suburban contexts. The achieved results were especially made possible thanks to the intensive relationship between the subjects involved and their different approaches to the urban issue. The cooperation between the institutions permitted to the students to enhance the project with their own personal and professional experiences for a more valuable urban and architectural proposal. Cooperation, therefore, was an important element for the good result of the project in its architectural and urban aspects. The conjunction of these factors straightened the already outlined cooperative relations between Polytechnic of Turin, DMQ and UCE; this could symbolize how academic and institutional entities can collaborate to achieve good planning results and help the students involved to improve personal working consciousness.

**Elimu na Malezi: psychosocial adjustment assessment in Tanzanian primary school children**  
**Massimo Cotichella, Emanuela Rabaglietti, Beatrice Sacconi**  
 Department of Psychology, Laboratory of Developmental Psychology, University of Torino, Italy  
**Samwel Kilimuhana, Vivian Nankurlu**  
 Department of Counselling Psychology, Tumaini University, Iringa, Tanzania

*Since decades the world has been facing an unrelenting globalization process; but then, there is a growing moral and practical problem, that is the great imbalance in world's resources distribution and life improvement opportunities between people living in Western Countries and in Developing Countries*

## Introduction

This pilot study aimed to assess social and relational adjustment in Tanzanian primary school children, extending similar projects already carried out in Western Countries [Pastorelli, Barbaranelli, Cermak, Rozsa, Caprara, 1997; Lansford, Capanna, Caprara, Bates, Pettit, Pastorelli, 2007; Ciairano, Rabaglietti, Vacirca, 2008]. As no information about similar studies realized in Tanzania have been found, the first goal of the project was to adapt the measurement instruments to the Tanzanian context. For this purpose and in order to cope properly with any cultural issue, the involvement of a local University was considered fundamental. The assessment of social and relational adjustment has been realized in two different contexts: urban and rural. A total amount of thirty children from two Tanzanian primary schools (fifteen from urban context and fifteen from rural context) were recruited to participate in this research. The instruments used were: Caprara's scales for psychosocial adjustment assessment (prosocial behavior, emotional instability, and aggressiveness, Caprara et al., 1992) and an Italian adaptation of Bukowski's Friendship Quality Scale (FQS, Fonzi et al., 1996; Bukowski et al., 1994). A self-report questionnaire (including the above mentioned scales) was administered to the children in two separate sessions: one in the rural context school, the second in the urban context school, at the same time in the day (morning) during the month of October 2012.

## Objectives

- 1) Instruments set adjustment to the very local cultural context, involving the local University
- 2) First assessment of possible distinctive features on Tanzanian children's adjusting processes to the adult world requirements

## Methodological approach

The questionnaire was first built in Italian than translated in Swahili by an independent translator. The Swahili version was checked and slightly modified with Tumaini's staff before the first administration. Two schools were chosen by Tumaini University as typically representative of urban and rural context within the Iringa region.

30 children (15 from each primary school) were recruited to participate in the pilot study. Specifically, the sample consisted in 20 females (66.7%) and 10 males (33.3%) aged between 9 and 12 years (M=10; SD=0.98).

A self-report questionnaire was administered; it included:

- ❖ Measures of psychosocial adjustment (Caprara et al., 1992) in three different dimensions: prosocial behavior, emotional instability and aggression.
- ❖ Friendship quality (FQS; Fonzi et al., 1996; Bukowski et al., 1994) in five different dimensions: intimacy/closeness, companionship, conflict, help/aid, security

A T test was conducted to verify if any differences occurred between: psychosocial adjustment and gender, friendship quality and gender, psychosocial adjustment and context, friendship quality and context.

## Achieved Results

As regards the **first objective**, an agreement between University of Torino and Tumaini University (Iringa, Tanzania) was signed to realize this project together. A selected group of Tanzanian students attended a specific training and participated to the administrations by reading the sentences and helping the children to fill the questionnaires. No misunderstanding problems were recorded during the administrations; children comprehended all the items of each scale.

As regards the **second objective** the findings indicate that **there aren't gender differences** neither among Caprara's dimensions of psychosocial adjustment nor among FQS's dimensions. Furthermore our findings show that the two schools differ significantly in the level of psychosocial adjustment and in particular in the level of prosocial behavior (Fig. 1). Precisely, **St. Dominic Savio Primary School (urban) reports level of prosocial behavior greater than Masukanzi Primary School (rural)**. Turning to the issue of Friendship Quality Scale, the level of intimacy/closeness dimension significantly differ between the two school (Fig. 2). In particular, **St. Dominic Savio Primary School (urban) reports scores of intimacy/closeness higher than Masukanzi Primary School (rural) ones**.

## Conclusion

General findings from the present study indicate that the gender seems not to be an important factor in social and relational adjustment of Tanzanian children, while the rural or urban context appear to influence two specific dimensions of psychosocial adjustment and friendship quality.

As this is just a pilot study, it is quite too early to pronounce definitive opinions about children adjustment process in Tanzania. Nevertheless, further administrations will be conducted in 2013 with a more representative sample to verify the present results; thanks to the collaboration with Tumaini University, these next steps could be easier to be carried out.

But the final goal of the project is to contribute to focus on the most effective practices for a full and healthy development, addressing helps and subsidies of the International Cooperation.

This imply to find partners and sponsors, sharing ideas, exploring direct actions which may actually help children in their growth, realize them practically, than measure again if any change has occurred.

## FLOAT-RAM: A NEW HUMAN POWERED PRESS FOR EARTH BLOCKS

Carlo Ferraresi, Walter Franco, Giuseppe Quaglia  
Politecnico di Torino

Dept. of Mechanical and Aerospace Engineering DIMEAS

**Abstract** The Float-Ram is a novel kind of human-powered press for raw earth blocks. It is able to provide very high performance, while maintaining a limited cost, due to some technical characteristics like:  
 •the adoption of a **floating mould**, which provides a bi-directional pressing action in simple way;  
 •**Optimized kinematic structure**, based on a cam-roller transmission system;  
 •**General mechanical simplicity**, since the node of all kinematic pairs is constituted by a single shaft.  
 Therefore the Float-Ram can be considered as an important media for the diffusion of high-quality raw earth building in developing Countries.

### Building with raw earth

Blocks made of pressed and stabilized earth play a strategic role in self-building experiences of low-cost houses, as concerns improvement of housing condition for people in developing Countries, while respecting the environment and local cultures. One of the advantages of such building technique is that the production of blocks and the construction of the house can be carried out in the same place by means of a low-cost and no energy consuming human-powered press.

Distribution of raw earth building technique in the World

The Argentina project, led by Gloria Pasero.

### Type of press

In the World today there is a large spread of very simple and cheap presses, which are able to produce earth adobes of rather limited quality. This is mainly due to a poor level of the kinematic and functional design, as well as to the *mono-directional pressing action*.

The quality and mechanical properties of the adobe are greatly improved by adopting a *bi-directional pressing action*, i.e. by presses able to compress at the same time both the top and the bottom face of the block. Few presses of this kind are available on the market, but they are typically mechanically complex, and then expensive and difficult to use.

The main characteristic of the Float-Ram is the employment of the *floating mould*, that permits to produce uniform blocks moving only one plate and using a freely translating mould.

### Using a human-powered press

Production of raw earth blocks (adobes) with a human-powered press provides advantages like:

- Better earth compaction
- Constant and calibrated block geometry
- Quick and simple house building
- Non use of non renewable energy

**The Float-Ram** adopts the concept of the floating mould, the process of block forming develops in 4 phases, switching between two different conditions of the machine:  
 (a) earth filling/block expulsion;  
 (b) block pressing.

1. earth filling

2. changing condition

3. Pressing

4. expelling the block

the "Mattone" block

### EVALUATION OF THE HORIZONTAL FLOW PLANTED FILTERS AND ANAEROBIC FILTER FOR THE TREATMENT OF GREY WATER IN VENEZUELA

F.H. Gomez\*, S. Sorlini\* F. Vitali\* M.C. Collivignarelli\*\*  
CeTAmb, University of Brescia\*/University of Pavia\*\* – Italy

[franco.gomez@ing.unibs.it](mailto:franco.gomez@ing.unibs.it) [cetamb@ing.unibs.it](mailto:cetamb@ing.unibs.it)

#### Abstract

This research provides an analysis for the appropriate environmental management of the greywater in the neighbourhood of Moscú II, a district of San Felix (Ciudad Guayana, Venezuela), where the inadequate management of these wastewaters has a high impact on the public health and the environment. The experimental study began at the end of 2010, with an environmental and territorial study of the neighbourhood and the choice of the most appropriate technology (horizontal flow planted filters HFPP and anaerobic filter AF). After the experimental phase in Italy (2011), the technology was implemented in Venezuela and a monitoring phase of the physical-chemical and microbiological quality of the water treated was initiated (2012). The results obtained demonstrate that the systems work in accordance with Venezuelan environmental standards, which means they may be reused for the purposes of household cleaning and irrigation of family lots or gardens. This study has been developed by CeTAmb (University of Brescia) with the technical and financial support of the Italian NGO "Servizio Volontario Internazionale" SVI.

#### Achieved Results

The Moscú neighborhood was built in 1995. The area of study has a size of 12,000 m<sup>2</sup> and it has a population of 75 families (which live in 69 houses), 153 adults and 151 children. The inhabitants are low-income people and they work in informal activities. The sources of wastewater, the characteristics, the type of wastewater, the different management systems and their distribution in the neighborhood. The experiment in Italy, with the pilot plants in laboratory, confirmed that the two types chosen (HFPP and AF), are the most appropriate technology and these often yield optimal cleaning : Turbidity  $\approx$  90%, SST  $\approx$  85%, COD  $\approx$  90%, BOD<sub>5</sub>  $\approx$  93%.

In the case of the study in Venezuela, the design, construction and experiment of the pilot plants is characterized by an average daily flow of greywater of 350 L/d. The final systems configuration with the trap of oils and fats as a primary treatment, the bypass system, as a secondary treatment: the HFPP and the AF with vertical flow, the accumulation tank, common to both systems, and the infiltration system. The treatment capacity in Venezuela of the HFPP is 350 L/d of greywater, for the AF is 120 L/d.

The cost of the installation of both systems  $\approx$  € 500. After the construction of the plant pilot plant (april 2012), it has started the first monitoring analysis of the physico-chemical and microbiological characteristics of grey water (I-M) and the second monitoring (Sep 2012) (II -M) compared to Venezuelan normative limits for discharge in for reuse in agriculture for human consumption. As additional activity has been built a family small vegetable garden, downstream of the HFPP.

#### Objectives

The aim of the research is to develop the appropriate technologies (horizontal flow planted filters HFPP and anaerobic filter AF), in order to solve the problem of wastewater, in particular of greywater, in the neighborhood of Moscú, Ciudad Guayana, Venezuela.

#### Methodological approach

The phases of the project summarized below:

Territorial and environmental assessment of the city Ciudad Guayana, Venezuela (second half 2010);

Study of appropriate systems for the management of wastewater, analyses of best technological solutions for the district, designing of pilot plants in Italy and Venezuela (first half 2011);

Development of experiment in Italy, construction and experiments with the pilot plants in laboratory. (second half 2011);

Development of experimental work in Venezuela, construction and testing of the pilot plants and monitoring analysis of the physico-chemical and microbiological characteristics of greywater (first half 2012);

Analysis of chemical and microbiological characteristics of raw greywater (second half 2012);

#### Conclusion

- The experiment, both in Italy and in Venezuela, has shown that the constructed anaerobic filters and horizontal flow planted filters effectively remove very good chemical and microbiological parameters as P<sub>Total</sub>, N<sub>Total</sub>, Coliform Total, Fecal Coliform, Esterichia colli
- The treatment of horizontal flow planted filters must be compatible with the reuse of treated water in agriculture for human consumption, respecting the limits of Venezuelan standards, after four months of regular operation.
- The optimal pilot plant for management of greywater (case study: 376 L / g - 8 persons) was found to be composed of a trap oils and fats, followed by a HFPP and a storage tank of water that, once purified, can be reused to irrigate for the family small vegetable garden.
- This solution, tested at domestic scale, has been well received by the community and is easy to operate.

## III Congresso scientifico CUCS Torino, 19-21 Settembre 2013

### Abstract

**Costruire con la comunità** è un progetto di cooperazione tra il CRD-PVS del Politecnico di Torino, l'UNAM (Universidad Autonoma de Mexico), l'associazione Archintorno, ONG C.A.M.P.O. e la cooperativa Rio Pluma, svoltosi tra settembre 2011 e ottobre 2012. Esso si inserisce all'interno di un più ampio percorso che la ONG C.A.M.P.O. porta avanti dal 2009, con lo scopo di innescare processi di **innovazione tecnologica** attraverso la trasmissione della tecnica costruttiva del pisè, così da attuare uno **sviluppo locale sostenibile** nelle comunità indigene della regione messicana di Oaxaca. Il progetto ha visto la realizzazione di un centro microregionale nel villaggio rurale di Pensamiento Liberal Mexicano al fine di riattivare la **microeconomia locale**. Vi è stata inoltre la volontà di **trasferire tecniche costruttive** e di creare un momento di **confronto accademico** tra studenti di differenti università e la comunità. La vocazione fortemente didattica del progetto, ha coinvolto su più fasi del processo 10 studenti della Facoltà di Architettura e Ingegneria del Politecnico di Torino e 15 del Taller Max Cetto dell'UNAM (Universidad Autonoma de Mexico) consentendo loro un'importante **acquisizione di competenze** in campo edile-architettonico e di **cooperazione internazionale**. La prima fase ha visto la stesura di più proposte progettuali tra le quali è stata scelta dalla comunità quella più vicina alle proprie esigenze. Il progetto architettonico è stato poi trasformato dall'intero gruppo di studenti in progetto esecutivo, iniziando così un percorso congiunto durato quattro mesi, periodo in cui si è svolto il cantiere in **autocostruzione partecipata**.

### Risultati acquisiti

#### COOPERAZIONE

#### DIDATTICA

#### CANTIERE

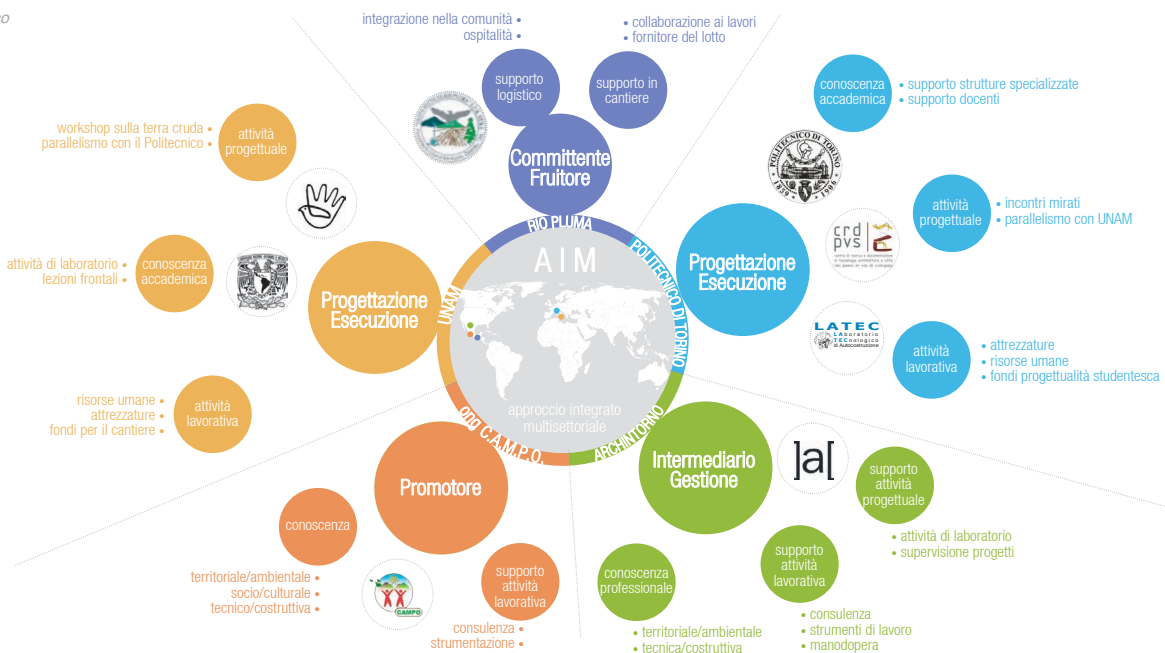

### Obiettivi

Acquisizione competenze sulla progettazione architettonica nei PVS e competenze tecniche di cantiere.

Condivisione di competenze e trasferimento bilaterale di tecnologie

Avviare un processo di sviluppo economico implementando le attività agricole già presenti sul territorio.

### Approccio metodologico

### Conclusioni

Il progetto ha coinvolto diversi attori i quali grazie alle loro competenze hanno permesso di realizzare il centro microregionale, ed ha operato contemporaneamente su tre ambiti: la Cooperazione, lo Sviluppo e la Partecipazione Locale, la Didattica. La cooperazione e l'autocostruzione in un contesto con una tradizione architettonica e costruttiva differente, ha permesso di attuare una strategia Top-down/Bottom-up coniugando il trasferimento di un sapere tecnologico con lo scambio di saperi empirici della comunità, favorendo un processo di interazione e apprendimento collettivo. Le criticità riscontrate sul campo non sono state un limite alla realizzazione, al contrario hanno permesso di raggiungere risultati più adeguati alle risorse a disposizione.

### Hervé Brugoux. Architetture in Madagascar

Laura Marino

Università degli Studi *Mediterranea* di Reggio Calabria  
DarTe – Dipartimento di Architettura e Territorio

#### Abstract

**Trovare un'espressione architettonica per un problema che racconti la storia del problema stesso.**

È quello che l'architetto Hervé Brugoux da più di 30 anni prova e riesce a fare in Madagascar. Riuscire a rispondere alle richieste dei committenti, a volte anche particolarmente esigenti, con materiali locali, riducendo al minimo l'uso del cemento e ancor meno del cemento armato. Ridurre al minimo il trasporto di materiali, utilizzare maestranze del posto risolvendo con tecniche costruttive elementari dei nodi tettonici complessi sono tutti obiettivi che l'architetto Hervé Brugoux si è posto e che, nel corso degli anni, con le sue architetture, ha raggiunto.

Parafrasando un testo di Giovanni Leoni su Pier Luigi Nervi, "La forza del lavoro di Brugoux consiste non in una sfida alla materia condotta con mezzi scientifico-matematici ma nella ricerca di un modo elementare ed economico, raggiunto per via intuitiva e solamente perfezionato grazie agli strumenti di calcolo, per organizzare la materia in funzione di un problema costruttivo derivato da una richiesta programmatica, che nella maggior parte delle opere più significative di Brugoux consiste nel compito elementare di coprire uno spazio. [...] Un atto costruttivo semplice viene messo al servizio di un compito architettonico elementare."\*

\*G. Leoni "Stile di verità". La lezione inascoltata di Pier Luigi Nervi in A. Trentin T. Trombetti a cura di La lezione di Pier Luigi Nervi Bruno Mondadori Milano 2010

#### I materiali

Hervé Brugoux utilizza nei suoi progetti pochissimi materiali: mattoni o pietra e legno.

Questi materiali sono utilizzati ciascuno con una sua specificità. I mattoni pieni a faccia vista o la pietra, utilizzati non come semplice rivestimento ma come materiali collaboranti alla struttura, sono impiegati per la partitura verticale. Brugoux utilizza i mattoni o le pietre per creare dei setti che hanno il compito di delimitare lo spazio interno come nel caso della Chiesa di Mahavatse. Raramente ad essi è assegnato il compito di sorreggere la copertura. O meglio, in alcuni casi la copertura è semplicemente appoggiata sui setti, in altri casi invece la copertura ha una struttura indipendente e i setti si muovono liberamente sotto di essa in un ideale rimando alla pianta libera di Mies o di Le Corbusier.

Brugoux utilizza la pietra nelle zone più vicine al mare, negli alberghi e nella scuola di Ankilibé dove la pietra è il materiale più facile da reperire a km 0, più resistente all'umidità e alla salsedine e più coerente con il paesaggio circostante.

I mattoni pieni invece li utilizza di più negli edifici "pubblici", nella chiesa, nell'oratorio e nel seminario e prevalentemente in zone più interne, inserite in un contesto più "urbano": è il caso degli alberghi a Tuléar e a Fianarantsoa dove le strutture ricettive si affacciano sulle strade principali delle due cittadine.

Brugoux utilizza il legno in molteplici declinazioni: lamellare o semplice, strutturale o di rivestimento, naturale o laccato, affiancato sia ai mattoni che alle pietre. L'unica costante è che Brugoux utilizza il legno prevalentemente per le partizioni orizzontali, per le coperture. Nella chiesa di Nôtre Dame des Flots il legno è utilizzato in singoli elementi per costruire il reticolo spaziale della copertura; per la scuola di Ankilibé il legno lamellare è utilizzato per le travi e per tutto il tetto; per la biblioteca dell'Alliance Française il legno è utilizzato sotto forma di pannelli con orditure differenti.

La ricerca sull'architetto francese ha trovato esito nella pubblicazione "Hervé Brugoux. Architetture in Madagascar" LetteraVentidue Siracusa 2012

## III Congresso scientifico CUCS Torino, 19-21 Settembre 2013

### CASA DEI MESTIERI CERRO LA GRANADILLA GUATEMALA

team C.A.S.A. (Mezzosangue lab + AKO) under the patronage of Università Roma Tre

Architettura a kilometro zero

C.A.S.A. is an experience that merges aspects of education, experimental research and international cooperation involving professionals, students, volunteers and a local community in Guatemala.

#### ACHIEVED RESULTS

The first project phase of C.A.S.A. has been concluded in Cerro la Granadilla with the erection of the first construction stage. The design includes a second kitchen that has yet to be build. During construction, the presence of 25 volunteers provided the opportunity for bidirectional knowledge exchanges. Students and young professionals from Europe gained experience with building procedures and detail solutions. On the other hand their presence on site stimulated local craftsmen to (re-)use appropriate techniques like rammed earth or wattle and daub.

#### OBJECTIVES

The project aimed at developing and applying technological solutions with low environmental and high social impact. The use of wood and raw earth techniques seemed to provide the best potential to reach these goals.

#### METHODOLOGICAL APPROACH

The cooperative elaboration of technologically, economically and aesthetically appropriate solutions not only provides a useful building, that will help to improve the life of some persons from the local community, but can be replicated in other processes of self-construction for private houses and small public buildings.

#### CONCLUSION

Building abroad enhances the communication between designers, builders and end users of the architectural work. The borders between the three categories blur and a spontaneous but intense knowledge flow starts having the building site as an exchange hub. This provides fertile ground for locally appropriate techniques and detail solutions and for a close identification of all involved actors with the built result. Specific findings can easily be replicated in future experiences.

## IMMIGRANT ENTREPRENEURSHIP

Alessandro Arrighetti\*, Andrea Lasagni\*

\*Università di Parma, Italy, [alessandro.arrighetti@unipr.it](mailto:alessandro.arrighetti@unipr.it), [andrea.lasagni@unipr.it](mailto:andrea.lasagni@unipr.it)

In recent years, the ethnic entrepreneurship has assumed a role of major importance in Italy. Firms managed by immigrants are a significant part of Italian business world, but they are also an opportunity for exchange between populations of different origin, an opportunity for social mobility, the search for autonomy (individual and group) and, in some circumstances, a factor strengthening social cohesion. Not a few, finally, are the experiences that provide for their involvement in transnational initiatives and projects in co-development.

This panel session has explored the issue and provided an update on the state of the art research with several contributions by scholars working in the Italian universities, according to different disciplinary approaches.

The paper presented by Arrighetti, Bolzani and Lasagni has provided new empirical evidence to understand the evolutionary paths of ethnic businesses in Italy. Besides a sharp decline in the birth rate of enterprises founded by Italians, the number of new businesses run by immigrants in Italy is growing steadily. Today ethnic businesses are able to offer new types of services and to extend the variety of products available, including on markets to which access the natives. This study confirms that the enhancement of the physical resources, knowledge and financial requirements of the communities of origin retains an important role in the entrepreneurial motivations of immigrants. At the same time, it has also showed the presence of significant relationships with mainstream markets. Looking at a considerable portion of the firms analysed, it is possible to find support for the traditional models that associate strongly to the enterprise social network of the ethnic communities of origin entrepreneur who founded it. However, for a relatively large segment of firms, they observe phenomena such as strengthening formal inter-ethnic relations and founding teams and firms where members of the majority groups operate as partners or employees. In short, there is evidence of multicultural hybrid organizational models and increasing 'diversity' in organizations in the evolution of ethnic firms in Italy.

Fullin's paper focused on self-employment among immigrants, a theme that has been the subject of several studies in Italy. However, there are few contributions that compare self-employment of immigrants with self-employment of natives. On the other hand, the studies on self-employment often tend to overlook at all or only marginally consider the differences between natives and immigrants. This paper used Eurostat data to assess the characteristics of self-employed immigrants and natives in five European countries. In addition, it seeks to shed new light on whether and to what extent self-employment might be a refuge choice both for the natives and immigrants having low education skills.

De Luca's paper is aimed at assessing the development of the entrepreneurial career and the transnational ways of living of 28 immigrant women. The role of the family and the different use of the ethnic resources bring to different career paths. These differences are also evident in the transnational activity, which is mainly of an economic nature and linked to the company. The company also benefits from the different cultural background of the owner. Some companies, in fact, arise from the desire to take advantage of their different cultural background, turning their passions and skills in economic activity, while other follow a more traditional path, which not necessarily include the use of ethnic resources. In addition, attention to the country of origin is also visible in the social engagement, which also moves parallel on two fronts: that of the host society and the one of society of origin. While, on the one hand, there is a desire to help other immigrants to deal with the daily problems that arise in the Italian context, on the other hand some women develop afterwards the wish to do something for those who remained in the country of origin. In this case, visibility, contacts and skills acquired in the course of the business are of particular importance and facilitate the success of transnational projects.

The contribution by Coviello takes into account a particular case of immigrant entrepreneurship institutional body: a consortium of craftsman, conceived and founded in 2006 by a Romanian entrepreneur with a fellow and an Italian company. The consortium includes several companies with Romanian owner, most individual firms but there are cases of some relevance also with Italian employees. The consortium is not only an innovative solution in terms of coordination and efficiency but also acts as a channel of social mobility by promoting the transition to self-employment of immigrant workers previously placed in a position of dependency. The case of CerTo allows to highlight mechanisms of integration and social advancement which, although based on membership in networks of compatriots and pre-existing fiduciary bonds, lead to better conditions for socio-economic inclusion in the context of inclusion.

**PERCORSI EVOLUTIVI E VARIETÀ DELLE IMPRESE ETNICHE IN ITALIA**Alessandro Arrighetti\*, Daniela Bolzani<sup>o</sup>, Andrea Lasagni\*\*Università di Parma, Italy, [alessandro.arrighetti@unipr.it](mailto:alessandro.arrighetti@unipr.it), [andrea.lasagni@unipr.it](mailto:andrea.lasagni@unipr.it)<sup>o</sup>Università di Bologna, Italy, [daniela.bolzani2@unibo.it](mailto:daniela.bolzani2@unibo.it)**ABSTRACT**

A fronte di un netto calo del tasso di natalità delle imprese fondate da italiani, il numero di nuove imprese gestite da immigrati in Italia è in costante crescita. Oggi le imprese etniche sono in grado di fornire nuove tipologie di servizi e di estendere la varietà dei prodotti disponibili, anche sui mercati a cui accedono gli autoctoni. Il presente lavoro propone nuove evidenze empiriche per comprendere i percorsi evolutivi delle imprese etniche in Italia. L'indagine conferma che la valorizzazione delle risorse fisiche, conoscitive e finanziarie specifiche della comunità di origine conserva un ruolo rilevante per le motivazioni imprenditoriali degli immigrati. Allo stesso tempo, viene segnalata anche la presenza di rapporti significativi e, talvolta, prevalenti con i mercati *mainstream*. Si osserva inoltre che una porzione delle imprese analizzate appare coerente con i modelli tradizionali che legano fortemente l'impresa etnica al *network* sociale della comunità di origine dell'imprenditore che l'ha fondata. Un segmento relativamente ampio di imprese, invece, sembra allontanarsi significativamente da questa rappresentazione fino a comprendere soluzioni che prevedono l'inclusione di individui (soci o addetti) nativi o provenienti da comunità diverse da quelle di origine dell'imprenditore. L'ipotesi di una crescente varietà delle forme organizzative dell'impresa gestita da immigrati riceve ampia conferma empirica.

**Parole chiave:** Immigrazione; Imprenditoria immigrata; Impresa etnica; Italia**INTRODUZIONE**

A fronte di un netto calo del tasso di natalità delle imprese fondate da italiani, il numero di nuove imprese gestite da immigrati in Italia è in costante crescita. Oggi le imprese cosiddette "etiche" sono in grado di fornire nuove tipologie di servizi e di estendere la varietà dei prodotti disponibili, anche sui mercati a cui accedono gli autoctoni.

A questo si aggiunge che negli anni più recenti l'imprenditoria immigrata ha assunto in Italia un ruolo sempre più rilevante, come fattore di consolidamento dei processi di integrazione socio-economica degli stranieri nel nostro paese. I risultati ottenuti in questo lavoro offrono un quadro parzialmente inedito. Infatti, l'impresa etnica può essere considerata un fattore importante per rafforzare la coesione sociale, perché diviene un vero e proprio luogo di scambio e di interazione sociale e non solo economica.

**LA LETTERATURA DI RIFERIMENTO**

Lo sguardo sull'imprenditoria immigrata oggi è cambiato rispetto al passato. Le imprese etniche sono, infatti, più diversificate ed eterogenee di quanto la loro rappresentazione stereotipata mostri. Tradizionalmente, infatti, venivano messe in evidenza le differenze tra imprenditori "nativi" e imprenditori immigrati (diverse motivazioni, differenti risorse disponibili, distanza nelle esperienze e nella cultura, ecc.). Le imprese etniche sono state descritte come intrinsecamente "fragili", per la discriminazione della società ospitante o perché esse operano in mercati protetti basati su stretti rapporti co-etnici (Ambrosini e Erminio, 2011).

Attualmente, dal dibattito emerge una maggiore complessità del fenomeno. I nuovi modelli tendono a sottolineare l'eterogeneità (cioè la notevole varietà) delle soluzioni organizzative e produttive adottate dalle imprese etniche. Ne risulta un profilo dell'impresa gestita da immigrati rinnovato: all'immagine semplificata dell'impresa gestita da immigrati che ottiene un supporto essenziale dalle risorse fisiche, conoscitive e finanziarie specifiche della propria comunità di origine, si va sostituendo una visione in cui sono presenti numerosi modelli organizzativi e molteplici strategie di *business*.

La letteratura tradizionale sulle tipologie di imprenditori e di imprese fondate/gestite da immigrati distingue tre diversi tipi: *middleman minorities* (minoranze di intermediazione), *enclave entrepreneurs* (imprenditori di *enclave*) (Zhou, 2004) e *imprenditori transnazionali* (Portes *et al.*, 2002).

## Middleman minorities

Storicamente le *middleman minorities* sono costituite da imprenditori immigrati che svolgono la loro attività imprenditoriale in forma di commercio e di scambio tra le élite di una specifica società e il resto della popolazione (Zhou, 2004), per lo più concentrandosi in alcune occupazioni a basso-medio valore aggiunto. Il loro ingresso in attività di intermediazione è stato tradizionalmente spiegato da due argomenti: a) la reazione culturale ostile della società circostante ad uno specifico gruppo etnico e b) la mancanza di uno status sociale riconosciuto nel Paese in cui si sono stabiliti. Bonacich (1973) ha sottolineato che questa scelta è legata a una c.d. “mentalità di soggiorno” che caratterizza certi gruppi di immigrati, i quali sognano un ritorno a casa e pianificano la loro esperienza migratoria solo come un modo per accumulare denaro rapidamente, per poterlo investire nel Paese di origine e rendere possibile il ritorno. Questo tipo di mentalità fa sì che le attività dei *middleman* sia caratterizzata da lunghi orari di lavoro, frugalità, concentrazione in attività facilmente accessibili e liquidabili e elevati livelli di solidarietà interna. Tali imprenditori hanno pochi legami con le strutture e le relazioni sociali della comunità locale nella quale svolgono le loro attività imprenditoriali. Le imprese sono tendenzialmente localizzate nei quartieri urbani poveri e popolati da minoranze etniche, spesso andando ad occupare attività di commercio al minuto o del terziario abbandonate dagli imprenditori locali. Tuttavia studi più recenti hanno anche messo in luce casi di imprese *middleman* attive non solo nel commercio e nel settore terziario, ma anche in ambito manifatturiero o primario, localizzate nelle periferie o nei quartieri urbani più benestanti e popolati dalla classe media locale.

## Enclave entrepreneurs

Gli imprenditori di *enclave* sono caratterizzati da stretti legami di tipo etnico e di co-nazionalità, che pervadono le strutture sociali e influenzano la localizzazione di queste imprese (vedi Portes, 1981; Portes e Shafer, 2006). Le imprese di *enclave* tendono a concentrarsi in una stessa localizzazione urbana, caratterizzata dalla presenza di una forte identificazione etnica e un minimo livello di organizzazione istituzionale. Inoltre tali imprese svolgono attività in settori diversificati (es. servizi professionali; produzione; commercio al dettaglio), non solo occupando nicchie di mercato lasciate vuote dagli imprenditori locali. Infine, le relazioni tra proprietari e lavoratori e tra imprenditori e clienti (anche se in misura minore) sono caratterizzate da rapporti di co-etnicità.

Tali caratteristiche di localizzazione e concentrazione in zone popolate da connazionali sono spiegate dalle modalità in cui si sviluppano queste attività. Soprattutto nelle prime fasi di sviluppo, queste imprese hanno bisogno di essere prossime alla clientela co-etnica cui si rivolgono e alle fonti di risorse di cui abbisognano, tra cui credito, informazioni, lavoro e altre forme di sostegno (Portes e Manning, 1986). Light (1972) avanza l'ipotesi di un “mercato protetto” in cui le condizioni di nicchia all'interno di una comunità etnica promuovono il successo dell'impresa etnica. Dal momento che le comunità etniche sviluppano spesso esigenze particolari in termini di prodotti/servizi (es. orientamento all'acquisto di prodotti etnici; preferenza per negozi gestiti da qualcuno della stessa provenienza culturale), gli imprenditori loro connazionali hanno un notevole vantaggio competitivo rispetto agli imprenditori locali nel rispondere a queste esigenze (Aldrich *et al.*, 1985; Masurel *et al.*, 2002). Studi più recenti hanno, però, evidenziato che l'evoluzione di molte aree urbane in quartieri multietnici sta favorendo lo sviluppo di imprese di *enclave* che contemporaneamente svolgono il ruolo di *middleman* con altre nazionalità e gli abitanti nativi (Zhou, 2004).

Nella letteratura sono stati identificati diversi fattori che spingono gli immigrati ad aprire imprese del tipo di *enclave*. Tra questi, sono stati particolarmente rilevanti la dimensione del mercato (ampiezza della comunità straniera appartenente allo stesso gruppo culturale, in particolare con bassa competenza linguistica), l'esistenza di gruppi di lavoratori isolati (Evans, 1989), il capitale umano e la dotazione di capitale sociale (Brenner *et al.*, 2010). Gli aspetti culturali sono molto importanti per le economie di *enclave*. Le attività economiche sono regolate dalla solidarietà interna (*bounded solidarity*) e di fiducia regolamentata dalle norme sociali (*enforceable trust*), meccanismi di sostegno e controllo necessari per la vita economica della comunità e per il rispetto delle norme, dei valori e per il sanzionamento di comportamenti socialmente devianti (Portes e Zhou, 1992). I rapporti di tipo co-etnico tra imprenditori e lavoratori, così come con i clienti, in genere trascendono i legami di tipo economico e contrattuale e si basano su norme di reciprocità comunemente accettate (Zhou, 2004).

## Imprenditori transnazionali

Gli imprenditori transnazionali gestiscono attività che coinvolgono contemporaneamente i loro Paesi di origine ed i Paesi ospitanti. Portes *et al.* (2002) per l'identificazione di questa categoria di imprese, impiegano variabili quali lo svolgimento di frequenti viaggi all'estero per motivi di lavoro e l'esistenza di una relazione positiva tra il successo dell'impresa e i contatti con il Paese d'origine o con Paesi terzi.

Gli studi sul fenomeno dell'imprenditoria transnazionale sono stati effettuati soprattutto negli Stati Uniti, in cui i comportamenti transnazionali caratterizzano la vita di molti immigrati, specialmente quelli originari dal Sud America. Lo studio di Portes *et al.* (2002) ha dimostrato che gli imprenditori transnazionali rappresentano una quota considerevole degli imprenditori immigrati, anche se non costituiscono la maggioranza degli immigrati. Gli autori hanno dimostrato che gli imprenditori transnazionali presentano caratteristiche diverse rispetto a quelli che svolgono

attività domestiche e rispetto agli immigrati occupati come lavoratori dipendenti, soprattutto in termini di dimensioni e portata delle reti sociali.

Anche all'interno della categoria degli imprenditori transnazionali sono state proposte alcune tipologie specifiche. Una delle più citate è quella proposta da Landolt *et al.* (1999) sui migranti Salvadoreni negli USA, empiricamente convalidata da Sequeira *et al.* (2009). Tale tipologia presenta cinque diverse classi di imprese a seconda del loro grado di coinvolgimento a livello transnazionale sul piano finanziario, del personale occupato, delle risorse destinate alla crescita e del mercato di riferimento:

- Imprese “circuito”: sostengono il flusso di risorse materiali e immateriali tra il Paese di origine e il Paese ospitante;
- Imprese “culturali”: distribuiscono prodotti provenienti dal Paese di origine nel Paese ospitante;
- Imprese “etiche”: vendono a una clientela multi-etnica i prodotti provenienti dal Paese di origine dell'imprenditore o di altri prodotti occidentali;
- Imprese “di ritorno”: fondate dagli immigrati che rientrano nel Paese di origine;
- Imprese “transnazionali di espansione”: imprese costituite nel Paese di origine ma che considerano gli immigrati all'estero come parte del loro mercato.

Un modello simile è stato proposto da Itzingsohn *et al.* (1999) nel suo studio delle comunità dominicane di immigrati nella zona di Washington Heights di New York City. Sequeira *et al.* (2009) hanno analizzato ulteriormente i fattori che influenzano la scelta del tipo di impresa transnazionale da sviluppare, in particolare esaminando il ruolo delle percezioni degli immigrati verso il Paese ospitante e l'intensità del legame con il Paese di origine. Generalmente si può affermare che l'esperienza degli immigrati e il loro atteggiamento verso il Paese ospitante è strettamente correlato alla positiva percezione di opportunità imprenditoriali. Migranti che subiscono discriminazioni sul mercato del lavoro del Paese ospitante potrebbero essere maggiormente spinti verso forme reattive di imprenditorialità transnazionale, in quanto questa esperienza negativa potrebbe influenzare sfavorevolmente le loro percezioni verso il Paese in cui sono ospitati. Ancora in Sequeira *et al.* (2009) viene dimostrato che i migranti con una percezione più positiva delle opportunità disponibili sono generalmente attivi in imprese del tipo “circuito” o “culturale” piuttosto che imprese “etiche”. Gli immigrati con più intense relazioni con il Paese di origine hanno invece più probabilità di essere coinvolti in attività transnazionali, quindi con una minore presenza nelle imprese “etiche”. Un ulteriore aspetto interessante che emerge da questo studio è che gli imprenditori di imprese “circuito” o “culturali” hanno una maggiore probabilità di attribuire il successo della loro impresa alle caratteristiche personali dell'imprenditore (es. capacità ed efficacia personale) o al sostegno sociale, mentre gli imprenditori “etnici” percepiscono come più importante la qualità dei prodotti/servizi offerti.

### Nuovi indirizzi di riflessione

In tempi più recenti, oltre alle distinzioni tipologiche sopra viste, l'osservazione della realtà imprenditoriale etnica ha spinto alcuni autori a una maggiore sofisticazione dei modelli teorici ed empirici adottati, cominciando a spostare l'attenzione verso l'aspetto proattivo e manageriale delle scelte strategiche e gestionali sviluppate dagli imprenditori immigrati. In alcune ricerche si è, quindi, iniziato a distinguere analiticamente le tipologie di strategie attuate dalle imprese controllate da immigrati. La distinzione più comune si basa sul grado di etnicità del prodotto/servizio offerto e sul grado di co-etnicità tra l'imprenditore e i clienti finali / mercato. In sostanza, questi studi si ispirano alla letteratura tradizionale che differenzia tra imprenditori *middleman* vs. *enclave* (Zhou, 2004).

Seguendo questa distinzione dicotomica, alcuni autori hanno identificato diversi tipi di strategie – e di imprese fondate da immigrati – sulla base delle possibili combinazioni tra prodotto etnico vs. non etnico (lato offerta) e di clientela etnica vs. non-etnica (lato domanda). Rusinovic (2007) ha proposto una classificazione dei mercati disponibili all'imprenditoria degli immigrati sulla base della clientela e del prodotto, come mostrato nella Fig. 1.

**Fig. 1** – Tipologia di imprese secondo la matrice clientela/prodotto di Rusinovic (2007).

		Clientela (domanda)	
		Co-etnica	Mainstream
Prodotto (offerta)	Etnico	Mercato etnico	Mercato <i>middleman</i>
	Non-Etnico	Mercato di nicchia	Mercato <i>mainstream</i>

Questi quattro mercati sono definiti come segue:

- Mercato etnico: popolato da imprenditori che vendono un prodotto etnico a una clientela principalmente delle stesse origini nazionali e culturali dell'imprenditore. Tali clienti, che definiamo “co-etnici” presentano una serie di esigenze e preferenze speciali, che sono soddisfatte al meglio da chi condivide questi bisogni e li conosce intimamente (Waldinger, 2000). Pertanto gli imprenditori immigrati che scelgono di collocarsi in questo mercato sfruttano un “mercato protetto” in cui non sperimentano virtualmente alcuna competizione da

parte di imprenditori locali esterni alla loro comunità (cfr. Ward, 1987). Questa situazione può dunque essere descritta come un monopolio di fornitori etnici, o una “no-go area” per concorrenti esterni (Ward, 1987), il che costituisce certamente un vantaggio per questi imprenditori.

