A key point is that this mode of development cooperation made of a nexus of aid, trade and investment does not include conditionalities on particular policies - economic or political. This is a major difference with western aid, multilateral or bilateral. Whether it is made of loans or grants, the development assistance of OECD-DAC countries, of international financial institutions or of a major donor such as the European Commission is conditional to economic reform that affect the entirety of a country's macro- and microeconomic policies (as in the IMF and World Bank programmes) - and often, to political reforms.

In contrast, China's aid is more a development cooperation driven by diplomatic and political economy relationships, which go back to the period of independence of SSA countries in the late 1950s-early 1960s and Cold War context, and its motives are broader than strictly economic ones, as they explicitly include the support of Chinese firms [Brautigam, 2009]. China's conditions therefore relates to contractual issues, and not to a government entire macroeconomic policy. China's claims non-interference with recipient countries domestic affairs and its cooperation therefore deals with all regimes, be they illiberal democracies or even 'pariah' regimes [Alden, 2007]. Chinese aid is therefore often criticised for supporting dictatorships and corrupt regimes.

### **Developed countries aid as based on conditionality: the most detrimental asymmetry?**

Many dimensions of developed countries' ODA, however, convey aspects that do not compare positively with China, particularly the fact that developed countries' financial assistance is conditional on recipient countries' domestic reforms. The latter may be very intrusive and prescribe drastic changes in recipient countries economic and political equilibria. Given their asymmetric position - the 'donor'-recipient relationship - aid-dependent low-income countries have little possibility to refuse these reforms.

There is no doubt that the absence of conditionality on financing may induce many problems, e.g., the support of certain types of political regimes, opaque deals, corruption and the like. Developed countries' conditional aid - multilateral or bilateral - , also includes these problems, in addition to other negative effects that are inherent to conditionality itself, i.e. committing aid ex ante and making aid conditional on reform. They have long been demonstrated since the first programmes of stabilisation and structural adjustment prescribed from the 1980s onwards to SSA governments by the international financial institutions - the IMF and the World Bank. Loans were conditional on government policy and institutional reforms in the borrower country, aid here being a lever to encourage policy reform. As SSA countries' performance did not improve, the IFIs reacted in augmenting their conditionalities in the 1990s. The latter became increasingly structural and extended to non-economic issues, e.g., 'governance'.

The effectiveness of conditionality is obviously mediated by the recipient government's willingness to accept the conditions. Conditionalities, however, by definition express the existence of tensions, imply a limitation of sovereignty and trigger resistance. Conditionality inherently induces policy reversals (stemming from the 'exchange of reform for financing', the 'buying of reform'). It paves the way of the 'aid game'. The persistent failure of conditional IMF stabilisation programmes has led, on the donors' side, to a repetition of lending since the 1980s onwards, and on the recipients side, to the continuation of dependence on donor lending. Another reaction of IFIs has been to add 'selectivity' to conditionality, where donors lend to governments that already have good policies and institutions: conditionalities appear to be effective mostly in countries that reform.

Conditionality indeed demonstrates the inherent divergence of interests and asymmetry between the aid-providing IFI and an aid-receiving government, including domestic interest groups. These divergences between donors and recipients, which are intrinsic to the mechanisms of conditionality, entail negative effects. Donors may impose conditions on unwilling recipients, while recipients may be willing but unable to implement conditions. Aid is typically affected by the 'Samaritan dilemma'. For example, if the recipient government knows that donors condition their aid on a reduction of poverty, it has little incentives to exert high effort toward this objective, as in doing so it will receive less aid in the future; and the 'Samaritan's dilemma' is aggravated by moral hazard: the donor can never know if a poor outcome is the result of low effort ('bad policies') or 'bad luck' [Svensson, 2005]. Conditional aid indeed inherently exhibits important coordination failures (including information problems on other donors' aid).

On their side, donors did not enforce the conditions, due to their own institutional incentives to lend. The device of conditionality has therefore contributed to the erosion of the credibility of the IMF vis-à-vis borrowing countries

<sup>2</sup> See Brautigam's very informative and relevant blog: <http://www.chinaafricarealstory.com>.

[Marchesi and Sabani, 2007]. In being non-conditional, China's aid avoids these pitfalls.

In addition, aid – be it conditional or not – is a dimension of the foreign policy of developed economies [Alesina and Dollar, 2000]. Aid delivered by developed countries' donors has also allowed for the maintenance in power of autocratic or corrupt regimes [Easterly and Williamson, 2011], which use aid as a rent and for redistribution to clienteles and manipulate donors' conditions as instruments for their own domestic politics, or a strategy using donors as 'scapegoats' [Vreeland, 1999]. All this is an obvious cause of aid failures.