- Mercato *middleman*: in questa situazione i prodotti etnici sono venduti ad un pubblico generale (Engelen, 2001). Se il termine “*middleman minorities*” era stato originariamente coniato per descrivere le relazioni tra minoranze etniche e maggioranza della popolazione nelle società pre-capitalistiche, nel suo attuale uso caratterizza anche imprenditori immigrati che servono una clientela non necessariamente co-etnica (Kim, 1999). Come affermato da Jones *et al.* (2000), questi imprenditori hanno un vantaggio in quanto essi promuovono un prodotto che deriva dal proprio patrimonio culturale, è unico per loro e non appropriabile altri. A differenza degli imprenditori attivi nel mercato etnico, però, essi godono di un monopolio relativo ai prodotti etnici, e quindi di un mercato protetto, ma senza i limiti demografici e finanziari collegati all’orientamento verso una clientela strettamente co-etnica.
- Mercato di nicchia: mercato in cui gli imprenditori non forniscono prodotti etnici, ma generali, come ad esempio assicurazioni, servizi finanziari, assistenza legale, scuole-guida, intermediazione immobiliare verso clienti co-etnici.
- Mercato *mainstream*: gli immigrati operanti in questo mercato offrono prodotti generali, non di tipo etnico, a clientela locale, nativa del Paese ospitante. Essi entrano dunque direttamente in competizione con gli imprenditori locali e sono in sintonia con le esigenze di un mercato più ampio. Le transazioni su questo mercato sono spesso trascurate negli studi attinenti all’imprenditorialità degli immigrati, con le recenti eccezioni di Leung (2001) sulle imprese ICT cinesi in Germania o di Saxenian (2002) sulle imprese indiane e cinesi nella Silicon Valley.

Naturalmente è da intendersi che, sia a livello teorico che nella realtà, i confini tra i diversi mercati non sono così netti e distinti come possono sembrare a un primo esame. Potrebbero, inoltre, esistere differenze tra imprenditori immigrati nella scelta di quali mercati servire. Ad esempio, Rusinovic (2007) ha dimostrato che gli imprenditori immigrati di prima e seconda generazione differiscono in tali scelte in quanto gli immigrati di prima generazione tendono ad essere più attivi nei mercati etnici e a servire clienti co-etnici, mentre quelli di seconda generazione tendono a scegliere mercati di tipo *mainstream*. I risultati differiscono altresì tra diversi gruppi etnici, riportandoci alla necessità di considerare sia fattori culturali che strutturali quando si affrontano indagini di questo tipo.

Una proposta ulteriore è quella di Ndofo e Priem (2011) che hanno individuato due strategie opposte in termini di combinazioni di prodotto/mercato etnico o *mainstream*. Essi definiscono una “strategia di *enclave*” quando l’impresa gestita da immigrati serve pienamente una comunità etnica, con un prodotto etnico, realizzato da lavoratori co-etnici e con materiali forniti da fornitori co-etnici. In sostanza essi identificano la partecipazione ad una intera catena del valore di tipo co-etnico. All’opposto, una “strategia dominante” viene messa in essere quando l’impresa serve il mercato locale con un prodotto di massa che viene prodotto attraverso manodopera non necessariamente co-etnica e con materiali forniti da fornitori *mainstream*.

Nello specifico ambito del fenomeno imprenditoriale dei migranti nel contesto italiano, una tipologia che ricalca le precedenti è quella offerta da Ambrosini (2011). Egli differenzia tra cinque tipi di imprese:

- Impresa etnica, che offre prodotti etnici a clienti immigrati;
- Impresa allargata (o impresa esotica), che fornisce prodotti etnici a clienti misti (nativi e immigrati);
- Società di intermediazione, che offre prodotti non etnici (generali) a clienti immigrati;
- Impresa di prossimità, che commercializza prodotti non etnici a clienti misti (nativi e immigrati);
- Impresa aperta, che offre prodotti non etnici (generali) a clienti di origine locale.

Infine, è necessario fare un cenno ad una classificazione basata sull’intersezione tra le tipologie di proprietà delle imprese degli immigrati e il settore di riferimento, proposta da Li (1993) in uno studio riferito alle imprese cinesi in Canada. Egli distingue i seguenti quattro tipi di imprese:

- l’impresa di tipo tradizionale, a gestione individuale o familiare, attiva principalmente nei settori di servizio alla persona (es. servizi di ristorazione) e del commercio al dettaglio;
- lo studio professionale di proprietà e gestito da professionisti nei campi medico, legale, contabilità, che sono proliferati negli ultimi decenni;
- imprese controllate attraverso investimenti diretti da società con sede in Asia e, talvolta, aventi filiali anche in Canada;
- investimenti ad alta intensità di capitali eseguite da immigrati in risposta ai programmi di immigrazione del Governo Canadese.

Il contributo di Li (1993) mette in luce alcune interessanti considerazioni di tipo storico e temporale. Il primo tipo di imprese, più tradizionale, è quella stabilita dagli immigrati all’inizio dei loro percorsi migratori, quando l’ipotesi della mobilità bloccata può spiegare perché molti stranieri tentano di aprire un’impresa come un mezzo per sfuggire a un mercato del lavoro per loro svantaggioso. Con l’incremento del numero dei migranti e del loro insediamento, la

domanda di servizi, di beni etnici e generali aumenta e questo può essere un'ulteriore stimolo per le imprese tradizionali e per la nascita degli studi professionali. L'autore sottolinea che gli ultimi due tipi di impresa sono, invece, spiegate da fattori politici, relativi ai cambiamenti nelle politiche migratorie e da variabili economico-finanziarie.

## L'INDAGINE SUL CAMPO: UN PROFILO DELLA IMPRENDITORIA IMMIGRATA IN EMILIA ROMAGNA

Il nostro lavoro si propone di offrire un ulteriore contributo alla comprensione dell'imprenditoria immigrata in Italia e all'analisi della varietà dei modelli e delle tipologie che caratterizzano tali imprese. L'indagine, che è stata realizzata attraverso 130 interviste a imprese etniche localizzate nelle province di Parma e di Bologna, fornisce evidenze descrittive sostanzialmente coerenti con risultati da tempo consolidati nella letteratura di riferimento (Tab.1).

In primo luogo, la distribuzione della numerosità delle imprese etniche per provenienza geografica può delineare un quadro non dissimile dalla struttura della popolazione immigrata in Italia. Inoltre, il grado di scolarizzazione degli imprenditori alla guida delle imprese etniche considerate risulta molto alto: quasi il 50% degli intervistati ha conseguito un titolo di studio di scuola secondaria superiore con un curriculum di cinque anni e più di un terzo è in possesso di una laurea. Infine, occorre sottolineare un aspetto importante: per fare impresa al di fuori della propria comunità di origine è fondamentale la conoscenza della lingua locale e la possibilità di comunicare senza barriere significative con i potenziali clienti. In altre parole, è importante capire se le imprese etniche siano sostenute da una effettiva conoscenza della lingua italiana. I risultati ottenuti (di nuovo in Tab. 1) mostrano che oltre metà degli imprenditori immigrati intervistati parla italiano in modo più che soddisfacente.

**Tab. 1** - Statistiche descrittive relative agli imprenditori immigrati intervistati.

	% su tot. imprese	Nr. Imprese
<b>Genere intervistato/a</b>		
Maschio	67,7	88
Femmina	32,3	42
<b>Area geografica di origine</b>		
Est Europa	29,2	38
Asia e Medio Oriente	26,2	35
Africa	35,4	46
America Latina	8,5	11
<b>Titolo di studio</b>		
Nessuno o scuola primaria	1,5	2
Scuola m. superiore (profess. - 3 anni)	13,1	17
Scuola m. superiore (liceo/college)	20,8	27

Laurea	36,2	47
<b>Competenza linguistica</b>		
Non parla bene Italiano (1)	1,5	2
(2)	16,2	21
(3)	40,0	52
Parla Italiano in modo fluente (4)	42,3	55

Fonte: elaborazioni su risposte interviste ad imprenditori immigrati – Univ. Parma – anno 2012.

Per comprendere ulteriori elementi legati alle esperienze degli imprenditori immigrati intervistati, è utile fare riferimento ad un ulteriore insieme di caratteristiche descrittive riportate nella Tab. 2. Innanzitutto, è degno di nota il fatto che i dati raccolti fanno riferimento ad un campione di imprese composto in larga misura da ditte individuali (quasi il 60% del totale), ma sono stati intervistati anche i titolari di società. Per questi ultimi si tratta, quindi, di una forma organizzativa di maggiore complessità e di notevole interesse nella prospettiva di cambiamento.

Secondariamente, si può osservare che in almeno un terzo dei casi l'impresa è stata fondata o acquisita da un gruppo di soci e non da un singolo individuo. Ciò conferma che l'impresa etnica sta articolando e differenziando i propri percorsi evolutivi assumendo modelli organizzativi più complessi sul piano imprenditoriale-manageriale di quelli tipici delle soluzioni di *self-employment*.

**Tab. 2** - Statistiche descrittive relative alle imprese etniche.

	% su tot. imprese	Nr. Imprese
<b>Forma societaria</b>		
Ditta individuale	59,2	77
Società	40,8	53

<b>Fondazione dell'impresa</b>		
Fondata da solo o acquistata da solo	63,1	82

Altre nazionalità	13,8	-

*Fonte:* elaborazioni su risposte interviste ad imprenditori immigrati – Univ. Parma – anno 2012.

In molti casi, l'avvio dell'impresa per gli immigrati non risulta essere un fatto contingente o la reazione ad una situazione temporanea, ma l'esito conclusivo di una lunga fase di inserimento nel territorio e nel paese di destinazione. Dalle interviste raccolte in questa indagine, emerge come la maggioranza delle imprese (il 54%) segnali un'età di costituzione molto bassa, inferiore o uguale ai cinque anni. Solo una su quattro risulta attiva da oltre dieci anni.

L'integrazione con la realtà locale è evidente se vengono analizzati alcuni aspetti delle politiche commerciali adottate dalle imprese intervistate. Lo stereotipo dell'impresa etnica che si rivolge prevalentemente, se non esclusivamente, ai propri connazionali o si orienta a soddisfare essenzialmente la domanda proveniente dalla popolazione immigrata, non trova riscontro nei dati raccolti. Si osserva una propensione marcata verso la domanda *mainstream* e si osserva che i prodotti e i servizi sono destinati prevalentemente alla clientela italiana (ancora in Tab. 2). Ed è significativo anche che per le imprese etniche considerate quasi l'80% dei fornitori sia rappresentato da italiani. E' vero che in termini di valore gli acquisti realizzati presso fornitori connazionali risultano di entità non trascurabile (quasi l'8% del totale), ma questo dato non sembra sufficiente a suggerire una particolare focalizzazione degli scambi a favore dei mercati di origine. In sintesi, si può ipotizzare che le filiere in cui si collocano le imprese etniche analizzate nel presente lavoro presentano una propensione allo sviluppo di scambi con mercati esteri non elevata, mentre sono in grado di operare in modo integrato con la struttura commerciale delle imprese italiane.

Le principali motivazioni per l'avvio dell'impresa sono: la ricerca di autonomia, indipendenza e soddisfazione per il lavoro e la voglia di valorizzare le proprie competenze. I principali punti di forza che gli imprenditori immigrati considerano rilevanti per la loro attività sono la migliore qualità dei prodotti e servizi offerti rispetto ai concorrenti, i migliori servizi offerti (es. assistenza post-vendita) e, infine, le buone relazioni con i clienti italiani. I principali punti di debolezza che essi hanno indicato sono i costi di gestione, le insufficienti risorse finanziarie e le difficoltà nelle pratiche burocratiche e fiscali.

Anche se lo studio non aveva come obiettivo la valutazione degli effetti della grave crisi economica, è stato proposto il seguente interrogativo agli imprenditori immigrati: "Secondo Lei, quale è la probabilità (da 0% al 100%) che questa Sua impresa sia ancora attiva tra 3 anni?". Secondo le risposte fornite, quasi il 60% degli intervistati si dichiara fiducioso e prevede che la probabilità di superare la crisi sia molto elevata per la propria impresa.

## **QUALI STRATEGIE, COMPETENZE E COMPORTAMENTI PER LE IMPRESE ETNICHE?**

Nel complesso, dal nostro lavoro emerge una rappresentazione dell'imprenditorialità immigrata più composita di quanto non appaia negli studi precedenti. Innanzitutto, l'impresa etnica, non utilizza in modo esclusivo risorse della comunità di origine, ma appare in grado di accedere alle opportunità fornite dai mercati *principali* (cioè i mercati in cui sono presenti sia consumatori immigrati che italiani) e dalla comunità autoctona.

Come accade per gli imprenditori italiani, la spinta alla costituzione dell'impresa è collegata al desiderio di autonomia e di indipendenza personale ed è sostenuta dal desiderio di autorealizzazione professionale e di valorizzazione delle proprie competenze e attitudini. Inoltre, le motivazioni che vedono la scelta imprenditoriale come ripiego (rispetto ad un lavoro dipendente) o come reazione alla condizione svantaggiata di immigrato sono presenti, ma non prevalenti. Poi, le scelte imprenditoriali sembrano meno condizionate dai legami con la comunità di origine rispetto a quanto previsto nella letteratura.

In sintesi, una parte delle imprese analizzate appare coerente con i modelli tradizionali che legano fortemente l'impresa etnica al *network* sociale di appartenenza dell'imprenditore che l'ha fondata, mentre una quota relativamente ampia di imprese etniche, invece, trova corrispondenze solo parziale in questo quadro concettuale.

### ORGANIZZAZIONE E IMPRESA ETNICA: L'IPOTESI DI "IBRIDISMO CULTURALE"

Le evidenze raccolte mostrano che, all'aumento della complessità organizzativa e alla varietà delle strategie adottate, cresce anche l'apertura dell'impresa a soggetti (clienti, fornitori, soci, dipendenti) provenienti da comunità diverse da quelle di origine dell'imprenditore. Si è scelto di utilizzare il concetto di 'ibridismo culturale' per descrivere le imprese gestite da soci di diverse nazionalità o in cui lavorano dipendenti non-coetnici. Il risultato è che le imprese connotate da ibridismo culturale non sembrano mostrare strategie e comportamenti riconducibili alla fragilità e alla marginalità.

Le imprese con connotazioni "ibride" risultano caratterizzate da un orientamento molto marcato verso il consumatore italiano e da una offerta di prodotti e servizi non-etnici ad una popolazione di clienti in prevalenza non co-etnica. Tali imprese, inoltre, dopo la fase di *start up*, hanno ricevuto un supporto esplicito da amici e conoscenti italiani e da consulenti e professionisti. Figure, queste, esterne alla comunità di origine e derivanti da legami sociali e contatti sviluppati in Italia nel corso del tempo. Infine, le interviste presso le imprese "ibride" hanno permesso di evidenziare una migliore conoscenza della lingua italiana rispetto alle altre imprese gestite da immigrati.

Le imprese 'ibride' nel campione analizzato risultano essere più del 30% del totale (Tab. 3). Si nota che tali imprese 'ibride' hanno una età media (circa 10 anni) superiore al valore medio delle imprese intervistate (circa 7 anni). Inoltre le imprese "ibride" risultano maggiormente orientate verso una offerta di prodotti e servizi non-etnici per una popolazione di consumatori in prevalenza non co-etnica. Infine, una quota molto elevata (quasi 80%) delle imprese 'ibride' ha dichiarato di aderire a qualche forma volontaria di associazionismo.

**Tab. 3** - Classificazione delle imprese etniche: l'ipotesi di ibridismo culturale.

Tipologie di imprese	Nr.	% su totale
Ibridismo culturale nullo	80	61,5
Ibridismo culturale limitato	26	20,0
Ibridismo culturale elevato	24	18,5
<b>Totale</b>	<b>130</b>	<b>100,0</b>

Fonte: elaborazioni su risposte interviste ad imprenditori immigrati – Univ. Parma – anno 2012.

In conclusione, possiamo affermare che l'impresa etnica sta diventando, non soltanto una importante realtà economica, ma anche un nuovo fulcro di scambio e di integrazione tra individui appartenenti a diverse comunità e depositari di relazioni e conoscenze molteplici e stratificate. In questo senso, l'impresa etnica deve essere considerata un fattore importante per la coesione sociale nel nostro paese.

## **IMMIGRANT WOMEN AND ENTREPRENEURSHIP: STRATEGIES OF DEVELOPMENT AND FORMS OF TRANSNATIONALISM**

### **ABSTRACT**

The goal of this work is to explore the development of the entrepreneurial career and the transnational ways of living of 28 immigrant women. The role of the family and the different use of the ethnic resources bring to different career paths. These differences are also evident in the transnational activity, which is mainly of an economic nature and linked to the company. The company also benefits from the different cultural background of the owner. Some companies, in fact, arise from the desire to take advantage of their different cultural background, turning their passions and skills in economic activity, while other follow a more traditional path, which not necessarily include the use of ethnic resources. In addition, attention to the country of origin is also visible in the social engagement, which also moves parallel on two fronts: that of the host society and the one of society of origin. While, on the one hand, there is a desire to help other immigrants to deal with the daily problems that arise in the Italian context, on the other hand some women develop afterwards the wish to do something for those who remained in the country of origin. In this case, visibility, contacts and skills acquired in the course of the business are of particular importance and facilitate the success of transnational projects.

### **FEMALE IMMIGRANT ENTREPRENEURSHIP**

The attention towards female migration is quite recent [1]. This delay was motivated primarily in two ways. In general, even when the female migration is independent, it is mainly due to economic reasons [2], as in the case of men, and therefore it is believed that the differences between men and women are not such as to require a specific theory. In fact, family reunification or departure to form a new family in the context of immigration are for women frequent reasons for emigration [3]. In addition, other authors have emphasized the role played by the search for greater freedom and by the desire to escape from an overly patriarchal society [4] as well as by the fact that, in the context of immigration, women are able to improve their status [5].

If several authors have noted the marked asymmetry in the attention paid to migrant men compared to women's migration, it is not surprising that this asymmetry is even greater when we narrow the field to the study of entrepreneurship. The interest towards (male) immigrant entrepreneurship has produced over the last decades many works (see, among others, [6] [7] [8] [9] [10]) about the motivations encouraging migrants to choose self-employment, the different rates of entrepreneurship in different ethnic groups, the role of human and social capital (family and ethnic ties).

Given the wideness of the studies on the subject, we will here focus our attention on those aspects that also affect women's entrepreneurship, in order to be able later to highlight their peculiarities.

For example, the vacancy chain theory [11] suggests the existence of a substitution mechanism such that the most disadvantaged in the labour market tend to fill positions vacated by those who have the opportunity to choose the most profitable and prestigious occupations. In this case, immigrants penetrate and occupy progressively (both dependent and independent) heavier, less paid and precarious jobs (as defined also by [12]). In self-employment, immigrants often occupy market niches related to activities that require low skills and long working hours, such as small shops, bars/restaurants, or small firms of packaging in textile sector, or become small carriers or self-employed in construction.

Even the blocked mobility theory (for example, [13]) suggests that self-employment for immigrants represent a valid alternative to the underemployment of dependent workers or even a response to unemployment.

Other elements to be considered in the study of immigrant entrepreneurship are the role of ethnic and family ties and human capital. While the theory of Aldrich and Waldinger [6] emphasizes the role of the ethnic community, other authors [7] emphasize the importance of human capital and distinguish between community ties and ethnic and familiar ones [14]. The first, in fact, although potentially useful to start the activity, may later become an obstacle to the growth and the company's expansion beyond the ethnic context of reference. The latter, however, are useful in any case, helping to provide the initial capital and labour at low cost. This second aspect is less relevant when referring to tasks that require specific skills and qualifications. Overall, though, the difference in the level of family intervention in the enterprise is an aspect that helps to differentiate between immigrants, both male and female.

Finally, some authors have criticized the structuralist explanations, emphasizing instead the role of free will and conscious decision of immigrant entrepreneurs who "take control over their own lives and do not only appeal to ethnic and class resources [...], but also to experiential and motivational resources" [10, p. 394].

In this brief literature review, we cannot forget the few studies concerning female immigrant entrepreneurship. In some research, with a structuralist approach, the gender variable is just one of many used to detect any inter-group differences in the profile of immigrants [14] [7] [8]. Overall, the most important results that emerge from this body of research is that, with rare exceptions, the propensity to entrepreneurship is higher among unmarried women. Other studies use a qualitative approach, which highlight the important role played by immigrant women in the ethnic economy [15], their decision to pursue self-employment to find a better balance between work and family, as well as to earn more money [16]. Self-employment also provides a greater gain compared to being an employee, generally of low-level [17]. Finally, according to Lunghi [18], female enterprise is typically the implementation of a specific project aimed to give up unskilled work to create a more creative activity, which ensures greater personal satisfaction.

## FORMS AND PERSPECTIVES OF TRANSNATIONALISM

The search for a higher gain and/or greater personal satisfaction are also important motivations to undertake a transnational activity, in the economic, political and/or socio-cultural field.

Strictly speaking, the concept of transnationalism has been used in recent years to indicate "occupations and activities that require regular and sustained social contacts over time across national borders for their implementation" [19]. In reality, that of Portes *et al.* is just one of the many definitions of this concept, which emphasizes the presence of regular and sustained, then "empirically verifiable", activities [20]. This definition severely limits the scope of the concept of transnationalism, since, as also admits Ambrosini [21], the majority of migrants are settled and transnational activities are usually occasional. However, it is a clear definition, which helps to perceive transnationalism as something new thanks to the intensity and frequency of these exchanges. In fact, a criticism to the concept of transnationalism is that it does not actually describe a new phenomenon, as transnational ties have always been part of international migration [22].

Another way to respond to this criticism is to consider transnationalism not a new phenomenon, but a new perspective. Guarnizo [23] speaks of 'transnational living', i.e. cross-border relations of social, cultural, political and economic nature that emerge from the migrants determination to maintain and reproduce in the host country their social environment of origin. The transnational experience is very close to the concept of 'bifocality' used by Vertovec [24], which defines the two points of view in which migrants live and define their own identity, but that does not necessarily translate into verifiable activities [21].

This step is crucial to connect with the other line of studies on transnationalism, the anthropological one [25] [26] [27]. In this perspective, focus is on the roots of the migrant in different social and territorial contexts, its belonging to transnational 'social fields', or to a set of social relationships multiple, interdependent, through which ideas, practices and resources are exchanged. Levitt [27] makes it clear that to be part of these fields, individuals do not need to move physically between borders, but it is sufficient communication, the transfer of ideas, the comparison between different ways of belonging. It is no coincidence that Levitt and Glick Schiller [25] suggest the distinction between ways of being and ways of belonging. Only the first refer to concrete and empirically verifiable activities, while the latter refers to the conscious definition of their own identity and belonging.

The emphasis on belonging and identity are useful to clarify the relationship between transnationalism and assimilation. In the traditional assimilation view, in fact, the links with the country of origin were treated with distrust by the hosting one, who suspected the migrant of 'double loyalty' [21]. On the contrary, the protagonists of social and political transnationalism are in fact mainly stable and integrated immigrants [28] [5]. This aspect was important in our decision to investigate the transnationalism of immigrant entrepreneurs, as those who have taken the path of self-employment are resident for some years in the host country and rarely plan to go back home [29] [30]. The acquisition of economic stability and, in many cases, a good level of integration in the host country, could enhance the interest in establishing economic ties with the country of origin not only through business activities, but also through investment projects and development of local communities, which contribute to the visibility and symbolic power to immigrants [31].

These investment projects in the country of origin are one of the possible forms of transnational activity. They are usually developed by groups of immigrants (the so-called HomeTown Associations, HTA), which are also responsible for advocating the rights of minorities and to give visibility to local problems [32] [21]. Apart from this form of political transnationalism, others are less relevant in our research, like the actions taken by International NGOs, which nevertheless in some cases seem less effective than informal initiatives [33].

The political activity of this type of association intertwines with the economic one, i.e. investments in terms of infrastructure and public goods designed to improve the quality of life of the communities of origin. Although this form of economic transnationalism is undoubtedly interesting, these initiatives, at least in the Italian context, are still sporadic. Another type of economic transnationalism, for us the most important, is that of entrepreneurial activities. The growth of immigrant communities promotes the formation of ethnic businesses that provide goods and services to their community, importing or anyway maintaining ongoing and regular ties with the country of origin [34] [23]. From the

business point of view, many activities undertaken by immigrant businesses are 'open' [12] but there are some areas of the economy where more properly 'ethnic' businesses are growing and in which, as we show in this paper, national or 'ethnic' belonging is fundamental to the entrepreneurial activity. In general, cultural transnationalism is promoted at various levels: through participation in voluntary associations and cultural activities [35] and through the maintenance of certain traditions and customs of the culture of origin, encouraging the construction of a multi-faceted identity sometimes difficult to detect empirically [28] [37]. Fully connected to cultural transnationalism is symbolic transnationalism, "that does not import goods, or it does so only on a side basis, in order to reconstruct atmospheres, environments and meanings" [36, p.20]. However, in the present work, we find few example of this type of economic-cultural activity. From this point of view, more important are activities that the interviewed women entrepreneurs undertake in their spare time, through more specifically socio-cultural initiatives.

## DATA AND METHODS

This work on immigrant entrepreneurs is part of a more general research on the national profile of immigrant entrepreneurs, which used as a method of data collection a semi-structured questionnaire. Among the topics addressed in the questionnaire, there are family background, pull and push factors in migration, job career, economic situation of the company, social and associational networks, economic transnationalism.

Often, the selected sectors and nationalities have made the presence of women entrepreneurs unlikely. For this reason, in order to obtain a sufficient number of cases to focus on women, 7 more questionnaires were administered to women immigrant entrepreneurs operating in the province of Milan, without any selection concerning nationality or sector, because of the difficulty in finding them. To these 7 entrepreneurs, as well as to the 3 successful women entrepreneurs, always operating in the province of Milan (see note 2), in addition to the semi-structured questionnaire, we asked some open-ended questions, mainly aimed at understanding the difficulties faced by respondents as a woman and as an entrepreneur. The questions covered the following topics: reasons for the decision to start their own business, benefits of entrepreneurial activity for balancing work and family, or discrimination faced difficulties as a woman and / or as a foreigner, and any other activities - associations, cultural - carried out in their spare time.

The theme of transnationalism, therefore, only concerned their business. However, during the interviews, there were numerous references to other forms of transnationalism, both 'political' and cultural. The bifocality and belonging to transnational social fields by migrants emerge in various forms in our research, which will be analysed in the next paragraphs.

Instead, we start now to present briefly some of the characteristics of the women interviewed. As you can see by looking at the summary table in the appendix, apart from the Chinese - with one exception – that all work in the textile and leather, in the other cases we have a great variety of activities carried out, although most relate to trade and services. In addition, there are many nationalities represented. Despite this diversity, there are many elements that these women have in common in their experience of life and business management.

A first interesting fact is that the interviewed women are in Italy since several years, almost 16 on average. It is therefore a group of people that has already passed the early stages of migration and has already reached a certain stability, not only economic, but presumably also from the point of view of integration in the social context. This is especially true for the women interviewed in the province of Milan, which show good knowledge of the language and, in 6 out of 10 cases, they also have Italian citizenship, while all the other interviewees are foreign citizenship. Moreover, half of the respondents have a diploma or a degree. It is generally among these people, as shown in the literature, that transnational activities should emerge more frequently [23] [21].

## FAMILY, CAREER AND REASONS FOR BEING AN ENTREPRENEUR

In this section, we focus initially on the role of the family in business development, as well as on the constraints and opportunities offered by the family in business management. In fact, as frequently shown in literature, the presence or absence of the family in Italy often contributes in shaping the relational and economic context in which female (and male) immigrant entrepreneurs move. First, 24 out of 28 interviewees have one or more children, 21 are married or cohabiting. No wonder, then, that more than two thirds of the respondents have asked for help and advice to their families in the daily management of the company and in the recruitment of workers and funds necessary to start and run the business. Less frequently, on the other hand, the people who women have asked for help and advice are Italian (about half of the respondents citing them in their contacts), while only a third of the women entrepreneurs have in their contacts of non-relatives compatriots. The contacts with Italian rather than with family members in the social networks of respondents varies greatly depending on nationality. In fact, while only 2 out of 11 Chinese do not have family members in their network, a third of other entrepreneurs (6 of 17) do not have family members among their useful contacts for business management. Similar differences also concern to their compatriots. Conversely, while only 3 out of 11 Chinese have useful contacts with Italians, more than half of the other entrepreneurs (9 out of 17) have significant contacts with Italians. Some of the women interviewed in Milan have highlighted the dynamic role that Italian friends have played at the beginning of the business: *"And is there anyone in particular who has supported this process of*

gaining a good reputation? Yes, there are. Italian friends. That pushed me. In fact, I could say that they were very important because in the beginning I had not this confidence that I would be successful. They encouraged me a lot" (M9). Another one: "Who gave you the most support? There was a dear friend of mine [...]. He already knew I was doing odd jobs and was looking around when I was not working for the cleaning company, to earn more [...] Then he saw that I was doing all of this work without an invoice, and said: "A., Look, it's the moment. If you want I will speak with an administrator and so you begin" So, with a lot of fear - but he gave me so much strength - I started my business" (M7). Instead, this is the point of view of a Chinese on the relationship with the family and compatriots: "It is normal I feel better with Chinese, there are fewer problems with the language and then also privacy is important so I prefer to work only with relatives" (C10).

The family at various levels has some importance also in the reasons that have led women to start their business. In three cases, other relatives had already started the entrepreneurial activity and, therefore, the interviewee only participates to a wider entrepreneurial project. In another case, the activity started on the advice of the partner. Among the secondary reasons for beginning the activity, respondents mentioned the desire to follow the family traditions, the need to be closer to the family and get a job for family members. The influence of the family, although not negligible, is secondary to the desire to earn more money (mentioned by 9 respondents as main reason and by 5 as secondary) and the desire to enhance their skills and competences acquired (referred to as main reason by 6 women and as secondary by 11). However, it could also be linked to the need to have a more regular work (referred to as main reason by 7 respondents and, secondly, by 2). The desire for a more regular work can also be interpreted as an expression of the wish to get out of underemployment, as well as - after all - the desire to see enhanced their skills and expertise. In two cases, moreover, women mention the aspiration to less strenuous work and, in one case, as a secondary reason, it is recognized that business activity represented an alternative to unemployment. The theory of blocked mobility seems to get an acknowledgement from our interviews.

The reference to the enhancement of their capabilities and skills and the desire to work more regularly prompts us to wonder what career paths the women interviewed followed before starting their entrepreneurial activity.

First, only 16 women out of 28 had worked in their country of origin, therefore almost half of the women have only the working path in the host country. Since the working career, as well as the business activities, are too different to be examined in detail in a synthetic way, we built a typology that summarizes the most significant features, while also taking into account what has already appeared in the literature (contribution of family, degree of 'ethnicization').

The first group, the biggest one (10 women, all of them Chinese), includes women who in Italy have worked almost exclusively by relatives or fellow citizens. Their jobs were somehow connected to the future company (for example, in the textile industry) or occupations in contact with customers who favoured language learning (ex. waitress) and who later opened a business in the apparel or leather sector, often with the help of a spouse or other family members. Thus, the career path ends with an ethnic family business in sectors with high foreign presence (*vacancy chain family path*).

The second group (3 Moroccan women) differs from the first only by the fact that women have previously worked for Italian and have little or no previous experience in the sector of their entrepreneurial activity. The random career path ends with a company in sectors with high foreign presence (*vacancy chain random path*).

The third group (3 Senegalese women and one Ecuadorean) had a career path in foreign-dominated sectors (such as peddler or anyway self-employed) and also run an entrepreneurial activity aimed at co-ethnic or other foreigners. So this is the path most closely ethnic (*ethnic business*).

The fourth group (5 women, different nationalities) is instead composed of women who have managed to maintain or return to the profession they performed at home or turn a hobby that they had for many years in a business. These entrepreneurs most valued the skills and competences they acquired (*creative enterprise*).

The fifth group (4 women, different nationalities) is made up of women who, after several experiences, have invested in a business in the open market, generally alone or - in one case - with the Italian partner and, consequently, their identity nationality is neither shown nor valued, and could even be a disadvantage (*unidentified company*).

Finally, the last two women, with higher education and that in Italy were able to get clerical jobs, decided to exploit, in the context of their own business, their being a foreigner. In fact, working together with other foreigners, they offer services to Italian public organization or private subjects to improve their knowledge of cultures other than their own (*bridge or intermediary business*).

Regarding the companies in the first, second, and, in part, the fifth group, we find a path of ecological succession, while the third and last group benefited from new business opportunities offered by the growing presence of foreign immigrants.

If these two groups can be considered to be those that best exemplify the situation of bifocality and transnational ways of belonging, in reality transnational ways of being of the interviewed women are multiple and do not only concern the economic field, even if we will start right from the latter.

## ECONOMIC TRANSNATIONALISM

From the economic point of view, our research has shown a reasonable level of transnational relations, especially with the country of origin, but also with other countries. Most important are economic ties with the motherland. In fact, about one-third of the respondents (8 of 28) said they entertain business relations with the country of origin. Seven

women buy products in the country of origin and resale them in Italy. Among these, we find an owner of a deli that also sells kebab, a Chinese pastry and a hairdresser. In these cases, the goods are purchased at the country of origin to ensure the authenticity of the product, both when the customers are mainly Italian, and, as in the case of the hairdresser and the Chinese pastry, when the customers are both Italian and foreigners. The authenticity of the product allows attributing a specific cultural identity even if, at least in the case of kebab, this identity has become increasingly globalized and artificial, and has lost much of its original connotation [39]. Adapting the typology proposed by Ambrosini [21] [36], we could define this category as symbolic transnationalism based on authentic products. The strategy of these companies is the originality, regardless of the quality of the product or service. This originality appeals to the Italians, but also to compatriots and foreigners in general, just because the authenticity of the product can satisfy the one and the other.

In other cases, entrepreneurs purchase the products in the country of origin, or commission semi-finished products, as in the case of clothing and leather goods intended to be sold in the shops of Chinese import-export. In fact, even if some of the Chinese entrepreneurs purchase in Italy from Chinese wholesalers, most entrepreneurs prefer to maintain direct relationships with their country, in order to reduce transaction costs. Two entrepreneurs follow the production and commission in details the types of goods to be produced. In this way, they can gain a competitive advantage compared to the Chinese who simply buy their goods from wholesalers, tending to sell products very similar to each other. Instead, these women seek to maintain their own specificity and originality, always trying to take into account the demands of the market. This is a competitive merchant transnationalism (even if the products are not 'ethnic'). Since the products marketed are often similar and primarily aimed at low-end market segments, competitive advantage is given by the speed and flexibility in the identification of specific customer preferences.

Finally, another example of economic transnationalism is that of M., an Ecuadorian entrepreneur, and owner, together with another woman compatriot, of a travel agency, which is also money transfer and which recently has started as real estate agent. This business has developed following the requests of compatriots, who increasingly want to invest their earnings in the purchase of real estate in the country of origin. However, customers are not only compatriot, but also immigrants from other South American countries. In the interview, M. stressed the importance of her very good reputation among customers, consolidated thanks not only to her efficiency, but also to her ability to listen to customers, their stories and their everyday problems. She said, jokingly: *"We always say that we should buy more uncomfortable chairs, because people are here for hours and do not go anymore. This gave me a good reputation. Once I have also received a call from Spain to see if I could provide a cheaper ticket, and I did. They call me and trust me only by word of mouth, even though they have never seen me"*(M5). The good reputation allows her to operate on a transnational level not only with her country of origin, but also with clients (compatriots) residing in other European countries. It is here an example of connective transnationalism, which, however, has found its own peculiarity in the real estate business.

The economic activities outlined above are transnational ways of being, and are also regular and long-lasting activities, as well as empirically documented, which can be included in the narrowest definition of transnationalism.

It is not always the case, however, for the transnational activities that we will discuss in the next section.

## CULTURAL TRANSNATIONALISM AND SOCIAL ENGAGEMENT

Some of the activities undertaken by the interviewed women have a strong cultural connotation, so we can speak of cultural transnationalism even if there are no concrete business ties with the country of origin. For example, some food services, unlike the kebab restaurant mentioned above, do not buy outside Italy the raw materials they need.

First, in our sample there are three food services run by Senegalese women. These activities are 'informal', designed primarily for compatriots. It is important to note that Senegalese immigration in Italy is predominantly male, although the female presence is growing [34]. There are still many Senegalese leaving their wife and children at the country of origin, where they spend several months a year anyway. When they are in Italy, these food services represent important gathering places, where they spend their free time with friends and family finding familiar flavours and atmosphere, typical of their country. The fact that the food services are 'informal' and are addressed primarily to their compatriots (even if one of the Senegalese women said she has also Italian and Bangladeshi customers), allows for greater flexibility with respect to compliance with the rules of hygiene and formal requirements required by Italian bureaucracy. This helps to keep costs down, but also gives a sense of insecurity and uncertainty (they would be forced to close or to pay fines if the authorities would inspect them) and limits their ability to attract a larger and varied customer base, as they do not advertise their activities, but rely only on word of mouth. In any case, the current activity, as well as representing a connection with their culture of origin, has made it possible for these women to terminate their previous work as street vendors. In addition, this type of activity does not require special training, since the women interviewed draw only on their culinary skills.

A similar case is that of H., a Moroccan woman who runs a deli in Turin directed both to Italians and to compatriots. The business strategy here is to offer local products to Italians and Moroccan products to compatriots, so that both can find their own traditional foods. This choice, therefore, is opposite to that of the owner of the deli kebab viewed in the previous paragraph, since while the latter turned to Italian customers betting on the product exoticism, H. instead has chosen the path of tradition and familiarity.

A mix of familiarity and exoticism provides the Senegalese hairdresser, who addresses to foreign women (co-nationals or not) and Italian ones, suggesting her country's traditional hairstyles (braids, etc.). The possibility to appeal to a Italian clientele is also an effect of the increased visibility and regulation of its activity, which currently run a real store, while before the activity was run in her house. Instead, G. has mainly focused on the exotic charm of customs and traditions others than their own, as she owns a school of belly dance with an Italian clientele.

The activities discussed above are linked to symbolic transnationalism in a broad sense and, in these, economic elements and marketing strategies intersect with cultural values and identity. Among them, we find a typical ethnic business (Senegalese food service), next to an expanded ethnic business (the hairdresser), open business (gastronomy) and an exotic one (belly dance), according to the typology proposed by Ambrosini [12]. However, this is a symbolic transnationalism closely connected with the entrepreneurial activity, a transnationalism then mostly weak, because it is rarely connected to a regular and constant exchange with the country of origin. However, in many cases, this transnationalism allows the interviewed women to enhance their identity and their ethnicity. Apart from this option, there are few entrepreneurs who engage in social, political or cultural activities that can be transnational, even in the broadest sense of the term, that is to re-define identity and belonging in a bifocal perspective that takes into account the dual context, the country of origin and of immigration. Among our respondents, five promote cultural or socio-political trans-national activities.

Owner of a beauty salon, S. in her spare time organizes events with the support of the belly dancing school where her daughter works, that is owned by Italians. These events, a mix of competitions and performances by famous artists in North Africa, represent to S. not only an additional income, but also the possibility to introduce an important aspect of their culture that has always been a great passion for her. Among her future projects there is a greater investment in these cultural initiatives, in the hope of being able to transform it into a real work, shifting from a job that has no cultural connotation linked to her country of origin to one rather strongly marked in this sense.

D., in Italy since 1993, is the chairperson of a cultural mediation cooperative company, which employs both foreigners and Italians. Through this activity she has managed to tighten ties with local associations and institutions in the area. These ties have been useful for a project that she has pursued alongside her business. It is a program of education and development for women resident in her country of origin, aimed at encouraging a process of empowerment of women and awareness of their rights in a society still deeply patriarchal [40]. The first goal is to build a house of culture, health and labour for women with the help of the Italian institutions and some NGOs. D. has followed this project as part of her associative activity. She is the president of a cultural association of compatriots. Thanks to the visibility and the social capital built while running her business, D. was able to help her fellow citizens in the dual context where she moves, that of the host country and that of the country of origin. Her intervention in the country of origin, however, is the result of a social commitment beside her job, even if it is in the working environment that the necessary conditions to carry it forward have developed.

A similar pattern can also be observed in the activity of L., a member of a cooperative cleaning company that is also responsible for a multi-ethnic catering service (further example of an enterprise of exotic and symbolic transnationalism) and president of an association that assists women who want to obtain recognition of their qualifications in Italy. In addition to social commitment with the immigrants in our country, also L., which has been in Italy since 1975, in more recent years has turned her attention to the country of origin. In this regard, she founded, along with other fellow compatriots and some Italian, a twinning committee with her city of origin that promotes exchanges between teachers and social workers of the two countries to help them better manage students at risk of social exclusion, developing specific and targeted approaches [40].

A., a Filipino woman married with an Italian man that runs a café, in her free time is member of an Italian association that gives legal assistance to immigrants. Moreover, she is member of the Women Federation for World Peace, which works for the empowerment of women all over the world.

Finally, M., the Ecuadorian entrepreneur who, with her travel agency and real estate represents a case of economic transnationalism, is also active from the cultural point of view. Her commitment aims to raise awareness of the conditions of discrimination and inequality that Ecuadorean women experience both in the country of origin and in the host country. For the moment, this commitment addresses especially to seek improvement in the condition of the Ecuadorians in Italy, in marital relationships and with their children, while there are no measures to help women residing in the country of origin. M. dedicates to this activity as member of a cultural association of compatriots. The lack of involvement of M. in properly transnational actions from a social perspective in support of women in her country of origin, beside the economic one already seen, may be due to different reasons: her relatively recent arrival in Italy (in 2000), her being the single mother of a small daughter (while D. and L. do not have children, and S. and A. have adult ones) with therefore less free time and, more importantly, the still temporary prospect of her migration project, which is still aimed to return to her country of origin.