## CONCLUSION

This paper has examined the structural asymmetries that characterise SSA export structures. It has shown that emerging countries, and particularly China, follow the patterns that have been initiated by developed countries, and that emerging countries' trade and foreign direct investment have complex effects, positive and negative [Sindzingre, 2013]. The paper has also shown firstly that more than trade or investment, aid relationships convey the greatest differences between developed and emerging countries, notably China. Secondly, despite the recurrent critiques of unconditional aid in the literature, it has revealed that that developed countries' aid may be among the strongest determinants of asymmetry between Sub-Saharan Africa and other countries, because of the mechanism of conditional financing.

## ACRONYMS

FDI	Foreign Direct Investment
GNI	Gross National Income
ODA	Official Development Assistance
SSA	Sub-Saharan Africa

## GENERALIZED TARIFF PREFERENCES FOR DEVELOPMENT AND EMERGING COUNTRIES: ASSESSMENT AND PERSPECTIVES

Lorenza Mola\*

\* Department of Law, University of Turin, Italy - [lorenza.mola@unito.it](mailto:lorenza.mola@unito.it)

### ABSTRACT

The paper addresses the role and efficacy of trade preferences within development cooperation policies. It does so from a legal perspective, in relation to past, current and prospective frameworks of trade preferences for developing countries, and takes into account the role of private business as major actors of development in beneficiary countries, given that the trade (and investment) component of development policies relies on firms for successful implementation. Moreover, it looks at emerging countries, particularly African ones, as significant examples of the evolving relevance of trade preferences to processes and actors involved in promoting development. Accordingly, the main problematic issues will be outlined with regard to the traditional trade instrument designed to foster development, i.e. the Generalized System of Preferences adopted since the 70s by developed countries to extend preferential duties on imports of products originating from developing countries (Section 2). The legal arrangements backing such trade regime up with respect to resource-seeking and export-oriented investments by foreign firms into beneficiary countries, on the one hand, and the recent trend to raise export restrictions on raw materials and mineral products by some governments, on the other hand, will also be introduced into the discussion (Section 3). The challenges thus identified will be described in relation to the Sub-Saharan emerging countries throughout the evolving trade regime applied by the European Union for the last decade, that is also informed by World Trade Organization-compatibility, as compared with China's policy in the region (Section 4). In conclusion, some critical considerations will be drawn as regards the post-2015 development cooperation strategies and the increasing role attributed to trade therein, in light of recent academic contributions to their formulation by the EU.

### PREFERENTIAL TRADE AS A COMPONENT OF DEVELOPMENT COOPERATION POLICIES

Focusing on trade within international development cooperation prompts some general observations. In particular, it is clear that any effort on enhancing trade performance of developing countries ultimately relies on private, for-profit actors' responses to the policies designed to that effect, thus strengthening the relevance of such actors with respect to public institutions and not-for-profit sectors. This, in turn, calls for carefully crafted incentives and guarantees for (both domestic and foreign) investments in the sectors envisaged by 'trade and development' strategies. The other general observation concerns the instruments through which the trade pillar of development policies is implemented. The traditional trade tool for development, i.e. unilateral concessions by developed countries of preferential tariffs upon the importation of goods originating from beneficiary developing countries, has attracted many studies and controversial assessment as to its effectiveness. The reasoning coming into play in the discussion concerns both the structural elements characterizing these arrangements – as will be outlined in Section 2 – and the general trend towards the erosion of the margins for preferences available to developing, beneficiary countries (following successive rounds of multilateral trade liberalization and the widespread conclusion of free trade agreements). Preferential trade with developing countries aims at boosting their exports thus promoting the industrialization and diversification of their economy, and contributing to economic growth. However, this rationale is hampered by the fact that developing countries acceding liberalized international markets may not have or develop sufficient capacity for coping with such integration.

These observations suffice to underline the point for a critical assessment of the recourse to trade preferences for development alone. Indeed, several other trade or trade-related policy interventions such as regulating non-tariff barriers to trade, offering aid for trade, promoting and protecting investment, guaranteeing protection and enforcement of intellectual property rights, extending loans and guarantees to private actors investing in strategic sectors, assisting developing countries to improve the domestic business environment and, enhancing corporate social responsibility have increasingly appeared as necessary to foster development. Thus, other instruments alongside or instead of tariff preferences are envisaged by countries interested in a 'modern' 'trade and development' strategy.

Imagining however that this dynamic is inherent to the evolution of 'trade for development' strategies without taking into account the broad international legal environment of international exchanges as well as the changes that occurred in the world economy over the last decades would be misconceived and unrealistic. In particular, the multilateral trade rules set through the GATT and the WTO agreements, and the stagnation of the Doha Round of

negotiations since 2000, have influenced the strategies of States. Also, the problematic economic growth of emerging countries like the BRICS and several other countries has played a significant role in the revision of the existing 'trade for development' instruments, such as the unilateral tariff preference arrangements. The several instances in which these two factors have impacted on the undergoing changes of the trade component of development policies will be outlined in Sections 2 and 3.