## **FINAL REMARKS**

In most cases, the business path of immigrant women does not deviate - in its main features - significantly from that of men. Most entrepreneurs seized - often as part of a shared family project - the opportunities offered by the vacancy chain or by niche sectors more closely ethnic. Nonetheless, reasons related to the family appear to be

particularly relevant. In addition, some women have been able to use in an original and successful way their creative skills that sometimes, in the country of origin, were not more than hobbies. In other cases, finally, the entrepreneurs have taken advantage in their own business of the opportunities resulting from their bifocality, participating in a sort of cultural transnationalism.

Overall, the area where there is greater transnationalism is the economic one. This may seem obvious considering the fact that we interviewed women entrepreneurs, in many cases Chinese, but thanks to this research, we have better defined the different exchanges of transnational goods, services and information. In addition, many of the activities do not have real ties with the motherland, but merely to import atmospheres and cultural traditions.

Finally, of particular interest seemed to us the social commitment of some of the interviewed women, both in the Italian context and in the country of origin. In both places, this effort is dedicated primarily to women and it is this aspect that is most influenced by the gender identity of our respondents, together with the almost total absence of a strictly political connotation in their transnational action. The transnational social commitment is more recent than that to immigrant women (compatriots or not) in Italy and it is conceivable therefore, that in the coming years we will see a growth of this phenomenon, as is already the case in several countries, where immigration is less recent.

Finally, it is likely that the different levels of transnational activity depend on the different institutional and social contexts of the countries of origin and the different levels of interest and ability of the different countries to attract and encourage this type of initiatives, which also move to a local, not national, level. We hope to explore this aspect in future research.

## LOCAL DEVELOPMENT IN INTERNATIONAL COOPERATION: ISSUES, APPROACHES AND PERSPECTIVES FOR A TERRITORIALISATION OF DEVELOPMENT POLICIES

Egidio Dansero<sup>a</sup>, Cristina Scarpocchi<sup>b</sup>

### INTRODUCTION

The session aimed at investigating the relationship between cooperation and local development practices in the Global South. Theoretically as well as at the level of development cooperation policies and strategies, a reconfiguration of the reference scales at which the very idea of development is conceptualized has been taking place since the Seventies. The context is that of the process of reorganization of the international politico-economic system that began in those years, which also encouraged the social sciences to adopt new perspectives in analyzing and interpreting social phenomena and economic processes. Alongside the essentially aspatial and macroeconomic approaches which remain dominant to this day, an attention to the local dimensions of development has gradually gained ground, moving from somewhat subterranean beginnings to its current prominence [1]. This reconfiguration is very much part of the considerations that have matured since the early Eighties regarding the crisis that swept through the field of development studies and the post-impasse debate that has enlivened the subsequent decades. In this context, local development has steadily become more and more central to development policies, starting with a number of Northern countries in the Eighties, and explicitly emerging in the developing countries since the second half of the Nineties.

Local development's rise to prominence in the South raises a number of questions that the contributors have tried to address in the session. Are we dealing here with yet another transfer of development "technologies" - technologies that are basically theoretical and operating approaches - from North to South? And how appropriate are these technologies? Can we speak of a "discovery of local development" in Developing Countries (DCs), or is what we are seeing more of a top-down approach, where the impetus descends through the long networks of international development, with the latter's own rhetoric and priorities? How does the attention to local development in DCs link up with the debate surrounding endogenous development, the informal economy and the activism of civil society on the one hand, and the processes of political and administrative decentralization on the other? And, above all, where does local development stand in a context that would appear to be dominated by the processes of globalization and deterritorialization? One of the hypotheses underlying this investigation is that the growing international stress given to local development must be interpreted from a multi- and trans-scalar standpoint, through an approach capable of encompassing local dynamics, national cultural and politico-social contexts, and processes that operate on the supranational and global scales. In this perspective, dealing with local development means considering a complex sequence of global-local interactions, between economic trends and processes of redefining political space, between local discoveries in the framework of global conditions, conceptualizing them through multiple decontextualizations and subsequent reconceptualization practices at different scales and in different contexts.

In the next section we will outline the fortune of local development in the DC, highlighting both the (global) context where local development emerged in the Nineties and the inner tension between top-down and bottom-up approached in development theories.

### LOCAL DEVELOPMENT IN THE ECONOMIES OF THE DCs

#### The global context of local development in DCs

With a certain delay with respect to the North's debate concerning local development theory and practice, the latter concept began to appear in the policies of the developing world during the Nineties [2] [3]. At this point, it was closely connected with the shifting strategies for international cooperation in its various forms (bilateral, decentralized, nongovernmental), both in Eastern Europe - those portions affected by the UE's expansion in particular [4] - and in many developing countries in Africa, Latin America and Asia. A glance at the list of the programs and projects spearheaded by the organizations involved in international cooperation (the World Bank, various United Nations agencies such as UNIDO, the ILO, FENU and the European Union itself) [5], is sufficient to provide an idea of how local development has become one of the buzzwords of international cooperation in the last decade.

This espousal of local development and all its trappings by the major supranational organizations is something of a watershed in our view, as it was in some respects the seed and source of the ambiguities that have beset local development initiatives in developing countries. While in the literature discussed in these pages, local development

proceeds from the solid empirical evidence provided by observed economic trends - often openly at odds with the orthodox narratives of economic development - the interpretation that the international organizations proffer is heavily influenced by the ideological/normative context in which these institutions live. The break between the concerns of local development - like those of participation and gender differences - and the neo laissez-faire orthodoxy of groups such as the World Bank - is, in fact, more apparent than real. As we will see above all in the case of Egypt, heterodox theories are often introduced in the mainstream - intellectual and operative - of these supranational actors as a means of highlighting the need to revamp the relationship between the State and the market. If it is true that abandoning the rigid monetarist orthodoxy goes hand in hand with acknowledging the regulatory role of the State, it is equally true that most of the criticisms target the State's disorganization, and the bureaucracy that amplify rather than restrain the markets' flaws.

In particular, in order to clarify the context from which this investigation springs, it is advisable to dwell for a moment on the fact that the neo laissez-faire approach taken in the strategies of the major exponents of development cooperation was virtually the only alternative to the development crisis and the debate it fueled, so much so, indeed, that the international literature refers to it as a mainstream approach. Starting from the early Eighties, with the so-called Washington Consensus, this approach found adherents in the World Bank and the International Monetary Fund, spreading thence to permeate the thinking and policy-making of many development agencies, including those of the United Nations, other international bodies and a large proportion of national governments worldwide.

In the early Nineties, following the failure of the Structural Adjustment Programs, development cooperation policies were heavily impacted by the change of course embodied in the Post-Washington Consensus, which was explicitly influenced by the neo-institutional approach. In this connection, it is now widely acknowledged that the local scale's new role in development cooperation policies and strategies resulted from the considerations triggered in the second half of the Seventies by the attempt to create a view of development that could constitute an alternative to the aspatial approaches of the macroeconomic school, as well as from the influence that the New Institutional Economics [6] exerted on the work of the major players in development cooperation. This approach is based in identifying, at the national, subnational and local scales, those institutions that are not directly linked to the market as actors capable of correcting the market's shortcomings.

In the developing countries, following the new rules of the internationalized economy - mostly through the channels of development cooperation - has hinged on two sets of factors, one politico-economic, and the other more purely political, which refer explicitly to good governance. In this context, development cooperation has gradually incorporated local development policies as the preferred tool for combining initiatives that are intended to influence the economic as well as the political spheres by promoting processes of divestiture and decentralization, often seen as the necessary accompaniment to local development policies. There can be little doubt that the link between the new role of the local in development cooperation strategies and the gradual enlargement of the very goals of development, which in some cases extend so far as to include the political dimension by making development aid conditional upon introducing democratization processes, is emblematic of the relationship between the political and economic perspectives of local development. This overlap not only demonstrates how a focus on participatory democracy, local governance and decentralization has accompanied local development thinking in the DCs, but has also contributed to unmasking the inadequacy of approaches, concepts and models that are explicitly tied to the Western world's specific historic and cultural patterns. Here, as the controversy sparked by what has been termed the right-based approach has made clear, the legitimacy of efforts to export and impose (through military intervention in some cases) models and processes of forced democratization is very much a moot point. The criticisms inspired by these processes of standardization have been similarly skeptical of the work of the supranational political bodies that have taken it upon themselves to develop and spread a sort of "global policy" based on the universality of democratic principles.

### **Local development in the DCs: between top-down and bottom-up approaches**

If we analyze local development in the DCs, as least as far as Senegal, the rest of French-speaking Africa [7] and Egypt are concerned, we find that two opposing visions have been at work. The first sees local development as a highly institutionalized process, marching in lock-step with political and administrative decentralization. However much it can mobilize local society through inclusive processes, it still moves from the center downwards. Local development is generally presented as the one essential means of stimulating local agencies, and hence local society, to formulate and deploy strategies for their own areas' infrastructures, economy and welfare [8] [9]. By contrast, the other vision of local development puts greater emphasis on the community, or on relatively endogenous - and possibly even marginal - dynamics, some seen as residual, others as innovative.

In recent years, many countries in the Southern reaches of the world have discovered endogenous local dynamics that were either unpredicted or cannot be seen as issuing strictly from development aid; at the same time, they have also changed their approach to development cooperation, passing from exogenous, top-down processes, to self-reliant, bottom-up approaches that have largely been put forward by groups who are in the minority as regards their ability to wield power, like many of the NGOs in the North and an increasing number of Southern NGOs. Among the unforeseen changes, we can include a variety of interesting social movements that have taken place in different parts of the South [10]. These organized initiatives have striven to re-conquer and regenerate their own "local space", and have been successful in rising above the merely local and banding together in quite complex organizations involving as many as

half a million people and more, as has been the case of certain initiatives in Mexico or West Africa. It should be noted that many of the efforts are far from being antagonistic to development cooperation, and indeed have prospered thanks to their ability to attract and manage sizeable amounts of international aid. At the same time, they have been able to garner grass-roots support among small farmers and villagers, while striking a balance between tradition and modernity. As a result, these initiatives bask in the floodlights of international cooperation, and many aid agencies and NGOs rely on their dynamism as the fulcrum of their intervention strategies.

As part of this change of approach, there is a growing critical awareness of the meaning and role of an aid agency, of the importance of the actors involved, of local values, the crucial need to strengthen and support the local area's capacity for self-organization, and of the social, relational and environmental dimensions of a type of development that cannot be rooted only in an economic sphere that has nothing to do with the social [11]. In making way for an approach stemming from an idea of community-based, self-reliant and bottom-up development, the world of cooperation has also fitted itself out with a whole series of tools for analyzing the territorial, social and cultural context that leverage participation and the need to understand the local viewpoint, as exemplified by the various approaches that fall under the heading of "participatory diagnostics" (MARP, RRA, etc.) [12]. As mentioned earlier, this change in outlook would appear to have spread to the major international bodies, rather than being restricted to the more bottom-up actors such as the NGOs.

The distinction between an institutional top-down vision and a "community-based", bottom-up vision of local development also hinges on the conceptual view of the territory in which the trends triggered by local development processes operate, where on the one hand we have a received territory, which precedes the process and is generally a politico-administrative division of space, and, on the other hand, a constructed territory, the "project" territory. As the territory is the result of a process of construction on the part of the actors, not defined beforehand but recognized a posteriori, the territory of local development is not something that exists everywhere: often, in fact, we find that we are dealing with spaces dominated by the exogenous laws of localization, which are not identified as territories. The two conceptual views must not be confused, but must both be taken into account in the local development discourse. Territory then can be defined as the 'container' and the result of a process of elaborating content [2: 299].

### **Situating the contributions**

Within the contributions presented at the session, we can identify at least two main themes. The first one is the relationship between territories in sharing and establishing different, yet related, patterns, of Local Economic Development (LED). The second stream is related to the interaction between LED and social structures, with specific reference to LED as an interface between different source of power and legitimacy and between different scales of decision and implementation. As the first theme is concerned, the first two papers in this sub-section make reference to project between Italian authorities and national and local administration in the Sahel area (Burkina Faso, Mali, Niger and Senegal). In their intervention, Egidio Dansero and Agnese Migliardi outline a critical assessment of the Italia-Sahel programme, with special reference to the "Fondo Italia-CILSS di lotta contro la desertificazione e per la riduzione della povertà nel Sahel" (ITALY-CILSS FUND, ICF), established in 2002 and active until 2011. ICF is a very interesting case-study that shows from one side the attempt to adopt a spatial and territorial approach to development cooperation, with analysis and actions interlinking different political and action scales, and from the other side a technocratic development machine that failed in try to put together the different actors of development cooperation but at the same time has been quite effective in local initiatives.

The two other contributions dealing with the Italian Development Cooperation's practices take into account a more specific issue, that is to say the role of decentralized cooperation and the possibility of technology and practices transfer. The paper presented by Maurizio Tiepolo and Mario Artuso is the report of a decentralized cooperation between the Politecnico of Turin and Niger and Senegal. The establishment of a multipurpose and open access GIS in the public administration of three minor cities has highlighted the potential of codified geographical knowledge in order to make effective the control of local authorities over their territory in order to facilitate and secure Local Economic Development processes. The presentation of the group led by Giulio Mondini and Sergio Olivero addresses a totally different issue that is the social and territorial impact of the RENEP (Renewable Energy for Palestine). What is at stake, here, is the fundamental issue of transfer of models (in this case the smart city framework) and technologies (renewable energies, with special reference to solar production) from their original Northern context to the Global South (in this case to a context, the Palestinian one, which is characterized by an unusual degree of conflict). The case study provides evidence for the positive impact of such transfers on LED, creating opportunities for employment and empowerment, above all among the youngest generation. The second group of papers deals with the interaction between LED and social structures, with special reference to the puzzle of different sources of legitimacy and (political, social, economic) power in Africa and Brazil. Sara Belotti's case studies on sustainable tourism in Mozambique, with reference to the specific case of Zinave National Park (PNZ) highlights the complex relationship between "traditional" and "legitimate" structures and hierarchies and the superimposing administrative "legal" authorities. In particular, using GIS, the author demonstrates that the dynamic interaction between legitimate and legal sources of authority is projected into a territorialization which is evolving over time, mirroring the emerging power architecture. As a consequence spatial hierarchies are unceasingly reworked and redesigned in order to match power dynamics. Such a view is also confirmed by Roberto Di Meglio on Local Economic Development and social economy in the context of the ILO (International

Labour Organization) policies apt to secure decent work, fair income and participation into the development processes. In particular, the brief case study concerning the Ghana Decent Work Programme (GDWP) shows the importance of the dialogues between “local norms and values” – as embodied in traditional sources of power and legitimacy – and local government authorities and agencies. Once again, the interaction of different power architectures enact Local Economic Development processes and entails spatial transformation (in the Ghanaian case the multiplication, integration and up-scaling of LED projects at different scales and in different regional contexts). A similar standpoint arises from Francesco Biciato’s account on the ART (Articulation of Territorial Networks for Sustainable Human Development) framework of the UNDP, where the role of local communities is twofold: on the one hand, they support decentralization and local governance; on the other hand they can get involved in South-South decentralized cooperation, facilitating the exchange and integration of LED practices. From a different perspective Carla Inguaggiato observes the interaction between producers’ cooperatives and social structure in the case of Northeast Brazil. It is interesting to read the Latin-American case study in comparison with the African ones. Inguaggiato, in fact, takes into account three villages created by the agrarian reform (assentamentos) between 1997 and 2005. As such these settlements cannot be considered as bearer of traditional forms of legitimacy. On the contrary, they rather are the outcome of a policy dropped from central and local political authority. The assentamentos policy actually denotes a “third culture” between traditional indigenous settlements and State-sponsored massive colonization and intensive exploitation. Using the methodology of network analysis, the author shows that different social structures (arising from kinship ties, previous working experiences, political and/or religious background, and technical knowledge) do play a role in differentiating the Local Economic Development processes enacted by different villages. Of course it is not about “traditional” architecture of knowledge and power, yet it shows the transformative capability of different territorialization patterns to adjust and adapt LED. Massimo Pallottino’s theoretical reflections show some “family resemblance” with Inguaggiato’s standpoint, apart from the common geographical focus on Brazil. In particular, Pallottino emphasizes the continuity between theory and practices in Local Economic Development processes: as a consequence, the internal stratification of the local communities (that is, ties and relations among the social actors) becomes a pivotal element driving the success and the failures of LED projects.

## LOCAL DEVELOPMENT: SOME PERSONAL REFLECTIONS

Massimo Pallottino\*

\*LVIA / Interdisciplinary Center for Peace Studies, University of Pisa, Italy -  
[massimo.pallottino@cisp.unipi.it](mailto:massimo.pallottino@cisp.unipi.it)

The attention paid to the local dimension of development contributes casting a new light on the whole development debate, as it roots economic, social and political transformation processes into the concrete lives of women and men struggling for a better livelihood. In this debate many reflections have been devoted to explore the way the social actors interact and generate what we conventionally call 'development objectives'. After all, the idea that 'development' will take place within a sort of mechanistic process of consensus is the key (implicit) assumption that justifies a lot of efforts in this domain, and under which the interaction of the social actors is assumed to take place.

Some implications of the discontinuities in what it is often unduly assumed to be the fundamental unity and homogeneity of the local communities, and that may undermine the development consensus mentioned above, need however to be recognized and taken into account. The case of the national park in Mozambique shows well the coexistence of different and alternative institutional sets: the modern 'developmental' world which includes (and sometimes embeds) the formal governmental institutions; and the 'traditional' social institutions, that Giddens [1] describes as the forerunner of the modern formal states, and that on the contrary in many cases coexist with the latter, within a setting that could hardly be defined as 'temporary'. It is not only matter of recognising the internal stratification of the local society; but to acknowledge the existence of a 'double institutional truth' concerning associated life.

While the recognition of this 'double institutional truth' has been object of many reflections and well documented studies, there is perhaps still some unanswered question on the way these interact in the domain of development. They are often understood as they were two alternative ways of approaching the field: the practice of development that 'acts', offering a 'developmental' grasp on things that are to be done; and a theory that is able to unveil the social reality beyond the structures that are set up in order to carry on policies and projects, which offers useful indications to the development practice. However, the latter extends its influence well beyond what is expected from a simple and 'neutral' technical set-up, insofar it shapes our understanding of the world. In some sense it becomes a practice-and-theory altogether, where it is difficult to keep a clear distinction between the two elements: we 'do' things coherently with what we have understood of the world, or we understand the world in a way that confirms our way of doing things? Thus, practice generates theory (or it 'is' a theory in itself); and somehow unavoidably, knowledge often ends up legitimising practice rather than challenging it.

The case from Brazil offers an interesting perspective on the internal stratification of the local communities. We are often used to think at development in terms of specific initiatives, aimed at pursuing stated objectives. Through a highly formalised local network analysis, we can acknowledge in the Brazilian case how development initiatives can be represented in terms of ties and relations among the social actors: something so simple and implicit, to be systematically uncared for in many current development analysis techniques. A deeper reflection on the idea of relationship as a key concept towards a better understanding of development and development cooperation [2] can be a promising area in which efforts can be spent.

## TERRITORY AND LOCAL DEVELOPMENT IN THE ITALY-CILSS FUND

Egidio Dansero<sup>a</sup>, Agnese Migliardi<sup>b</sup>

<sup>a</sup>University of Turin, Italy - [egidio.dansero@unito.it](mailto:egidio.dansero@unito.it)

<sup>b</sup>University of Padova, Italy - [agnese5-10@libero.it](mailto:agnese5-10@libero.it)

### ABSTRACT

The communication starts from the analysis of Italy-Cilss Fund (ICF), a cooperation program that has engaged for about a decade, from the beginning of 2000, the Italian governmental international cooperation in the Sahel, involving various forms of partnerships: International Organizations (UNOPS, Cilss), the central government of Mali, Senegal, Burkina Faso and Niger, regional and local governments of the selected areas of intervention (Zarese), Italian NGOs, and especially Sahelian various associations of civil society just to the villages of intervention.

ICF represents a program of great interest, such as organic attempt to coordinate an approach focused on local development and territory, variously defined, combining a wide range of initiatives to combat desertification. Despite a great effort in the process of setting up and defining the program, with many innovative issues, in its implementation it has experienced considerable difficulties, delays, route changes, even radical.

ICF experienced all the difficulties and ambiguities of an approach combining "positive" local development approach (relatively autonomous dynamics in the room) and a "normative" one, trying to stimulate with relatively similar approaches in different contexts of the interventions local projects oriented to combating drought and desertification as obstacles to development.

ICF has been and still is a collection of stories, a great event in its preparation and becoming, a mirror and a laboratory of Italian way to international cooperation. It is not only interesting but relevant from a political, civil and scientific point of view to reconstruct the ratio, the becoming, out of a evaluation logic (even if considering evaluation reports in the various stages of its life cycle) to put in evidence light and shadow, good and bad practices, capitalize and stimulate a process of collective learning in a world such as that of cooperation that seems to be hard to not proceed to tear and removals.

### INTRODUCTION

The Italy-CILSS Fund (abbreviated here in ICF) is a major project that has been implemented in four Sub-Saharan countries (Mali, Niger, Burkina Faso, Senegal<sup>1</sup>) for over eight years. It represents an interesting research lab for analyzing local development approaches within international development policies in the late 1990s and early 2000s. Indeed within it, we can find some of the key features characterizing international aid policies at the time: the food security goal supported by technological knowledge and GIS; the call for a strategic collaboration between international/governmental development agencies, decentralized cooperation, NGOs and national governments towards political and administrative decentralization processes; the integration of previous development approaches into a local development perspective.

In our opinion it is useful to adopt the conceptual framework offered by a *geography of – and for –* the development cooperation [1] [2] to retrace the territorial rationality of this program: from the articulated *ex ante* spatial analysis to the - symbolic, material and organizational - production of territory and scales engendered by its intervention (ICF territorialization). If this is certainly relevant from an academic point of view, we believe it could also encourage a debate into the development cooperation world where benchmarking and critical knowledge sharing do not come easily. After a brief analysis of genesis, structure and evolution of ICF, we will develop some reflections about its relationships with a territorial approach oriented to local development.

### THE ITALY-CILSS FUND

The ICF to Combat Desertification for Poverty Reduction in the Sahel was part of a wider Italy-Sahel Program for poverty reduction, following the DGCS Guidelines adopted in 1998. The ICF was approved by the Italian General Directorate for Development and Cooperation (DGCS) in October 2002, and formally started in 2004-2005 for a

<sup>1</sup> The research has been done in IAO-Gender project, financed by the IDC (Italian Development Cooperation - Direzione Generale alla Cooperazione allo Sviluppo del Ministero) under the Italian Ministry for Foreign Affairs, managed by the IAO and based in Florence.

duration of three years after extended until 2011<sup>2</sup>. Both the Italy-Sahel Program and the ICF focused on 4 of the 9 CILSS countries<sup>3</sup>, which in 2000 represented more than 75% of the CILSS region in terms of GDP and population, and almost 87% in terms of active population in the agricultural sector.

The preliminary talks about the Italy-Sahel Program and ICF took place between 1999 and 2002, by means of an institutional and technical partnership between DGCS, CILSS, national governments of the 4 countries, Italian NGOs<sup>4</sup> and decentralized cooperation<sup>5</sup> operating in those countries.

ICF was expected to treasure good practices experienced in the last years by the Italian cooperation, while the Italia-Sahel Program represented the common framework to identify synergies between a wide range of actors involved in development at the regional, national and local level.

Within the framework of a more rational management of natural resources, the general objective of ICF was to tackle the poverty and desertification spirals by improving the socio-economic conditions of rural populations in some marginal and vulnerable areas, labeled ZARESE<sup>6</sup>.

The ICF was based on a complex institutional structure, articulated on three managing levels: a “Sub-regional Pilot Committee” (CSR) located at CILSS headquarters; a “National Pilot Committee” (CNP) for each country; and a “Fund Managing Committee” for each ZARESE (CZGF) at the local level. All of these committees were composed of institutional and civil society delegates (from DGCS, CILSS, NGOs, national or local governments, peasant’s organizations), according to the managing level.

Furthermore, a technical assistance structure (IAC) – made by NGOs’ and peasants’ organizations members - was designated to support local actors (CZGF, local governments and civil societies organizations) in outlining or updating their Local Development Plans and, at the same time, identifying and implementing the most appropriate interventions. Beneficiaries of ICF grants were indeed both peasant’s or community based organizations and local governments which had to submit their project proposals to CZGF and CNP for approving.

Beside all this mechanism, two executive bodies were identified: the IAO<sup>7</sup> of Florence with technical assistance and monitoring duties; and the UNOPS<sup>8</sup> as administrator of the Fund.

Through this complex and articulated institutional structure which absorbed a great amount of energies and resources (in terms of time, money, capabilities and motivations of the actors involved), the ICF has been implemented in 12 ZARESE<sup>9</sup> (3 for each country), embracing some 1302 villages and a population of 300.000 people. During the first phase (2005-2008), the activities of ICF led to financing and realizing 754 micro-projects at the village scale. These micro-projects concentrated on four areas of intervention<sup>10</sup>, and mainly focused on horticultural and agro-forestry production, food processing and socio-economic infrastructures. However, by the medium-term evaluations in 2006-2007, some problems came to light such as the lack of coherence among many small interventions scattered all over the territory of each ZARESE, and the little attention actually paid to the natural resources management component. Therefore a change in strategy occurred at the beginning of the extension phase (2009-2011), characterized by a shift from micro-projects at village scale to structural projects – focusing on restoration and conservation of natural resources – at the inter-village or rural community scale<sup>11</sup>.

## **CONTEXTS OF ACTION AND SPACES FOR REFLECTION: A CRITICAL ANALYSIS OF ITALY-CILSS FUND**

As we have mentioned before, the aim of our research was to deconstruct theory and practices of ICF in Sahel to better understand its history and territoriality (at different scales), its multi-level institutional architecture, and the local development funds approach adopted by the Italian Cooperation.

The organizational set-up of ICF clearly shows its complexity. It included the experimentation of the ZARESE method, the defining process of intervention areas (through data collecting, negotiation and multilevel governance mechanisms), the identification of a broad set of stakeholders and their roles, the adoption of a local development

<sup>2</sup> The initial allocation established by the DGCS amounted to €15,5 million, after increased to €21,2 million.

<sup>3</sup> The “Comité permanent Inter-Etats de Lutte contre la Sécheresse dans le Sahel” (CILSS), created in 1973, is actually made by 9 countries (Gambia, Guinea-Bissau, Mauritania, Senegal, Mali, Burkina Faso, Niger, Chad and Cape Verde).

<sup>4</sup> More active NGOs on rural development in those countries were Lvia, Cisp, Cospe, Acra, Terra Nuova). All of them have been involved in ICF.

<sup>5</sup> Especially Piedmont and Tuscany Regions and Bolzano Province.

<sup>6</sup> “Zone à risqué Environnemental et Social Elevé”. This tool was originally developed by the center Agrhyment-CILSS to identify target-areas for intervention. Within ICF, the Zareses coincided with the administrative unit named *Département*, *Circle*, or *Province* (according to the country), embracing some smaller local governments called *Communes* or *Communautés Rurales* (political units) and several villages within them.

<sup>7</sup> The “*Istituto Agronomico per l’Oltremare*” is the consultancy and technical assistance organ of the Ministry of Foreign Affairs on the field of agricultural science and technology.

<sup>8</sup> United Nations Office For Project Services, created in 1974 as a member agency of UNDP, has become independent in 1995.

<sup>9</sup> According to the country, the 12 Zarese corresponded to the local administrative level called *Province* in Burkina Faso (Kourittenga, Oubritenga and Zondoma), *Circle* in Mali (Douentza, Mioro and Kolokami), or *Département* in Niger (Illega, Loga and Keita) and Senegal (Louga, Bignona and Matam).

<sup>10</sup> Support to Community Development (SCD); Support to Socio-Economic Development (SSD); Strengthening of Community Capacities (SCC); Natural Resources Management (NRM).

<sup>11</sup> The size of projects increased also in budget terms: micro-projects varied between 3 thousands to 30 thousands euro while structural projects spanned from €0 thousands to €100 thousands.

approach combined with a multilevel operational architecture<sup>12</sup>.

Several critical issues have emerged from the mid-term and final evaluations as well as from our interviews to actors involved in ICF (both in Italy and Sahel). These issues concerned the organizational complexity, the ambiguous role of some actors (e.g. UNOPS<sup>13</sup>, Italian NGOs<sup>14</sup>) and the absence of some others (like the decentralized cooperation<sup>15</sup>), the lack of timing between the outflow of grants and the activities on the ground, the difficulties encountered in peasant's - or community based - organizations involvement, the need to stimulate the applications for funds in the specific sector of natural resources management (otherwise quite neglected).

However, beyond that complexity, a core element of ICF was - or should have been - its local development approach to ensure local communities ownership of development processes. Furthermore, over the same period and in the same countries many other interventions of the international cooperation<sup>16</sup> were centered on this approach. But what did that mean?

In the following section we try to summarize some reflections raised in the international debate which can shed light on the ICF approach. Between 90's and 2000's, local development approaches, albeit belated with regard to Northern theoretical and political debate [4], have become a core element of development policies [5] [6] in Africa, as well as in Latin America and Asia. This was closely related to a shift in strategy made by the international cooperation in its different forms (multilateral, bilateral and non-governmental) [7] [8].

Paradoxically this has happened while, in Northern countries, local development era was seemingly coming to an end, at least according to some critical authors [9]. On the one hand, in many symbolic places of local development, for example in Italy, some warning signs of crisis were coming to light. On the other hand, local development policies were not achieving the intended effects for many reasons: the challenges of globalization; the first symptoms of the international economic and financial crisis followed by drastic cuts in public expenditures; the risks for these policies of becoming mere instruments for local appropriation of financial resources, without considering the very (innovative) meaning of theoretical constructs such as local, territory and participation [10].

Borrowing the title of an important essay edited by Becattini and Sforzi [11], there are still many "lessons about local development" to be learnt nowadays. However a critical approach is then strongly recommended, especially with regard to local development strategies and practices adopted in developing countries. Misunderstandings, ambiguities and oversimplifications have occurred in the practice, leading many authors to ask themselves how far local development discourse has been driven by endogenous dynamics rather than stimulated by exogenous expectations of international cooperation. In this latter case, can it be considered an "appropriate technology" (from a cultural, economical and political point of view) for developing countries? Or does it have been just a new wave in the international development sector [12], legitimated by other rhetorical discourses such as those on governance, decentralization and participation?

Here we present some answers given by international literature through an analysis of local development between North and South [4], focusing in particular on the Senegalese case study [13] [14] [15] [16].

The label "local development" often include a vast array of mutually contradictory definitions and approaches which can be placed along three different continuums:

- normative/positive (or policies/processes). Local development may be conceived, in a normative way, as a policy (local development as it should be) or, from a positive perspective, as a process (local development as an empirical fact, although not objective and linked to the observer's point of view). Local development history is characterized by a progressive shift from its discovery as a new and unexplainable fact (e.g. Italian industrial districts), to its institutionalization (policies to support existing local development processes), till its normative definition (how and what must be done to activate local development processes). International cooperation has clearly assumed a normative perspective, even when it started - or should have started - from local dynamisms recognition;
- top/bottom. Partly overlapping the previous distinction, we can identify two different ways to local development. A top-down dynamic, on the one hand, trying to fix roles and rules of action and to stimulate local development planning<sup>17</sup>. And on the other hand, a bottom-up dynamic, resulting from local dynamisms

<sup>12</sup> For a detailed analysis of the multi-stakeholders nature of ICF see Perotti [3].

<sup>13</sup> Many questions have arisen about costs and financial management transparency of UNOPS which should have had a purely technical role, too often trespassing into a political one.

<sup>14</sup> Italian NGOs should have had a double role: a political one, supporting the peasant's movement and actively participating in ICF governing bodies; and a technical one, supporting and counseling the promoters of micro-projects at local level. For this second purpose, it was assumed that NGOs would receive external funds from Italian decentralized and government cooperation by presenting projects proposals consistent with ICF objectives. In fact to let NGOs participating, it has been necessary to cover their operating expenses directly with ICF resources, which has not been well accepted by many actors. This also led NGOs to be considered as merely "work providers" instead of political speakers.

<sup>15</sup> One of the most interesting features of the Italy-Sahel Agenda and the ICF was represented by the attempt to involve Italian decentralized cooperation and NGOs into a national integrated system. While NGOs involvement has somehow occurred (see previous footnote), it has not been the case for decentralized cooperation. This is because, on the one hand, DGCS couldn't deploy additional resources for them (but rather counted on receiving financial support from them), and on the other hand, decentralized cooperation and NGOs often worked within the ZARESE areas chosen by ICF but in different localities or with different partners so it was difficult to reorienting their activities.

<sup>16</sup> For example the Italian Cooperation was adopting a similar approach in the Casamance Region of Senegal (Primoca and Sedhiou projects), in Niger (Keita project) and in Burkina Faso (in partnership with Ngo Lvia).

<sup>17</sup> See Lazarev and Arab [17].

and resources, often linked to a “community” dimension. The first one is also closely intertwined to the political and administrative decentralization processes which have been taking place since the 90’s in the four African countries selected by ICF [18]. These processes have entailed the creation of local communities, stimulating local governance and involving civil society stakeholders in both negotiation and planning mechanisms, which have often lead to more formalized “Local Development Plans”. Therefore some authors believe that it would be more appropriate to differentiate between decentralization – as a descending movement originating from governmental policies – and local development which is basically an ascending process [19];

- political/economical dimensions. Local development literature has been especially insisting on economical aspects, often proposing idealized representations of homogeneous local communities, and leaving aside internal conflicts [10].

In this variety of definitions, the most aware ones affirm “that local development does not merely consist in reducing inequalities between places, but rather that specific features of places play an essential role in driving development processes, in offering opportunities and in reducing risks” [20, p.44]. It is basically the relational intensity between actors and local material resources that differentiate one place from another [20]. In this perspective, local development can be conceived as a dynamic of change, activated by a set of actors (public, private, or both) who share some development visions for increasing local (human, economic, natural) resources value. These actors, thanks to their specific local knowledge and their interpersonal relations (of trust, identity ...), can stimulate positive dynamics of change in a quite endogenous and place specific way.

Development agencies usually consider territory as a constitutive element of local development. However in practice, this notion has often be employed in specious and partial manners, always mentioned but rarely examined in depth. Territory thus become a passive frame for action or a mere space for exercising political-administrative jurisdictions; otherwise it has been assumed as a set of relations facilitated by proximity, or even as a clot of resources and values which can be known objectively, without regard to different local actors representations.

In order to be more effective, the international cooperation should consider the territory as a dynamic support for its actions, and be aware of: the local resources and their modes of exploitation, the local actors and the way they are organized, territorial representations, evident or hidden conflicts, cross-scale relationship, competitive advantages.

## **THE ICF BETWEEN DECENTRALIZATION AND THE ZARESE METHOD**

Having briefly summarized the debate on local development, we now apply these observations to the different phases and contexts of intervention of ICF. ICF considered the ZARESE as the reference “scale” for the management of grants, although getting implemented in specific rural communities and - within these - in specific villages. The ZARESE’s were “forced” to be a space for negotiating local development, even if this was already falling within local governments’ prerogative.

The ICF was conceived with a strongly geographical approach, or better inspired by a strong territorial rationality which attempted to impose itself against very different economical, political and social situations, at the national and local scales. The Italy-Sahel program and ICF referred to a “natural” region – the Sahel - within which some high risk areas were identified. The term ZARESE described at the same time an approach, a target-region of intervention, a set of scales of action and a method. This approach attempted to combine the use of social-economical and environmental indexes (obtained through quantitative analysis), with representations and indicators resulting from interviews with a variety of actors at different scales (national governments, peasant’s movement and CBO, local governments and NGOs).

Before ICF, the ZARESE method has been experimented for the first time in the late 90’s within a wide program for the monitoring of agricultural productions and food crisis alert. It has been developed by the Italian cooperation and the Agrhymet – CILLS Center of Niamey, which made available a big amount of data and socio-economic information. Who initially conceived the idea of ZARESE had very clear that the selection of such areas was not only an identification of some geographic regions (based on environmental and socio-economic indicators), but that is required the involvement of the appropriate actors and that it should have been finalized to the strategic objectives of ICF.

As a matter of fact, the ZARESE method constituted a regionalization process with a resulting production of scales of observation and action, and of territories of intervention. The ZARESE has thus become a “project” scale of action overlapping- in a conflicting manner - the territories of competencies, legitimacy, and of the relations among the actors involved directly or indirectly by ICF. The sustainability of such territorial approach is arguable, and was strongly criticized since the early days of ICF.

Moreover, the institutional and social architecture of ICF was constituted by the intersection of the ZARESE method and the approach of the local development funds. It thus clearly elected the territory as the theoretical and operative perspective for identifying the actors, stimulating the local governance, defining a common vision of local development. This perspective though conflicted with the territorial complexity, with the problematic relation between different levels of political representation, of consensus building, and of territorial self-acknowledgements.

A critical point was the relationship between ICF and the decentralization processes. ICF deployed itself in 4

countries which were - and are still today - living very different phases of the decentralization process. This is a crucial difference considering that the ICF approach is based on a multilevel governance, inspired by the idea of balancing an institutional “top-down” method, with a “bottom up” method, intended to value the local dynamics.

When ICF started, for example, Senegal was fully involved in a decentralization process, while in Burkina this has happened more recently. In this latter the ICF arrived after the General code of Burkinabé territorial collectivities was just adopted in 2004 with the first elections of 351 *Communes* (49 urban, 102 rural), and before the establishment of regional boards in 2006. It is useful here to highlight the peculiarities of the Burkina case compared to the other countries involved in the ICF. In Burkina the ZARESE relied on an administrative level - the *Provinces* - which were not inherited from the colonialism, as were the *Départementes* in Senegal. The Provinces were indeed introduced after the Sankara revolution in 1984 and, although they were non elected administrative levels, they represented a form of regionalization which accounted for the territorial differences, especially with regard to ethnical differentiations. However the Provinces, initially foreseen by the decentralization bills, will be eliminated by the General code of territorial collectivities, which encompassed only the “Regions” and the “Municipalities”. On the one hand, the Regions appear as mere geographical inventions with names which are purely referential (East, North, Mid-Center, Sahel), clear expression of a “top-down” driven regionalization. On the other hand, the Provinces are only relevant in the frame of administrative deconcentration, with an High Commissioner and a Provincial consultation framework.

The ICF thus tried to integrate an institutional “top-down” vision of local development (closer to the administrative decentralization), with a “bottom-up” communitarian one. This happened first involving in the ZARESE Managing Committees a complex variety of actors: elected, representative of the decentralized government services and of organizations of the civil society. Secondly, making sure that the projects proposed to the Fund were consistent with Local Development Plans, without considering the fact that they did not often exist (and ICF did not envisage any budget to elaborate them) or, in most cases, were (as it happened in Italy) the mere addition of desired projects, not the outcome of a common and strategic view.

The choice to work at the scale of ZARESE thus represented both an element of interest and controversy. A first critical issue is the assignment of a governance role to the ZARESE scale which yet corresponded to an administrative level rather than a political one. ICF relied in all 4 countries to levels which were an expression of deconcentration, rather than decentralization. On one side the intention was to trigger local decisional and managing processes, on the other side ICF settled on a territorial-political level which was not existing before. Despite all these contradictory elements, it should be noticed that the ZARESE helped to make clear the need for territorial development policies to be grounded to an intermediate level between the Regions (too large) and the single Municipalities (or Rural Communities in Senegal).

A second critical issue is the promotion of micro-projects at village-scale, moving from the ZARESE level to the micro-local one, and skipping in fact the Municipality or Rural Community level. This strategic choice caused the belief that the ICF was not much consistent with a local development approach. The shift to structural projects during the extension phase implied a change of scale (a supra-village one), giving a greater role to the local authorities, such as the Municipalities or the Rural Communities, which were indeed fully activated only in 2007.

A further critical element, although very common in local development projects, has been the assumption to replicate everywhere the same local development model, following a “top-down” view rather than a “bottom-up” one [21]. A key element in local development processes is the very presence of local dynamisms, of self-organization capabilities, often taken for granted. Where these conditions do not exist (and the ZARESE method was not able to detect them), it is necessary to build them up before starting the project.

## CONCLUSION

In this paper we have attempted to develop some reflections about the institutional infrastructure of ICF and its local development approach. We would like to conclude our analysis of ICF by considering its threefold nature. On the one hand, the ICF can be seen as a “golem”, the popular figure made out of clay which can be shaped to be strong and perfectly obedient, but unable to think. This is a frequent temptation for big development project to create the perfect machine - based on technical knowledge - who serves man under controlled conditions.

On the other hand, it actually looks much more as the “Frankenstein” because it holds together “the best of” Italian cooperation strategies and methods, but if you make some small changes results may be very different from your intended purposes. In ICF history, a problematic aspect is represented by the fact that the higher rationality of the project had been supposed to integrate and conciliate a wide set of individual rationalities (decentralized cooperation, NGOs and peasant’s movements, CILSS, national and local governments, stakeholders and their knowledge at local level). Moreover, the final outcome of each strategy and action, which has been taking place at different scales during ICF, may be seen as a multilevel and multi-country “*bricolage*”.

Despite that, one of the positive features highlighted during our interviews was that many actors have shown the ability to reorient direction, approach and scale of intervention of ICF, even if this change has occurred too late when grants were almost finished.