The purpose of this paper is to assess the legal frameworks of these policy developments and to discuss the critical aspects they involve in relation to emerging countries. It should be noted that the paper concentrates on trade in goods, although the services sector has been growing in importance in trade relations with the developing world and especially with the emerging countries. Section 4 of the paper elects Sub-Saharan countries among emerging countries as particularly suitable to describe what is analysed in general and theoretical terms in the previous sections. There are several reasons for this choice: the potential effects of the shift from auto-selection to objective indicators of developing needs for eligibility to tariff preferences; the trade-related approach to sustainable development and eradication of poverty followed by the EU within the general evolution of EU-ACP relations, which owes its specificity to historical ties; the major influence played by WTO rules and the claims of third States within the WTO; the way other emerging countries, in particular China, approach developing countries and how this may affect developed countries' trade arrangements with the region.

### **THE GENERALIZED SYSTEM OF PREFERENCES: ITS RATIONALE AND STRUCTURE (TAKING THE EU AS AN EXAMPLE)**

The idea of tariff preferences for development represents an application of the principle of dualism of rules applying to countries with different levels of developments, that was claimed by the "New International Economic Order" and characterizes the right to development [1]. It emerged at the first UNCTAD conference in 1964 and received unanimous support at its second conference four years later, when Resolution 21 (II) was adopted. The text called for the establishment of a "generalized, non-reciprocal, non-discriminatory system of preferences in favour of the developing countries, including special measures in favour of the least advanced countries". The objectives of the Generalized System of Preferences (GSP) were encapsulated in the title of the Resolution ("Expansion and Diversification of Exports of Manufactures and Semi-Manufactures of developing countries") and were stated in the following terms: "(a) To increase their export earnings; (b) To promote their industrialization; (c) To accelerate their rates of economic growth" [2]. Thus, at least on the surface, the basic elements of such a preferential arrangement consist of its unilateral adoption, general application, non-discrimination (apart for the most preferential treatment for least developed countries), lack of reciprocity, and focus on manufactured goods as the main beneficiary products in order to reduce reliance of developing countries on export of primary products. Indeed, absence of across-the-board preferences in terms of product coverage implies a kind of *de facto* discrimination across beneficiaries in favour of those countries having "greater capacity to produce the manufactured goods that are designed for preferential treatment" [3].

Such an arrangement represents a departure from the 'most-favoured-nation' (MFN) rule expressing the non-discrimination principle on which the post-world war II multilateral legal trade regime is founded, and it cannot be justified under the regional integration exception. Art. I GATT provides the MFN treatment according to which any GATT Party (now, any WTO Member) shall receive the best treatment accorded to any third country as regards customs duties primarily and among other issues. This clause is unconditional, meaning that the MFN treatment extends to all other parties automatically without any advantage in return. The only exception admitted to this rule in the original framework of GATT 1947 refers to the creation of customs unions or free trade areas (Art. XXIV GATT). This recognizes the potential benefits of closer integration of the economies of the parties to international trade, provided that certain conditions are met to assure that these preferential arrangements work as 'building blocks' rather than 'stumbling blocks' for exchanges with third parties. In particular, among other conditions, this means that tariff preferences are accepted under GATT law by means of international agreements, in so far as they consist of the elimination of duties or other restrictive regulations of commerce on substantially all the trade (in terms of product coverage and volumes of trade) between the constituent parties.

The acceptance of the GSP within the GATT was premised on the introduction of Part IV on Trade and Development in 1964, which laid down non-binding commitments in favour of developing countries. The embodiment of the GSP arrangement was firstly realized on a 10 year basis by means of a Decision adopted in 1971 [4] and permanently in 1979 through the Decision generally referred to as 'Enabling Clause' [5]. Based on it, contracting parties may accord differential and more favourable treatment to developing countries as regards tariffs levied on imported products in accordance with the GSP. Thus, the general features of the arrangement conceived at UNCTAD apply. The Decision also states that the preferential treatment "shall [...] be designed and, if necessary, modified, to respond positively to the development, financial and trade needs of developing countries".

An authoritative source of interpretation of several conditions attached to the GSP arrangement came later in 2004 from the WTO Appellate Body (AB)'s report on the *EC-Tariff Preferences* dispute brought by India [6]. The AB considered the Enabling Clause as an exception to the MFN rule. It specified that the requirements on the "generalized, non reciprocal and non discriminatory" nature of the preferential arrangement for developing countries (set out at

footnote 3 of the Enabling Clause) are binding (paras. 146-147). It also clarified that the requirement of "generalized" preferences refers both to the entire category of developing countries (i.e., not only to former colonies - para. 155) and to product coverage. It interpreted the "non-discrimination" requirement in the sense that donor countries are not prevented from according differential treatment among developing countries provided that this is based on differences in their "development, financial and trade needs", to be assessed on objective grounds, and responds positively to such needs (paras. 163-164). On this point, the AB outlawed the Panel's findings (at para. 193) [7].