## ACKNOWLEDGEMENTS

The fieldwork on which this paper is based was made possible by the research project “IAO-Gender”, funded by the DGCS (General Directorate for Development Cooperation at the Italian Ministry of Foreign Affairs) and supported by the IAO (Overseas Agronomy Institute, Florence). This part of the research has been done in particular by CISAIO (Centro Interdipartimentale di Ricerca e Collaborazione Scientifica con i Paesi del Sahel e dell’Africa Occidentale) of the University of Turin. Although we assume full responsibility for the shortcomings of our work, we are grateful to all those who participated to this project and those who have been interviewed in Senegal, Burkina Faso and Italy.

## PRODUCERS' COOPERATIVES BROKERS OR MIRRORS OF SOCIAL STRUCTURE: A CASE STUDY FROM NORTHEAST OF BRAZIL

### ABSTRACT

This working paper aims at showing how relevant variability of social structure influences the different diffusion of agriculture. My arguments are the following. First the different social network structure of villages reflects different history of village creation. Second the presence of more connected network favours the diffusion of agriculture as income generating strategy. Third that the producers' cooperative plays a different role in the villages according to importance of agricultural employment as income generating activities and driving forces behind network formation.

Three villages created by the agrarian reform ("assentamentos") can be considered quasi-natural experiments of village composition and network formation as they include both old and new settlers; family agriculture is an innovation for the context and producers' cooperative represent a change in the organizational landscape. Households living in these villages ("assentados") are a new category of rural inhabitants that have higher political participation than average rural inhabitants and which are more connected to the state [1]. "Assentamentos" have potential for promotion of local development as in an area historically characterized by sugarcane monoculture, land tenure inequality and "coronelism" [2], agrarian reform permitted access to land to households with different professional experience and geographical origins.

Villages case studies analyzed show how a combination of kinship and agricultural employment ties foster the creation of connections between households of different geographical origins. The two main elements allowing for such connections are villagers' recruitment patterns and the role-played producers' cooperative. By analyzing the history of three villages' creation and the results of a household survey including both socio-economic features and social networks, the paper shows how the village where agriculture is more widespread is the one where there are more bridges across groups.

### COMMUNITY BASED ORGANISATIONS: EMPOWERMENT THROUGH PARTICIPATION OR ELITES CAPTURING?

Development agencies aim at becoming drivers of innovations that they consider beneficial to empower the target population. Participation and local development have become central issue in development discourse after the failure of structural adjustment policies. They identified, among others, in households' participation in Community Based Organizations (CBOs) an instrument to spread the innovation they want to promote.

The main negative effects of CBOs are creation of exclusion patterns either related to the costs of specialization or the difficulty of innovation diffusion. CBOs such as producers' cooperatives often promote specialization in some cash crops and smaller producers that tend to adopt multiple livelihood strategies [3]. "CBOs reproduce and reinforce relations of domination and subordination between elites and non-elites"[4]. This phenomenon is referred in literature as "elites capturing" [5] [6]. The strong presence of this phenomenon made it consider a form re-functionality previous dependency patterns such as colonial indirect rule.

Most studies focused on two main issues; first understanding what characteristics of early and late adopters and how innovation introduced by development projects spread through social networks focusing on the number of adopters of the same behaviour [7], on the people they are communicating with [8] [9], role of information versus other forms of peers influence [10] and second identifying what are drivers of households' participation by using dyadic regression [11] [12].

The main aspect that I would to complement in this paper is the weak approach to network theory. Most previous studies focus on the idea is that inclusion and exclusion dynamics are essentially based on individual characteristics. Development agency action instead goes beyond participants in the project that are often quite a small number. The previous authors look mainly for individual factors that increase the likelihood of households to participate and/or to

<sup>1</sup> This research has been developed in the framework of the International Doctoral Program in Local Development and Global Dynamics, School of Social Sciences, University of Trento, where the author is a PhD student.

<sup>2</sup> The Training Centre for International Cooperation has supported the definition and implementation of this research.

adopt the innovation but they do not consider the local structure of interdependencies in which households are embedded.

It is possible to refer to local development not only in terms of expansion of individual capabilities [13] but also in terms of emergence of autocatalytic society that is not totally dependent on external support but which is able to auto-reproduce. My approach is not to consider innovation in terms of emergence of new organizational forms [14].

The aim of my analysis is first to map multiple ties that connect the households in the villages (nodes), second to identify groups and third to understand what are the forms of brokerage that connect groups. For each village all the households of permanent residents have been interviewed collecting both attributes and social, economic and kinship ties among them.

Such approach can also respond to some critiques directed to the shallowest aspects of participatory development conception and rationale. First the utopic idea of community [15] has been contested as networks of constituency (kinship) and exchange (agricultural employment and frequent contact) have been elicited. Second conception of development based on individual motivation and voluntarism discourse [16] as the research has, as main starting point is interdependence among actors and importance of peer influence and contextual effects in shaping behaviours.

My argument is that a development intervention, such as producers' cooperative, which aims at introducing innovation, is likely to trigger local development when it is created in a context where there are already connections across groups or when it is able to facilitate the creation of ties across groups. This social structure might be able in fact to overcome the main causes of the exclusion patterns and elites capturing phenomena such as homophily, innovation diffusion patterns and peer effects. The combination of innovation that reaches first central individuals, individuals that tend to interact with similar others (homophily), behaviour is influenced by individuals with whom they interact, in absence of brokering links across groups, defined by individuals that share the same characteristics, will lead to the fact that the benefitted group will just one and most probably be the most connected one.

## CONTEXT OF ANALYSIS

Object of analysis are three villages created by agrarian reform (*assentamentos*) in state of Alagoas, Northeast of Brazil where it operates a producers' cooperative, supported by Italian and Brazilian donors. The three villages can be considered quasi-natural experiments in terms of village composition and network formation as they include both old and new settlers. Households living in the settlements ("*assentados*") are a new category of rural inhabitants that have higher political participation than average rural inhabitants and which are more connected to the state [1].

Alagoas has the lowest life expectancy (67,6 years), one of the lowest GDP per capita and highest illiteracy rate of Brazil [17]. Alagoas economy has been dominated by monoculture since XVI century and today it is the fifth producer of sugar cane in Brazil and first producer in Northeast region [18]. The municipality object of analysis has unequal land distribution being the Gini Index of land 0,85 and Gini index is 0,39 [17]. It is a quite small municipality with a total population of 28.749 inhabitants and 35,1% of the population lives in rural areas.

*Assentamentos* have potential for local development as in an area historically characterized by sugarcane monoculture, land tenure inequality and "coronelism" [2], agrarian reform permitted access to land to households with different professional experience and geographical origins. The risk is that rather than new organizational forms what will emerge are forms re-functionality [14] of existing forms of domination. Access to land alone is not enough to trigger structural change. Two are the forms of re-functionality that can be identified: change only in label of captivity namely from landlord responsibility over workers to state responsibility over villagers or return land tenure concentration as prior to agrarian reform. In the first case the two tools of control used with sugar cane labour force, namely housing guarantee and debts persisted over time. First the land of "*assentados*" is still property of the state and they have been negotiating with the local administration to have access to resources both at community and individual level. Second there was great attention towards guaranteeing housing facilities. Third all of the households in the settlements have debts towards the state, as nobody was able to pay back the first and only state credit support agricultural production. In this second case few big farmers will concentrate the large majority of plots ("*lotes*") and a large number of households would work as labour force for new landlords ("*trabalho alugado*") and there will be an increased dependence on state subsidies and state employment.

New organizational forms instead can be represented by rising importance as agriculture as economic activity. The emergence of wealthy smallholders' farmers that in the state of Alagoas and in general Brazil is very rare. These "new men" could be a new political group, less influenced by patron-client dynamics, as they do not depend on state subsidies (bolsa família, cesta básica, pensão) but that are more politically active than average inhabitants of rural areas. The potential for the cooperative is therefore to support the emergence of this new social category. The risk though is that the cooperative could only include the biggest producers, excluding small producers. Keeping together small and big producers could place the cooperative in the position of a broker between several groups while serving only big producers could create envy and hatred from the least successful farmers.

**SAMPLING STRATEGY**

The three villages have been selected out the 18 existing rural settlements created by agrarian reform [19] [20]. The sampling criteria were: 1) difference in villages' history namely social movement recruiting households to occupy the land, 2) percentage of households' members of the cooperative and 3) household average income from sell of products to cooperative. The aim of this sampling strategy is that different village creation rules lead to different households' features and network formation patterns.

I have interviewed 102 households in village A, 38 in village B and 37 in village C that represent all households permanently living in village A and B and 95% of those living in village C. The total number of household living in each settlement does not reflect the number plots registered at INCRA: more than one household live on one plot and some households has more than one plot.

**Tab. 1 - Villages' main features.**

Settlement name	Creation year	Settlement area (ha)	# Plots <sup>3</sup>	Total population <sup>4</sup>	% Coop members	Household income from coop	Members contribution to total coop production	Households with agriculture as main livelihood strategy	Name of social movement
VILLAGE A	1998	690	100	437	28.0	10478.9	65.6%	49%	Private association
VILLAGE B	2005	453	42	279	4.8	1337.7	0.3%	45%	MST
VILLAGE C	1997	445	38	285	23.7	119.3	0.6%	22%	Comissão Pastoral da Terra

**DATA ANALYSIS**

Agriculture represents an innovation as income generating strategy. It can represent a possible way to promote local development, the question is what makes some settlers decide to adopt such innovation and others do not. The table below illustrates the different distribution of income from agriculture in the three villages. While the median value does not differ significantly it is possible to observe that range is very different across villages. In village A in fact values go up until 2000 reais corresponding to more the medium salary.

**Fig. 1 - Box plots comparing income from agriculture in the three villages.**

I argue that the reason why village A is the most successful settlement in terms of agricultural production and also organizational structure, is not only because many of the settlers had already experience in agriculture (32% of settlers), but also because of the co-evolution of intertwined social ties that allow for the creation of ties across groups that better allow innovation to spread, namely to adopt agriculture as main livelihood strategy.

<sup>3</sup> Number of plots in which the area of the village has been divided by INCRA.

<sup>4</sup> The data refers to municipality health services (September 2012).

My argument is that the difference in history of the three villages and especially recruitment and early organization of the village explain village composition and kinship network features and marriages between new and old settlers in the village.

1. History of the villages, especially households' mobilization and recruitment patterns and early organization of settlements, explain the different structure of kinship networks.
2. Agricultural employment, supported by cooperative activity, allows for the creation of links beyond kinship that allows more connection across groups of different geographical origin or different migration waves.
3. The three observed frequent contact networks of the three villages are based different network patterns, that despite the similar level of density, allows for a different level of diffusion of information and behavior across households.

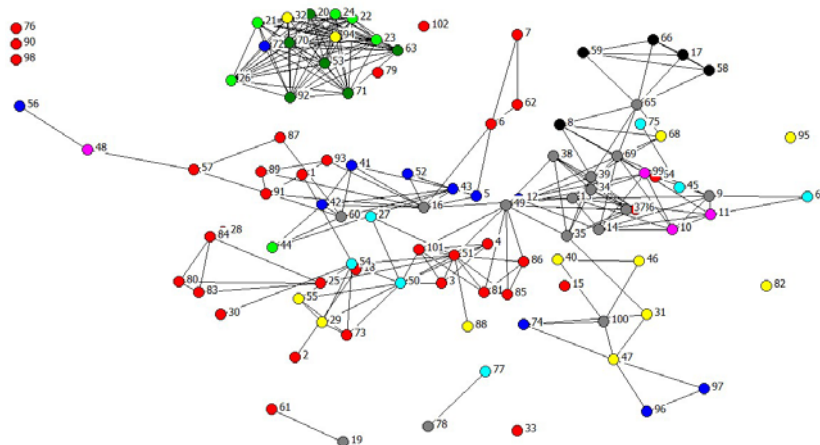

To test such hypotheses both quantitative and qualitative analysis will be adopted. First the description of villages' history shows the differences in kinship networks structure (polycentric versus centralized) along with the difference in village composition. Networks visualization has been produced with the software UCINET [21]. Second the crucial role of agricultural employment in building ties across groups defined by common origin in the three villages. Third the use of Exponential Random Graph Models (ERGM) allows identifying the factors that predicts the contact network, which is considered to be a good approximation of how people interact.

### Village history and kinship networks

The three organizations recruiting households in the three villages sampled differ first in criteria to recruit and mobilize households, second in the rule to define households who can have access to land after a period of occupation, third in spatial organization of the settlement and in political representation of settlers and ability to negotiate with local and national authorities and fourth in the way the state access to land (expropriation versus acquisition). These factors influenced several variables such as number of households experience with agriculture, second number of households that already knew each other before occupation (whether they were coming from the first village or in the same migration wave), third in density of kinship network and percentage of old and new settlers and percentage of old and new settlers.

In village A the charismatic leader of a private association, that led the process of encampment and expropriation of the land, recruited a large portion of households that now live in the village. Most of these households were members of this association that was based in the south of Alagoas. The creation of an association also allowed for more time for households recruitment factor that is reflected on a higher number of household already with experience in agriculture 32% and also the fact that many of them already knew each other for almost two years. At the moment of settlement establishment the leader of the association, at that point became the first president of the settlement, declared the settlement collective. This allowed him to prevent to send away households that were in exceeding the number of plots indicated by INCRA. There were no rules limiting the number of households connected by kinship and there is in fact low percentage of isolates in kinship network (12%). Furthermore during the period of encampment and early period of settlement composition several collective activities were organized in the village. This latter element probably favoured the creation of more marriages among different groups both among old settlers and new settlers and also among new settlers of different origins. There are in fact in the village 12 marriages across different groups where household of same geographical origin defines groups.

Fig. 2 - Village A kinship network: nodes coloured by origin.

Village B was created by Movimento Sem Terra that defined a maximum number of households linked by sibling ties that could live in the same village. The observed kinship network is quite sparse being only 50% of households connected by kinship ties. Only a very small number of households already knew each other before the process of

encampment and occupation. MST activists calling people to occupy had in fact short time gather people and therefore collected households with very different work experience, mostly they were employed in the sugarcane sector (37%) and only 21% were already living of agriculture. Many households have been literally socialized by politics: most of activities promoted by MST were especially participation to political parades, occupation and other forms of protest to make pressure on the government to expropriate the land. Furthermore at the moment of land division in plots when MST indicated households that could have access to land, participation in political parades was an important criterion. Marriages brokering ties across group are quite lacking there is in fact only one marriage connecting among two households of different geographical origin arriving during the first migration wave or the first group of settlers and no marriages between old settlers and new settlers.

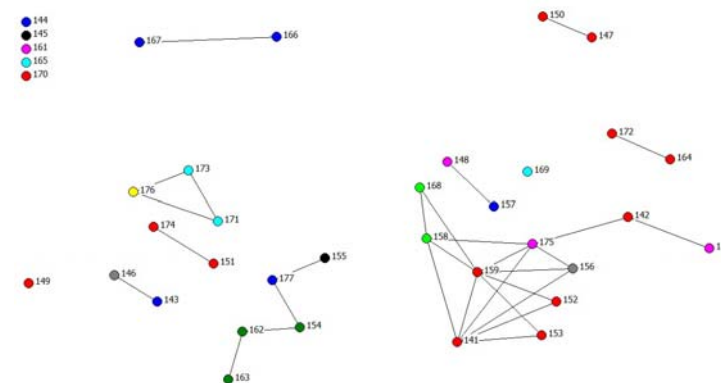

**Fig. 3 - Village B kinship network: nodes coloured by origin.**

Comissão Pastoral da Terra created village C, differently from the previous two settlements, the land has not been expropriated after a process of occupation but instead it has been bought by INCRA. This factor has important two implications. First there are a larger number of households that were already living in the village (27%) or in the immediate neighbouring area that arrived there as soon as they received information by their relatives that it was possible to get access to the land and old rural workers were eligible. Second most of the new settlers did not shared a common history of occupation but rather INCRA with the intermediation of Comissão Pastoral da Terra called households that already had experience of struggle in different settlements across the state of Alagoas. A small group of three households have already been occupying in other settlements for over six years.

This situation is represented by the graph of kinship ties there is a larger group mostly composed by old settlers coloured in red and few new settlers connected by kinship ties. The lack of the a strict rule certainly favoured the presence of larger clans in the village and less isolates (only 19%) but the lack of common joint activities certainly hampered the creation of brokering marriages across groups. There are only two inter-group marriages between old and new settlers. Furthermore similarly to what we observe in village origin is not an important factor to predict frequent contact network, more relevant are in fact kinship and agricultural employment.

**Fig. 4 - Village C kinship network: nodes coloured by origin.**

**Agricultural employment as brokering tie**

Agricultural employment is an important form of brokerage as it creates connections between different groups defined by kinship; what varies though is the overall impact of this brokering connection. Three different graphs represented below show the different brokering power represented by agricultural employment. Nodes coloured by party, kinship ties in red and agricultural employment ties in green.

In village A the presence of agricultural employment ties totally changes that network structure of the village; there

is a shift from a situation of potential clash between two cohesive unconnected blocks to an integrated system. Only with kinship ties there were two distinct and isolated groups being one a large endogamous cohesive clan and a more polycentric structure where households of different origins are tied together by marriage. Agricultural employment ties keep together the two groups in a quite articulate way. The presence of multiple ties between the two groups makes the whole structure less vulnerable to possible tie cuts that can tear the two groups apart. Most of the households are in fact integrated in the system and there are only three households that are left aside. Agricultural employment includes in fact 77% of the households. On a more general scale this also means that many households are able to find their source of employment in the same village where they reside. The cooperative has role in the importance of agricultural employment as the guarantee of a market for households' crops allows creating the necessity for agricultural labour force to support their production. It is important point though that not all households specialized in agriculture are economically sustained by the cooperative as there are important producers that do not sell to the cooperative. It certainly through that the technical assistance and credit provided by the cooperative initially along with the facility to collect products in their field that members currently have certainly represent a big support for their economic activity.

**Tab. 2 - Comparison among agricultural employment network in the three villages.**

	Village A	Village B	Village C
<b>Isolates</b>	33%	50%	54%
<b>Density</b>	0.014	0.024	0.021
<b>Average degree</b>	1.41	0.89	0.76

**Fig. 5 - Village A kinship and agricultural employment tie.**

The picture in village B is totally different in fact, despite the brokering role between the two main groups, many families are left aside being the percentage of isolates 26%. There are 45% of the households declare to make their living mostly out agriculture but when it comes to income from agriculture the values are mostly below one salary. This data show that most of the households that agricultural production is mainly for subsistence and not on larger scale that would allow them to hire somebody even occasionally to work on their plot. There is in fact a quite strong correlation (0.44) between income from agriculture and number of households employed in agriculture and between being member of the cooperative and number of households hired (0.41) while only weak correlation between agricultural income and being member of the coop (0.25). There are in fact quite a number of members that almost do not sell any product to the cooperative.

**Fig. 6 - Village B kinship and agricultural employment ties.**

In village C the brokering role of agricultural employment is extremely relevant but quite vulnerable. There are only three ties that connect the main clan mostly composed by old settlers and their relatives and some of new settlers. The role of agriculture is certainly the lowest among the three villages: only 22% of households make their living out of agriculture and most of households (57%) live out of a mixture between sugar cane employment and other activities. The role of producers' cooperative is still very marginal as only two people are members of the cooperative and the cooperative has been operating in the village only since 2009.

**Fig. 7-** Village C kinship and agricultural employment ties.

**Different history different elements to compose contact network: ERGM results**

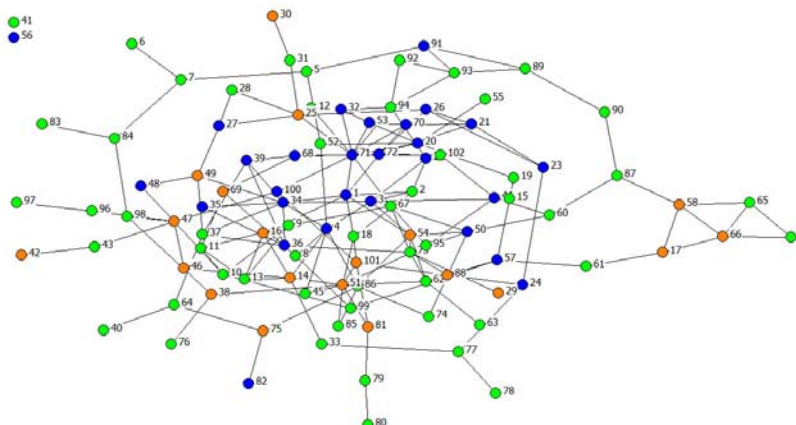

The three graphs below illustrate the frequent contact network of each of the villages. The three networks have a very small number of isolates and similar average degree but they present different local structures.

**Tab. 3 -** Comparison among contact network.

	A	B	C
<b>Density</b>	0.034	0.114	0.101
<b>Isolates</b>	2%	5%	0%
<b>Average degree</b>	3.39	4.21	3.6

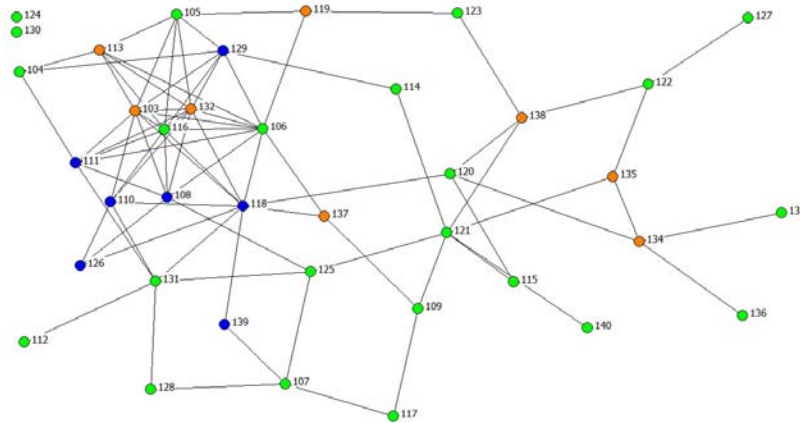

Village A network is more interconnected being difficult to separate single cliques, except at the periphery of the network. In village B and C instead it is easier to identify cliques.

**Fig. 8 -** Village A contact network.

In village B there is very dense group where all households are connected to each other whether the rest of households are only connected by a smaller number of ties. Households that arrived together at very beginning of encampment process and that are currently living in the same road compose this group.

Fig. 9 - Village B contact network.

In village C two main groups that composed by households connected by several ties but there are few brokering ties among the groups.

Fig. 10 - Village C contact network.

ERGMs are a class of statistical models for social network analysis that is designed to enable network pattern recognition, which represent the structural signature of the network [22]. The ERGMs use maximum likelihood estimation and Monte Carlo Simulation. The model creates a theoretical network and tests it against the observed network. The goodness of fit statistics gives a precise measure of how the predicted network is similar to the observed one.

My objective is identifying what are the shared features and/or shared contact (homophily) and the local structures that are able to predict the network of contacts and how do they vary across the three villages. The four statistics parameters that I am using in the models are “nodematch” that measures when two nodes (households) in the dyad share the same attribute, “edgescov” that measures when two edges share the same networks and two ERGMs terms namely geometrically weighted edgewise shared partner distribution and geometrically weighted degree distribution. The variables analyzed were selected as they were considered to be the most likely to foster the creation of link among nodes: monthly income from agriculture, monthly total income, participation into political parades, migration wave in which the household has arrived, household membership in the cooperative, household present employment, the occupation of the households before the occupation period, the number of households that referred the household in object as among the most popular, place where the household lived shortly before the agrarian reform, connection of the households in the other two collected network kinship and agricultural employment. All covariates are categorical or indicators variable as there is low probability that two households to match on a specific value.

In village A, that is the most complex village in terms of networks and the village with the highest agricultural production, there is wider number of factors contributing to network formation while in the other villages there is a smaller number of factors that are to able explain the contact network. In village A same geographical origin and homophily are to be the most important elements. In village B instead it is more difficult to identify what drivers of households frequent contact but being in the same migration wave and in the same party are important in defining a link in the frequent contact network. In village C the co-existence in the same network of households is the major factor that allow predicting the other networks while no shared attributes has a relevant effect.

## CONCLUDING REMARKS

This working paper starting from the analysis of three social networks namely agricultural employment, kinship and frequent contact explored how groups emerge and how they are connected to each other in three villages created by agrarian reform. The differences among the three villages show that an innovation such as agriculture can more easily spread in a context where there are more connections across groups. These connections are represented by kinship that is mainly related to history of the village and agricultural employment that has been supported by the role played by the cooperative.

### ABSTRACT

The RENEP project arose from the need to develop the energy sector in the city of Hebron, in Palestine, bringing know-how at local level and helping create innovative entrepreneurship and new jobs in the market of renewable energy in the Middle East. At the same time there is an interesting opportunity to demonstrate, through a real implementation, the advantages offered by new technologies that can be also exported in other Middle East countries. Starting from Energy, the City of Hebron aims at an effective integration of all utilities (energy, water, telecommunications), creating smart ICT infrastructures for e-governance, attracting external investors and enabling funding by international organizations.

The main objectives of RENEP are the improvement of the efficiency of electric energy networks and the enhancement of the quality of life for citizens through continuous availability of electric energy from renewable sources connected within a smart network, reducing energy costs and environmental impacts. These objectives will be met through the design and building of a Pilot Site, interconnecting existing solar panels, through a “smart grid approach” consisting of an experimental production of energy optimized in economic and environmental terms. The role of energy storage capacity will be also thoroughly investigated. International donors may be interested in being involved in order to fund project implementation, since the experience made in Hebron can be at the basis of further activities in the Middle East.

Therefore, the project will define technical and organizational requirements to build economically and environmentally sustainable intelligent infrastructure systems and services for smart cities. Moreover, the systematic installation of photovoltaic systems on Hebron’s roofs can become part of the city urban planning strategies and, at the same time, offer new opportunities for qualified jobs in installation, management and maintenance.

### CONTEXT

Increasing population and urban growth are driving a major change in Palestine’s energy demand, boosting consumptions and requiring environmentally sustainable solutions. At the same time, global warming and related worldwide CO2 reduction policies are forcing a technologic transition to Renewable Energy Sources (RES), like wind and solar. RES market will be one of the main drivers of green economy, enhancing business and creating new qualified jobs. For Palestine, renewable energies represent therefore both a need and an economic opportunity, within a wide strategic scenario that can be oriented to energetic independence reducing the need of importing energy from Israel.

The City of Hebron is a Palestinian city in the southern West Bank, 30 km south of Jerusalem. It is the district capital of the Hebron Governorate, the largest one in the West Bank, in an area where the sun shines with continuity: photovoltaic systems are therefore a potential important energy source. No solar production is obviously possible during the night, and surplus production during the daytime is not self-consumed in case energy production exceeds energy consumptions. Solar panels represent the city “distributed power plant”, and need therefore effective energy governance networks (smart grids) and mechanisms in order to be fully and efficiently exploited.

The systematic installation of photovoltaic systems on Hebron’s roofs can become part of the City urban planning strategies. At the same time, this can offer new opportunities for qualified jobs in installation, management and maintenance processes. Energy storage capacity represents a strategic issue, since it is able to make the entire City RES-based energy system profitable. The City of Hebron can become the area where innovative energy storage technology is tested and used as catalyst of profitable energy initiatives.

The City of Hebron can aim at an effective integration of all utilities (energy, water, telecommunications), through an energy driven, bottom-up, business-oriented approach to build economically and environmentally sustainable smart infrastructures. This approach can create resources to fund smart ICT infrastructures for e-governance, attracting external investors and enabling funding by International organizations.

**RENEP PROJECT**

The RENEP (Renewable Energy for Palestine) project, a business-oriented research project, funded by the PMSP (Palestine Municipal Support Program) of the Italian Ministry of Foreign Affairs, is an attempt to develop new energy management strategies to exploit the maximum potential from renewable energy sources. The project is part of a cooperation agreement signed by Hebron and Turin Municipalities, with SiTI, AI Engineering and Province of Turin as technical and scientific partners. The project originated from SiTI’s presentation on smart energy during the 1<sup>st</sup> Conference on e-Municipality that was held in Hebron in June 2012 [1].

**Fig. 1** - Example of a possible smart grid in the city of Hebron.

RENEP project starts from the idea that city can be seen as a network of “prosumers” (producer – consumers), where buildings (houses, offices, industries, schools, hospitals, sport facilities, etc.) can act as energy consumers in a traditional way, but also as energy producers. Each building is connected through “smart” connection, enabling data and power exchanges on both directions.

Figure 1 shows a possible implementation of a smart grid in the Hebron urban context, where public and private buildings are connected by a smart infrastructures able to both collect data and transfer energy from producers to consumers.

Energy can be produced through new or existing photovoltaic systems on roofs, representing a potential important energy source. However, the production during daytime can be higher than consumptions, so surplus production is not self-consumed. At the same time, no production is possible during the night. The main idea is to store the surplus production during the day and use it during the night. In order to do so, local energy storage systems needs to be installed. A proper energy flow management by means of energy storage units, dispatchable loads and demand side management will allow the efficient exploitation of renewable energy sources within the technical limits of the current electrical infrastructures.

Figure 2 shows the integration between the building, acting as a “prosumer”, and the surrounding infrastructure, composed by the electrical grid and the energy storage systems.

**Fig. 2** - Building as a prosumer in a Virtual Power Plant.

A proper energy management strategy must be developed [2] to exploit the maximum potential from solar source and to guarantee an efficient use of storage systems. Through a smart grid approach, solar panels are identified as

distributed power plant, with a central management which finds the optimal matching between production and consumption, also with the help of storage.

## PROJECT ACTIVITIES

Several specific activities have to be carried out in order to reach the expected objectives.

1. **Data Collection.** The collection of baseline data will consider the existing networks and energy facilities in Hebron with the collaboration of the HEPCo Company. Other information that will be collected concern the localization of the public buildings, schools, Municipality departments and other buildings. The collection will cover also the data of already existing renewable plants and in particular solar plants. The process should be carried out in the field and at the offices of the HEPCo Company. Before being used for the technical study itself, the data will be further checked and validated in order to ensure a good level of credibility and accuracy. Collected data will be analysed and discussed in cooperation with local technicians, in order to verify, through a process of validation, compliance with the actual condition and completeness of the information obtained. During the data collection activities, several site visits will be organized to better understand the feasibility of the connection of different types of buildings that can be linked and managed through a smart grid approach.
2. **Legislative framework analysis.** The legislative framework will be collected and then analysed by means of the local electrical technicians in Hebron, the Palestinian Electric Energy Authority and other Municipalities and management Authorities. On the basis of data concerning the pilot site and preliminary analysis, some suggestions and considerations can be made also concerning the tariff system.
3. **Building of pilot site.** A set of technical and organizational criteria will be defined in order to identify the exact territorial contexts to be used as pilot site (Figure 3). Areas characterized by different building types with different load types will be selected, where there is a strong presence of RES production systems. In the pilot testing phase the selected buildings will be treated as a “Virtual Power Plant” (VPP), evaluating their load and energy production profiles and defining optimization criteria at economic and environmental level. The PV installations on this set of buildings will be monitored through ICT interfaces, using available transmission lines and systems: this VPP represents the basis for the future “smart grid”, whose design and implementation depends upon investments. The investments are related to sustainable business models relying on energy policies by the City. The VPP will create a living context where energy storage potentials, energy production and data transmission technologies, and the integration between them can be evaluated. Therefore, the pilot site will be designed in order to become a benchmarking context for foreign companies to test innovative products and solutions in the smart grid and smart city context. A critical issue is represented by the connection between the distribution grid and local RES systems, that can become able to operate as semi-independent unit (only actions that are compliant with Palestinian laws and regulations will be considered). These connections will be deeply analysed in order to find out possible solutions able to overcome possible grid problems. Solutions can be identified both on the technical side and on the governance side. Energy storage requirements will be identified, investigating existing technological solutions able to cope with the challenges.

Fig. 3 - Smart pilot site.

4. **Preparation of tender documents.** The preparation of Terms of Reference (TOR) and tender documents is a major step: a contracting company has to be chosen, by means of an international tender, in order to implement

a city-wide smart grid, whose size is enough to test and validate innovative business models and to help improving Palestinian energy regulations. Based on the Pilot Site, a financial analysis will be carried out in order to define a suitable business plan for the Hebron Municipality, including cash flow, break-even point and the IRR related to the investments and energy cost. The analysis will consider the possible future installation of renewable energies and the implementation of a more extended smart grid in all the city of Hebron. The capacity of the pilot site to host testing and simulation of innovative smart grid solution can attract foreign donors (Foundations, Investment Funds, Companies, etc.), with a positive impact for the economic sustainability of the project. In addition an energy driven, bottom-up, business oriented approach to build economically and environmentally sustainable smart infrastructures will be also activated. The collected data during the exercise on the pilot site will be compared with the estimates and the financial analysis, leading to an on-field verified process.

5. **Training. Local young technicians** will be trained with special reference to VPP approach, integrated governance of distributed energy sources, installation and management of renewable energy technologies, design, management and commissioning of smart energy technologies, design of smart energy systems and smart grids. The main goal is the development of a local expertise able to create jobs and innovative technology-intensive start-ups.

## EXPECTED RESULTS

Energy can represent a first important step in smart infrastructure implementation process. A “smart grid” approach can create an ideal context to gather the required financial resources to build the infrastructures of a “smart city”. Hebron’s best practices may be extended to other cities and to all Palestine, empowering energy self-production and self governance by a smart use of renewable energy sources in urban contexts, paving the way to a medium-term wider energy independence of Palestine. The approach of the project will allow to build economically and environmentally sustainable intelligent infrastructure services for smart cities.

The expected results of the project are:

- comparison report upon Italian and Palestinian town and territorial energetic plans.
- Training for trainers plan.
- Photovoltaic building roofs as a distributed generation for smart cities. The installation of photovoltaic systems on Hebron’s roofs can become part of the City urban planning strategies; at the same time can offer new opportunities for qualified jobs in installation, management and maintenance.
- Building of a Demonstrative Pilot Site based upon photovoltaic panels above some mayor Hebron buildings, in order to better show the potentialities of adopting a smart grid approach in energy management.
- Collection and analysis of the Palestinian laws on Renewable Energy and analysis of the tariff system for RES.
- Business models to attract investors to build city e-infrastructure: financial analyses will be carried out in order to define a suitable business plan for Hebron Municipality.
- Empowering energy independence and self governance by a smart use of renewable energy sources in urban contexts, by applying energy saving practices in new and existing buildings and by training tools, courses and materials for a selected group of Hebron’s young technicians with special reference to the installation and management of solar panels and their connection with the Smart Grid.
- Creation of a living context where energy storage, energy production and data transmission technologies can be effectively tested.
- Geofenced maps of the area to be used to correctly locate technology on the territory, choosing the best areas (e.g. PV orientation with respect to the sun). Detailed assessments will be performed with reference to: GIS systems, energy services GIS based data, cadastral systems and procedures, financial applications and billing systems, ICT networks, protocols, and-common state of the existing network.
- Technology testing of new Renewable Energy Sources (RES) for cities with the aim to generate value and create resources to fund smart ICT infrastructures for e-governance. Technologies will be tested in selected pilot areas and sites, creating a smart distributed energy system.

## BENEFICIARIES

Several target groups can be positively affected by the definition of innovative energy management protocols aiming at exploiting the potential of renewable sources, like sun and wind.

The Municipality of Hebron is the first direct beneficiary, as it will become a virtuous example of best energy governance practice, recognized at Palestinian level and in the entire Middle East. As a result, the Hebron area can attract foreign donors, starting from Arab countries (Companies, Foundations, Investment Funds, etc.) in order to test and simulate innovative solutions and products in the energy sector.

Through the definition of innovative energy services, as well as the creation of new job opportunities, also citizens

(especially young people) can experience valuable benefits. Innovative energy services based on the exploitation of RES will lead to a greener society, while optimal management of the different RES can increase economic gain. At the same time, new jobs will increase the financial resources for each families.

However, the definition of business models also involves vocational training bodies and local SMEs. Vocational training bodies, with the help of foreign institutions, can increase their innovation level and expand their market in order to place new young trained persons for local enterprises. In addition, the entire Palestinian Training System will benefit from cultural exchanges with Italy, through the identification of new courses and disciplines to provide a strong link between academic and applied research.

New or existing SMEs will gain qualified personnel from the increased training capacity, guaranteeing installation and maintenance of operational systems in the energy sector.

Finally, the Hebron Electric Power Company (HEPCo) can develop new services for citizens and, therefore, new business models that can be replicated in other Palestinian areas.

### **ABSTRACT**

From 2001 to 2012, in Burkina Faso, Niger and Senegal, over 1.6 billion Euros were invested in the environmental sector. Most of this money comes from donations and low-interest loans to increase access to water and safe sewage systems to reach the Millennium Development Goal 7C. However, the incessant growth of the Sahelian cities and their proverbial inability to ensure the maintenance of the infrastructures created hamper the achievement of this goal. More transfers from the State to local governments and a reform of local taxation are needed. This article summarises the early achievements of an assessment of the potential of local taxation in Kébémér, Louga (Senegal) and Niamey (Niger): three municipalities that represent three classes of Sahelian urban centres. The assessment was carried out within the Triangular project Italie-Niger-Sénégal (INS) coordinated by the Province of Turin, co-funded by EuropeAid where the DIST-Politecnico di Torino, the Province of Milan, the Milanese Provincial Fund for international cooperation, the Region of Louga and the City of Niamey were partners. To carry out the assessment, it was necessary to accomplish a street addressing in Kébémér and complete it in Louga, carry out an extensive process of photo interpretation of satellite images to identify built-up plots, construct an open source multi-scope GIS in each of the three municipalities. This made it possible (i) to identify the tax base of the street tax, of the tax on garbage removal, of the tax on vacant land, of the rights of occupation of public land, (ii) to assess their yield, (iii) to localise areas with less access to infrastructure, and (iv) to identify the potential contribution of an improved local taxation to reduce the infrastructural deficit in these areas.

### **INTRODUCTION**

Between 2001 and 2012, in Burkina Faso, Niger and Senegal, investments in the environmental sector amounted to just over 1.6 billion Euros (Tiepolo 2012). The sum is considerable and, unlike the previous decade, it was spent mostly in the urban sector to achieve the MDG 7C, which concerns improvement to the access of drinking water and to safe sewage systems. Much of these resources are attributed to donations or low-interest loans to the ministries.

The supply of drinking water and private and public sewage systems in secondary towns is merit worthy and is a partial turnaround of what has been done up to now. However, we mustn't kid ourselves that all this solves the urban environmental problems of the Sahel. Aqueducts, latrines and the rainstorm drainage are just part of the problem. In Sahelian municipalities the lack of treatment for sewage water and for the sludge from the latrines as well as the collection and treatment of solid urban waste, besides being an endless source of pollution, prevent the operation of the storm water drainage network.

It is unthinkable that international aid can also make provision for this essential environmental component in the 37 cities with over 25 thousand inhabitants now existing in the eight countries of the Western Sahel, and in the numerous small towns. Two matters become important.

First, how to maintain the aqueducts and storm water drainage which have multiplied several times in just a few years? The case of the storm water drainage is emblematic: where existing, it is obstructed by waste, sand or vegetation, completely preventing its operation.

Second, where to find the resources needed to expand the drinking water supply networks and the storm water drainage, to multiply the private sewage systems and plants for purification and the storage of solid urban waste? The 1.6 billion Euros mentioned above will only cover the previous deficit, not future requirements. And on this point we need to be clear. The incessant demographic growth of every kind of urban centre, the consequent proliferation of dwellings and basic services (schools, healthcare centres) will at least double the need for infrastructures within the space of a decade.

In the light of these considerations, the only possible answer has to come from the single states and, given the

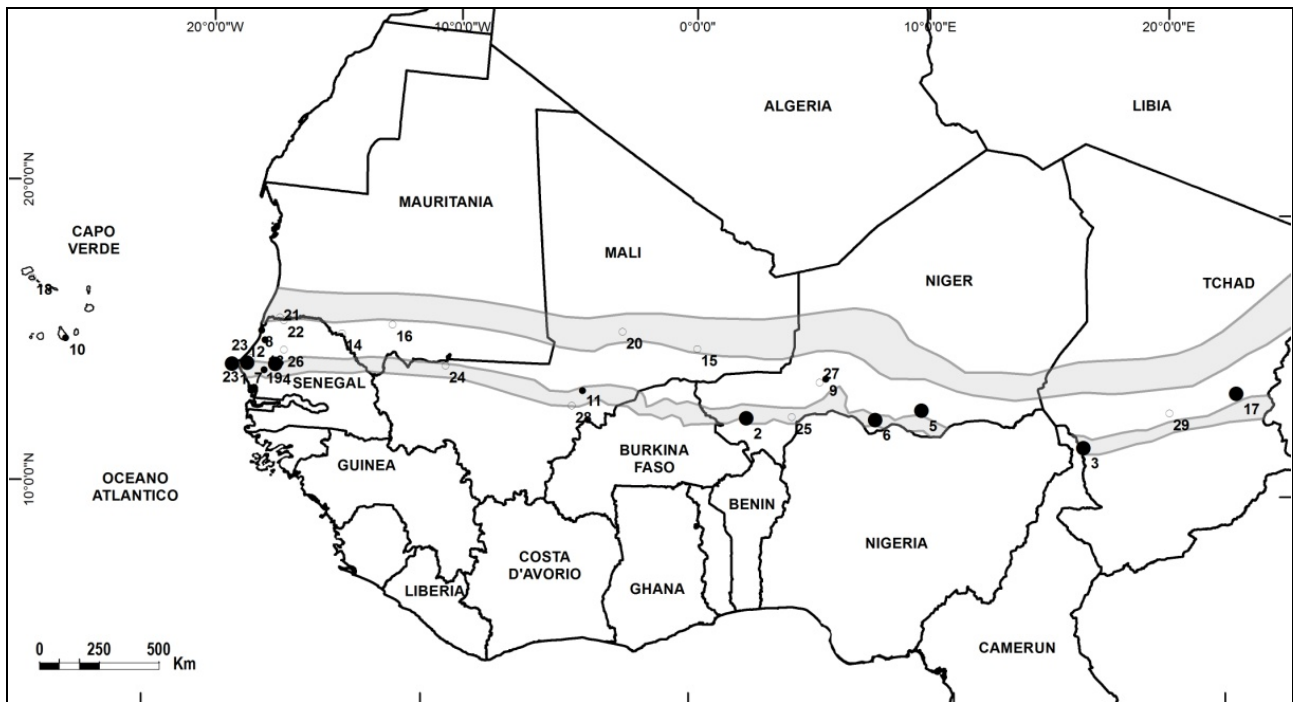

<sup>1</sup> "Introduction" and "Main knowledge gained" are by Maurizio Tiepolo, "The project" is by Mario Artuso, "Coverage of the deficit", "Conclusions" and all the figures are by Sarah Braccio. The contents of the article do not express the position of the INS Project, but only that of the authors.

ongoing decentralisation process, from the municipalities themselves.

The achievement of the MDG 7C is an essential condition of local development. It is not only matter of enduring decent living conditions to urban residents. MDG 7C mitigates the impacts of climate change which, in the Sahel, brings disastrous floods which destroy key tools (business) and investments (dwellings) of local development. A local economy cannot develop if it has to rebuild everything and pay compensation for damages to tens of thousands of victims every year [16].

Urban public finance reform in Global South has been addressed as a key topic of development since the late 70s, focusing particularly on property taxation [6] [2] [3] [5].

Nevertheless, how much local resources can contribute to the need for new urban infrastructure continues to be a politically uncomfortable and unpopular question, which very few scholars prepared to focus on [4].

**Fig. 1** - Western Sahel delimited by the fluctuation band 1970-2000 of 200-500 mm isohyets. Cities with population over 250 k (large dots), 100-250 k (dot), 25-100 k (circlet). Niamey (2), Louga (8) and Kébémér (26) are shown. (Sources: 1, INE 2010, INS 2012 e 2001, INSD 2006, INSEED 2009, INSTAT 2009, ONS 2013, AP3A. By E. Ponte).

The triangular cooperation project Italie-Niger-Sénégal (INS) for developing the capacity of the local authorities to manage their resources, implemented between January 2010 and December 2013 with the coordination of the Province of Turin and co-funding from EuropeAid, has made it possible to lay the foundations for improving local taxation in three cities and has assessed the potential yield of local taxation.

The municipalities of Kébémér (23,380 res. in 2010), Louga (90,432 res. in 2010) and Niamey (1,011,277 res. in 2012) represent three classes of Sahelian urban centres (Fig. 1) [13] [8].

DIST-Politecnico di Torino, as associated partner of the Province of Turin, conceived and accompanied the assessment in close collaboration with the other partners: the Province of Milan, the Fund of the Province of Milan for international cooperation, the Region of Louga (Senegal) and the City of Niamey (Niger).

To assess the local resources it was necessary not only to examine budgets and administrative accounts of three municipalities, but also to assess the tax base using administrative census, a survey at dwelling level, and photo interpretation of high-resolution satellite images. The result is a GIS for monitoring the tax base conceived for municipal use.

The following paragraphs will look at the main features of the Project, the main information gathered, the conclusions and recommendations.

## THE PROJECT

Assessing the potential of local taxation in reducing infrastructure deficit is not particularly difficult when the extent of the tax base (properties, taxpayers, businesses, etc.), the deficit to be reduced and the unitary costs of the infrastructure to be created are known, especially if the tax base and the needs do not vary much over time.

At the beginning of the assessment, in the three municipalities considered, this information was missing or not up to date. Moreover, in all three municipalities, the tax base was rapidly evolving. The population doubled every ten years, the dwellings multiplied from 12% (Kébémér) to 28% (Louga) to 50% (Niamey) within the same space of time and the parcelled out area increased even more.

In these conditions, even the most willing of local authorities was unable to assess anything. A simple and updatable information system was needed. Its performance had to be calibrated to the forces available. For Niamey it was not possible to update the census of the properties started with the street addressing of 2003, in view of the extension reached by the built up area. It was however possible to build up a GIS with the lot as the minimum unit of analysis, which made it possible to find out the name of the owner, the state of construction and the infrastructures to which the lot had access (surfaced road, storm water drainage, public lighting, etc.). In a context where municipalities have no control on the building lots nor a situation of the built-up area, a GIS allowing the questioning of the data base (DB) by lot, owner or road already seemed to be an important step forward.

In the case of the Senegalese cities, given the much smaller size compared to Niamey, it was possible to concentrate on a survey, lot by lot, and to know the name of the owner and the occupant, the type of latrine and the water supply system, as well as other information. To reach this goal it was necessary to assign to every entrance a street number through a street addressing operation in Kébémér and to update the street addressing of Louga begun in 2003, when the city was just 72% its current size. The lot by lot survey generated an embryo of a DB for municipal use, linkable to other DB, such as those of the land register, the tax department, etc.

These activities were carried out by the INS Project, the technical part of which was entirely defined and accompanied in its implementation by the authors of this paper.

The tax base identification and the potential yield for reducing the deficit of key infrastructures was carried out after completing the GIS.

## MAIN KNOWLEDGE GAINED

The Project was divided into 5 phases: (i) identification of the weakness of local taxation, (ii) potential yield of improved taxation, (iii) infrastructures that could be achieved with said yield, (iv) infrastructures priorities and deficit assessment, (v) gap between achievable infrastructures and deficit. The following pages explain the knowledge that was gained in each of these phases.

## WEAKNESS OF LOCAL RESOURCES

The weakness of local taxation most frequently complained of by local authorities is the insufficient transferral of resources from the State to finance the tasks assigned to municipalities by administrative decentralisation. This is definitely true, but it is joined by at least three other weaknesses.

First, the modest yield on certain taxes billed and collected by municipalities. Among these, for example, the rights of occupation of public land with kiosks and hangars, the tax on the collection of household solid waste, the street tax (*taxe de voirie*), the tax on outdoor publicity, the costs for delimiting building lots, the tax on the markets kiosks (*souks*).

Second, the transferral to the municipalities of the parts of certain state taxes, such as the tax on vacant land (*contribution foncière propriétés bâties et non bâties* - CFPNB) or properties. The municipal councils complain of the lack of transparency on these transfers, which make it impossible for them to understand to what extent the tax in question is effectively collected by the State.

Third, the capacity to programme income and expenses. According to the ordainment of the local authorities of the two countries, municipalities cannot programme their expenses over several years. However, the reason also lies in the absence of information systems and, therefore, the inability to keep track of the evolution of the tax base and of late payers. An example could be the knowledge of the street tax (*taxe de voirie*) payers: the doubling of construction every ten years (Fig. 2) does not allow the current instruments, which are usually in hardcopy form, to monitor this evolution. Consequently, there is a gap, which is sometimes considerable in size, between the yield programmed when drawing up the budget and the resources collected at the end of the year.

## POTENTIAL OF THREE INCOME ITEMS IN THE MUNICIPAL BUDGET

The detailed analysis was developed using three income items in the budget of Kébémér, Louga and Niamey (Tab. 1). These revenues were chosen because they are among those that present the biggest gap between potential and expected (by municipalities) yield, as well as between expected and collected return. They were the street tax, the tax on vacant land, and the rights of occupation of public land in Niger, the garbage removal tax, the rights of occupation of public land and tax on vacant land in Senegal.

Monitoring the tax yield over times presents several problems. In Niger, following the *Statut de la ville de Niamey*

(2011), the decentralisation of tax billing and collection to the 5 districts composing the municipality was eliminated in favour of a centralised structure. Certain taxes, like tax on vacant land, were absorbed in property tax (*taxe immobilière*). The amount to be returned to the city on certain taxes collected from the State changes. This implicated the non-comparability of budgets from before 2011 with those from after this date.

These resources can be greatly increased. It is a matter of broadening the tax base and making collection more efficient.

We have traced three taxation scenarios for the Senegalese municipalities and four for Niamey. They vary substantially depending on the taxation system on vacant land in Senegal and the analogous in Niger: (a) only vacant land served by surfaced roads and/or equipped with storm water drainage and/or public lighting, (b) all vacant land in the built-up zone, (c-d) all vacant land within the municipal area.

Fig. 2 – Kébémér 2004-2013 (left), Louga 2002-2013 (centre), Niamey 2002 -2013 (right). Built-up surface (by S. Braccio).

Tab. 1 – Kébémér, Louga, Niamey. Theoretic yield (authors estimations), envisaged yield (municipalities), collected entrance.

Budget items	Kébémér			Louga			Niamey

Rights of occupation	15,2	22,9	13,8	-	31	15,7	...	937	251

\* Mean 2010-2013. \*\* Mean 2011-2013.

## INFRASTRUCTURES THAT CAN BE CREATED WITH THE IMPROVEMENT OF THE THREE REVENUES

Once we know the yield, municipality by municipality and according to different scenarios, of the improved local taxation, we need to translate the expected yield into infrastructures. Reference is made to the cost of building surfaced roads, with public lighting, sometimes provided of storm water drainage, in the three municipalities. For the Senegalese cities we made reference to the costs estimated in 2006 for the construction of several urban roads in Guediawaye [12] and, in the case of Niamey, to the costs for the construction of a road of 12 km built in 2013 with a width of 6 m and equipped with storm water drainage and entirely equipped with public lighting.

On the basis of these costs, the mean unitary cost has been established, allowing the prefiguring, on the basis of the amount of resources available, the kilometres of roads that can be built (Tab. 3).

The quantities were calculated on the basis of the yield over 5 years. In some cases, they were considerable quantities of works that could be achieved with the improvement of just 3 items from the municipal budget.

**Tab. 2** – Kébémér, Louga, Niamey, 2013. Viability that could be created according to the local taxation scenarios.

<i>Scenario</i>	<i>Yield (5 years) FCFA millions</i>	<i>Unitary cost* FCFA/Km millions</i>	<i>Creatable infrastructure Km</i>

B	2,945	111	26.5
C	3,745	111	33.7

## DEFICIT AND PRIORITIES OF INFRASTRUCTURAL NETWORKS

At this point it is a matter of seeing to what extent these works make it possible to reduce the existing infrastructure deficit. The first step is to verify the identity and the localisation of the deficit of basic infrastructures. The analysis is concentrated on the state of the surfaced road network, equipped with storm water drainage and public lighting. The criteria for defining the priority interventions include that of the greatest deficit. This is expressed not only by the lesser access to basic infrastructures but also by the number of the population who find themselves in this condition. Therefore, we have considered the infrastructural density and also the population density. The limit values considered are 10,000 res./km<sup>2</sup> for the population density and 5 km/km<sup>2</sup> for infrastructural density, which corresponds to less than one surfaced, drained and lit road out of four (Tab. 3).

In short, in Kébémér, three neighbourhoods out of eight are below the limit of 5 km/km<sup>2</sup> and four are between 5 and 8 km/km<sup>2</sup>. In Louga 4 neighbourhoods are below 5 km/km<sup>2</sup> and 1 between 5 and 8 km/km<sup>2</sup>. In Niamey, four neighbourhoods are below 5 km/km<sup>2</sup> and seven are between 5 and 8 km/km<sup>2</sup> (Fig. 3). This is 14,300 (82%) and 188,000 residents (19%) in Kébémér and Niamey respectively. The incidence of these areas lacking in infrastructure is therefore greater in the small municipality than in the big one but in both cases the numbers are high.

**Tab. 3** – Kébémér, Louga, Niamey, 2013. Deficit of surfaced roads with storm water drainage and public lighting by neighbourhood.

<i>Neighbourhoods</i>	<i>Kébémér km</i>	<i>Louga km</i>	<i>Niamey km</i>
5.1-10 km network/km <sup>2</sup>	6.3	3.3	19.4
< 5 km network/km <sup>2</sup>	2.3	20.3	29.2
Total	8.6	23.6	48.6

## COVERAGE OF THE DEFICIT

The potential yield on improved local taxation expressed in kilometres of surface roads provided with storm water drainage and public lighting can be compared with the deficit of these infrastructures in the neighbourhoods identified as having priority. The result is that the deficit can be zeroed only through taxation of every vacant land throughout the whole municipal territory for five years (scenario C). The other scenarios only allow the reduction of the deficit in five years (Fig. 4).

There is still the underlying issue: after the first five years, will improved taxation also allow an influence on the deficit which, year after year, is generated following incessant urban expansion without infrastructures typical of the

three towns in question? Our assessment assume that the physical growth in the municipalities continues with the same pace it has over the last decade and that the potential taxation translates effectively into works. According these assumptions Kébémér shows an infrastructure capacity higher than the infrastructure demand of the next decade. This means that at long term the deficit could be entirely reduced. On the opposite, Louga and Niamey have an infrastructure capacity far below the growth of infrastructure demand. This means that infrastructure investments using the increased resources from local taxation in Louga and in the Niger capital city could significantly improve the access of residents in the less deserved neighbourhoods. Nevertheless the pace of urban expansion create an infrastructure demand that far exceeds the infrastructure capacity sustained with local resources only.

Gap	47	- 7	- 28

\* Based on the previous decade performance. \*\* Assessed after local taxation improvement.

## CONCLUSION

The analysis developed so far has proven the existence of strong road infrastructure deficits, that are more severe in large municipalities than in small ones. It has also highlighted that the expected yields of local taxation in municipal budget is often far from accomplishment.

The GIS has enabled an assessment of local taxation potential yield in three Sahelian municipalities that can help decision making.

It has shown that the improvement of just three revenues would make it possible to bring neighbourhoods with fewer infrastructures to the level of one surfaced, drained and lit road out of two within five years.

To achieve this aim it is necessary to tax all vacant land and collect 100% of the billed taxes.

Lesser billing or collecting capacity of vacant land tax would partially reduce the previous deficit in smaller

municipalities as Kébémér and, for the future, would keep the growth rate of infrastructure below the rate of generation of the deficit following incessant urbanisation without infrastructures. Otherwise, in large cities as Niamey, even a full collection of local taxes and their translation into new infrastructure will be able to keep the pace of infrastructure demand in the next decade.

Improving local taxation is an ambitious aim which has to face with a large number of taxpayers who never intend to pay at all. The solution has to come initially from local government, which has to prove that the payment of taxes corresponds to the creation of infrastructures.

There are three recommendations to the local and central governments that are not requiring large law modifications:

- to link the GIS on local taxation to other DB to allow the monitoring of delinquent taxpayers;
- to increase significantly the cost of building lots authorization in order to increase the funds for basic infrastructures construction;
- to introduce a progressive tax rate into street and vacant land taxation depending on the degree of access of the properties to infrastructure.

## DEVELOPMENT COOPERATION AND SUSTAINABLE TOURISM IN MOZAMBIQUE: TERRITORIAL SYSTEMS AND CULTURAL HERITAGE IN THE ZINAVE NATIONAL PARK

Sara Belotti\*

\*University of Bergamo, University of Naples “L’Orientale”, Italy - [sara.belotti@unibg.it](mailto:sara.belotti@unibg.it)

### ABSTRACT

The paper presents the existing relationship between development cooperation, environmental policies and sustainable tourism in Mozambique, analyzing the specific case of Zinave National Park (PNZ). By adopting an approach that investigates the socio-territorial configurations and the traditional knowledge of African communities [Turco, 2002], we want to prove that the knowledge of territorial systems is crucial for the management of environmental cooperation projects, particularly for the promotion of sustainable tourism activities, in order to preserve cultural heritage and promote local development.

In this perspective, the PNZ is an interesting case study because it is going through a phase of conservative and tourism planning, supported by the Ministry of Tourism of Mozambique, two Italian NGOs (CeLIM and LVIA) and some international organizations, in order to promote a *community conservation*.

Applying a participatory research method, called SIGAP Strategy [Casti, 2006], based on field research and the involvement of local actors, we will discuss the results obtained during the fieldwork carried out in the PNZ, in order to reconstruct the territorial structures existing within the Park. This is shown using the participatory mapping [Burini, 2010] which could be the base of a GIS community mapping system able to express and communicate these values, to implement the process of participation of populations to the decision-making process, promoting the sustainable development at a local level.

**KEYWORDS:** community conservation, sustainable development, environmental cooperation, participation, territorial systems.

### COMMUNITY CONSERVATION AND PARTICIPATION IN SOUTHERN AFRICA

The experiences of *community conservation*<sup>1</sup> carried out in Southern Africa ranging from a wide number of guidelines, which move from forms of passive participation, in which the communities have a limited control over the decision-making process, to a full and direct participation in the resources management, called active participation [Cencini, 2011]. Between these two extremes there are many combinations, that has had as result the identification of several classifications, which emphasizes different aspects, including the level of participation [IIED, 1994], the type of ownership [Barrow, Murphree, 2001], or the participatory or contractual approach [Venema, Van de Breemer, 1999]<sup>2</sup>.

The experiments of community conservation, have been also characterized by a considerable differentiation of results, gaining support, as well as critics and doubts. Despite this, the new approach has greatly contributed to reintroduce the importance of the local community in the debate on conservation, leading, in some cases, the improvement of the living conditions of local population<sup>3</sup>. However, achieve the goals of community conservation, particularly in reality such as those of Southern Africa, characterized by an enormous natural wealth, but weak economies and uncertain political situations, it's often very difficult.

Analyzing the Mozambican reality, in particular, it's possible to emphasize that, despite in the programs of tourism promotion and in the development strategies of protected areas [Ministério do Turismo, 2004; República de Moçambique, 2010; Resolução n. 63, 2009] one of the first objectives is the implementation of local communities participation, in practice this appear still incomplete, due to the lack of both funding and personnel qualified, requiring the intervention of external actors such as the World Bank or others organizations of cooperation. In order to realize successful projects, therefore, in the future it will be needed not only a greater awareness on behalf of the promoters about the part played by African communities for the conservation of their territory, but it will be essential to provide adequate tools to enable these people to cooperate for the natural resources management, enhancing, at the same time,

<sup>1</sup> The term *Community Conservation* is used to describe those principles and practices that argue that conservation goals should be pursued by strategies that emphasize the role of local residents in the management of natural resources [Adams, Hulme, 2001].

<sup>2</sup> Integrating the different classifications, Cencini [2004] distinguishes three forms of *community conservation*, in particular: Protected Area Outreach; Collaborative Management; Community Based Natural Resources Management – CBNRM.

<sup>3</sup> As occurred for example in Zambia (ADMANE project) and Zimbabwe (CAMPFIRE project) where the revenues of hunting, in the past used exclusively by the Government, are now allocated to the residents of the various districts.

the traditional knowledge, which for centuries have regulated the symbiotic relationship between man and nature.

Is in this perspective that this paper presents the results obtained during the fieldwork carried out in the Zinave National Park, with the application of a specific methodology, the SIGAP Strategy [Casti, 2006], which, starting from the reconstruction of socio-territorial structure of the villages within the protected area, proposes the use of participatory mapping as the base of a GIS community cartographical system that can express and communicate easily the local values, facilitating the implementation of the process of governance and people participation, as well as contributing to the management of environmental cooperation projects and tourism development that are currently affecting the protected area.

## THE ZINAVE NATIONAL PARK

Established in 1973, with the Government Regulation No. 47 of 26<sup>th</sup> June, the Zinave National Park had the objective to protect certain species of animals, especially the giraffe (*Giraffa camelopardalis*), historically found in Mozambique only south of the Save River [Stalmans, Peel, 2010], the roan antelope (*Hippotragus Equinos*), the common tsessebe (*Damaliscis lunatus*) and the ostrich (*Struthio camelus*). Before the creation of the Park, since 1962, this area was designated as a game reserve under the management of the *Safarilândia Moçambique Lda* [Lobão Tello, 1990]. With the proclamation of independence in 1975, Mozambique experienced a short period of reconstruction by the new Government, soon interrupted by the outbreak of a civil war that afflicted the country for more than ten years. Because of these political events the PNZ remained for a long time without administration, furthering the increase of poaching and the installation of guerrilla groups, who caused the extinction of many animal species, including giraffes [Ministério do Turismo, 2010]. After the signing of the peace agreement in 1992, the park remain without a guide until 1996, when it was established the first administration with the aim of renewing the effort for the conservation of ecosystems and biodiversity, later strengthened by the inclusion of the PNZ in the project of the Great Limpopo Transfrontier Park (Fig. 1), since 2006.

Fig. 1 – The Zinave National Park and the Great Limpopo Transfrontier Park.

Transfrontier Park. For that reason, the situation requires a careful study that, based on an analysis of the local context, bring out the socio-territorial organization of the villages of the PNZ and recovers the basic knowledge and the cultural aspects that characterize it, useful in the phases of programming as well as for the enhancement of the entire protected area for tourism purposes.

Analyzing the official documents produced in recent years by the Park in collaboration with the different actors involved in the cooperation projects [Ministério do Turismo, 2010; 2011], as well as flipping through the pages of the national strategies for the development of tourism in the protected areas [Ministério do Turismo, 2004], it is possible to detect three key words: sustainability, participation and development. These papers, in fact, put protected areas at the

<sup>4</sup> The article 11 of Law 10/99 of 7th July defines the parks as a “delimited total protection zones destined for the propagation, protection, conservation and management of plants and wild animals, as well as the protection of places, landscapes or geological formations of particular scientific, cultural or aesthetic value, in the interests of and for public recreation, which are representative of national heritage.” [Art. 11, paragraph 1].

<sup>5</sup> In order to reduce the human pressure on the protected area the Park administration, in collaboration with the Ministry of Tourism, decided, after a careful study and several meetings with the local population, to modify the current boundaries of the Zinave National Park, in order to exclude all the villages, with the exception of those located in the Covane area, north of the park. The surrounding area, located to the east and the west of the new boundaries, will be converted in controlled activity areas, where local people will be able to carry out their traditional activities, as well as enabling the development of alternative activities.

center of the strategies to promote tourism as the main resource capable of support local development through the implementation of a sustainable management, in which local communities are the main protagonists. If we consider, in particular, the actions implemented in the Zinave National Park, as an example of the application of these principles, however, we soon realize how all the activities start on the assumption that it is necessary to protect the natural environment, while communities are viewed as a potential danger for the biological balance. The emphasis is therefore on the environmental issues and the protection of ecosystems, rather than on the social process linked to the territorial local forms, pointing out the need to understand the existing relationship between the local communities and their own territory, in order to avoid conflicts and promote an harmonious development. In this context, the application of a participatory methodology of research to the fieldwork presented here has made possible the visualization and the location of the existing resources in the park, highlighting the most fragile habitats, but at the same time encouraged a deeper reflection about the meaning of territory from a social point of view. Let's analyze in detail the results obtained in the first phase of application of this methodology in the PNZ.

### The SIGAP Strategy as participatory research method

The SIGAP Strategy (*Sistemi Informativi Geografici per le Aree Protette/Azioni Partecipate*)<sup>6</sup> is a research method, articulated in different modular phases and based on the fieldwork and the involvement of local actors. It has, in particular, the objective of recover the territorial dynamics and the landscape values of local cultures, as a platform on which manage a territory. Through a participatory and multiple scales (local and regional) mapping these values are shown and communicated, in order to create useful tools for the steps of negotiation [Casti, 2009; 2012]. In this way, the map, tool par excellence able to show a territory, multiply the agents of production through participation. In this context, the actors that operate in the territory become themselves builders of their own cartography, which, through graphics representations that often break the rigid topographical pattern, can communicate the sense of place in the same way it is experienced by the community [Casti, 2009].

In particular, this methodology adopt the principles of sustainable development and community conservation, translating them operationally, allowing that the information collected during the fieldwork become the true indicators for planning. In fact, the territory is not only a set of natural resources, but refers to symbolic and cultural values, which cooperate to build the identity of the community itself. Recover these values allows to deepen the type of relationship the society has with its own environment, which becomes the foundation for the development of strategies for resource management and environmental conservation. We present the results obtained by applying this strategy to the fieldwork carried out within the Zinave National Park, in order to highlight the dynamics activated by local populations.

### Territorial organization of the villages in the Zinave National Park

The Zinave National Park has been the subject of a research conducted by the writer between April and September 2011 as part of a PhD in "Geography of development"<sup>7</sup> which provided the application of the first phase of the SIGAP Strategy, implemented through observation, investigation and the creation of a participatory cartography of knowledge, useful to recover the information about the cultural heritage of the villages<sup>8</sup>. In particular, during the research was carried out the census of the villages existing inside the protected area and its buffer zone, inquiring the traditional organization, followed by an in-depth analysis of two sample villages, in order to recover the traditional resource-use system. This analysis has allowed the creation, directly in collaboration with local populations, of a database until then inexistent, and it has make possible to create participatory cartographic documents, which can be employed in order to implement the process of environmental governance and participation in decision-making moments [Burini, 2012]. Finally, the study has enabled highlight the potential of development of a sustainable tourism as an alternative asset to the livelihood of local communities, in view of the implementation of new regulations for the use of resources. In this context, the paper will focus specifically on the analysis of traditional organizational structure that governs the territory, highlighting the problems detected in the protected area.

The villages currently present within the PNZ and its buffer zone, according to the narrative of the traditional chiefs, were founded at the time of the war of Ngungunhane, last Emperor of Gaza<sup>9</sup>, with the *Tsonga* who lived in this region. The king, in order to exercise the control over the newly conquered areas, used to replace the old leaders with individuals belonging to its lineage, which guaranteed the maintenance of its authority [Rita-Ferreira, 1974; Dava, 1997]. Following the end of the Empire of Gaza and the deportation of Ngungunhane in Portugal, in 1896<sup>10</sup>, the

<sup>6</sup> Developed by the group of researchers of the University of Bergamo (Italy), this strategy has been tested within the peripheries of the W Transborder Park (between Burkina Faso, Benin and Niger), acting within the «Programme Régional Parc W/ECOPAS» (*Ecosystèmes Protégés en Afrique Sahélienne*).

<sup>7</sup> The thesis, whose discussion is expected for early 2014, is coordinated by Prof. Emanuela Casti, head of the *Diathesis* Cartographic Lab of the University of Bergamo (Italy): [www.unibg.it/Diathesis](http://www.unibg.it/Diathesis).

<sup>8</sup> This is the body of knowledge related to the territorial organization and use of resources that ensures the physical and symbolic reproduction of the local population.

<sup>9</sup> The Empire of Gaza in the 1860, at the height of its expansion, covered the area included between the Maputo river and the Zambezi river.

<sup>10</sup> Ngungunhane reigned from 1884 to 28 December 1895, the day he was imprisoned by Joaquim Mouzinho de Albuquerque in the fortified village of Chaimite. Exiled by the colonial Portuguese he was transported to Lisbon, accompanied by one of his sons, Godide, and other dignitaries. After a

Portuguese began their political-administrative installation in this area [Dava, 1997]. The reorganization of the territory into administrative uniform units that followed caused deep changes in the traditional political structure of the region, producing the splitting up of the possession of the largest aristocratic lineages, renamed *regulado* or *cabado* [YañezCasal, 1996]. In this way the traditional authorities became ambiguous political institutions, whose power was reduced because, while they were continuing to represent the socio-territorial organization at the local level, they were simultaneously integrated and submissive to the colonial administration, which gave them different tasks (collection of the *imposto da palhota* – the tax on the hut; control to the access of strangers in the *regulado*) [Yañez Casal, 1996; Dava, 1997]. The situation didn't get better after the independence, when the *Frente de Libertação de Moçambique* (FRELIMO), since 1974, carried out a campaign of annihilation of the traditional leaders, considered collaborators of the colonial Government, in view of the creation of the "new man", free from any prejudice and superstition [Kyed, Buur, da Silva, 2007]. The *Grupos Dinamizadores*, composed by reliable people to the Party, replaced the *regulos*, while the political and religious traditional structure was completely banned [Dava, 1997]. Even the Zinave National Park was affected by this process of transformation, reflecting still today of the outside influences. After an initial denial, the Government has returned today to officially recognize the traditional authorities, but these at the legislative level are equated to the Secretaries of the administration, the lowest level of the official hierarchy<sup>11</sup>. The effort to recognition and valorization of traditional leaders implemented by the State, although it may be considered an important change, in practice helps to create confusion among the leaders themselves, due to the ambiguity of laws, that cause the emptying of the power exercised by the traditional authorities in favor of the Secretaries.

The fieldwork carried out in the Zinave park has tried, in this context, to reconstruct the traditional hierarchical network still existing in the villages, starting by the creation of a localization map of the traditional villages, identified for the presence of a traditional authority and specific sacred places recognized by the entire population. In this regard, it was identified a first information gap comparing the information gathered during the fieldwork with the official documents (Community Action Plan - 2010, Management Plan - 2011) published by the administration of the PNZ, in collaboration with the NGOs involved in the cooperation projects activated in the Park, which neglect the traditional organization, making reference instead to the administrative system established by the central Government. According to these reports the villages are 21 in total, grouped into 6 administrative Communities (Covane, Machaqueta, Maculuve, Malindile, Mechisso, Tanguane), a group of villages headed by a Secretary. At the same time, these Communities are grouped in two *Localidade* (Maculuve and Tanguane), defined as the basic unit of the local administration system<sup>12</sup>. Even after the first meetings with the local people we have realized that the real situation is more complex, since those who are indicated as "villages" in the official plans, often correspond to administrative entities such as the Community headquarter, or to areas in the Park where there aren't a real village but just a group of concession, since they haven't any autonomy statute. We proceeded, therefore, to collect information regarding the traditional organization of the local communities in order to identify the role played by the different settlements mentioned in the official documents and their traditional status. It's so that, through many meetings with the population and the visit of all the villages, as well as the use of a participatory mapping, we were able to create a first map of the traditional organization of the Park (Fig. 2)<sup>13</sup>.

At the end of the work, in the protected area and its buffer zone, have been surveyed 19 villages, more 6 that are disappearing, as they are situated in an arid area and most of the resident population has moved near to the administrative Community, in which the water supply is facilitated (hand pumps, waterhole). It was found that the status of the villages has a hierarchy that reflect the *matsua* organization, based on different levels of authority installed in the various villages in the protected area and its buffer zone, as well as in neighboring areas. These traditional leaders manage the land access and the political relations of its own territory of competence.

At the top of this hierarchy we find the *hossi ya hombe* (or *regulo*), with the highest political and symbolic power, able to resolve the conflict dynamics between villages, the religious issues and other symbolic functions. Within the community the *hossi ya hombe* acts as a "father", because he stands for the link between the community and the ancestors. These, in fact, lay down the rules to which it must submit the community through the gestures and the words of the *hossi*, affecting the political, economic and cosmic order. The *kupahla* is the most important moment during which is celebrated this connection between the spiritual and the material sphere, with a ritual invocation of the spirits organized in the most significant moments of village life (start of the agricultural season, famine...) [Dava, 1997]. To the *hosi ya hombe* is also recognized the political power, that is to say the right to distribute the land among the other village leaders who depend on him. In fact, there are three levels of authority, which correspond to specific areas of competence: *hossy ya missava* (in Portuguese *cabo*), *nganakana 1* and *nganakana 2* (in Portuguese *papassão*). These

---

brief stay, he was transferred to the Azores, where he would die eleven years later.

<sup>11</sup> The Legislative Decree No. 15 of 20th June 2000 defines the traditional leaders as "people who take and exercise power in accordance with the traditional rules of the respective communities", but when exists a legitimate authority as well as a Secretary, the community can decide which of the two figures has precedence in hierarchical level.

<sup>12</sup> According to the *Lei dos Orgãos Locais* No. 8/2003, of 27<sup>th</sup> of March, the *Localidade* is the basic territorial unit of the local administration of the State and represents the level of permanent contact between the local communities and their authorities [art. 14, paragraph 1]. It includes villages and other housing groups included in its territory [art. 14, paragraph 2].

<sup>13</sup> The fieldwork was done by who is writing in collaboration with Hélio Olímpio Moisés, graduate student in Geography, and the Department of Geography of the University Eduardo Mondlane in Maputo, with the support of the PNZ Administration and the Warden, the Ministry of Tourism of Mozambique and the Italian NGOs LVIA and CeLIM.

*missava* of Matumbele depend directly the *nganakana 1* of Macuacua, Mupandze and Mpsirrisi, whose villages are located along the Save River, near to the Park Administration headquarter. In particular, the fact that the village of Chixongue, where the *regulo* is living, is located outside the protected area has led the Park Administration to exclude him from the official management of the issues about this portion of its territory. In fact, in the official documents of the PNZ the coexistence of two different traditional authorities (*hossi ya hombe*) and the territory division between two different *regulado* is ignored. In addition, while the *hossi ya hombe* of Chikelene is involved in the activities carried out by the Administration, being a member of the association *Vuka Zinave*<sup>15</sup>, the *regulo* Chixongue is not involved at all, as inhabitant in a village not affected by the local issues related to conservation.

Fig. 3 – Administrative status of the PNZ and its overlap with the traditional organization of villages.

Continuing with the analysis of the system of authorities existing in the villages of the Park we can detect a real overlap between the areas of influence of traditional authorities and the new administrative organization imposed by the central Government (Fig. 3). According to the story tell by the local people, with the outbreak of the civil war and the installation of several military headquarters of FRELIMO inside the Park, many people decided to leave their concessions to move close to these installations, to be more protected. After the war, many families decided to stay in the new home, while a territorial reorganization was established by the Government, and encouraged by the Administration of the Park, in order to centralize the population by eliminating the sparse settlements existing in the protected area. They were thus created the administrative Communities near to the existing housing districts, located around the military headquarters during the war, but disconnected from their traditional network. While this situation has had a positive impact on quality of life of the local population, ensuring the access to the basic social services (a primary school in each Community, two medical centers with maternity in Tanguane and Maculuve, the construction of several manual water pumps), at the same time it caused the creation of a double level of authority, traditional and official, which led to the emergence of symbolic conflict such as disputes over land ownership.

The territorial organization established by the Government, in fact, has based the creation of the administrative Communities on the proximity of the villages, ignoring the traditional links existing between them, cutting, in many cases, the ties between the *hossi ya missava* and their *nganakana*. It's for this reason that the Community of Mechisso include the village of Macharane, governed by a *nganakana 2* traditionally connected to the village of Maculuve, in addition to the territories of Mboma, Mheho and Djeque dependent from the *hossi ya missava* of Mechisso, while in the case of the Community of Malindile, the villages of Ussela and Gundane, governed by two different *hossi ya missava*, were grouped into the same administrative structure, reducing the power of the traditional leaders. Similarly, the villages of Ngovene and Maluca, two *nganakana* traditionally subjected to the *hossi ya missava* of Malindile, but located far from this village in the south, now depend administratively by the Community of Machaqueta, whose

<sup>15</sup> The intercommunity association *Vuka Zinave* ("Awake Zinave") was officially created in 2010, for the initiative of the Italian NGOs LVIA and CeLIM involved in the cooperation development projects within the protected area, with the aim of strengthening the dialogue between the community of the PNZ and the other actors working in the Park. The group is made up of various representatives, both men and women, of the five administrative Communities, including some village leaders, the *hossi ya hombe* Chithlango and some local administration members (Secretaries and chiefs of the *Localidade*).

headquarter is located close to the villages. In Tanguane, however, the creation of the administrative Community, that group the villages of Makitchile, Phomela and Chinehane, led the emergence of conflicts between different traditional chiefs of the area, since the Community headquarter is located in the territory of the *nganakana 2* of Makitchile, while the village of the *nganakana 1* Phomela is now almost uninhabited, with a reduction in its power also he is at a higher hierarchical level. In addition, within the same village of Makitchile, have formed two different housing districts, with distinct functions: Tanguane, headquarter of the administrative Community and the Localidade, and Dondoti, in which is living the *nganakana 2*.

The new administrative organization is creating problems for the recognition of the power of traditional authorities, as already noted, because some villages governed by *hossi ya missava* are now disappearing, in favor of the headquarter of the Communities, situated in the territories of competence of headman of a lower level, creating hostility. In fact, despite the families choose to move, the symbolic links with the *hossi* of the original village persists, and they continue to entrust to this the celebration of the ceremony and the conflict resolution. At the same time, however, these households has also to submit to the official authorities, as well as to the traditional chief responsible for the distribution of land and for the resource use in the new village, with a complexification of the situation.

Finally, if we examine the construction of the “sanctuary”, created by the Administration of the Park for the reintroduction of the fauna locally extinct, as an example of the actions carried out under the projects that are affecting the Park, we can observe that, also by the administration and the organizations that are working in this area, has been ignored or underestimated the symbolic importance still recognized to the traditional authorities. In fact, the sanctuary, which extends between the area of the village of Chikelene, where lives the *regulo* Chitlango, and the village of Mutsanzuane, as well as having subtracted part of the lands under the authority of the *hossi ya hombe*, caused, during the building of the structure, the closing of the only track leading the village of Chikelene with the rest of the Park for a few months. Despite the *regulo* has been very diplomatic and during several meetings has stated that the reintroduction of the animals and the development of tourism in the Park may in the future lead to an improvement of the living conditions of its population, and the Administration has motivated the closing of the fence with issues related to theft of material and it has worked (after our report) in order to open the new road in a short time, this action shows a lack of consideration of the authority represented by the *regulo*. Although the village of Chikelene is now inhabited by a few families (18 concessions), it is still the core of a bigger territory, which stretches south to the Zimane District, beyond the boundaries of the Zinave National Park, while his traditional headman is the main religious and political authority on the territory, an aspect that cannot be ignored when are established and implemented planning actions in the area.

## CONCLUSIONS

The area of the Zinave Park, as we have analyzed, is still characterized by the presence of a traditional structure threatened today because of the overlap of governmental authority. This situation has caused, and will be cause in the future, the emergence of conflicts between traditional and legal power. In fact, despite a declaration of intent by the Government to respect the traditional authorities implied in the Decree 15/2000, in practice the traditional organization is reduced and emptied in favor of the administration one, with the creation of homogeneous entities that do not reflect local reality. In this context, the Park Administration, as well as the actors who collaborate with it in different projects (World Bank, NGOs), adapts, taking the Community as basic reference for the management of the territory included within its borders. As already pointed out above, the Management Plan of the PNZ almost completely ignores the traditional organization and hierarchy of the villages, rather than develop their specifically, being more worried about modify the boundaries of the Park in order to exclude the greatest number of people from the protected area, that stop to analyze the dynamics of the area. In particular, with regard to the socio-territorial organization of the villages, it's important to underline that in the official documents and reports prepared by NGOs, there is no reliable list of the villages located inside the PNZ. At the same time, any document considers the fact that the protected area is divided between two different *hossi ya hombe*, ignoring the authority of the *regulo* Chixongue as resident outside the Park, and enhancing the role played by the *regulo* Chithlango, a situation that, with the implementation of new regulations, could result in the emergence of conflicts.

The NGOs who have worked for years in the PNZ have begun an important process, which aims to promote awareness of the role that communities must assume, through training, sensitization and facilitation, as well as allowing a better flow of information about the projects realized by the Park. Despite this, it is necessary to highlight a lack of knowledge about the structure of authority that regulates the life of the communities of the area. As we have seen, the mechanisms that govern the traditional political issues, the spiritual sphere and the land use, are more complex than the organization established by the Government, taken as reference system for the projects undertaken. In addition, to understand whose are the actors that operate in the area, with the *regulo* and the secretaries, it is essential to communicate in an effective and comprehensive way, as well as to make the whole population feel as part of a common project, a project that respects roles, traditions and beliefs.

The process, currently in progress, for the redefinition of the boundaries and the reshaping of the role played by the communities towards the protected area can be an excellent opportunity to implement new schemes of management, redefining priorities, models, methodologies, in order to create an active involvement of local people, improving their living conditions and, at the same time, optimizing the natural resources management. It 'sin this way that the fieldwork

carried out within the Park using the SIGAP Strategy, stands as the first phase to know the socio-territorial structure of the Park, which have to be studied in deep, in order to break the traditional patterns of conservation, concentrated on the preservation of ecosystems, to fully embrace the concept of sustainability.

## THE ILO's APPROACH TO LOCAL DEVELOPMENT

Roberto Di Meglio\*

\*International Labour Organization, Geneva, Switzerland - [dimeglio@ilo.org](mailto:dimeglio@ilo.org)

### INTRODUCTION

The ILO's approach to local economic development<sup>1</sup> (LED) aims to promote decent work, productive employment that delivers a fair income, provides social protection and allows women and men to participate in the development process. It does this by focusing on a specific territory, targeting sectors with economic potential, linking job quality to enterprise competitiveness, building capacity of local and national stakeholders, involving employers' and workers' organizations, being locally owned and managed, prioritizing strategies and tools that benefit the poor and linking LED to employment policies.

### THE ILO's APPROACH TO LOCAL DEVELOPMENT

The LED<sup>2</sup> approach provides a comprehensive framework of initiatives and actions that respond to the need to integrate the economic, social, political and institutional dimensions of development at the local level in the rural areas. As a consequence LED is a process that will provide different solutions according to place, culture, economic potential and political circumstances, as well as social and institutional environment. Although its adaptability does not make it possible to define what actions and policies a typical LED initiative consists of, the inalienable principles of the LED approach are:

- **participation and social dialogue:** the use of participatory mechanisms fosters social cohesion;
- **public/private partnership:** cooperation and coordination of development activities prevent ineffective go-it-alone approaches and support the legitimacy and sustainability of the development process;
- **territory:** The territory is an ideal platform for the creation of a strong local voice on behalf of its stakeholders. Unlike traditional community development approaches, LED provides the means and structures that represent the local voice when dealing with its national and international counterparts.

The economic dimension of development is particularly important within the LED approach, since economic activities and interactions are a driving force that fosters **social inclusion, poverty alleviation and innovation**. The local or territorial dimension in the LED process is crucial and reflects **the degree of common interests, self-regulation and knowledge; the intensity and frequency of interactions; the likelihood of tapping into national and global decision-making structures**.