Central to the issue of emerging countries, the system builds in a 'graduation clause'. Para. 7 of the Enabling Clause *calls* less-developed countries to "participate more fully in the framework of rights and obligations" under the GATT, as their economies progressively develop and thus differently, according to the achieved degree of economic development. In the WTO era, the approach changed. The system now *aims* at eliminating discrimination and integrating developing countries into the general regime, as stated in the Ministerial Declaration adopted at the first WTO Ministerial Conference, 1996 (para. 6) [8]. Another main element concerning development needs within the WTO legal framework relates to Least Developed Countries (LDCs - i.e., countries falling in the category officially recognized in 1971 by the UN General Assembly) [9], which are granted privileged status across the whole system of rules [10]. With respect to commitments and concessions, this is affirmed by Art. XI, para. 2 WTO Agreement.

The GSP did not result in a common arrangement implemented by developed countries, which, on the contrary, separately adopted their own GSPs. There are currently eleven donor countries, namely Australia, Belarus (a non-WTO member in the process of negotiating accession, at the same time being a GSP beneficiary under some other donors' arrangements), Canada, the EU, Japan, New Zealand, Norway, the Russian Federation, Switzerland, Turkey and the United States [11].

Against this background, the EU's and the US's GSP arrangements, in particular, share some peculiar features which are of particular interest for the purposes of this paper focusing on emerging countries. These consist of mechanisms of eligibility, country and product graduation, tariff modulation, safeguards, differentiation, and conditionality. Their main implications for the treatment of emerging countries by GSP donors will be now outlined, taking the EU's GSP as an example.

The EU adopted its GSP arrangement in 1971 [12]. Since then, general schemes were renewed on 10-year cycles, each adapted to the evolution of international trade every year, and more recently every three years [13]. Since the Nineties, the EU combined the original objectives of the system inherent to the link between "trade and development" with specific objectives on the promotion of and respect for the environment, labour rights, human rights and good governance in the beneficiary countries. The currently-in-force Regulation (EC) No. 732/2008 [14] will be superseded by Regulation (EU) No. 978/2012 (the 'new Regulation' or the 'new EU GSP') [15] on 1 January 2014, to be applied for an extended period of ten years until 2023 for purposes of legal certainty and stability [16]. These two schemes are designed to take account of the above-mentioned AB's decision, which indeed dealt with the WTO compatibility of the special regime to combat drug under the EU GSP previously in force.

Under the current and the new EU GSP schemes, preferential treatment is granted according to three regimes: the general regime, the incentive arrangement for sustainable development and good governance ('GSP+'), and a special arrangement for the LDCs which offers duty-free market access into the EU ('Everything but Arms', or EBA). The new EU GSP scheme is designed with a view to taking more into account the diversity of the developing countries and the purpose is to focus on helping the less advanced among them (whereas 7)[15]. In a nutshell, it is premised on the assumption that because of global tariff erosion (see Section 3 below) maintaining tariff preferences for the more advanced developing countries would imply too high competitive pressure on poorer countries [16]. And, as is evident in the language of the preamble part of the Regulation, this approach is meant to abide by the non-discrimination requirement for generalized tariff preferences set by WTO law as interpreted by the AB in the *EC-Preferences* decision (whereas 9) [15].

This overall approach is evident in the criteria adopted for benefitting developing countries of trade preferences under the general regime. Hereunder, tariff reductions are granted on the products covered by the unilateral arrangement instead of the MFN duty applied by the EU. To benefit from this regime, GSP eligible countries shall not have been classified by the World Bank as high-income or upper-middle income countries during three consecutive years immediately preceding the update of the list of beneficiary countries. Accordingly, and subject to annual revision, eight countries recently classified as high-income countries and fourteen upper-income countries will no longer benefit from EU GSP trade preferences from January 2014; among these, Brazil figures prominently [17]. They nonetheless remain eligible countries under the EU GSP, in order to benefit from the ordinary tariff preferences again, in case their classification downgrades. It is quite interesting to note that the new system will depart from the current one, abandoning the additional consideration for the diversification of exports of potential beneficiary countries - a criterion that has maintained Brazil among beneficiary countries so far [16].

However, even for those countries which remain eligible for tariff preferences under the general regime, a product graduation mechanism is foreseen in order to exclude certain products originating in a specific country when they have become competitive enough, as reflected by the fact that their exportation exceeds a certain threshold of all GSP imports of the same products into the EU. The new EU GSP will increase the threshold percentages determining such graduation (textiles products being subject to a lower percentage and to other specific provisions aimed at safeguarding the EU production). The new GSP legislation will make graduation more targeted on narrower product sectors. It will also strengthen the devices construed so as to avoid graduation in case of non-diversification of a beneficiary's exports -

an occurrence which could disrupt its economy. As a result of these new rules, two BRICS will be denied tariff preferences for more product sectors than they currently are, China for precisely twenty-seven sectors in total (six more than under the current regime, including several 'sensitive' products as will be outlined next) and India for six (five more); also Costa Rica, Ecuador, Indonesia, Nigeria, Thailand and Ukraine are concerned with one or two sectors each [18] [16]. The graduation list is to be reviewed on a three-year basis.