Although the fluidity of the LED process makes it impossible to prescribe a strict set of policies and actions, a typical LED intervention is led by a certain number of basic steps, which include:

- Territorial diagnosis and institutional mapping
- Sensitizing
- Creation of a local/regional forum
- Designing the LED strategy
- *Coordination/implementation structures*
- *Monitoring and evaluation*

Within the LED strategies it is important to highlight the role played by the SSE Organizations and Enterprises. The SSEOs **provide stable jobs** – they are difficult to relocate as a result of their territorial anchorage – and provide an opportunity to reintegrate vulnerable groups into society and working life and they are also more resilient to the crisis. The economic crisis of 2008 has had negative impacts on the majority of enterprises; however an ILO report<sup>3</sup> provides historical evidence and current empirical evidence that proves that the cooperative model of enterprise survives crisis,

<sup>1</sup> LED is a participatory development process that encourages partnership arrangements between the main private and public stakeholders in a defined territory, enabling the joint design and implementation of a common development strategy, by making use of local resources and competitive advantages in a global context with the final objective of creating decent jobs and stimulating economic activity. See Gasser (2002).

<sup>2</sup> Extract from Gasser et al. 2002.

<sup>3</sup> Resilience of the Cooperative Business Model in Times of Crisis, J. Birchall and L. Hammond Ketilson, ILO COOP Geneva 2009; [www.ilo.org/empent/Publications/WCMS\\_108416/lang-en/index.htm](http://www.ilo.org/empent/Publications/WCMS_108416/lang-en/index.htm).

but more importantly that it is a sustainable form of enterprise able to withstand crisis<sup>4</sup>, maintaining the livelihoods of the communities in which they operate.

Social and solidarity economy entities can open markets, provide financial intermediation, facilitate procurement and organize market information. For many small producers the only possibility of getting the required economic dimension to market their products is through some kind of association. SSE organizations are, by definition, local in nature, but have the potentiality to connect the local to the global and the rural with the urban.

Local development and social economy offer opportunities to include groups that have suffered social and economic exclusion as showed by many studies.<sup>5</sup>

Since SSEOs work for growth and sustainable development of the communities where they operate and being locally rooted, they are the stakeholders more interested in defining and implementing local development strategies. Social and Solidarity Economy<sup>6</sup> is a concept designating enterprises and organizations, in particular cooperatives, mutual benefit societies, associations, foundations and social enterprises, which have the specific feature of producing goods, services and knowledge while pursuing both economic and social aims and fostering solidarity.

The ILO Declaration on Social Justice for a Fair Globalization, adopted unanimously in 2008, recognized that *a strong social economy was critical to sustainable economic development and employment opportunities, along with productive, profitable and sustainable enterprises and a viable public sector.*

Policies supporting *sustainable economic local development*, in particular through SSE, can play a key role in response to the challenges of globalization and the drive for decentralization, in particular increasing the participation and local dialogue, connecting people and their resources for better employment and a higher quality of life in the rural areas.

The ability of supplying **social services** to those who are not covered by the public systems, has been repeatedly shown by the SSE, as in the case of Italy, where the increasing vacuum has been filled satisfactorily, by the social cooperatives. In developing countries, finding ways of providing relevant and effective coverage to informal workers and their families is a priority.

For more than 20 years, SSEOs in developing countries have provided, for example, community-based health insurance schemes, especially to rural and informal workers who are not covered by national social security systems. In some countries, these health insurance initiatives have been integrated into national health insurance schemes. Other socio-economic groups (e.g. teachers) also have created mutual health organizations to benefit from complementary health insurance schemes. These kinds of organizations are found especially in Central and West Africa. An increasing number of these initiatives are organized in networks and federations in order to better represent their movement and to offer administrative and financial services.<sup>7</sup>

As crucial part of the territorial agendas, the **social dialogue** can be strengthened by a large number of social and solidarity economy organizations representing the voice and interests of those who are not normally represented by the traditional social partners: for example, small farmers, represented by marketing cooperatives of agricultural products or operators of the informal economy and associations of street vendors.

At the local level, the ILO acts as a facilitator of dialogue between the public and private sectors and local communities, to promote development which is unthinkable without the active participation of the social economy. Many technical cooperation projects<sup>8</sup>, implemented by the ILO in Latin America and Africa have shown how, in implementing local development strategies, the role played by Social Economy organizations is particularly significant.

The inclusive and transparent decision-making process and the operational rules, which is a character of SSEOs, helps to establish a culture of dialogue, which could shed new light on the governance<sup>9</sup> and social dialogue. It may be in the interest of the classic tripartite social dialogue structures to involve and consult SSEOs, as well as other actors of civil society which are representing the most vulnerable populations in the world of work. The collaboration between the social partners and SSEOs could be strengthened in a common effort towards the resolution of social and economic issues.

Finally, the **environmental problems** as well as **food security, migration, informal economy, land ownership and a greater control over public resources**, can be tackled better through policies and programs based on the local development approach and the promotion of social and solidarity economy.

<sup>7</sup> ILO Reader 2011 "Our common road towards Decent Work"; <http://socialeconomy.itcilo.org/en>.

<sup>8</sup> See the experience of PRODERE in Central America in the '90. PRODERE was an interagency project (UNDP-UNOPS-WHO-ILO) and the LED component was implemented by the ILO. <http://web.worldbank.org/WBSITE/EXTERNAL/TOPICS/EXTURBANDEVELOPMENT/EXTLED/0,,contentMDK:20274433~menuPK:402644~pagePK:148956~piPK:216618~theSitePK:341139,00.html>.

<sup>9</sup> In the social economy people get together and help each other, helping them value their place in society. The government actors and the private sectors can easily and at less cost reach them collectively. By getting together they will be able to be involved in the policy making at the national, sub-regional, and regional level.

Most countries in the Organization for Economic Cooperation and Development (OECD) and many in Africa, Latin America and Asia have launched decentralization processes, driving adoption of policies for local development, thus promoting agendas for territorial development.

Social and Solidarity Economy Organizations and Enterprises are characterized by democratic governance, without the objective of profit maximization. This makes them very appropriate for endogenous development. As mentioned by Borzaga and Tortia (2009) “These institutional features strongly support an active role for social enterprises not only in the provision of goods and services of general interest, but also in local development processes. In the United Kingdom, social enterprises are defined by law as community companies. In Italy, social enterprises develop similar strong linkages with the community, since the subjects controlling them are locally-based and usually serve objectives relevant to the local level. Limitations to participation in regulated financial markets also make them dependent on localised financial sources.”

It is important to promote policies to support local development, deepening decentralization and deconcentration at a national level. The territorial agendas and local development initiatives not only have to find the connections outside their own reference socioeconomic environment, but must be supported from the central level, with policies and mechanisms. In this sense, the role of social actors is crucial to achieve the necessary consensus. At local level, both workers’ and employers’ organizations have a special interest in getting involved in LED because interventions will benefit the work and livelihoods of their members and that of their families. More specifically, LED offers them an opportunity to be part of institutional forms of participation and social dialogue such as LED forums, value chain development facilitation groups or project steering committees

## WHAT THE ILO IS DOING

The ILO<sup>10</sup> works to create more and better jobs by promoting the social and solidarity economy through local development approach. It does this by:

- Advising on policy and law. The ILO provides advice on the design and implementation of policies and laws on social economy policies. At the local level, the ILO acts as a facilitator of dialogue between the public and private sectors and local communities providing an operational framework for the four dimensions of the ILO’s decent work agenda, employment, labour rights, social protection and social dialogue, combining them in multidisciplinary, integrated approaches.
- Building capacity. The ILO provides a wide range of capacity-building tools related to local development and social economy<sup>11</sup>. Among others, I would like to mention the Academy on Social and Solidarity Economy<sup>12</sup>, carried out since 2010 every year. See also at [www.delnetitcilo.net/en](http://www.delnetitcilo.net/en) the distance learning activities on local development. In preparation there is a distance learning course on Social and Solidarity Economy that will be ready by the end of 2013.
- Providing research-based advocacy. The ILO produces<sup>13</sup> case studies and other material highlighting the relevance of promoting social economy through LED for social protection, employment creation, rights at work, social dialogue and “green” jobs. Consolidated partnerships exist at international, national and local level with academic and research institutions and the International Cooperative Alliance.
- Technical assistance. Local Economic Development approach<sup>14</sup> has been used successfully, with ILO support, by around 36 countries in the world.

Since the 1990s, ILO has promoted LED in 36 countries: 13 in Africa, 2 in Arab States, 9 in Asia, 6 in Europe and Central Asia, and 6 in Latin America.

ILO member States increasingly apply LED as an integrative strategy to implement the decent work agenda<sup>15</sup> at sub-national level. Over 13 countries from 3 regions (Africa, Asia and Latin America) have identified decent work objectives that make reference to LED and rural enterprise development.<sup>16</sup>

<sup>10</sup> Rodríguez-Pose A. (2001).

<sup>11</sup> See at [moodle.itcilo.org/mycoop/](http://moodle.itcilo.org/mycoop/).

<sup>12</sup> See at <http://socialeconomy.itcilo.org/en>.

<sup>13</sup> See the websites [www.ilo.org/coop](http://www.ilo.org/coop); [www.ilo.org/led](http://www.ilo.org/led); [www.itcilo.org/socialeconomy](http://www.itcilo.org/socialeconomy).

<sup>14</sup> The LED approach can include:

- stimulate entrepreneurship, businesses and development of SSEOs;
- improve enterprise competitiveness and exports;
- upgrade value chains to generate local benefits and attract inward investment and tourism
- upgrade skills and improve access to local labour market information;
- mobilize savings and credit, and facilitate access to social protection;
- improve physical and financial infrastructure;
- strengthen local institutional frameworks and governance.

<sup>15</sup> The ILO strategy addresses the need for practical decent work policies and programs from the outset, while encompassing both rural and urban economies in an integrated manner.

<sup>16</sup> ILO: Strategic Policy Framework 2010-2015, Governing Body, 304<sup>th</sup> Session (Geneva: 2009).

There are many examples of ILO projects and programs implementing the LED approach, below in the BOX 1 a summary *from the Ghana Decent Work Programme*.

The ILO has also facilitated the creation of a community of LED and SSE practitioners and experts around platforms like [www.ledknowledge.org](http://www.ledknowledge.org) and the “COLLECTIVE BRAIN” at <http://www.sseacb.net>.

LED projects generate impact: for instance in Sri Lanka, the “Enter-Growth” project (2006 - 2009) has impacted 16,400 businesses (rising to 52,000 once interventions have impacted along value chains); has led to a near tripling of household incomes; and achieved a 15 percent increase in employment in four targeted districts.<sup>17</sup>

LED projects also generate progressive approaches: in El Salvador, the Local Economic Development Agency (LEDA) of the Department of Sonsonate promoted a Centre of Entrepreneurial Services for women, which has allowed them to access business development services, but also to be better represented in local government.<sup>18</sup>

Worldwide 68 LEDAs are members of the network, “International Links and Services for LEDAs, ILS-LEDA”.<sup>19</sup>

## FINAL REMARKS

The ILO's comparative advantage in the implementation of technical cooperation projects lies primarily in the experience, in being part of consolidated networks on LED and SSE, in its tripartite structure and also in the worldwide ILO office structure, which can count on international specialists on decent work agenda related issues.

Additionally, the long experience of the International Training Center of the ILO in Turin in delivery residential, distance learning and blended training courses, is a relevant comparative advantage with regard to the LED and SSE capacity building activities. The ILO training programme on SSE and LED is well known and recognized.

SSE and LED can facilitate the transition to the formal economy, to offer alternative models of “doing business to the young people”, to have a more rooted economy in the territory, offering more stable jobs and taking care of the environment. LED and Social Economy should play a significant role in the post-2015 MDG agenda to support a more inclusive and sustainable development.

## THE TERRITORIAL APPROACH TO LOCAL DEVELOPMENT AND LOCAL GOVERNANCE: THE UNDP ART INITIATIVE

Francesco Biciato\*

\*ART Programme Advisor, United Nations Development Programme Brussels Office - [francesco.biciato@undp.org](mailto:francesco.biciato@undp.org); <http://web.undp.org/geneva/ART/index.html>

The United Nations Development Programme (UNDP) recognizes the critical role played by Local and Regional Authorities (LRAs) in pursuing the development agenda. As tier of government closest to citizens, LRAs play a crucial role alongside with central governments and Civil Society Organizations in promoting sustainable development and inclusive growth at local level. UNDP's new Strategic Plan puts special emphasis on the role of local governance and local development in eradicating extreme poverty, reducing inequalities and addressing exclusion.

Through the ART Initiative (Articulation of Territorial Networks for Sustainable Human Development) launched in 2005, UNDP promotes a territorial approach to development. This is a multi-actor and multi-sectorial approach in which different local institutions and actors (public – LRAs, and private – CSOs, private sector) work together to define development strategies that reflect a wide range of interests and needs at the local level. The bottom-up approach based in the community demand allows identifying territorial priorities adopting a real participatory approach. Through the participation of Local Authorities and the mobilisation of additional private and community capacities and resources, the territorial approach to development intends to trigger a change in the quality of citizens' life and wellbeing, ensuring a balance between socio-economic growth, equity and environmental quality and increasing the resilience of the most vulnerable. The rationale of ART Initiative is that the local and global dimensions are increasingly interlinked. There are issues that affect citizens with causes that escape the local sphere, i.e.: employment, migration, climate change, health, human security. In the end in many cases, the answers to local needs can only be given through linking with intermediate, national or global levels.

ART is a programme that facilitates the complementarities and strategic and operational coordination among different international development actors on the field: national programmes, decentralized cooperation actors, agencies of the UN System, civil society organizations, NGOs, private sector and academia. It supports national policies and local development processes prioritized by the countries themselves to achieve the Millennium Development Goals (MDGs) and the local level implementation of the principles for effective development cooperation.

Convinced of the importance of LRAs and the territories' social and economic stakeholders as relevant cooperation actors, the Initiative is an entry point for international partners interested in harmonizing activities in support of local governance and local development. The aim is to develop a common strategy instead of isolated and punctual projects. Interventions, focused on supporting local development and local governance, are aligned as much as possible to local, regional and national priorities. In this way, the tensions to recentralise the administrative and political power can be mitigated through a “multi-scale dialogue within a country”.

With the support of UNDP's ART Framework Programmes, participatory and inclusive instruments are established at the local and national levels to coordinate and streamline linkages and ensure ownership of development processes, harmonization of actors and actions, and alignment to national and local development priorities. In short, ART sets in motion processes to articulate decision-making and resources at the local, national and international levels while implementing concrete actions aimed at meeting immediate and medium-term needs. *National Coordination Committees* (NCCs) are undeniably one of UNDP's ART Framework Programme backbones. The most discernible of ART's national level instruments, they are the expression of the Programmes' drive to establish a partnership with the national government, based on dialogue, mutual responsibility, collaborative work towards common objectives and coordination, through the following instruments: *Territorial Working Groups* (TWGs) and *Local Working Groups* (LWGs) promote strategic planning management; facilitate consensual decision making among local authorities, civil society and private and public stakeholders; strengthen and develop territorial/local capacities and provide an accountability and monitoring mechanism of cooperation actions. *Local Economic Development Agencies* (LEDAs) are instruments to enhance territorial economies for a fair, balanced, inclusive and sustainable development. The *Local Planning Cycle* (LPC) is the territory's long-term vision of its development ambitions and potential; it seeks to concentrate activities around the most urgent problems and involves the collaboration of all local key stakeholders. Through the ART Initiative, UNDP also supports Decentralized Cooperation partnerships between LRAs in partner countries, as well as South-South cooperation partnerships with the exchange of knowledge and experience for the development of specific initiatives in different sectors. As a result of these efforts, more than 600 partnerships have been established with different stakeholders in Europe and more than 1,000 in developing countries. The ART initiative understands *Decentralization Cooperation* in a broad and inclusive sense, where local and sub-national governments, civil society, NGOs, the private sector and academia work with counterparts in other countries to advance local sustainable human development. In this sense, ART has the ability to maximize its immense potential to contribute to a new “development paradigm”.

ART also allies with LRAs Associations to connect country-level practice with policy/advocacy efforts, for instance in the Global Task Force of Local and Regional Governments for post-2015 development Agenda towards Habitat III, the II World Forum of Local Economic Development and in the framework of the Open Working Group on Sustainable Development Goals.

In the last 10 years the ART Initiative has proofed the validity of the Territorial Approach to Development through an inter-sectorial and integrated way in different fields of intervention:

- Policies for technical and administrative decentralization
- Democratic governance
- Delivery, quality and sustainability of territorial public services
- Local economic development
- Territorial planning systems
- Promotion and implementation of gender mainstreaming in all development activities

**Tab. 1-** ART Initiatives in the world.

COUNTRY	PROJECT	COUNTRY	PROJECT
Gabon	In 2011 ART Gabon conducted an evaluation of its first operational phase (2006 – 2011) and formulated the second one (2013 – 2016). The evaluation’s findings have revealed that the Programme has generated tangible and measurable results in local participatory platforms, local planning processes, capacity-building and financing of income-generating micro-projects.	Ecuador	ART UNDP Ecuador puts ART’s multilevel governance instruments at the disposition of national and local actors, in support of the country’s development strategies and MDG achievement. In this context, the Programme has activated five Provincial Working Groups and one Cantonal / Municipal Working Group in seven of Ecuador’s provinces.
Mauritania	In 2011 ART Mauritania reinforced the Programme’s institutional component through the establishment of the National Coordination Committee and two Regional Working troupes (the latter through a Wali’s decree) to support regional development processes.	El Salvador	ART El Salvador offers technical assistance and participatory instruments to implement local development national policies and development effectiveness initiatives at the local level.
Mozambique	Local economic development.	Uruguay	UNDP’s ART Uruguay Framework Programme supports the government in its decentralization efforts with a special focus on the second and third tiers; it also supports local economic development by strengthening territorial governance instruments.
Marocco	The Programme established the National Coordination Committee (NCC) in 2007; each of the two areas of operations have active Territorial Working Groups (TWGs) that have become reference points on issues of DC partnerships and strategic planning of local development: in 2011 alone, the working Groups took part in 18 exchange missions involving 124 development partners (DPs) and also participated in a local governance training cycle.	MyDEL	Women and Local Economic Development (MyDEL) was the first ART regional-level initiative aimed at directly addressing gender equality in El Salvador, Guatemala, Honduras and Nicaragua. It is coordinated by UN Women and headquartered in Guatemala’s regional coordination offices. It aims at laying the foundation for a Central American strategy on women’s empowerment to promote and enhance women’s entrepreneurship.
Senegal	Created in 2009, ART Senegal seeks to contribute to improve the population’s living conditions. To achieve this, it supports national decentralization, institutional capacity building and participatory local	Lebanon	ART Lebanon’s overall goal is to support the national government and the local communities in its areas of intervention and in the elaboration and implementation of strategic development plans, with a special focus on disadvantaged groups.

	planning processes.		
Bolivia	Operational since 2008, ART Bolivia has become an important tool in support of the country's decentralization process and reorientation of its productive sector, with a special focus on governance and local development	Indonesia	In the NTT province, the PWG has merged with the Province's mechanism for aid effectiveness, the "Integrated Secretariat for Development Partnerships" (SPADU). The PWG has been therefore institutionalized as an official unit within the provincial government, contributing to development effectiveness through the harmonization and alignment of development partners with locally established priorities
Colombia	The ART-REDES Framework Programme closely works with the Bureau for Crisis, prevention and Recovery (BCPR); it seeks to strengthen the role of local communities in achieving sustainable local development, democratic governance, MDs and reconciliation.	Sri Lanka	ART Sri Lanka started its activities in 2006 in the wake of the devastating December 2006 Tsunami. The Programme quickly became a valuable platform to coordinate the intervention of scores of decentralized cooperation partners wishing to support the country's post-disaster and early recovery schemes.
Cuba	The most senior of all ART Programmes, the Local Human Development Programme (PDHL), has emerged as a unique platform for Local Human Development in Cuba. It has maintained and reinforced its pivotal role to promote and facilitate UNDP's and other UN organizations and agencies' actions in local development, mainly thanks to its strong alliance	Albania	In collaboration with its national counterparts and UNOPS, ART GOLD2 Albania provides support to the reform agenda for the country's accession to the EU, MDG achievement and development effectiveness.
Dominican Republic	The ART Dominican Republic Framework Programme was born in 2007. The Programme works in line with the Government's strategies for local Development and decentralization. Furthermore, the activities of the ART Dominican Republic Programme are implemented within the UN Development Assistance Framework (UNDAF) and the UNDP Country Programme Action Plan (CPAP).	Kosovo	In view of the particularities of the region and the proliferation of development actors, ART has put its instruments and methodology at the service of existing initiatives and actors. In this sense, the Kosovo experience represents ART's added value par excellence as a facility for articulation, coordination and participation, offering instruments capable of enhancing and contributing to the agendas of existing development actors and donors to-be.

## MICROFINANCE: FROM THEORY TO PRACTICE

Pierluigi Conzo\*

\*Department of Economics & Statistics, University of Turin, Italy - [pierluigi.conzo@unito.it](mailto:pierluigi.conzo@unito.it)

Access to financial services is one of the fundamental engines of development. According to recent estimates by the World Bank 2.5 billion of adults (i.e. 50% of worldwide adults) do not have a formal bank account and the low-income individuals are the ones more exposed to financial exclusion because of poverty, travel distances and monetary and non-monetary burdens associated to opening a bank account.

Financial exclusion is also correlated to unequal distribution of income. It has been estimated by the World Bank that the richest adults in developing country are more than twice as likely to have a formal account. Moreover in many developing countries access to financial services either for loans or savings is generally informal; this implies the “unbanked” pay higher fees on such services than they would if they could access formal services.

Spread nowadays in many developing countries, microfinance services have contributed to bridge the gap between the unbankable’s investment ideas and financial opportunities, helping low-income households in asset-building, risk management and consumption smoothing as well as investment in education and health through the additional income generated by credit access.

As a side-effect, microfinance has also contributed to bridge the gap between practitioners and researchers and within the latter. The growing attention to microfinance practices has lead to new fruitful research ideas in the field of developing studies, attracting also large synergies between practitioners (i.e. NGOs, non-profit foundations, associations, institutions for development, etc.) and academic researchers with heterogeneous background (psychology, economics, sociology, anthropology, etc.).

This panel has collected academic research on financial services in developing countries often carried out jointly with national or international practitioners. In particular, the following studies focus respectively on micro-insurance schemes in southern Ethiopia, on current and new potential approaches to microfinance as a tool for social inclusion and on the microfinance as recovery tool after a natural disaster in the specific context of Sri Lanka.

All of these researches directly or indirectly highlight the importance of a mutual cooperation between the academic and the practitioners’ world for a more comprehensive and policy-oriented analysis of microfinance in the international cooperation arena.

## SOCIAL INCLUSION THROUGH MICROFINANCE: AN ANALYSIS OF CURRENT APPROACHES AND NEW FOLLOW-UP PROCEDURES

Andrea Bigio\*

\*University of Turin, Italy - [andrea.bigio@hotmail.it](mailto:andrea.bigio@hotmail.it)

### ABSTRACT

In the last twenty years, following a fast and strong expansion, microfinance has been characterized worldwide by a relevant heterogeneity of the actors involved, especially in its main segment, microcredit. The socio-economic vulnerability of the population involved in this type of project led to the need for new concepts of sustainability, based on a schism between the institutionist and the welfarist approaches. Previous impact assessments demonstrated that a proper access to financial services improves life conditions among economically active poor persons by increasing their entrepreneurship opportunities and thus their income. Nevertheless, commercial and institutional approaches can lead astray from the original purpose, considering microfinance merely as a new tool to access financial services and not as a whole range of social processes driven by both financial and social services. Based on a research paper on the microfinance sector in Jordan, one of the most developed Arab countries in terms of micro-lending, this study analyses the different approaches of microfinance adopted in Jordan in the last years, focusing on the socio-economic impacts and the development of a relevant social return, at three levels: personal, communitarian and regional levels. The research shows the need for the implementation of new procedures within microfinance institutions (MFIs), based on specific approaches that allow the fulfillment of all the requirements related to the business cycle, in both an economic and a social perspective. From the access to financial services to the management of the micro-enterprise, the population targeted by the MFIs faces a diverse range of challenges, therefore loan officers should act as social workers and business developers, adopting specific follow-up procedures able to contribute to a real social impact.

### INTRODUCTION

In the last decades, microfinance, and its main component microcredit, performed one of the most relevant sector growths, especially within the financial and socio-economic development system. Microfinance is recognized worldwide as the provision of financial services (savings, credits and insurance) to low-income persons carrying out productive activities and excluded by the standard financial system because of their socio-economic conditions and high risk profile. Therefore, microfinance represents one of the main tools for poverty reduction and socio-economic growth, especially in developing countries. Together with other similar tools, microfinance, especially with the microcredit supply, but also with the relevant impact of savings and insurance programs, represented a new approach for poverty alleviation. It approaches the target population without creating a dependency relationship, but looking at beneficiaries as micro-entrepreneurs that need a specific tool to empower their conditions with their own work and commitment. Since the first Global Microcredit Summit held in Washington D.C. in February 1997, the growth of microfinance institutions (MFIs) has been promoted in the socio-economic development sector. The strong expansion of the last thirty years is mostly related to the development of new and non-traditional methods and approaches implemented worldwide by microfinance institutions. In particular, the concept of “*group lending*” overcame collateral adverse selection problems related to information asymmetry through “peer monitoring” (Chowdhury, 2009).

The development of microfinance undertook different approaches, basically related to the type of the microfinance institutions (Non Governmental Organizations - NGOs, non banking financial institutions, banks), their status (regulated or non regulated), their activities (savings and credits, direct credit institutions, development projects including credit), their methodology (group lending, individual loans) and their sources of financing (deposits or external financing) (Berguiga, 2008). These different approaches are strictly related to the division, defined by Murdoch (1998) as the *microfinance schism*, between the *institutionist approach* and the *welfarist approach*. These are both based on the shared commitment of financial services provision for micro-entrepreneurs, but created a system split into what Woller described as “*two nations divided by a common language*” (Woller, 1999). Starting from a common purpose, different methodologies led to the development of a diverse range of experiences and results, depending on the way in which microfinance services are supplied, the target population selection criteria and the performance evaluation methods.

Welfarists base their position on the assumption of their commitment to serve the *very poor* (Woller, 1999). This approach considers the provision of a whole range of services, not only credit or saving, but also non-financial services,

such as specific entrepreneurial trainings and assistance able to support the target population in all the business cycle phases, under an economic and a social perspective. In some cases, an inappropriate and inaccurate administration brought to the failure of some microcredit programs, due to high unpaid rates and transaction costs (Von Pischke et al., 1983; Yaron, 1994), allowing institutionists to *attack* the welfarist approach identifying it as a threat for the effective fulfillment of the microfinance services provision (Woller, 1999). The institutionist approach is therefore based on the *logic of market* supported by different international organizations, such as the World Bank, the United Nations, the United States Agency for International Development (USAID) and the Consultative Group to Assist the Poorest (CGAP). This approach is based on the assumption of limited donors for a growing demand for microfinancial services (Ben Soltane, 2012). According to institutionists, all MFIs should aim at financial sustainability, maximizing the productivity, preferring *breadth of outreach* (number of beneficiaries) to *depth of outreach* (targeted level of poverty, usually shown by indicators such as the average loan size and the number of women beneficiaries). This approach places the institution at the center of the process, instead of the target population and the socio-economic impact or a relevant social return. What for the institutionist is a threat to financial self-sufficiency, under the welfarist approach represents a specific commitment towards social performance standards, in order to reach the common goal of reducing poverty and improving socio-economic conditions of the population excluded by the formal financial system.

This schism and the related debate proves the need for a in-depth understanding of the different approaches and the possibility to adopt and support a joint approach able to serve and reach different targets of the population and to fulfill both social and financial requirements. Starting with a theoretical overview of the *microfinance schism*, the paper analyses the results of a field research on the microfinance market in Jordan, which aimed at studying the microcredit supply in one of the most developed countries of the Middle East and North Africa (MENA) region, in terms of microfinance provision. The results will show the lack of a proper follow-up procedure and social impact assessment, except for rare cases where the institution had recently started to adopt this kind of tool. The *social blanks* identified during the research led to a methodological analysis that examines the core microcredit procedural steps, underlining some social measures considered highly relevant for the sector commitment. In the conclusions, the paper proposes a reflection on more social oriented procedures implemented by microfinance institutions. This includes an evaluation of the current gaps, valid not only for the Jordanian experience, but also for other developing countries where micro-entrepreneurs need a proper, specific and personalized support for the socio-economic growing process.

## THE MICROFINANCE SCHISM AND THE RELATIONSHIP BETWEEN SOCIAL AND FINANCIAL PERFORMANCES

Besides structural differences in terms of approaches and methodologies, microfinance has been defined (Woller, 1999) as a heterogeneous movement characterized and driven by a shared commitment to provide financial services for the development and growth of micro and small enterprises run by persons automatically excluded by the formal financial system due to their socio-economic conditions and the subsequent high risk profile. This common aim didn't prevent the development of different approaches. These concern the debate on the best way to achieve microcredit main goal and the use of the diverse range of tools that allow having an impact on poverty alleviation through access to financial services. According to each side of the debate, there is a *trade-off* which implies the implementation of a "*unique model*", instead of a combined approach that would allow reaching both social and financial performance requirements (Bédécarrats et al., 2011).

In the late '90s the failure of some microfinance institutions brought about the need of a debate between the two sides. The institutionists emphasized the achievement of financial self-sufficiency through breadth of outreach. They supported a *financial system* where microfinance is implemented by a large-scale approach, profit seeking MFIs and where positive beneficiary impacts are assumed (Woller, 1999). In order to accomplish this model, each institution should maximize productivity and effectiveness, raising interest rates to face the transactions costs (Ben Soltane, 2012). The development of this approach precedes two relevant trends of the last years: on one side, the upgrade process of microfinance institutions from an "*NGO*" and "*Non-Profit*" status to a regulated one, based on a profitability and market logic (De Briey, 2005). On the other side, an on-going downgrading process that brings traditional commercial banks to the discovery of new markets and new target populations, once considered as high risk.

Institutionists point out the difficulties in keeping a model based on social performances and standards without a careful financial administration and strategy. Welfarists instead base their approach on depth of outreach and the acknowledgment of the original social purpose of the movement, emphasizing the social impacts and livelihoods improvements reached through the access to financial services, without assuming them by any financial indicators. Welfarists also underline the importance of different non-financial tools and services that somehow are not considered by the institutionists, due to the high financial requirements. The vulnerability of the population targeted by socio-economic development tools such as microfinance requires the provision of a complete range of services. Beyond the access to credit of financial services, these can support and ensure the socio-economic development of the entrepreneur. Technical and social trainings, for instance, could enhance and develop certain skills that the target population requires to face all the direct and indirect challenges of the business cycle. In order to follow these methodologies, welfarists may require subsidies, which are instead eschewed by institutionists. Though, this belief does not consider that the main innovations implemented by the sector in the last years (group-lending and village banking) came from *subsidized* MFIs

(Woller, 1999). Furthermore, the analysis proposed by Woller (1999) considers, in the evaluation of *subsidy*, a distinction between a *social* investor and a *selfish* one, driven by different motivations and expectations towards the MFI's achievements, smoothing the institutionists' fears about donors' availability. This brings to relevant considerations related to the importance that the elaboration of *impact assessments* represents within each MFI. These assessments are unnecessary in an *institutionist system* but are a priority for a MFI depending on subsidies (Woller, 1999). Welfarists also consider the current microfinance evolution under the *logic of market* as a threat for the population usually targeted by these programs, as it could lead to a selection distortion and a marginalization of the poorest persons in favor of the ones considered more affordable and creditworthy (Chao-Beroff, 1997). Apart from any biased opinion, the risks related to the commercialization of microfinance seem to be real, with deep changes, not just in target population selection criteria, but also in the range of activities implemented, the indicators considered in the monitoring and the importance of social impacts in the evaluation of the intervention.

Recent studies (Bédécarrats, 2012) underline the need and the feasibility of combined models that go beyond the inner lack of communication between the two factions, overcoming the mutual distrust and the idea that just one of the approaches could lead to the achievement of the common goal. Financial and social performance therefore became relevant topics in the microfinance system, fostering the need for a specific evaluation, focused on the debate on the possible combination between the two. In the social and financial performance debate, it is relevant to consider that the factor analyzed for the financial debate has always been relatively clear and unquestioned throughout the years, referring usually to the ROA – Return on Assets, cost per borrower and portfolio quality (among all, the PAR 30). Instead, the debate regarding how to assess and measure the social performance of MFIs has been crucial. In the last ten years, the Social Performance Task Force (SPTF) has been working on the realization of a specific kit of standards of social performance for MFIs. As shown by previous researches, the social performance has been approached by four main dimensions, including “*serving larger numbers of poor and excluded people; delivering high-quality and appropriate financial services; creating benefits for clients and improving the social responsibility of MFIs*” (Bédécarrats et al., 2011; Hashemi, 2007). Therefore, the major relevance of social performance led to different researches aiming at proving a direct trade-off between the two performances. The main difficulty of these kinds of studies concerns the management of the data considered during the analysis, in most of the cases elaborated by the MIX – Microfinance Information Exchange, self-reported and largely unverified (Bédécarrats et al., 2011). The analysis conducted by CERISE, involving institutions from 51 countries, shows some relevant relations between financial and social performance, about their compatibility and the need for a specific mix that allows keeping all the financial requirements without underestimating social performance practices. The research underlines the relevance of the development of non-financial services able to improve customer satisfaction and payback capacity, though at first these may have a possible negative impact on efficiency and sustainability. Another study, based on Social Ratings elaborated by MicroFinanza Rating (Hoepner et al., 2012), considered the relation between social and financial performances. The research shows a parabolic relationship between client protection (external social performance) and financial sustainability, designing a *U shape* curve. Investing in social responsibility could therefore ensure clear impacts on financial performances; negative at the beginning, with the initial social performances improvement, but positive once a strong client protection has been achieved.

A proper analysis on the social commitment is also suggested by evidences of *mission drifts* of MFIs (Copestake, 2007). This trend is generated by a confusion related to the presence in the sector of diverse and heterogeneous institutions, and a *conflict* between financial sustainability and social performances. The contemporary activity of commercial banks, non-governmental organizations and financial institutions may be contributing to a general confusion regarding the common commitment and the relevance of social and financial performances. A proper reflection could, therefore, contribute to a more social oriented sector, focusing on the social impact achievements and its relevance within the institutions, clarifying and pointing out the different activities implemented.

An approach made by these inputs, considering the importance of a strategic mix between the two performances and the related practices, opens to new considerations and to the second part of this paper, based on a field research in Jordan. The survey allowed estimating the provision of microfinance services in the Arab country, the importance of social assessment and the subsequent development of a different methodology based on specific follow-up criteria and a social commitment focus.

Over the years, a large and not very productive debate split microfinance into a rigid *dichotomy*, where both institutionists and welfarists fall into the easy and automatic belief that just one way could be viable. This *dichotomy trap* (Woller, 1999) brought to failures in both sides, whether due to lack of financial sustainability, or missed achievements of basic social impacts. Nowadays, MFIs and academic researchers need to reconsider the whole microfinance and microcredit process under an updated point of view. This evaluation, based on actual and previous field experiences, could consider the diverse range of needs and difficulties that micro-entrepreneurs and economically active poor face daily.

## AN OVERVIEW OF THE MICROFINANCE SERVICES PROVISION IN JORDAN

The study presented in this paragraph refers to a field research conducted in Jordan in June and July 2012, preceded by an analysis of the existing scientific support (among all, Planet Finance, 2007; CGAP, 2009; Saqfalhait, 2010), that

led to a better understanding of the peculiarities in the Jordan experience<sup>1</sup>. Jordan is nowadays one of the most developed countries in the MENA region, with more than 250,000 beneficiaries (MIX, 2013) and a heterogeneous presence of MFIs, for their status, methodologies and services supplied. As in other developing countries, the microfinance sector in Jordan is a rather young sector that reached its maturity a few years ago; MFIs started their activity in the Kingdom in the 1990s, during a time where the country was facing a high unemployment rate, rising prices and a consequent growing poverty. The market has been supported by the Ministry of Planning and International Cooperation (MOPIC) and the United States Agency for International Development (USAID) that launched a specific program (Access to Achievement of Market-Friendly Initiatives and Results – AMIR) in 1998, that was able to provide financial and technical support for the development of three major Jordanian microfinance institutions.

The cited research considered the major microfinance institutions in Jordan, deciding to exclude from the analysis other relevant experiences carried on by international organizations (United Nation Relief and Works Agency – UNRWA – Microfinance Department) and local institutions, such as the Poverty Pockets Empowerment Project promoted by the MOPIC and implemented by four local NGOs. This choice has been motivated by the need to evaluate the approaches of the seven main MFIs in the country, building an overview of the current situation and focusing on the strengths and threats detected during the survey data collection and reported during the research.

Through an in-depth analysis on each MFI involved in the study, the research underlines the main features of the microfinance sector in Jordan, indicating a context mostly oriented to social performance, with high rates of women participation and an average loan that ensures the focus on the economically active poor of the country. In almost all the MFIs considered by the research, the product development is quite advanced and the local outreach, based on an average of 10 local branches per institution, seems to guarantee a strong link between the institutions and the beneficiaries, except for the rural areas, where the market needs to increase its intervention. One of the first features that clearly appear when analyzing microfinance in Jordan is the low presence of Islamic financial products, with only three MFIs providing them with a percentage on the current portfolio below 1%. Among all, the most evident results of the research regard the social performances of the MFIs, underlining, despite a good depth of outreach (average women participation above 90% and poor-targeted average loan), that just some of them realized constant social impact assessment. In most of the institutions, existing evaluation didn't lead to a proper reflection on the social responsibility and the quality of the intervention. This lack reflects weak follow-up procedures observed in almost all the institutions. In most cases, the relationship between the borrower and the institution, in the figure of the loan office, became quite weak after the credit provision. The whole process cycle seems affected by a *strong commercial approach*, with some crucial steps, such as target selection, project evaluation, follow-up procedures and social impact assessment, characterized by rigid market logics and strong financial and efficiency constraints. This approach, implemented within the different MFIs in a heterogenic way and with different outputs, clearly led to the growth of a stable and efficient market, which is one of the most developed in the MENA region. Though, as mentioned in the first part of this paper, a strong and intense microfinance commercialization may affect the original mission of the institutions. Unless we recognize the differences in the positions adopted by commercial banks and financial institutions implementing - not just in Jordan - microfinance, a deep reflection on the role of MFIs in the poverty alleviation sector is mandatory. This experience follows the recent sector downgrading mentioned in the first paragraphs, but within this paper the aim is not the analysis or the evaluation of these institutions' intervention. It offers an overview and an in-depth analysis that led to a reflection of how microfinance procedures could be implemented in a different way. Social impact assessments and non-financial services and activities represent a relevant cost for the institution, especially if they are constantly repeated during the process. It is, therefore, easily understandable, expected and reasonable that a MFI driven by a logic of market and dependent on a *selfish investor* won't invest in any social activity that apparently won't have specific and clear effects on the efficiency and the financial performance. Some authors (Bédécarrats et al., 2011) report a direct link between social and financial performance. It is therefore desirable that also commercial MFIs could invest more on social performances, pushed by international donors that would look for both financial and social achievement, through new tools such as social audits.

As in any other microfinance market, the institutions involved in Jordan are characterized by a strong heterogeneity, most of all declaring a not for-profit orientation and strong social values. This view and approach should automatically create expectations regarding non-financial services and their impacts on the target population, considering the role that the institution is assuming. Therefore, the first analysis of the data collected led to a deep reflection of the social performances of the Jordanian MFIs, observing that, despite the aforementioned remarkable financial results, the social performances seem to be quite weak. During the first semester of 2012, Tamweelcom, one of the biggest Jordanian MFIs, started a deep socio-economic evaluation based on the *Progress out of Poverty Index*<sup>2</sup>, considering household improvements, business income and family conditions. The project, supported by Grameen - Jameel Microfinance Ltd., aims at improving the target selection, follow-up procedures and development of new products. Although five out of the seven institutions considered in the survey mentioned an on-going social impacts assessment, in most cases the evaluation was not properly matched with a follow-up procedure that could provide a clear monitoring of the social conditions before, during and after the microcredit. Without respecting specific criteria and regular monitoring, this

<sup>1</sup> N. Saqfalhait and A. Bigio, Analyzing the Features of Microfinance in Jordan, *International Research Journal of Finance and Economics*, Issue 111, pp. 69-85, July, 2013.

<sup>2</sup> For further information about the Index and the Jordanian form, visit <http://www.progressoutofpoverty.org/>.

could lead to an overestimation of the changes - positive or negative - observed in the beneficiary's enterprise and life, considering variables that are not directly dependent on the access to microfinance services.

The research pointed out that most of the considered MFIs represent relevant and successful cases of socio-economic development, providing a valuable support to the most vulnerable population brackets. Therefore, the financial performances contribute to a healthy sector, but with many *social blanks*. Follow-up and social assessment gaps do not allow providing a complete microfinance support and most of the beneficiaries do not access the holistic support that would allow facing all the different challenges related to his enterprise and his vulnerable conditions.

The *social impact lacks* led to a further analysis that could design new tools and procedures able to overcome part of the issues. These considerations, based on field experiences in difference microfinance and socio-economic development environments aim at providing alternative ways to the current microfinance structures and processes in Jordan and in other developing countries where social impacts seem to be affected and overlooked by the commercialization process.

## FOLLOW-UP PROCEDURES

The analysis of the main results observed in the field research mentioned in the previous paragraph led to an analysis focused on the social performances in Jordan and other countries where microfinance has been implemented as one of the poverty alleviation and socio-economic development tools. As detailed, the microfinance market in Jordan is characterized by relevant financial performances, but also by some social issues that require an in-depth analysis on the main weak points underlined in the study (among all, follow-up procedures and social impacts assessment) . Most of the considerations concern the figure of the *loan officer* and his relationship with the *borrower* (or beneficiary in the case of broadening the focus to microfinance and not just microcredit). The commercialization of the sector could bring about a relationship between loan officer and borrower that is close to the commercial bank framework. This would be based on a financial focus and totally subjected to market logics not considering the relevance of social approaches in the development of micro and small enterprises within a highly vulnerable context.

As already mentioned, this methodological debate concerns the whole microcredit process, focusing on some core steps that could lead to a more social-oriented approach: 1) *Target selection and field visit*, 2) *Business and social orientation and commitment*, 3) *Business and social follow-up*, 4) *Socio-economic impact assessments*.

### Target selection and field visit

The Progress out of Poverty Index, currently adopted by one of the Jordanian MFIs, is one of the tools that could facilitate the beneficiary selection, targeting the vulnerabilities and verifying the likelihood that the participant and his/her household are living below the poverty line (or other margin considered by the institution). The analysis of the vulnerability, matched with a first business evaluation could ensure a first pre-selection of the participant (and his/her family<sup>3</sup>). This would allow gathering basic, but relevant, information concerning the main individual and familiar situation (internal conflicts, external threats for any household member, health conditions, access to education and nutritional habits) and the business project, new or on-going. In order to reach the accomplishment of a complete socio-economic profile, the loan officer should carry on at least one home visit and a visit to the place where the business is running or the entrepreneur is proposing to start a new one. This first phase and contact with the borrower and his/her family is highly important for at least two reasons: firstly, it allows verifying the target selected according to the institution's mission and vision. On the other hand, it enables the next steps ahead based on the main social and economic opportunities and threats identified during the pre-selection. According to the context and the organization's structure and mission, it may be advisable to draw a training plan, including both entrepreneurship and social topics, such as gender equality, assertiveness and self-confidence. Dealing with socially oriented topics, properly matched with economics ones, may ensure the required knowledge for the oncoming challenges. A specific training programme, as other non-financial services, represents a relevant and demanding institution's investment, but it is definitely a tool that can positively impact on the business and, therefore, on the payback capacity, as well as a clear individual improvement.

### Business and social orientation and commitment

Once the loan officer has concluded the first social and technical visit, both the familiar and entrepreneurial situation will be clearly defined, ensuring the elaboration of a basic *business plan* that will evaluate the feasibility of the

<sup>3</sup> It may be possible, during the analysis of the microcredit process, the mention of a relationship *loan officer-family* rather than a *loan officer-borrower*, due to social and environmental thoughts that consider the high vulnerability of the target population involved in the process as a constraint that recommends to manage a direct relationship with all the family and not just with the entrepreneur. The development of the micro and small enterprise could be widely affected by emergencies related to the whole household and the loan officer has to be previously informed about all the possible socio-economic risks that may arise. At the same time, starting a new business or enforcing an existing one is always an achievement reached by all the family, therefore the loan officer should consider all the strengths within the entrepreneur, starting from the most direct and close level, the household.

proposed project. The preparation of the plan, preferably done mutually with the beneficiary (as a second - practical - step of the theoretical training), could underline the main needs of the business, outlining the priorities on the oncoming investment through the microcredit. In the business plan phase, the loan officer should always leave the responsibilities to the beneficiary, enhancing his/her self-confidence and managerial skills (above all, decision making and technical competences). In order to foster the business development and the economic follow-up, the business plan should include basic steps, goals and achievements. These are quantitative benchmarks that will also positively impact on the personal motivations of the entrepreneur and his/her family. During this phase, it could be possible to consider the elaboration of a proper *social plan*, according to the expertise and social commitment of the institution. This would be matched in some parts with the economic and quantitative achievements of the business plan. This plan will reflect on the social information, individual and familiar, gathered during the home visit. The main aim of this mutual social deepening concerns the acknowledgment of specific *social actions points*, both for the loan officer who will carry on the follow-up and the beneficiary who is directly involved. These *points* are qualitative achievements that are related to certain situations that can positively affect the household conditions and, consequently, the beneficiary and his/her project. These action points should be measured qualitatively, but with precise steps, such as a better nutrition habit, household sanitary conditions and, in the case of school-age children, education involvement and interest. Together with the quantitative achievements of the business plan, the social improvements detailed in the social plan will be part of the follow-up methodology implemented by the loan officer. This will be based on the belief that any individual and familiar threat could seriously affect the business development, therefore also affecting the payback capacity and the institutional financial sustainability. Based on the adopted approach and the institution's mission and vision, this social evaluation could be part of a commitment between the beneficiary and the institution, in order to *use* the microcredit as a direct tool to work on some social weaknesses. This would constrain the credit renewal to some *social achievements*, or just serve as additional - but extremely relevant - support for the loan officer during all the follow-up phase, improving his acknowledgment regarding the personal sphere of the entrepreneur.

### Business and social follow-up

One of the main social weaknesses identified during the field study in Jordan concerns the follow-up procedures implemented by most of the MFIs. In some cases, the institution only schedules a visit subsequent to delays or problems in the repayment. This means that their actions are clearly too late, after the occurrence of the problem and its main effects, bringing about serious difficulties to design and plan any solution. In other situations, the field visits were not as frequent as they should be according to their main aim, which should be the constant monitoring of the project and checking of the threats identified during the first visit. The simple fact that the beneficiary is regularly paying the scheduled fee doesn't imply that is not facing any kind of economic or social difficulties. The over-indebtedness, one of the biggest problems in the microfinance sector in Jordan, in some cases comes from the need to pay a previous debt that is not possible to accomplish with their own resources. These difficulties make it easier for the beneficiary to open a new debt just to fulfill this prior obligation. Therefore, the regular repayment, despite representing a positive sign, cannot be used as a justification for not applying a rigorous, constant and necessary follow-up procedure. According to the context, the follow-up procedures should include at least one monthly visit, considering the high vulnerability of the target population and the frequency with which the occurrence of social and economic issues could lead to relevant changes in the existing family and business stability. The previous microcredit steps should ensure a proper wealth of information regarding the entrepreneur, his/her family and the business. The monthly field visits will be carried on, checking all the improvements or difficulties observed, taking into consideration both the economic and the social commitments defined before the microcredit. The regularity of field visits should be personalized (even if, as mentioned, it should be at least monthly), according to beneficiary's vulnerabilities and repayment plan. The need for constant and regular monitoring would suggest matching and crossing the visits with the repayments schedule; in case of a monthly repayment, the institution could organize the visits between each repayment, creating a bimonthly direct contact that will ensure a proper follow-up and socio-economic support. The first contacts between the loan officer and the borrower are crucial to define a relationship characterized by mutual trust and to consider the field visits as what they really are, a socio-economic monitoring of the family and the business, and not a formal control set up by the microfinance institution.

### Socio-economic impact assessments

In the last few years, the global changes involving microfinance brought about the need for more specific and regular social impacts assessment, especially if required by *social investors* interested in the *social rate of return*, the target population and their socio-economic improvements. Most of the MFIs involved in this study - except for the *profit oriented* commercial institutions - are currently performing a social impact assessment, adopting different criteria and socio-economic variables. The general concern that rises during the sector analysis has been the lack of implementation of a social approach by almost all the Jordanian MFIs. Therefore, the research questioned the relevance of an assessment devoid of a proper follow-up procedure and social information gathered during the microcredit cycle. The same happens with the economic information, which often is limited to the feedback obtained from the hypothetical regular repayment. One of the main risks of social impacts assessments as any other social development tool evaluation,

concerns the analysis of improvements not directly related to the microcredit, but to concurrent circumstances that the target population may be facing. The idea of a more social oriented microcredit cycle comes from the need for a new approach that is able to smooth these social blanks, getting the loan officer closer to the population and creating an information flow that could identify the improvements or the issues directly related to the microcredit. This would help to make a better analysis and to propose solutions also for the other situations being faced by the beneficiary, approaching the role of the loan officer to that of a social worker. Such an approach will render almost automatic the comparison of the qualitative and quantitative results at the end of the cycle with the ones gathered during the first visits and the elaboration of the *business* and *social plan*. The institution will consequently get a more realistic idea of the main issues faced by the target population, adapting the microcredit cycle to their needs and the previous feedback.

During the aforementioned four core steps, the procedures specified could provide a more social oriented process when matched to other procedures customized and related to the program implementation framework. The main doubts regarding an approach focusing too much on social performances would definitely be related to its financial sustainability. Previously mentioned research (Bédécarrats, 2011) demonstrated that financial performance strategies can be combined to the social ones, without facing a rigid *trade-off*. All the procedures, extra-activities (such as the *social plan* or the frequent home and business visits) proposed in this paper, imply clear and evidently higher transaction costs. Nevertheless, a better social orientation, together with a positive operational and repayment response by the borrower, can balance the financial efficiency loss and contribute to more relevant and deeper social impacts.

This paper does not want to underestimate the importance of financial performances, but aims at focusing on certain *gaps* identified during the field research in Jordan. A more social oriented approach that is not properly matched with specific strategies and procedures would lead to efficiency and sustainability problems. MFIs should consider that investing in better social performances will not make the fundraising more difficult. On the contrary, reaching the main social achievements, or at least getting closer, will point out the need for a deeper commitment towards the social impact of the sector by donors and institutions.

## CONCLUDING REMARKS

This paper is strictly related to the results gathered during the field research in Jordan, initially focused on a better understanding of the microfinance provision in the Arab country. The first results analyzed during the survey, showing a strong commercial orientation by the MFIs, led to a further in-depth study based on the social commitment of microfinance.

The theoretical overview in the first paragraph allowed considering the different approaches implemented over the last few years. The failure of several institutions led to new sector debates and to an evaluation of the relationship between financial and social performances, outlining the need to overcome the social impacts assumption based on good financial results. Therefore, microfinance should not just be considered as the provision of financial services and products, but as a tool that includes both financial and non-financial services. An analysis of a specific microfinance sector should consider the MFIs' ability in fostering the development of micro and small enterprises, enhancing personal and professional skills and improving the socio-economic conditions of the entrepreneur and his/her family. The provision of financial services without a holistic perspective will threaten not only the social commitment, but also the financial goal - above all the credit repayment. A concrete microfinance provision should therefore lead to concrete and relevant impacts on three levels: the personal, the community and the regional level. The first level refers to personal achievements, such as better education or nutrition and women empowerment, while the other two concern wider spectrum impacts based on job creation and local development. A proper analysis should be able to consider the role of MFIs' intervention toward these achievements, gathering information regarding the main needs and expectations of the population involved in the process.

Despite strong and relevant financial results, the field research in Jordan observed several social gaps, especially related to the follow-up procedures and social impact assessments. Specific considerations regarding vulnerabilities and needs of the population normally targeted by these programs allowed outlining and proposing proper procedures that could ensure a more social oriented intervention. The analysis points out four core steps in the microcredit process where appropriate and customized procedures could ensure a stronger relationship between the institution and the beneficiary. The differences between each context led to the development and provision of diverse services and procedures, based on the main features of the population involved. Therefore, this paper does not want to propose a new and complete methodological process, even if it focused on specific procedures. It aims at stimulating a reflection on the relevance of the social impact of microfinance and the provision of services by institutions so different from each other, but all included under the same *umbrella* of microfinance institutions. At the same time, though, the deep commercialization led to the need for a design of some core steps and activities that are able to ensure a stronger social perspective, underlining that a micro or a small enterprise cannot be properly supported without considering social and personal issues that clearly affect the borrower and his/her environment.

Further analysis concerning specific procedures and activities within the microcredit process in each context, possibly starting from tools like the Progress out of Poverty Index, could therefore enhance a social awareness that in the last few years seemed to be weakened by financial and market constraints. MFIs have to redefine their own structure and methodology according both to financial and social performances. A proper academic support will be

essential during this phase, but it should start by effective field surveys focused on the main features of the environment, the institutions and the micro-entrepreneurs, considering the vulnerabilities and the needs of the population and developing new processes and products able to have an impact on poverty alleviation.

## THE WILLINGNESS-TO-PAY FOR INSURANCE: EVIDENCE FROM SOUTHERN ETHIOPIA<sup>1</sup>

Davide Castellani\*, Belaynesh Tamire<sup>°</sup>, and Laura Viganò\*

\*FinDev, University of Bergamo, Italy - [davide.castellani@unibg.it](mailto:davide.castellani@unibg.it)

### ABSTRACT

Rainfall variability is a major problem in Ethiopia. The ability of Ethiopian farmers to deal with drought risk is made more scanty by the extension of land plots, which does not allow for a proper crop diversification, and by incomplete and inefficient financial markets which limit appropriate risk management financial strategies. Insurance can represent indeed a potential drought risk transfer mechanisms. However, the sustainability of a traditional drought insurance scheme is flawed by moral hazard, adverse selection, high administrative costs and risks not locally diversifiable. A promising alternative is index-based insurance whereby indemnities are related to an "index", rather than to verifiable losses. Several pilot projects and experiments have been carried out over the last fifteen years. This work is meant to contribute to such vast literature by reporting the results of an experiment carried out with Ethiopian farmers. Based on a sample of 120 rural households in the Wolayta zone - Southern Ethiopia, we aim to estimate the willingness-to-pay (WTP) for a drought index-based insurance product. Data were collected in 2013 through a discrete-choice experiment where household-heads were asked to make a choice out of different choice sets. Additional economic, financial and social data have been collected since 2011, within a wider research conducted on a larger sample including the one used in the current experiment. Data are analyzed employing a Mixed Logit model that allows for random preferences and overcomes a problem of the Multinomial Logit model, i.e. the irrelevance of independent alternatives (IIAs). The study is still in the implementation phase. Main preliminary outcomes are presented.

### INTRODUCTION

The consequences of man-made or natural shocks in rural areas of poor countries can be devastating but even non catastrophic adverse conditions may challenge farmers. Traditional strategies followed to comply with this vulnerability, such as having some savings or diversify production, or informal insurance mechanisms may not be effective (Fafchamps, 1999) while the adoption of formal insurance has generally been considered as challenging both for farmers and for the insurers (Brown, 2001). Many examples of failures in crop insurance are reported in the literature; schemes based on estimated crop losses suffer of moral hazard which loosens farmers' commitment in production with an adverse selection effect where only bad farmers buy insurance (Hess, Richter and Stoppa, 2002). On the opposite, relatively new products base the compensation on the value taken by properly designed, standardized, verifiable climatic indexes (precipitation, wind-speed, temperature, solar radiation) with statistical correlation with crop yields which cannot be influenced by the customer behaviour (Bryla, Dana, Hess, Varangis, 2003). Prevailing contracts are area yield, livestock, weather indexes or weather derivatives (Hess, Richter, and Stoppa, 2002; Skees, 2003). Results of pilot projects based on these contracts are expected to reduce farmers revenue volatility (Hill and Robles, 2011). However, take-ups seem still meagre (Sarris, 2013; Clark and Kalani, 2011) and weak points are stressed. They are related to basis risk, to their cost<sup>2</sup> and to limited delivery channels. Elabed et al. (2013) and Hill et al. (2011) suggest index products with more than one risk included to reduce the impact of basis risk and to improve WTP, but the latter also depends on many other factors.

Several studies attempting to better understand WTP of rural farmers in poor countries mainly rely on experiments, given that the market still has to be developed (Breidert, Hahsler, and Reutterer, 2006, as quoted by Hill et al., 2011).

<sup>1</sup> This research, based on a field experiment, is conducted by the "Finance and Development – FinDev" group of the Research Center on International Co-operation of the University of Bergamo in co-operation with Wolayta Soddo University (WSU-Ethiopia), College of Business and Economics (CBE). The two universities co-financed in equal share the research. The study represents a complementary analysis to the main research project named MicroRiMI (Microfinance, Risk Management and Innovation) through which FinDev has been collecting data – with the co-operation of WSU- in the same area of Ethiopia since 2010. MicroRiMI is sponsored by the University of Bergamo, Giordano Dell'Amore Foundation (Milan), Cariplo Foundation and Lombardia Region. The current paper is a very preliminary version of the main outcomes of the experiment. The full paper will benefit of further development of the analyses and will be complemented by a second, refined, round of the experiment foreseen for November 2013. Davide Castellani contributed to this version with literature review, experiment design and data analysis and interpretation; Belaynesh Tamire worked on data collection and data entry and Laura Viganò worked on literature review and experiment design.

<sup>2</sup> For more details, see Skees (2003), Hess (2003) and Larson, Varangis and Anderson (2002).

While experiments have been considered useful for the learning process that they trigger in potential customers (Patt et al., 2009), their efficacy has been challenged in some studies when limited correlation was found between outcomes from experiments and choices of real insurance (McIntosh et al., 2013) although for other authors this is not the case (Norton et al., 2011 and 2012). Factors affecting WTP pertain to the customer characteristics or the type of actors involved. Patt et al. (2009) point out that most studies focus on economic explanations while behavioral factors (emotions and trust in the suppliers, in the product or in oneself) may matter more. Among factors quoted by many authors, the attitude toward risk may be mentioned. Correlation between risk aversion and WTP may have opposite signs, sometimes counter-intuitively; a negative correlation was found, under specific conditions, by Giné et al. (2008) or Hill et al. (2011). According to Sakurai and Reardon (1997), Gautam et al. (1994), the demand depends, among other things, on households risk management strategies. Wealth is also relevant. Patrick (1988) found higher level of net worth associated with lower premiums. Assets, in fact, may allow to better absorb income shocks; however, even the opposite may be true if ownership of larger amount of assets induces the farmer to take risky decisions and, therefore, to buy insurance (Akter et al., 2009 find positive relationship between land owned and insurance). An ambiguous behavior related to wealth is proved by Clarke and Kalani (2011) which find the highest take-up ratio with intermediate wealth levels; in fact, too poor farmers may have nothing to lose and do not need to insure, while very rich farmers may have other options than weather index insurance (Castellani et al., 2013). Cole et al. (2009), find that insurance demand is sensitive to cash on hand but this depends on the source of cash; for example, Sakurai and Reardon (1997) find negative significant effects of off-farm income and livestock holdings on demand for formal insurance as both allow to implement self-insurance mechanisms. Indirectly linked to cash holdings, Giné et al. (2008) find that credit constraints reduce the purchase of insurance, possibly because it limits cash availability. On the other side, being indebted could negatively affect WTP if all cash is used to repay the loan. Related to the characteristics of the farm, Hill and Robles (2011) found that that farmers with poorer soil quality buy more insurance and Sakurai and Reardon (1997), stress the dependence of demand for drought insurance on the agro-climatic zone. The nature and types of different disaster risks are also important factors for insurance participation decision. Related to farms profitability, absolute value of income influences WTP (Akter et al., 2009) but income variability is relevant as well (Fraser, 1992). A quite controversial effect may be expected by the presence of aid as, while it undoubtedly increases available cash, it distorts demand. Experiments are often based on an initial “artificial” cash endowment which may have important distortions on behaviors during the game (Sarris, 2013) and may even compromise the possibility to implement a real project at market conditions (not subsidized).

Besides individual, households, or area characteristics, also the type of channel or strategy to offer insurance may make the difference, both in terms of accessibility and in terms of knowledge and trust by the potential customer. The latter could be increased if the delivery happens through risk sharing groups (Cole et al., 2009) and if marketing visits are constantly offered<sup>3</sup>. Education may help increasing knowledge of products and, then, trust (Akter et al., 2009) although some studies do not find direct correlation between education and WTP (but this may depend on the type of education provided). Knowledge, in turn, depends on the complexity of the contract, defined by its conditions: price, maturity, delivery methods, index chosen, triggers or thresholds. Price is relevant for Cole et al. (2009) while, as mentioned, basis risk is outlined by many studies (Fuchs and Wolff, 2011; Hill and Robles, 2011).

The ones quoted are just some of the possible patterns in exploring WTP for crop or drought insurance in poor rural areas. The Ethiopian case has been heavily analyzed. Among the relevant studies, Hill and Viceiza (2010), conducted a field experiment on a sample 261 Ethiopians of Silte Woreda (Southern Ethiopia), exploring the link between fertilizers purchase and the offer of weather insurance. Insurance showed positive effects on the purchase of fertilizers. Clark and Kalani (2011) studied the rationality of actual purchases of insurance using data on 378 farmers from the Ethiopian Rural Household Survey (ERHS), and conclude that while behavioral explanations to the low take-up rate offered by other studies could be weak, farmers buy few contracts because of rational decisions, due to the type of product offered. Hill and Robles (2011), working with farmers of Silte Woreda on the idea that farmers are different in their production and preference structures, show the need to offer diversified insurance contracts. Hill et al. (2011) studied 1,400 Ethiopian households for 15 years as part of the Ethiopia Rural Household Survey; they explored many aspects of WTP related to the product and farmers’ characteristics; for example, they found that insurance contracts are more likely bought by educated, wealthy and proactive potential customers. The role of local risk sharing groups as channels was outlined as well. Norton (et al., 2012) implemented a study based on experimental games in Tigray in 2010, within the HARITA<sup>4</sup> project to compare different choices among options on the use an initial endowment of 70 birr: taking the drought index insurance, investing in simulated savings accounts, participating into risk-sharing groups, or holding cash. Preference for higher frequencies of payouts was recorded together with more frequent choice of insurance over savings and over participation in risk sharing groups and, in some cases, over cash holdings. McIntosh et al. (2013) focused on fertilizers and their relationship with weather index insurance in Amhara region. They considered many factors among which credit and insurance availability and worked on two different research approaches: a survey estimating WTP and the observation of actual purchases. Although not completely comparable, also due to some weaknesses in the offer of the real product, slightly positive or even negative correlation is found between the two approaches. Purchases in the study sample were lower than those of the total population. Behavioral variables or basis

<sup>3</sup> As stated, Patt et al. (2009) consider experiments as possible ways to increase trust.

<sup>4</sup> Horn of Africa Risk Transfer for Adaptation.

risk (probably not well known) were little influential. Lack of cash was an obstacle to take-ups which were mainly driven by in cash endowments (vouchers offered by the researchers).

Besides the numerous weather insurance pilots projects, in Ethiopia, practical implementations are increasing. Among them, the Ethiopian Project on Interlinking Insurance with Credit in Agriculture (EPIICA) offered by Nyala Insurance Company (NISCO) and Dashen Bank in Amhara region (quoted by McIntosh, 2013). Nahu (2010) describes several products, including a weather derivative through which the World Food Program made the Government of Ethiopia buy a coverage by AXA Re in 2006 in order to obtain eventual financial resources for food aid in case of extended drought, and the one offered by the Ethiopian Insurance Corporation (EIC) in co-operation with the World Bank in 2008. The other products described are offered by NISCO: a pilot Double Trigger Multiple Peril Crop Insurance (DTMPCI) and a Weather Index Crop Insurance. The first was an area yield insurance started in 2007 in Oromia State; the second was first offered in 2009 in collaboration with OXFAM America and World Food Program in Tigray and Oromia regions, then extended in the South and in Amhara Region. Overall, the author lists some weakness and strengths of these pilots. Among the first, lack of awareness by farmers, of a suitable regulatory framework, and, very important, lack of reliable data. Also delivery channels are limited as insurance companies are based in towns and this increase transaction costs. However, the author stressed the increasing attention of the government to small farmers, the expected establishment of a reinsurance intermediary in Ethiopia, and the abundance of research and technical assistance. The author concludes with a positive judgment on these experiences by stressing the need of collaboration among the different actors and, at the farmers' level, the importance to also consider other risks faced by farmers. This latter statement also emerged in Volpi (2005) who, being involved in the first phases of the implementation of the pilot project by the EIC and the World Bank in 2008 mentioned by Nahu (2010), stressed the reasons why farmers were not so reactive to the proposed insurance contract. In fact, after the instruction phase, only 26 farmers bought the contract. Volpi (2005) stressed the rationality of farmers who stated that the contract was only addressing one important risk but several other risks equally important were affecting their vulnerability. Therefore, they could not afford to pay for only one of them.

The next section describes the experiment conducted in this study and reports the preliminary results.

## EXPERIMENT AND ADMINISTRATION OF THE SURVEY

In the study, we take a full client's perspective instead of a supply's perspective. The objective of is to have an understanding of who is the potential client and of the willingness-to-pay for drought insurance. No formal crop insurance was indeed available in the area where the survey was conducted. The hypothetical product was not designed according to the real rainfall data and tuned on the base of farmers' feedback, but we adjusted a product that was already available in another area of the same region<sup>5</sup>. The product is a weather derivative that pays a fixed indemnity when either a moderate or severe shortage of rainfall occurs in a specific month of the agricultural season (Hill and Robles, 2011). Farmers can get as much securities as they are willing to buy. This pilot-project was employed as a benchmark in order to build reasonable hypothetical products that farmers can afford. The actuarially fair price is thus unobserved but we can expect that it lays in one or more of the different premium-indemnity combinations that we consider in the discrete choice experiment.

In the preliminary phase of the experiment, we carried out focus-group interviews in the villages in order to understand farmers' perception about drought risk and to outline a shared definition of moderate drought and severe drought, respectively.

The categories of the product attributes are five: covered season, intensity of drought, supplier, premium and indemnity. In particular, the covered season category has two levels: *Belg* season, i.e. the small rainy season between the beginning of March and the end of May, and *Meher* season, i.e. the big rainy season between the beginning June and the end of September. The insurance supplier category has four levels: microfinance institution (MFI), farmers' cooperative, informal insurance association (*Iddir* in local name), and *Kebele* (the smallest administrative unit of Ethiopia).

The survey was administered by a team of ten trained enumerators to 120 farmers over a period of three weeks, in March 2013. The farmers were randomly selected from a larger sample of 360 farmers already involved in a three-year data collection project (2010-2013). The surveyed farmers are from three *Kebele*, of the Wolayta area located in the SNNPs Region of Ethiopia<sup>6</sup>.

The three villages are Hembecchio, Kutto Sorfella and Abala Faracho. Each village is representative of one of three agro-ecological zones. The zones are named by the Ethiopian Ministry of Agriculture after the characteristic crops: ginger and coffee zone, barley and wheat zone, and maize and root crop zone.

## EMPIRICAL METHODOLOGY

In this section, we analyze the household's optimizing behavior regarding the choice among different insurance alternatives. A household  $n$  faces a choice among  $J$  alternatives in each of  $T$  choice situations. We suppose that the

<sup>5</sup> See Hill and Robles (2011) for a comprehensive discussion of the product.

<sup>6</sup> For the sake of brevity, in the remainder of the paper we improperly refer to the *kebele* as villages.

utility that the household obtains from choosing alternative  $j$  is a linear combination of the insurance product attributes,  $x_{njt}$ , and a random term,  $\epsilon_{njt}$ <sup>7</sup>:

$$U_{njt} = \beta_n' x_{njt} + \epsilon_{njt} \quad (1)$$

Whereas the attributes are observed by the analyst, coefficient vector  $\beta_n$  is unobserved for each  $n$  and varies across households with density  $f(\beta_n|\Omega)$  where  $\Omega$  are the parameters of this distribution that are to be estimated. The stochastic element,  $\epsilon_{njt}$ , is also unobserved and different assumptions on its distribution result in different choice models. As usually common in the choice analysis, we impose the condition that  $\epsilon_{njt}$  is independent and identically distributed (IID) extreme value type 1 (or Gumbel) across all  $n, j$  and  $t$  (Hensher, Rose and Greene, 2005). Conditional on  $\beta_n$ , the Logit probability of household  $n$  choosing alternative  $j$  in the choice situation  $t$  is:

$$\pi_{njt}^{std} = \frac{e^{\beta_n' x_{njt}}}{\sum_i e^{\beta_n' x_{nit}}}, i = 1, \dots, J \quad (2)$$

The standard Logit model, as expressed by (2), does not allow for unobserved characteristics that can induce correlation among alternatives in a choice situation and among choices over time. The Mixed Logit model, i.e. the unconditional logit probability, overcomes these restrictions by allowing for the variance in the unobserved household-specific parameters and, therefore, does not exhibit the property of Independence from Irrelevant Alternatives (IIA) (Revelt and Train, 1998). The Mixed Logit probability is:

$$\pi_{njt}^{mix} = \int \left( \frac{e^{\beta_n' x_{njt}}}{\sum_i e^{\beta_n' x_{nit}}} \right) f(\beta_n|\Omega), i = 1, \dots, J \quad (2)$$

The (2) is a weighted average of the logit formula evaluated at different values of  $\beta_n$ . It follows that the Mixed Logit probability for the sequence of choices is:

$$\pi_{njt}^{mix} = \int \prod_t \left( \frac{e^{\beta_n' x_{njt}}}{\sum_i e^{\beta_n' x_{nit}}} \right) f(\beta_n|\Omega), i = 1, \dots, J \quad (3)$$

In (3), we want to estimate  $\Omega$ , that is, the population parameters that describe the distribution of individual parameters (Revelt and Train, 1998).

## HOUSEHOLDS' CHARACTERISTICS

We include several variables that proxy for household's characteristics in order to allow for potential heterogeneity in the attributes' coefficient. An important household's characteristic is net income. It is, along with the price, the usual component of demand models. However, we are unable to properly estimate net income. The expenses borne by the household over the period when the income is generated are to be deducted but the current data available do not allow for a proper costing<sup>8</sup>. For that reason, the net income is not included in the analysis.

As alternative proxy of the household's economic capacity we use the household's net-worth, that is, the difference between total assets and total financial liabilities. Total assets include agricultural assets, non-agricultural assets, and financial assets<sup>9</sup>. Financial liabilities are made up of all outstanding debts. The net-worth is also a proxy for the ability of the household to cope with negative shocks and make up for unexpected expenses. However, we do not control for the different liquidity costs of assets. Instead of considering the absolute value of net-worth, we test for a non-linear relationship with the insurance take-up probability by taking net-worth percentiles.

The land holding is not considered in the assets since in Ethiopia it is not an household's property, cannot be transferred or used as collateral<sup>10</sup>. Farmers are used to establish crop-sharing or short-term rent agreements. The size of land is however important in the decision of what to crop and to what extension. Besides, when the land does not provide for a living, farmers are forced to seek for alternative source of income. We control for the households' land

<sup>7</sup> The expression (1) is how the utility is usually represented in discrete choice models (Hensher, Rose and Greene, 2005).

<sup>8</sup> This is one of the objectives of the three-year research project that is expected to end in December 2013.

<sup>9</sup> The non-agricultural assets are: bicycles, motorcycles, radio sets, mobile phones, jewels and watches, tables and chairs, and beds. The financial assets are savings and outstanding credits.

<sup>10</sup> In Ethiopia the land is owned by the government.

holdings in terms of *timad*, that is, a local unit of land<sup>11</sup>.

Other characteristics may proxy for the interviewee's risk aversion such as the interviewee's age, gender, and the number of family members. Others, such as the education, can influence the ability to understand the insurance product and properly appreciate the insurance's utility. We consider if the interviewee is both literate and the grade reached.

Since trust and transaction costs are significant determinants of financial contracts, we expect that being client of a microfinance institution, member of a local cooperative, or part of one or more *Iddirs*, i.e. local informal insurance parties, can increase the respective likelihood to prefer one supplier instead of another one.

Finally, we include some dummy variables to control for basis risk. In our case, the basis risk is the probability of receiving an indemnity when the households are not affected by drought, or not receiving an indemnity when it is affected. The dummy variables are built on stated perceptions of how different is the rainfall pattern at the household's field compared to where the weather station is located, and how much more or much less it rains at the weather station than at the household's field.

Table 1 reports all attribute and control variables.

**Tab. 1** – Variables.

Variable name	Definition	Unit	Type
<b>Product's attributes</b>			
Premium	Cost of the insurance contract	ETB	Integer
Indemnity	Expected payment in case of drought	ETB	Integer
Belg	If Belg is the covered season	0,1	Dummy
Perceived probability	How often a moderate or severe drought occurs	Years	Integer
Cooperative	If cooperative is the supplier	0,1	Dummy
MFI	If MFI is the supplier	0,1	Dummy
Iddir	If Iddir is the supplier	0,1	Dummy
<b>Households's and interviewees's characteristics</b>			
Networth lower than 2nd centile	Networth $\leq$ ETB 4,055	0,1	Dummy
Networth between 2nd and 4th centiles	ETB 4,055 < Networth $\leq$ ETB 6,902	0,1	Dummy
Networth between 4th and 6th centiles	ETB 6,902 < Networth $\leq$ ETB 11,155	0,1	Dummy
Networth between 6th and 8th centiles	ETB 11,155 < Networth $\leq$ ETB 14,780	0,1	Dummy
Networth greater than 8th centile	Networth > ETB 14,780	0,1	Dummy
Log of landholdings	Household's landholdings	Log(Timad)	Continuous
Age	Interviewee's age	Years	
Gender	If the interviewee is male	0,1	Dummy
Number of fam. members	Number of members who live with the head	N.	Integer
Illiterate	If the interviewee is illiterate	0,1	Dummy
Education	Grade reached at school	N.	Integer
Cooperative client	If client of at least one cooperative	0,1	Dummy
MFI client	If client of at least one MFI	0,1	Dummy
Iddir member	Number of Iddirs where the HH is member	N.	Integer
Very different pattern and less rain	Very different rainfall pattern and less rain on average	0,1	Dummy
Somewhat different pattern and less rain	Somewhat different rainfall pattern and less rain on average	0,1	Dummy
Somewhat different pattern and more rain	Very different rainfall pattern and less rain on average	0,1	Dummy
Very different pattern and more rain	Very different rainfall pattern and more rain on average	0,1	Dummy

## ESTIMATES OF MARGINAL EFFECTS AND WILLINGNESS-TO-PAY

A preliminary analysis was carried out considering all the variables listed in Table 1. However, in the final model we retained only those variables that turned out to be statistically significant and sufficiently consistent over different model specifications. Table 2 presents the estimation results of the Conditional Logit (CL) model and the Mixed Logit (ML) model. The estimates coefficients of the ML are almost all significant and the overall goodness of fit is somewhat higher than in the CL. Besides, the standard deviations of the two random coefficients are statistically very significant and important in terms of size. This suggests that the ML is more appropriate.

The premium coefficient is negative as expected and the marginal effect implies that, for instance, an ETB 100 increase in the insurance price decreases the likelihood to purchase it by 28%. The price's marginal effect accounts for the opposite behavior, that is a positive coefficient, of high net-worth households who, given the average experiment

<sup>11</sup> Four *timad* are approximately one hectare.

premium, are more willing to purchase insurance by 13%, on average. Unexpectedly, the indemnity coefficient is also negative and reflects unobservable motivations. Given that premium and indemnity are almost uncorrelated by experiment design, one reasonable explanation is that the greater the indemnity the lower the trust in that the indemnity will be actually paid. However, further analysis is required.

Despite the majority of interviewees stated to deem *Meher* as the most important agricultural season, the results hint that they prefer to insure against a possible drought in the *Belg* season. The likelihood to choose an insurance product that covers the production in the *Belg* season production is greater, on average, by about 6%. There are, though, some differences among households in terms of preferred season. In particular, households that have got a net-worth between the 2<sup>nd</sup> and 4<sup>th</sup> centiles and households that believe that the rainfall pattern on their field is somewhat different from that at the weather station and it rains more on average, tend to prefer the *Meher* season. On the other hand, households that believe that the rainfall pattern on their field is very different from that at the weather station and it rains less on average, tend to prefer the *Belg* season. These results put forward that *Belg* season is believed to be more exposed to drought risk.

\*\*\* Significance level at 1%

\*\* Significance level at 5%

\* Significance level at 10%

The perceived probability, i.e. how often a moderate or severe drought event occurs, lowers the likelihood to purchase drought insurance. This means that there is preference for insurance against moderate drought since it recurs more frequently and may be forecast with less uncertainty than a severe drought. Furthermore, poor rural households are probably impatient and discount long-term realizations more than the better-off. For instance, an increase of 3 years in the perceived probability of drought decreases the likelihood to purchase insurance by nearly 13% on average. The standard deviation of the perceived probability is also statistically significant but small, and implies that for 12% of the population the coefficient is positive instead.

With regards to the preferred insurance supplier, the results are somewhat uncertain. The only statistically significant coefficient is for the cooperative variable. If the insurance products were distributed by the cooperative instead of the administrative unit, i.e. *Kebele*, the willingness to purchase would decrease by 3% on average. The standard deviation is also very significant both statistically and in economic size. For 39% of the population the coefficient is indeed positive. The cooperative as insurance supplier is mostly preferred by illiterate interviewees and MFI clients. On the contrary, the coefficients for the MFI and *Iddir* variables are both positive but not statistically significant. However, as well as for the cooperative case, illiterate interviewees have a preference for both the MFI and the *Iddir* instead of the *Kebele*. MFI and *Iddir* are, on the contrary, less preferred by households with a net-worth between the 2<sup>nd</sup> and 4<sup>th</sup> centiles.

Table 3 presents the average estimates of the willingness-to-pay for the insurance attributes computing as the negative ratio of the attribute's coefficient and premium's coefficient. First, households would pay a lower premium by ETB 0.46 for every increase in the indemnity by ETB 1. Second, households would pay about extra ETB 11 for an insurance product that covers the *Belg* season. Third, for every more year in the perceived drought probability, households would pay a lower premium by nearly ETB 15 on average, but this is true for the 88% of the sample. The remaining 12% of the sample would pay more for an insurance product against a long-term severe drought. Finally, households would pay about ETB 13 less on average if the supplier was a local cooperative instead of the *Kebele*, but the 39% of the surveyed households would pay a higher premium.

### STANDARDIZED VS. CUSTOM-MADE INSURANCE PRODUCTS

Figure 1 and Figure 2 report the distributions of perceived probability of moderate and severe drought respectively. The stated frequency of occurrence of a moderate drought is very similar in the three villages considered, with an overall mean of 2.4 years and a standard deviation of 1.03 years. Besides, except for Kutto village, the shape of the distributions is also akin. Some differences can be observed in the frequency of severe drought but these are almost trivial in relative terms. For the severe drought case, the overall mean is 15.4 years and the standard deviation is 7.57 years. The differences are more remarkable when we look at the shape of the distributions with a median value between 10 and 20 years.

This preliminary analysis of the perceived probability provides some support to the design of a sole insurance product against the risk of moderate drought and, with appropriate caution, also against the risk of severe drought. In the development stage, the perceived probability must be however compared with the actual drought rainfall distribution in order to design a suitable product.

We here employ the ML model estimates of Table 2 to assess the convenience and attractiveness of hypothetical drought insurance products. In particular, we compare an *ad-hoc* product tailored according to the interviewee's perceived drought probability and different products designed according to a reference probability. This exercise allows to estimate the likelihood to purchase a standardized product (S) against a custom-made product (CM). We take different values as reference probability of drought that correspond to the ALL distribution's mean, mean plus one standard deviation, mean minus one standard deviation, mode, and median.

For every reference probability  $k$  and indemnity amount  $j$ , we, first, work out the equivalent fair premium (see Table 4) and, second, the market share ( $\Delta MS$ ) of CM as difference in terms of predicted aggregate likelihood of purchase. The latter is calculated as follows:

$$\Delta MS(k_j) = \frac{1}{N} \sum_{i=1}^N P(CM|k_j, X_i)$$

where  $X$  are household's characteristics that interact with  $k$  and  $j$ . Since the other product's attributes are the same for both products, they are irrelevant in the decision process.

We find that, first, as the reference probability is increased, the premium shrinks and the market share of the standardized product grows. Second, when the reference probability is smaller than the average perceived probability, as the indemnity increases, the market share of the standardized product falls. On the contrary, when the reference probability is greater than the average perceived probability, the market share of the standardized product increases along with the indemnity. Finally, as the average perceived probability of drought heightens, such as in the severe drought case, the market share of the standardized product becomes less sensitive to changes in the reference probability and the amount of indemnity. It follows that, in the design of an insurance product for moderate drought, a small change in the reference probability and, then, in the fair premium, can lead to a big change in the willingness to purchase insurance. On the contrary, in the design of an insurance product for severe drought, small changes in the reference probability barely affect the willingness to purchase such product.

**CONCLUSIONS**

Crop insurance against the risk of drought is still in a pilot phase in Ethiopia and, especially in rural areas, the most of households are unaware of formal insurance in general. We carry out a stated choice experiment in three villages in Southern Ethiopia in order to assess the willingness-to-pay for an insurance product that pays a fixed indemnity if a drought occurs. We find that premium, indemnity and perceived drought probability are important determinant in the insurance take-up. The estimated coefficients of the three variables are all negative. Whereas a negative coefficient is expected for premium and perceived probability, it is counterintuitive for the indemnity and further investigation with alternative hypotheses testing is necessary. A market simulation analysis suggests that households are more sensitive to premium and indemnity changes when the insurance product is against moderate but more frequent drought events.

This study suffers, in particular, from a proper design of the insurance product. Further research should allow for different payment alternatives and let household buy more than one contract. A second round of the experiment is planned for November 2013 to address these points.

### ABSTRACT

We summarize the joint work of academic scholars and ETIMOS (an Italian foundation involved in microfinance) for the evaluation of the intervention of the latter in Sri Lanka in the aftermath of the 2004 tsunami. After the shock ETIMOS recapitalized a local microfinance bank which faced a huge loss in its loan portfolio; then in 2007 and 2011 academic researchers conducted impact evaluations of such intervention. The main results are positive under different viewpoints since: i) the loans received after the shock were effective for the subjective and objective recovery of damaged people, and ii) the recovery aids highly damaged borrowers received enhanced a significant level of generosity among interviewed villagers.

**KEYWORDS:** microfinance, disaster recovery, altruism, life satisfaction, tsunami, impact evaluation.

### INTRODUCTION

Natural shocks produce consequences at a macroeconomic level through the destruction of material wealth and capital stock and at a microeconomic level affecting the way damaged people take decisions on several aspects of life, i.e. consumption, savings, human capital investment, trust and altruism. Under the first viewpoint, there has been a growth in the empirical macroeconomic research assessing the impact of natural shocks (see, among others, Skydmore 2001; Toya and Skidmore, 2002 and 2007; Kahn, 2005; Cuaresma et al. 2008; Noy, 2009); under the second one, an increasing number of microeconomic studies aim to assess the impact of either natural or caused-by-humans shocks on social preferences<sup>2</sup>.