Although the EU GSP scheme has a wide product coverage, it differentiates between 'non-sensitive' products, on which duties are suspended, and 'sensitive' products, on which duties are fixed at a specified lower rate than the MFN duty. The new EU GSP widens the scope of free market access granted to products originating from beneficiary developing countries, as it introduces new products or moves previously sensitive products into the category of non-sensitive products. 'Sensitivity' is defined in order to take account of the situation of the sectors manufacturing the same products in the Union. For example, most mineral products covered by the new EU GSP scheme are considered non-sensitive products, while the majority of textiles and machinery products are sensitive, with a more balanced split of metals between sensitive and non-sensitive products (Annex V) [15]. This is of a certain importance when assessing the effective pursuance by the GSP scheme of its overall objective of fostering the development of beneficiary countries through export-led industrialization and diversification.

Safeguards are also foreseen in the form of the reintroduction of the normal Common Customs Tariff duties. This procedure is managed by the Commission and initiated upon request by Member States, EU producers or on its own. It may take place when a product originating in a beneficiary country is imported in volumes and/or at prices which cause, or threaten to cause, serious difficulties to Union producers of like or directly competing products.

Another relevant mechanism provided by the EU GSP scheme, in combination with the new EU GSP origin rules [19], concerns origin cumulation. Products can be imported into the EU under the GSP tariff preferences only if they originate from beneficiary countries according to the specific rules of origin unilaterally set by the EU. Although this is a highly technical issue [20] [16], it is worth pointing out that the new EU rules aim at facilitating the acquisition of origin for purposes of GSP preferential treatment and also favour regional economic integration by allowing products produced in several countries to satisfy the applicable criteria conferring origin on a cumulative basis. Thus, the EU has elected four regional groups of countries for purposes of regional cumulation [19].

Lastly, both positive and negative conditionality mechanisms are put in place. The former subjects the extension of additional tariff preferences to a beneficiary country's respect for human rights, environmental protection and good governance. The special incentive arrangement (GSP+) is aimed at those eligible countries which abide by the condition of having ratified and implemented certain conventions on the environment, labour and human rights and good governance. This is intended as an objective condition for discriminating between eligible countries, as required by the WTO AB's interpretation of the non-discrimination requirement under the Enabling Clause. In fact, additional preferences should address the special burdens and responsibilities resulting from conventional commitments undertaken by vulnerable countries suffering from a lack of diversification and insufficient integration within the international trading system. Thus, this mechanism is driven by the general objective of the scheme too. The negative conditionality mechanism provides the temporary withdrawal of the preferential treatment, under whatever regime, upon the occurrence of systematic violations of core human and labour rights, shortcomings of customs controls, and also for "serious and systematic unfair trading practices including those affecting the supply of raw materials, which have an adverse effect on the Union industry and which have not been addressed by the beneficiary country", among other conditions (art. 19, para. 1 (d)) [15].

## **TRADE PREFERENCES IN CONTEXT: THEIR EFFECTIVE IMPACT AND THEIR INTERACTION WITH FOREIGN INVESTMENT AND WITH EXPORT RESTRICTIONS**

Whether and how trade preferences (have) effectively work(ed) for the development of developing countries is a matter of debate. The most evident point is that the margin of preference is eroded by successive multilateral tariff negotiations and by the continuing expansion of free trade agreements. Many of the mechanisms described above have also been criticized [21] [22] [23].

It has been suggested that criteria for eligibility, graduation, product coverage, tariff modulation and safeguards would rather meet the needs of preference granting countries for preserving imports pressure and surges in sensitive industrial domestic sectors [3]. Conversely, in the political rationale and legal texts of the (EU) GSP, at least the first two mechanisms are justified in light of the general objective to differentiate among developing countries according to their development needs on the basis of the non-discrimination requirement, in line with the interpretation of the Enabling Clause in the *EC-Preferences* case. Indeed, this should be the authentic spirit behind the inclusion in the Enabling Clause of the provision according to which "such treatment accorded by developed contracting parties to developing countries be designed and, if necessary, modified, to respond positively to the development, financial and trade needs of developing countries". At the same time, however, safeguards from import surges at least cannot be outlawed from a unilateral, voluntary, non-reciprocal preferential arrangement, and this was already embodied in the GSP envisioned by UNCTAD [3].

The non-reciprocity requirement applying to the GSP arrangement has also been challenged, with reference to those GSP schemes which indeed make the granting of preferences conditional on some specific behavior of the

beneficiary country. Moreover, a relevant point relates to the selection of objective criteria for granting preferences and differentiating among beneficiary countries (due to the lack of a common regime and to the unilateral, "*octroyée*" or "gift" nature of the arrangement, each donor country sets its own criteria according to its internal process, although it has the burden of proving their compatibility with the requirements set by the Enabling Clause) [24]. It has also been suggested, and rejected, that reciprocity (legally conveyed by treaties) would ensure greater market access concessions by developed States [25].