More severe consequences of natural calamities can be found in developing countries relative to developed ones. In the former, especially in low-income rural areas, natural disasters often destroy all the few available resources of the household; moreover, the poor local communities are highly vulnerable to natural hazards because of their inadequate housing and poor health-care systems. The negative impact of the shocks is also magnified by the scarce socio-ecological resilience to costal disasters of many developing countries which usually lack of efficient institutions for collective action, robust governance systems, and a diversity of livelihood choices that mitigate the effects of extreme natural hazards (Neil Adger et al, 2005).

For these reasons there is often, especially in developing countries, a close correlation between situations of economic vulnerability and increased exposure and fragility in the face of natural disasters, which in turn generate a further deterioration in the conditions of the affected communities, triggering a vicious circle between poverty and vulnerability to natural hazards. Once a given balance is compromised, the social, economic and political - but also environmental and the climatic system - arise more or less rapidly, looking for a new and different equilibrium position. The transition phase (or post) is characterized by the presence of multiple actors - social and institutional, public, private and third sector - called to intervene, as well as tools to support and help that combine among themselves to quickly restore a situation of normality and, more gradually, to address the community in the affected area towards a new horizon of growth of welfare.<sup>3</sup>

<sup>1</sup> We thank C. Angelico, C. Pagano, E. Agostino and N. Kurera for the precious support on field data collection. Etimos Foundation, Etimos Lanka and AMF is fully acknowledged for financial and logistic aid.

<sup>2</sup> Among others, Cassar et al (2011) find that Thai tsunami damaged are more impatient and trusting, while Callen (2010) document damaged people become less impatient. Whitt and Wilson (2007) show higher cooperation among the evacuees after the Hurricane Katrina and similarly Solnit (2009) find that disasters harness social capital. As far as shocks caused by humans are concerned, Becchetti et al. (2013) document the civil conflict in Kenya had a negative impact on trustworthiness and, similarly, Cassar et al. (2013) show evidence of a lower amount of trust among victims of the civil war in Tajikistan.

<sup>3</sup> The post emergency context is usually characterized by: i) The decreasing, more or less pronounced, more or less immediate, of the stock of available resources, human, financial, goods and services, especially those basic necessities. ii) The presence or acceleration of processes of exclusion from access to the resources themselves for certain groups of the population or certain geographic areas. iii) The low relatedness and increased cost of coordination, with presence - especially in the first post-emergency phase - of cases of adverse selection and / or moral hazard. iv) The extreme

With this premise, *can microfinance be considered as an asset by the poor households hit by a natural disaster through which they may recover? What are the direct and indirect effects of microfinance on tsunami-damaged borrowers' income, productivity and social preferences?*

This article is a brief summary of a broader project involving academic researchers and an Italian foundation, ETIMOS, aimed at answering the questions above in the specific case of Sri Lanka. After the 2004 tsunami, ETIMOS foundation recapitalized a local microfinance institution operating in the south of Sri Lanka, i.e. Agro Micro Finance (AMF) which witnessed a severe loss in its loan portfolio caused by the insolvency of many tsunami-damaged borrowers who lost all their capital assets were unable to repay their loans. The outcomes of this intervention have been then evaluated by a team of academic researchers through quantitative and experimental methodologies in two field studies conducted in 2007 and 2011/2012. The full set of findings presented in academic publications, working papers and communication material are briefly summarized in a consistent way in this article.

In general, ETIMOS's intervention through the capital injection to AMF was effective for disaster recovery under different viewpoints. The tsunami negatively impacted the Sri Lankan borrowers' wealth, income and life satisfaction. In particular, the negative effect of tsunami on life satisfaction has been estimated to be more than twice as its effect on income because of the significant drop in current income and the psychological/emotional effects. Damaged borrowers received advantageous loan conditions in terms of interest rate and loan size by AMF through which they were able to repay previous loans and start their recovery phase. Such loan policy is estimated to be effective since the loan to income ratio positively affected borrowers' income and worked hours especially for damaged relative to non-damaged borrowers. Finally, highly damaged borrowers received significantly more aids for the recovery showed higher generosity in a money donation experiment in comparison with less damaged borrowers (who, instead, received less help).

The descriptive and econometric evidence suggests a positive impact of microfinance on borrowers' monetary and non-monetary recovery and highlights a hidden channel through which it affected their altruistic preferences, namely indirect reciprocity. The main lesson we learnt from these fieldworks is that microfinance can work as an effective recovery tool in post-disaster contexts which can be used to restore the subjective and objective well-being of damaged individuals as well as to enhance for them a high level of generosity.

The remainder of the paper is the following. In section 2 we describe the characteristics of the context and the project implemented by ETIMOS in Sri Lanka. In section 3 we present the methodology of the impact analysis and in section 4 we summarize the main findings.

## MICROFINANCE, THE TSUNAMI IN SRI LANKA AND THE INTERVENTION OF ETIMOS

The devastating effects caused by the tsunami of 26 December 2004 have had a strong emotional impact in the world, with dimensions rarely seen before. The International community has had an immediate reaction and promised massive aid interventions in terms of unilateral, bilateral and multilateral aid. In the period that followed the tsunami were collected / or promised \$ 13.5 billion for the emergency and reconstruction of which more than 5.5 billion were private donations. If we look at the proportions of public funds by governments and multilateral banks and private funds, it can be seen over the last few years a strong growth trend in favour of private fundraisers. In 2003, 15% of the "humanitarian funds" came from private sources; in 2005 the percentage rose to 40%.

The implementation of activities has proved to be fast and efficient, even if the difficulties and external (governments and local partners) and internal (international implementing agencies and NGOs) obstacles have caused some slowdowns and loss of efficiency and effectiveness of the actions undertaken. The main difficulties, encountered by donor countries and agencies /organizations in the implementation of emergency response and reconstruction, were the existing weaknesses in national and local capacities of the affected countries.<sup>4</sup> Despite the difficulties and the shortcomings, the generous aid programs provided to affected populations, have helped to ensure their safety and start planning for the future. Within six months, there was already a palpable perception of recovery: the kids were back in school and health facilities and services had been partially rehabilitated in all country<sup>5</sup>.

In this context some elements, both in case of national and international emergencies, suggest to consider also the tool of microfinance among those activated in the post-emergency. Through microfinance it may be more likely to achieve precisely those poorer segments of the population who, being already at serious risk of survival, appear to be the most exposed and vulnerable in the event of severe crisis, whatever nature they have. Moreover, given the steady

---

variability of resources to be distributed, also determined by the now chronic anaemia of public budgets. v) Lack of full involvement of communities and local governments, according to the logic bottom-up, to take charge of a joint planning process, with a view to overcoming the very first phase of an emergency. vi) Most significant impact on the most vulnerable, poor population and micro- entrepreneurial activities.

<sup>4</sup> Armed conflicts in Indonesia and Sri Lanka, government policies, bureaucratic procedures often confused, politicized and centralized decisions (including the choice of target beneficiaries and the selection of the same), problems of corruption and distrust of leaders or local administrators, restrictive and often imposed by national and local authorities, have created serious obstacles to the international and the impact, inevitably, was less effective. The implementation was determined by the local contexts but also from inefficiencies and lack of coordination among International agencies, organizations and NGOs.

<sup>5</sup> The data relating to reconstruction in Sri Lanka were provided by RADA, (Agency for Reconstruction and Development), an agency created by the President of Sri Lanka in November 2005 with the aim to coordinate and monitor overall operations of post-tsunami reconstruction and development, including all damaged sectors and areas.

decrease of resources allocated globally to public development aid, to which is added the trend in recent decades to the progressive replacement of development aid with those for the emergency, any initiatives to promote tools that optimize, streamline and enhance the increasingly scarce resources, have become highly topical (and, of course, be more effective). In practice this means including among the actions to be implemented in response to an emergency situation, a specific measurement of micro-credit to be activated.<sup>6</sup>

The microfinance institutions (MFIs), despite having legal status differently from country to country are characterized by a high level of knowledge and presence in the local area, by the use of tools based on trust and not on collateral requirements, for effective support for micro-enterprise and gender policies, local communities. These features allow a rapid reactivation not only of the financial micro system, but also, to those ones related to the trust and hope for life, relational and social capital of a community or an entire country. In addition, by offering additional services of technical assistance, the MFIs allow their customers to receive a service with higher added value, which aims to support them in all the different needs (savings, investment, capacity building) that may occur during the term of the loan. The analysis of the specific operational context requires usually include the presence of flexible financial instruments, able to respond to the various needs that may arise in the post-emergency situations.<sup>7</sup>

In the initial phase of a post-disaster context, microfinance plays a subsidiary role. The local economy in a situation of arrest and stagnation is weak and unstable; people become dependent on foreign aid provided in the area of emergency by the government, international donors, individuals, from the mobilization of communities and local networks. MFIs themselves, supported by donors, take action to provide immediate relief and rescue operations to achieve both of its customers in the communities in which they work. The MFIs are in fact widely spread throughout the territory, they have relationships with local administrative authorities, are present in every village through their own agents of credit, the Credit and Saving Cooperatives, Community Based Organisations (CBOs) through which they play microcredit programs. The action is facilitated in case of need for the rapid mobilization and knowledge of the territory.

The second stage of the emergency, defined post-emergency, is the moment when the people affected by the catastrophic event fail again to achieve a minimum level of security. However, it is the phase in which microfinance becomes a technical tool for intervention by helping the rapid resumption of economic activities starting from the base of the destroyed communities and hence spreading widely. It may encourage savings for groups and can intervene with forms of insurance and leasing products, with credits for the construction of houses or to purchase assets for production that provide the opportunity - for those affected - to resume economic activities and to be able to re-generate income for the family.

In Sri Lanka, the post-emergency has generated a huge range of needs to be met: owners of small shops and traders who had to replace stocks lost goods, buy new goods for resale, repair shops; craftsmen who needed money to buy back small tools and equipment destroyed; small domestic herds of animals (mostly poultry) destroyed that had to be distributed; farmers who had lost their crop and needed funds to reclaim the land affected, to buy machinery and tools; fishermen who had to repair the boat and / or replace equipment destroyed or lost. In addition to this is the huge demand for funding for the reconstruction of houses destroyed or for the repair of houses damaged by the tsunami.

The microfinance sector in Sri Lanka has received for these purposes a considerable amount of money. International agencies, organizations usually working in the field and often NGOs have turned to MFIs offering different solutions: from donations to the emergency, to combinations of donations and soft loans for the resumption of production activities.<sup>8</sup> The provisions of funds by the Italian Civil Protection to Etimos arrive early after the event and the intervention started by the second half of 2005, when, after the immediate emergency phase, the population was working to restore normal economic conditions. The houses were rebuilt and it became crucial to support the rebuilding of micro entrepreneurial activities, formal but also informal, which had to ensure the survival of the poorest sections of the population. The intervention is aimed at microfinance institutions (MFIs) of different nature (NGOs, development banks, cooperative movement), which reflect the structure of the sector at national level. Among the beneficiaries of

<sup>6</sup> The actors are called upon to implement such a measure can be identified as follows: i) A local institution, already present and operating in the affected areas, who knows the socio-economic context, able to interpret and may order priorities, and that takes care of a listening phase and the preliminary investigation; ii) An entity - public or private - that has availability of fund and may constitute a guarantee fund or a fund for providing micro-credit; iii) The banking system and / or Microfinance Institutions (MFIs), which evaluates the creditworthiness of the beneficiaries and operate as lending agency; iv) The final beneficiaries, families, businesses and non-profit organizations, but also, to international logic, the same MFI.

<sup>7</sup> For example, lines of capitalization for the strengthening of the local production, craft, micro- or agricultural-rural business, already present in the territory or to be started up; lines of credit for the support cooperatives of producers, already established or to be supported, or tools to connect and channel the flow of migrants' remittances to their countries of origin, using the financial vehicle of the MFI and thus encouraging a double financial inclusion upstream and downstream of the process.

<sup>8</sup> From the point of view of the volumes allocated, Asian Development Bank has invested the largest amount of money through the programs implemented by the Central Bank of Sri Lanka and the Ministry of Finance. The circle of donors and international donors related to the field of microfinance has again played the most active and dominate role. In 2006 there were made 20 "Microfinance Schemes", for a total amount paid of Rs. 27,664,000, equal to \$ 276 million. Not all entities implementers are distinguished by efficiency and effectiveness but some of them had a strong impact on the territory for an excellent activation and mobilization of community lending. In the context of post-tsunami, the government has continued to support the field of microfinance and the "Small and Medium Enterprises" including forms of direct implementation realized by the two major financial institutions: the Ministry of Finance and the Central Bank. A negative effect of government intervention programs in favour of the Microfinance sector has been determined by the restrictions imposed on the final rate to be charged to the beneficiaries. The programs of the Central Bank and NDFT have been effective in terms of target group funded and speed of intervention. The placing on the market of money took place by placing constraints and restrictive conditions applicable, however, it has led to a mechanism of emulation and high competition among MFIs that has caused a race to the provision of micro financing at lower and lower rates, damaging the credit culture created through years of work.

this intervention, in this analysis we focus on Agro Micro Finance (AMF), an initiative of the Agromart Foundation which provides technical assistance and training for the creation of self-help groups aimed at conducting small businesses. Agro Micro Finance finances the final beneficiaries, especially in rural areas, through the village organizations, which are concerned with the selection of customers. The intervention in support of its microfinance activities was carried out in three ways: capitalization line, line of credit and capacity building.

The line of capitalization allows local MFIs to receive funds by paying a one-time 1% commission for monitoring. The initiative is designed to restore the operating conditions previous the tsunami and, subsequently, to support the development of organizations by strengthening the capital structure. The funds are included for the first two years in the liabilities of the balance sheet but do not involve the payment of interest or repayment of the capital. In this first phase they should be used for the purposes set out in the contract and any use is subject to monitoring by Etimos. Through the credit line, Etimos provides funding for a period of 3-4 years, to support the recovery of the productive activities of the beneficiaries or the launch of new business initiatives by micro entrepreneurs directly or indirectly affected by the tsunami. The loan is granted to organizations at an interest rate of 7%, with a repayment plan in monthly instalments and without requiring collateral. The rate of 7% is about 4 points percentage below the average rate at which organizations are funded on the market. The line of capacity building initiatives was to strengthen both institutions in the management of microcredit activities, both entrepreneurial skills of the beneficiaries of the institutions themselves. The loan is then directed to the strengthening of the institution and / or the beneficiaries of micro-credit: funding, assistance and training for the entrepreneur and the enterprise, and training and tutoring to staff and members of the institutions, the installation of a software created specially for the management of microfinance programs, counselling in the preparation of plans development. The training activities and consultancy funded involved training institutions both local and international present in the area.

The tsunami was an unexpected opportunity for growth for many of the MFIs affected. Through the total funds received by Etimos and other lenders, institutions were able to rebuild their assets and loan portfolio of fixed capital destroyed as a result of the disaster<sup>9</sup>.

## **METHODOLOGY OF THE IMPACT EVALUATION**

The first field data collection was implemented in April-June 2007. A group of Italian researchers delivered a questionnaire in three coastal districts in south Sri Lanka, namely Galle, Matara and Hambantota. Interviews were performed face-to-face to a sample of 200 damaged and 105 non-damaged randomly selected borrowers from the list of all the AMF customers in each district. The usual problem of ex-post impact analyses is the selection bias in the screening process so that observed differences between individuals who participate into a project and those who do not may depend on ex-ante (different) unobservable characteristics. The advantage in our case is that both the damaged and non-damaged samples consisted of *already selected* MFI borrowers, the only difference between the two groups being that *treatment* individuals have been hit by the shock (damaged) while *control* ones have not (non-damaged).<sup>10</sup>In other terms, both groups are likely to share the same observable and plausible unobservable ex ante factors which helped them to pass the screening of the same MFI (i.e. sense of entrepreneurship, trustworthiness, etc.).

Since the tsunami was unexpected it was impossible to arrange a panel survey with borrowers interviewed before and after tsunami. For this reason, in order to construct the pre-tsunami level of the variables/indicators of interest, a retrospective panel data approach (see McIntosh, Villaran&Wyduck, 2011) specifically tailored for our case. In particular respondents were asked to declare the current and remember the past levels of memorable variables by making reference to four different time windows: (P1) six month interval before the first microfinance loan ever obtained; (P2) the period going from the first microfinance loan to the tsunami date (December 26, 2004); (P3) the period between the tsunami date and the first microfinance loan after tsunami; (P4) the period from the first microfinance loan after tsunami to the survey date (April 2007). A detailed description of this methodology and related issues is reported in Becchetti and Castriota (2009, 2011).

The second field data collection was conducted in November 2011-January 2012 to a random sample of AMF damaged and non-damage borrowers and consisted of the standard socio-demographic survey plus an experimental session aimed at eliciting social, time and risk preferences. In particular, we implemented a "Dictator Game" (DG), a standard and simple game largely adopted in the literature to elicit altruistic preferences in an incentive compatible way. This game involves two players, a Sender (S) and a Receiver (R). Their true identity is not revealed so that no player can identify whom (s)he is playing with. S is endowed with 900 LKR (the equivalent of 5.74 €) and has to decide how much of it to send to R; R takes no actions in this game and receives the amount of money S has sent. According to the

---

<sup>9</sup> Especially for smaller organizations, the funds received were also an important contribution to the strengthening of the position on the ground. Several could open new branches. New customers were acquired either in the early stages of reconstruction, especially when it felt the need to share, and after months of the cessation of the state of emergency. The availability of funds made possible investments for the improvement of internal processes, through the development of information systems and training of staff. The organizations affected establish new ties with potential international financing agencies. The instrument of credit has allowed Etimos to increase the resources available and to optimize their use. With an initial fund of 6,500,000 euro Etimos has provided funding for more than 10,000,000 euro. The initial provision is still almost intact and amounts to 5,200,000 euro (net of management fees and funds given to the agencies for capacity building).

<sup>10</sup> Hereon "damaged" borrowers are defined as those who report at least one damage from the tsunami.

classic utility theory,  $S$ 's maximum utility is reached by sending 0 LKR and keeping the whole endowment (900 LKR). Any  $S$ 's deviation from 0 can be interpreted as a measure of altruism.<sup>11</sup> The survey contains questions concerning socio-demographic information, social preferences and – as the questionnaire delivered in 2007 – the kind of damage they received in the 2004 on six dimensions, i.e. family members, house, economic activity, buildings/assets, working tools, raw materials. For further details on the experimental protocol, the sampling and the survey questions see Becchetti et al. (2012a). Note also that in this last wave we retrieve from AMF its bank records consisting of information on 767 loans issued from 1995 to 2011.

## MAIN RESULTS

### a) Findings from the first wave (2007)

The full set of results and robustness checks from the first wave of data collection are reported in Becchetti and Castriota (2009, 2011). First of all, the tsunami had significant consequences not only on material well-being but also on psychological and emotional aspect of borrowers' life. In particular, when comparing cumulative distributions of real household income and changes in life satisfaction from the second (pre-Tsunami) to the third period (post-Tsunami, i.e. from the shock to the first MFI refinancing) for the damaged and non damaged individuals, we find first-order stochastic dominance of the distribution for the former with respect to latter, the difference becoming larger for those registering more damages.<sup>12</sup> The change in income is significant for the damaged and not significant for the non-damaged sample, while there are abnormal changes in life satisfaction for damaged depending on the number of damages received. Importantly, the loss of income only partially accounts for the dip in wellbeing: the econometric analysis highlights the tsunami generated, net of income effect, a decrease in life satisfaction twice in magnitude its effect on the change in income. A more comprehensive presentation of the results is in the paper by Becchetti and Castriota (2009).

In order to evaluate the impact of microfinance as recovery tool after tsunami we look at the impact of the loan to income ratio<sup>13</sup> on changes in real income and work hours in the periods before and after the refinancing, i.e. from P3 to P4. From a descriptive point of view, those with a loan to income ratio below the sample median report a change in income from P3 to P4 of 21.8% against 86.4% for those above it. In the same direction, the change in weekly worked hours for the former is 4.9 against 15.6 of the latter. To summarize, the post-tsunami loan to income ratio had a significant effect on the borrowers' recovery in terms of change in income and work hours, the effect being larger for those who were damaged by the tsunami than for those who were not. Consistently with the income path after the tsunami, the refinancing loans were effective also under the point of view of the borrowers' life satisfaction and self-esteem, having the sample distribution of these subjective well-being indicators reached its pre-tsunami form. The refinancing effect is robust to econometric estimations accounting for composition effects, heterogeneity between the sample of damaged and non-damaged borrowers and in time windows, and various selection effects. A complete description of descriptive and academic findings is reported in Becchetti and Castriota (2011).

### b) Findings from the second wave (2011-2012)

Results and robustness checks from the second wave of data collection are reported in the more recent papers by Becchetti et al. (2012a, 2012b) in which damaged and non damaged borrowers' social preferences and the AMF's strategy in the post-disaster context are investigated.

As far as the impact of the tsunami on the borrower's social preferences is concerned, through the implementation of the dictator game described above we compare behavioural measures of altruism of damaged borrowers with those of the non-damaged ones and, within the former, among those reporting more damages (not only losses to the economic activity but also injury or damages to the house) vis-à-vis those reporting less damages (only losses to the economic activity). Results are summarized in table 1. The tsunami had a negative impact on victims' altruism even at a 7-years distance from the event: those reporting at least one damage send 6% less (if played as Sender) and expect 5% less (if played as Receiver) of the total endowment. However, if we restrict the analysis to the sample of only damaged people, we find that those who received more help because more severely damaged tend to give and expect relatively more than less damaged/less helped borrowers. A possible interpretation for this result may be generalised indirect reciprocity

<sup>11</sup> We conducted also two other games in order to collect behavioural measures of risk aversion and impatience which we use as additional controls in the econometric analysis. In particular, we implemented a "Risky investment game" to collect risk preferences through a simple game consisting of an investment decision. Each participant is endowed with 300 LKR and has to decide whether keeping the money or investing any portion  $x$  of it in a risky asset that has a 50% chance of success (option 2). The investment pays  $3x$  if successful but zero if unsuccessful; the decision maker keeps all uninvested units. The amount invested ( $x$ ) provides us with a rough proxy of risk aversion (the higher the investment, the less risk averse being the individual). With a final lottery we elicited also a behavioural measure of all participants' time preferences in a standard incentivized way: each participant has to choose between receiving a fixed payoff immediately vs. payoff increasing with the delay of the money delivery.

<sup>12</sup> To have an idea of the magnitudes, consider that non-damaged facing negative changes in life satisfaction are 20% while damaged are 65%.

<sup>13</sup> The loan to income ratio is the amount of the first loan received in the post-tsunami phase divided by the post-tsunami pre-refinancing monthly income.

(Stanca, 2010, Nowak and Sigmund, 2005) according to which a kind (or unkind) action received directly or indirectly for example by development aid agencies is reciprocated towards a *third* agent, in our case, the receiver in a dictator game. In other terms, we showed a possible indirect effect of recovery after calamities since the benevolence experienced from donors heals the loss of pro-social attitudes generated by the calamity shock. The results are robust to econometric analysis controlling for selection, omitted variable bias and separating the indirect effect of aids on altruism from those deriving direct from the calamity (for a complete description see Becchetti, et al. 2012a).

**Tab. 1-** Comparison of altruistic preferences.

<b>Groups</b>	<b>Share of giving</b>	<b>Share of Exp. giving</b>
Non damaged	37 %	44 %
damaged	31 %	39 %
<i>Among which</i>		
less damages (less aid)	29 %	33 %
more damages (more aid)	34 %	43 %

The banking strategy followed by AMF before, during and after the calamity has been described using the bank records retrieved in the last wave and have been matched with the borrowers' socio-demographic information collected in same wave. We focused on the determinants of loan amounts, interest rates and credit defaults and find: i) the standard lending rules based on bank sustainability (for instance, new loans obtainable conditionally on the repayment of previous ones) were suspended to help the tsunami-damage borrowers to recover; ii) having been damaged by the tsunami has no effect on credit defaults but a significant and unexpected increase in default rates of non-damaged borrowers is observed soon after the calamity and iii) the interest rates paid by non-damaged borrowers were lower than those paid by the damaged ones in the post-tsunami period. Consider that the last finding is consistent with the disaster recovery policy of ETIMOS and AMF aimed at reaching the most damaged individuals and sustaining their recovery through credit concession at more advantageous conditions in terms of loan amount and interest rates relative to those offered to less or non damaged ones (cross-subsidization policy). If this policy, on the one hand, determined the positive effects described above, it may have indirectly generated, on the other, incentives for non-damaged borrowers to declare strategic default because of the tsunami or to hide their true status, declaring for instance a higher amount of damages than the real in order to access new loans at low interest rate. Consistently, the data show strategic default and/or contagion effect may have been in place during and after the tsunami. Hence, while the support of AMF helped damaged people to avoid contagion and recover from the calamity, it may have indirectly generated moral hazard problems for non damaged ones. We advise a form of compulsory micro-insurance scheme (complementary to the loan) which can reduce the probability of moral hazard/strategic default for borrowers not affected by future calamities who expect an increase in their financial burden to subsidize calamity-affected ones. More details on these aspects are in Becchetti, et al. (2012b).

## THE GLOBAL ECONOMY AND INTERNATIONAL DEVELOPMENT COOPERATION IN EMERGING COUNTRIES AND NEW MARKETS

Emanuele Fantini<sup>o</sup>

<sup>o</sup>Department of Cultures, Politics and Society, University of Turin, Italy - [emanuele.fantini@unito.it](mailto:emanuele.fantini@unito.it)

Several countries that in the past have been traditional beneficiaries of foreign aid and development cooperation are witnessing unprecedented processes of economic growth. The so called “African lions” or the countries of the “Emerging Africa”, India, Vietnam or Brazil are increasingly seen as attractive markets for foreign direct investments and the business community in general. Investors are competing to gain relevant positions within these markets, also as a way to compensate the crisis currently affecting traditional markets like Europe. Consequently, within these countries, new economic actors – companies, foundations, philanthro-capitalism, migrant entrepreneurs... - increasingly side or overlap with the traditional actors of international development cooperation. These processes poses relevant questions and challenges in terms of: *i*) the relationship between economic growth and social development, with particular focus on the issue of inclusiveness of the process of economic growth and accumulation; *ii*) the coherence between the initiatives of economic and development cooperation undertaken by national or local systems of cooperation; *iii*) innovation in the financing and implementing of development cooperation projects; *iv*) the relationship and the overlap between for profit and not for profit, between economic interests and international solidarity.

The papers presented during the panel addressed some of those issues. Alice Sindzingre’s analyses the factors behind the positive growth rates in Sub-Saharan African in the last ten years. Sindzingre shows how the processes of African growth mainly rely on structural imbalances, being generated by distorted export structures that are based on commodities, and therefore little sustainable in the long run. Lorenza Mola’s paper addresses the role and efficacy of trade preferences within development cooperation policies, focusing on emerging African countries, comparing the trade regime applied by the European Union with China’s policy in the region and highlighting critical points of the international trade regime that should be addressed within the debate on the post2015 global development agenda. Michele Boario and Emanuele Fantini’s paper take Ethiopia as a case study to assess the contribution of the private sector to African economic growth and the role that international cooperation should play in promoting such processes.

## THE IMPACT OF EMERGING COUNTRIES ON SUB-SAHARAN AFRICAN ECONOMIES: FACTORS OF LONG-TERM GROWTH?

Alice Nicole Sindzingre\*

### ABSTRACT

Sub-Saharan African economies have exhibited positive growth rates since the mid-2000s, and the contribution of emerging countries to this growth is the matter of heated debates. The paper shows the complexity of causalities, which depend on: i) channels (trade, investment); ii) the emerging country (China having by far the strongest impact); and iii) African countries' market structures. On the one hand, this growth relies on structural imbalances: it is generated by distorted export structures that are based on commodities, and falls if international prices decline, which necessarily occurs due to the inherent volatility of prices - high prices are moreover driven by factors that may not last, i.e. the growth of emerging countries; this growth also increases the specialisation of African economies in commodities. On the other hand, emerging countries have positive impacts via their investments, notably in infrastructure, which foster industrialisation. Likewise, developed countries' aid, due to policy conditionality and its detrimental effects, induces greater asymmetries than does the aid of emerging countries.

### INTRODUCTION<sup>1</sup>

After the 'lost decades' of the 1980s and the 1990s, Sub-Saharan African economies have exhibited positive growth rates in the 2000s. This has led observers to conclude that, thanks to emerging countries – China, India, Brazil -, stagnation is now a thing of the past. The paper shows the complexity of causalities: these depend on: i) channels (trade, investment); ii) the emerging country (China having by far the strongest impact); and iii) African countries' market structures. On the one hand, this growth relies on structural asymmetries. It is generated by distorted export structures that are based on commodities. This growth falls if international prices decline, which necessarily occurs due to the inherent volatility of prices. High prices are moreover driven by the growth of emerging countries: the growth of African economies depends on factors that are external to them and will decelerate if demand in emerging countries decelerates. This growth increases the specialisation of African economies in commodities, while emerging countries consolidate their comparative advantage in manufacturing and threaten nascent African industrial sectors. As industrialisation is a key determinant of long-term growth, emerging countries may, in the long-term, erode their short-term positive impact on African economies.

On the other hand, emerging countries have positive impacts via their investments, especially in infrastructure, which foster industrialisation and the spill over effects of investments in commodity sectors. In addition, developed countries' aid, due to its conditionality on the reform of core policies and competences of African governments, and its detrimental effects, induces far greater asymmetries than does the aid of emerging countries.

The paper is structured as follows. Firstly, it underscores the structural asymmetries that characterise Sub-Saharan African export structures, i.e. their dependence on primary commodities and a growth that is driven by exports, and therefore factors that are external to African domestic policies. Secondly, it explores whether emerging countries, notably China, amplify these structural asymmetries. Likewise examined are their positive (via demand and high prices) and negative impacts (incentives to keep the specialisation in commodities), emerging countries here following patterns that were initiated by developed countries. Thirdly, it shows that foreign direct investment also has positive and negative effects and that the asymmetries it conveys are similar across emerging and developed countries. Fourthly, it argues that the strongest asymmetry may be found in the aid device and in developed countries' conditional assistance.

### A GROWTH DRIVEN BY STRUCTURAL ASYMMETRIES: THE IMPORTANCE OF PRIMARY COMMODITIES IN EXPORTS

<sup>1</sup> This paper was presented at the III Congress of the Italian Universities Network for Development Cooperation (CUCS), Panel 7.4: Global Economy and Development Cooperation in Emerging Countries and New Markets, Turin, 19-21 September 2013. Elements were presented at the 5<sup>th</sup> European Conference on African Studies (ECAS), Lisbon, 27-29 June 2013.

### An asymmetric integration in the global economy: commodity-based exports

Sub-Saharan African (SSA) economies have enjoyed high growth since the early-2000s, with output growing by 5.1% in 2012 [IMF, 2013]. Most development finance institutions thus argue that the region may be on the verge of structural transformation (fig.1).

**Fig. 1 - Sub-Saharan Africa: GDP growth and GDP per capita growth, 1960-2011.**

Source: World Bank World Development Indicators, May 2013.

Underlying causalities and processes, however, are more complex. SSA growth performances must be put in a longer-term perspective, and the broad picture is that of a divergence vis-à-vis other regions (fig. 2).

**Fig. 2 - GDP per capita, Sub-Saharan Africa vs. the world, 1960–2011.**

Source: World Bank World Development Indicators, May 2013.

Above all, SSA is characterised by a distorted export structure based on the dependence on primary commodities. It is this distorted structure that has been the main driver of growth in the 2000s, because of the dramatic increase in commodity prices since the early-2000s, both fuels and non-fuels prices.

Commodity dependence generates vulnerabilities because commodity prices are inherently volatile [Nissanke and Kuleshov, 2013; Sindzingre, 2012]. Price volatility has a negative impact on growth rates for countries whose exports and fiscal balances often depend only on one or two commodities, not only because prices may decline, but also because volatility *per se* is detrimental to long-term growth: commodity-dependent countries are exposed to repeated price shocks, and their domestic policies have little effect on their growth rates, which depend on the fluctuations of prices - determined by external forces -, on the growth and demand of other countries (e.g., the US, EU countries, China) and on the vagaries of the latter' domestic policies (fig.3).

**Fig. 3 - Sub-Saharan Africa: growth rate (right scale) and commodity prices (annual price index, 2005=100, real 2005 dollars, left scale), 1960-2012.**

Source: World Bank Commodity Price Data and World Bank World Development Indicators, June 2013.

In addition, China’s demand has become a central driver of high prices in a significant number of commodities (Akyüz, 2012). High commodity prices represent a positive gain for SSA exporters of these commodities: an enhanced fiscal space and hence more space for investment, which is a key cause of long-term growth. China’s demand is especially strong for metals; it is the first energy consumer in the world, and its energy consumption is projected to triple by 2025 from its 2008 level [IMF, 2011a].

The sustained demand for SSA commodities by large emerging countries represents a diversification of partners, which may attenuate the asymmetry in global trade that is associated with commodity-based exports. All SSA countries export a lower share of their products to their ‘traditional’ partners (the US and the EU countries) than in 1990, and a greater share to emerging countries, in particular China (fig. 4).

**Fig. 4 - Sub-Saharan Africa: total exports and percentage of exports by partner.**

Source: <http://unctadstat.unctad.org>, author’s calculations.

**The vulnerabilities induced by this distorted export structure**

In 10 SSA countries, commodities exports represent more 75% of total exports [World Bank, 2012]. This distorted structure induces the dependence of fiscal revenues on commodities with volatile prices. In oil-rich countries government revenues from natural resources represented 60% of total government revenues in 2011 [World Bank, 2012]. This obviously makes fiscal earnings highly vulnerable to any external shock.

This distorted export structure also affects SSA trade over the long-term. In particular, it explains the diminution of the share of SSA in global exports, due to the increase of the trade of other countries, which trade goods with more value-added, despite the increase of SSA exports in absolute value (fig. 5).

**Fig. 5 - Sub-Saharan Africa’s exports: percentage of world exports (right axis) and value (left axis), 1948-2011.**

Source: UNCTAD Statistics: <http://unctadstat.unctad.org>.

The long-term forces that undermine SSA external trade generate more divergence than convergence (fig. 6).

## STRUCTURAL ASYMMETRIES AMPLIFIED BY EMERGING COUNTRIES? POSITIVE AND NEGATIVE IMPACTS

Emerging countries have positive impacts on SSA economies via higher demand for products exported by SSA and high prices for some primary commodities that are exported by SSA, and they have negative impacts via the incentives, which their demand for commodities generates towards the strengthening of SSA countries' commodity-based structures.

### Global trade's asymmetries: no 'exceptionalism' for emerging countries

Regarding trade and investment, emerging countries, including China, do not exhibit any 'exceptionalism'. Since the end of the 20<sup>th</sup> century there has been an increasing trend towards internationalisation of production – the global value chains and production networks [Baldwin, 2011]. These processes constitute the features of international trade and affect all countries - be they developed, emerging and developing.

Equally, SSA structural asymmetries are generated by causes that characterise all its partner countries: SSA is dependent on forces that are external to its domestic policies, notably international commodities prices, and on external shocks, i.e. on prices, or on the growth of countries which trade and invest in SSA. Moreover, in a globalised world where all countries are put in competition for attracting investors, the asymmetries created by the obligation to devise attractive trade and investment policies affect all developing countries vis-à-vis all countries, developed and emerging ones.

In addition, if since the early-2000s, due to their spectacular growth and the stagnation of euro zone countries, emerging countries have been driving SSA trade, too much may be assigned them. China's growth may decelerate, which may have important impacts on the growth and exports of SSA and on the demand that China will have towards SSA products as inputs to its own growth –the growth of India and Brazil may also decelerate in the 2010s.

### China trade relationships with Sub-Saharan Africa

SSA economies have diversified their trade and investment linkages in the direction of emerging countries, which reduces their vulnerability. SSA exports to emerging countries, however, are characterised by spectacular asymmetries: SSA exports mostly commodities, in particular fuels (fig.7).

Fig. 7 - Sub-Saharan Africa exports to China by key product groups, 1995-2011.

Source: UNCTAD Statistics: <http://unctadstat.unctad.org>; author's calculations.

China's exports to SSA are very different from its exports to developed countries, which is the second dimension of the asymmetry of trade between SSA and China. China exports low-end manufactured products, which threaten SSA manufacturing sectors and strengthen the specialisation in the export of commodities [Kaplinsky and Morris, 2008]. If China's growth rates continue, however, its demand for SSA products may be also directed towards low-end manufactured products no longer made in China due to increasing local factor costs, which may be a first step towards industrialisation, diversification and therefore long-term growth.

Other emerging countries exhibit even deeper asymmetries: SSA exports to Brazil are almost only made of fuels (fig. 8).

**Fig. 8 - Sub-Saharan Africa exports to Brazil by key product groups, 1995-2011.**

Source: UNCTAD Statistics: <http://unctadstat.unctad.org>; author's calculations.

Exports of SSA to India are similarly mostly made of fuels (fig. 9).

**Fig. 9 - Sub-Saharan Africa exports to India by key product groups, 1995-2011.**

Source: UNCTAD Statistics: <http://unctadstat.unctad.org>; author's calculations.

As industrialisation is a key determinant of long-term growth, emerging countries may, in the long-term, erode their short-term positive impact on SSA economies.

**Do developed countries do better? The similarity of emerging and developed countries trade structures**

Since the colonial period Western countries' trade patterns still broadly follow the model of the 'small colonial open economy' - exporting commodities, importing manufactured products (fig. 10).

**Fig. 10 - Sub-Saharan Africa exports to G8 countries by key product groups, 1995-2011.**

## FOREIGN DIRECT INVESTMENT: COMPLEX EFFECTS, SIMILAR ASYMMETRIES

### China's investment in Sub-Saharan Africa

Emerging countries, and China in particular, constitute important drivers of foreign direct investment (FDI) in SSA. Chinese FDI to SSA as a share of total FDI to the region climbed from less than 1% in 2003 to 16% by 2008 (IMF, 2011). China's FDI in SSA does not represent an important part of total Chinese outward investment, but for SSA it represents a rising share of its total inward FDI. This is a dimension of asymmetry between the two regions.

A great share of FDI is made by China multinationals, often backed by the state, and directed towards the resource sectors (oil, mines). It often consists in a contractual package that 'exchange' commodities for investment financing by Chinese firms, generally in infrastructure – the so-called 'Angola model' [Corkin, 2011]. These deals imply a risk of lock-in SSA structure in the exporting of commodities. The FDI of other emerging countries, Brazil and India, is more limited and more diversified. Likewise, developed countries' investors invest in the resource sector: for example, in Angola, the United States is by far the leading investor in the oil sector [GAO, 2013].

### Emerging countries as promoters of structural change for Sub-Saharan African economies?

Emerging countries, however, have the potential of reducing these asymmetries. They mean more players and more capital inflows towards SSA. Also, the growth of emerging countries implies increasing wages and costs in these countries, hence windows of opportunities for SSA countries, where FDI can outsource activities of the low-end segments of production networks.

Moreover, emerging countries invest in SSA industrial sectors, e.g., manufacturing, construction, finance, agriculture, services, which is an opportunity for structural change since industrialisation is a key determinant of long-term growth [Rodrik, 2009]. Chinese manufacturers increasingly invest in SSA in order to benefit from preferential trade tariffs and lower labour costs [Dinh et al., 2012]. China established several Special Economic Zones in SSA with the aim of promoting manufacturing. An increasing number of private medium and small enterprises from China operate in SSA in the sectors of manufacturing, infrastructure, agriculture and services [Shen, 2013; Gu, 2009]. In addition, emerging countries invest in infrastructure, and the enhancing of infrastructure by investors from China and other emerging countries is undoubtedly beneficial for SSA countries' growth [Calderon and Serven, 2010].

## AN IMPORTANT DIFFERENCE: CONDITIONALITY IN DEVELOPMENT COOPERATION

### A key cause of asymmetry: Sub-Saharan African countries' dependence on foreign aid

Some SSA countries are excessively dependent on aid, e.g., for budgets, investment, maintenance, infrastructure, health, education. Net Official Development Assistance (ODA) to SSA represented \$20 per capita in 2000 or 4.1% of Gross National Income (GNI); \$54 per capita and 4.3% of GNI in 2010. In 2000, ODA represented 23.1% of gross capital formation, and 18.8% in 2010. In 2000, ODA represented 11% of imports of goods, services and income; in 2010, 9.9% [World Bank World Development Indicators, 2012]. Despite important variations within SSA, besides the small-island economies of Oceania, SSA is the region of the world that is the most dependent on aid, and much above the average of low-income and middle-income countries (fig. 11).

Fig. 11 - Net Official Development Assistance received, in percentage of Gross National Income.

Source: World Bank World Development Indicators online, May 2013.

Aid dependence induce well-known negative effects, e.g. Dutch disease, negative effects of volatility - as aid is very volatile (Bulir and Hamann, 2008) -, and the undermining of institutions, in particular tax institutions [Moss et al., 2006].

### China's specific mode of development cooperation: a trade-aid-investment-nexus

China's aid is not easy to compute: loans are difficult to distinguish from export credits, and Chinese statistics do

not use the OECD Development Assistance Committee criteria<sup>2</sup>. China's financial resources provided for aid fall into three types: grants (aid gratis), interest-free loans and concessional loans [Chinese Government, 2011]. The first two types come from China's state finances, while concessional loans are provided by the Exim Bank. This demonstrates the close links between trade, investment and aid. Chinese aid to Africa is much less important than Exim Bank export credits, despite a clear increase [Brautigam, 2009; Mlachila and Takebe, 2011].

In contrast with developed countries' donors, Chinese financing is largely focused on infrastructure investments; part of export credits and other financing for infrastructure investments are linked to extraction of natural resources through 'infrastructure for natural resources' deals. China's aid also differs from 'traditional' donors by its close ties with the state banks and state enterprises, often involved in the implementation of China's foreign policy vis-à-vis SSA [Christensen, 2010]. In addition, Chinese aid has not suffered from volatility in amounts, paradigms and fads that have characterised Western aid [Brautigam, 2009].