As has been seen, both forms of preferential trade treatment depart from multilateral trade rules based on non-discrimination but, as almost all countries in the world are WTO-members, unilateral or conventional arrangements have also to abide by the requirements and limitations provided by WTO law - and may be challenged before the WTO dispute settlement system. All aim at and rely on private business as the drivers of development. GSP and free trade area success depends on their final users, i.e. firms. Therefore, one may argue that they should be coupled with policies leading investment strategies by firms from donor countries into beneficiaries countries as well as by domestic firms therein. In both cases, investments are export-driven, that is, they do not seek to access the local market but are aimed at sourcing donor countries' industries and markets with resources and manufactured goods.

Preferential arrangements - and resource-seeking investments in GSP beneficiary countries - are confronted with a recently increasing phenomenon, that is, the introduction of export restraints of raw materials and mineral products by certain developing countries. Quantitative restrictions on exports are prohibited under GATT Art. XI, unless "temporarily applied to prevent or relieve critical shortages of foodstuffs or other products *essential* to the exporting contracting party". But the violation of such provision may seek justification under the GATT general exceptions, which provide for the conservation of exhaustible natural resources among other justifications. Other forms of export restraints may be put in place too, such as export duties (which are not prohibited *per se* under WTO law).

A recent instance concerns Chinese measures restraining exports of raw materials and of rare earths, which have been challenged by the EU and other countries within the WTO. It appears from the decisions adopted so far [26] [27], development considerations may come into relevance under two opposite perspectives. On the one hand, the implications of export restraints of natural resources for the export performance of other developing countries can easily be derived from the observations made by the claimants. Export restraints not only produce scarcity and cause higher prices in global markets, but they also advantage domestic industry by ensuring it sufficient supply, and lower and more stable prices for the materials concerned. On the other hand, China claimed that under Art. XI interpreted in light of the 'trade and development' provisions of the GATT (Art. XXXVI in Part IV), a developing country may adopt export quotas on 'primary products' which have a role in "securing economic diversification through the development of domestic processing industries" (para. 7.265) [26]. However, the panel and the AB ruled that Art. XI does not hold a different meaning or should not be applied differently for developing countries (para. 7.280) [26]. China also evoked the customary norm in international law of sovereignty over natural resources as "developed in recognition of the 'essential' role that natural resources play in the progress and development of states that possess those resources" (para. 7.265) [26]. How can these points be connected and their relevance to preferential tariff arrangements for developing countries assessed? Although both sides of the legal dispute make suggestive arguments, it seems that under WTO law none of them relevantly apply to GSP schemes. Countries are 'enabled' but not obliged to extend tariff preferences to developing countries and it is generally understood that Part IV of the GATT enounces non-binding commitments in favour of developing countries; any country, independent of its level of development, may challenge another WTO member's measures nullifying or impairing the benefits accruing to it from WTO law. Moreover, beneficiary countries, and economic operators, are not bound to accept or apply the preferential duty accorded under an importing country's GSP, and they are not prevented from adopting export restraints in WTO-compatible forms counterbalancing that tariff advantage.

## THE CASE OF AFRICAN EMERGING COUNTRIES: THEIR PLACE WITHIN THE EU'S POLICY TOWARDS THE ACP COUNTRIES AND OTHER APPROACHES

Against these scenarios, the African continent is a significant setting for analysis as regards the dynamics involved in the economic relations with emerging economies. The phenomenon of "African lions" [28] and other African emerging countries witnessing higher export and/or GDP growth rates than the global rates [29] triggers policy responses by both developed and emerging countries (such as China and India) [30]. The policy approaches differ among trading partners, and this has stimulated a debate in development studies, although it has so far received less focused attention in the legal literature as compared with other disciplines. For example, a recent contribution "assesses the 'competitive pressure' that China's growing presence in Africa exerts on the European development policy regime" by focusing on Ethiopia [31]. The following analysis shows that the EU approach to African, Sub-Saharan emerging countries is to be framed within the EU-ACP relations and explains the set of legal instruments deployed accordingly. It also compares these instruments to those involved in China's approach to the region.

The Sub-Saharan countries including South Africa comprise the African component of the ACP Group of States [32]. As a result of historical ties, ACP States have always enjoyed a privileged position in their trade relations with the EEC/EU compared to other developing countries [33]. Throughout the Yaoundé I-II and the Lomé I-IV conventions, and still under the Cotonou Agreement on a temporary basis until the end of 2007, the EU granted ACP countries more

non-reciprocal, preferential tariff treatment than the preferential treatment given to other developing countries under the EU GSP. This privileged regime was challenged before the WTO dispute settlement bodies, which ultimately ruled against its compatibility with WTO law [33]. The trade provisions encapsulated in the Cotonou Agreement (the new general framework for EU-ACP partnership signed in 2000) was aimed at bringing EU-ACP trade relations into conformity with WTO law while at the same time preserving their more preferential character (arts. 34-37) [34]. Thus, a waiver from WTO obligations was obtained according to Art. XXV, para. 5 GATT for a transitory period until the end of 2007 [35]. Meanwhile, the Cotonou agreement provided for negotiations on a regional basis of reciprocal, free trade agreements within the Economic and Partnership Agreements (EPAs). Up to 2007 and indeed now, these are far from being concluded homogeneously, on the ACP side, among regions and within each region (the Caribbean, the Pacific and four African regions).

On the EU side, in order to comply with WTO law, the so called 'Market Access Regulation' was adopted in 2007 to unilaterally apply the conventional trade arrangements with those ACP countries having already concluded an EPA or an interim, goods-only trade agreement which however had not entered into force yet as of 1 January 2008 with the EU. Since then, lack of this conclusion, or the undertaking of the necessary steps to ratify the already concluded agreements, on the part of ACP countries, the EU applies its GSP scheme, thus equating trade preferences to the ACP countries concerned to the other eligible developing countries [36].

As a result, the picture of EU-ACP trade rules is one of great fragmentation and diversification, even among Sub-Saharan emerging countries [37]. As for African ACP countries, only the Seychelles, Zimbabwe, Mauritius and Madagascar within the Eastern and Southern African region are covered by the Market Access Regulation and thus their exports towards the EU benefit from duty-free access on all products except arms [38]. Conversely, Comoros and Zambia within the same region and other countries from the other African regions having concluded an interim agreement or a full EPA with the EU have recently been moved from the Market Access Regulation. They are thus treated under the EU GSP scheme together with the other African ACP countries which have not concluded any agreement with the EU so far. This implies that, as in the case of Nigeria mentioned above, they are subject to the product graduation mechanism or, if and as soon as their economic growth evolves to reach upper-income or high income status for three consecutive years, they are excluded from the GSP general regime, thus being treated on a MFN basis. This would put competitive pressure on them in comparison with the other ACP countries, with the developing countries having concluded a free trade agreement with the EU (such as the North-African countries or Central-American countries), with those developing countries that, although a beneficiary of the EU GSP arrangement, have seen some products graduated out of it, or even with developed countries having concluded free trade agreements with the EU, such as Singapore.

Under the overall political and institutional framework of the Cotonou Agreement, interim EPAs would establish free trade areas and comprehensive EPAs would extend trade rules to matters such as agricultural products, services, intellectual property rights, competition, and accompanying measures on development cooperation. As regards foreign direct investment by the EU, the Cotonou Agreement calls for the conclusion of agreements and for the introduction of general principles in EPAs as regards investment promotion and protection (art. 78) [34]. Therefore, bilateral investment treaties (BITs) between single African countries and EU Member States still feature as the main legal instruments in this subject field.

This 'model' significantly differs from other forms of economic cooperation proposed to African countries from outside the region. China and India have recently developed their own Africa Policy [30]. Focusing on China, there are no preferential trade agreements in force with any African country [39]. LDCs African countries benefit from the duty-free treatment for LDCs, which China extends to a few other countries in the Asian continent [40]. On the contrary, BITs have been concluded between China and many African countries in the last fifteen years [41]. Because of China's interests in outward foreign investment towards Africa and because BITs are reciprocal by nature, these treaties partly follow the more liberal approach to international investment regulation adopted by China since the late Nineties [42]. This notwithstanding, China resists pressure from developed negotiating partners to align to the global tendency towards comprehensive, trade and investment liberalization agreements on a bilateral or regional basis [43]. Such legal landscape concerning China-Africa relations does not seem to be subject to changes for the near future [44]. Another difference between the EU's and China's approach to development linked to trade is that China premises it on the principle of non-interference and rejects conditionality, while the EU stresses the importance of ownership and respect for human rights (being an 'essential element' of the partnership; art. 9) [34]. Overall, China's economic cooperation policy is not considered as being framed within international development strategies [31].

## **CONCLUDING REMARKS ON THE TRADE ASPECTS OF THE FUTURE DEVELOPMENT STRATEGY DESIGNED BY THE EU**

In the light of the above analysis, some brief concluding comments are outlined. There is an unresolved tension between the overall objectives of the GSP arrangement - that is, to respond positively to the economic, financial and development needs of developing countries through preferential tariff treatment - and the policy limitations and conditions at which developed countries consent to grant such treatment. With a view to integrating developing countries into the world trading system, tariff preferences risk not effectively pursuing their development objectives if

they are not coupled with other sound trade-related and investment policies. At the same time, different legal frameworks for trade relations applying between the EU and Sub-Saharan African countries show that emerging countries have different positions and preferences towards preferential trade arrangements with major trading partners. If trade emerges as a central driver of development, it must be intended in broader terms than the traditional instrument of trade preferences, because of the pitfalls, ambiguities and doubts on their efficacy.

The academic world has recognized this shift in developing strategies towards more focused preferential trade arrangements and more comprehensive trade policies. Indeed, the EU seems to favour this direction. In so doing, it both addresses initiatives on private business (in the form of credit, loans and guarantees) and on public institutions (through regulatory engagements but also institution-building and trade facilitation). Recent designs of development cooperation policies by European actors emphasize the role of trade as compared with other components of international development cooperation, mainly official development assistance. In a recent contribution to the debate on a post-2015 global framework to succeed the Millennium Development Goals (MDGs), three independent European research institutes identify trade as a key driver of development provided that trade policies are designed to tackle the problems of marginalized and vulnerable economies by promoting economic and trade diversification and by creating productive jobs [45]. In its documents on the future of EU development policy [46], the European Commission builds the new EU's 'trade and development' goals upon the acknowledgment that "trade-driven development is possible and that open markets can play a major role in generating growth" [47].

## ACKNOWLEDGMENT

The conception of this paper stems from discussions with Silvia Cantoni (Professor of International Law at University of Turin, Department of Law) to whom I owe the understanding of the implications of the international legal framework for trade and development cooperation. ## **CROWDING IN THE PRIVATE SECTOR UNDER A DEVELOPMENTAL STATE: WHICH ROLE FOR INTERNATIONAL COOPERATION IN ETHIOPIA?**

Michele Boario\* and Emanuele Fantini<sup>o</sup>

### **ABSTRACT**

The article revisits Ethiopia's impressive performance in terms of economic growth during the last ten years, highlighting its shortcomings and discussing the scope of the private sector development in addressing such issues. Particular focus is devoted to the role that international cooperation could play in supporting private sector development in Ethiopia.

Over the past decade, Ethiopia has achieved strong results in terms of economic growth, averaging 10.7 percent per year and human development, getting on track to reach the UN Millennium Development Goals (MDGs) with the exception of the target on maternal mortality. In 2012, Ethiopia became the 12th fastest growing economy in the World. If the country can continue its historically impressive growth performance, it could potentially reach the middle income status by 2025 as foreseen by the Ethiopian government in the Growth and Transformation Plan (GTP) [1].

The Ethiopian government, led by the Ethiopian People's Revolutionary Democratic Front (EPRDF) – in power since 1991 after defeating the military regime of the *Derg* at the end of a sixteen years long civil war – has achieved these results by adopting a development model based on a strong developmental state, driving and dominating the national economy. In the 1990s the EPRDF strategy opposing structural adjustments and economic liberalization policies had been perceived as heretical by international financial institutions. Nowadays, however, Ethiopia has been presented as a success story and praised by international organizations and donors as a model for the whole continent. The Ethiopian developmental state appears in line with the shift in the official discourse of the international development apparatus, rethinking the role of the state in least developed countries and rediscovering the importance of public institutions for the promotion of economic growth and development in Africa [2].

With the GTP the Ethiopian government operated a radical shift in its development strategies. EPRDF has abandoned its traditional focus on household agriculture to achieve food security and fight rural poverty, in order to embrace neoliberal strategies to create wealth and employment through the promotion of micro and small enterprises, as well as market led agriculture production. While the Ethiopian developmental state still plays a major role in orienting and promoting these processes, the GTP has foreseen an increased role for private sector's investments and capacities to mobilise the resources needed to achieve its goals.

Until now, however, the government's efforts to "create an enabling environment for private sector investment growth" have proved little effective, particularly in attracting foreign investors. Ethiopia's position in the World Bank's Doing Business ranking did not significantly improved in the last years, languishing around the middle of the regional average [3]. The Ethiopian market is still perceived as an environment dominated by state owned enterprises and private companies affiliated to the ruling party coalition, hostile to the competition by outsiders. These difficulties raise concerns about the sustainability of the whole process of economic growth, and about its inclusiveness and equity in terms of access to and management of resources. This broadly questions the legitimacy of the Ethiopian government and its development policies.

The article addresses this debate, by exploring the potential of private sector development for the achievement of Ethiopian government's development targets, as well as the role of international development cooperation in supporting this process. The thesis we wish to defend is that in order to ensure sustainability and inclusiveness of the process of economic growth – and ultimately its political legitimacy – the Ethiopian government should promote an enabling and expanded environment for the private sector in the economy. This has been acknowledged by the Ethiopian government itself within the GTP [4], but until now little implemented. The process can be facilitated by the international cooperation streamlining private sector development initiatives across all programmes, replicating successful experiences and exploring innovative approaches to engage with local and international private sector.

The first section of the article revisits the tale of Ethiopia as "African Lion", highlights the risks and the bottlenecks implicit in the current process of economic growth and transformation. The second section recalls main economic theories on the scope and contribution of private sector in order to tackle the issues described before. The third section assesses the current situation of the private sector in Ethiopia. The final session discusses the role of international cooperation in support of private sector development.

## Revisiting Ethiopia's economic performance

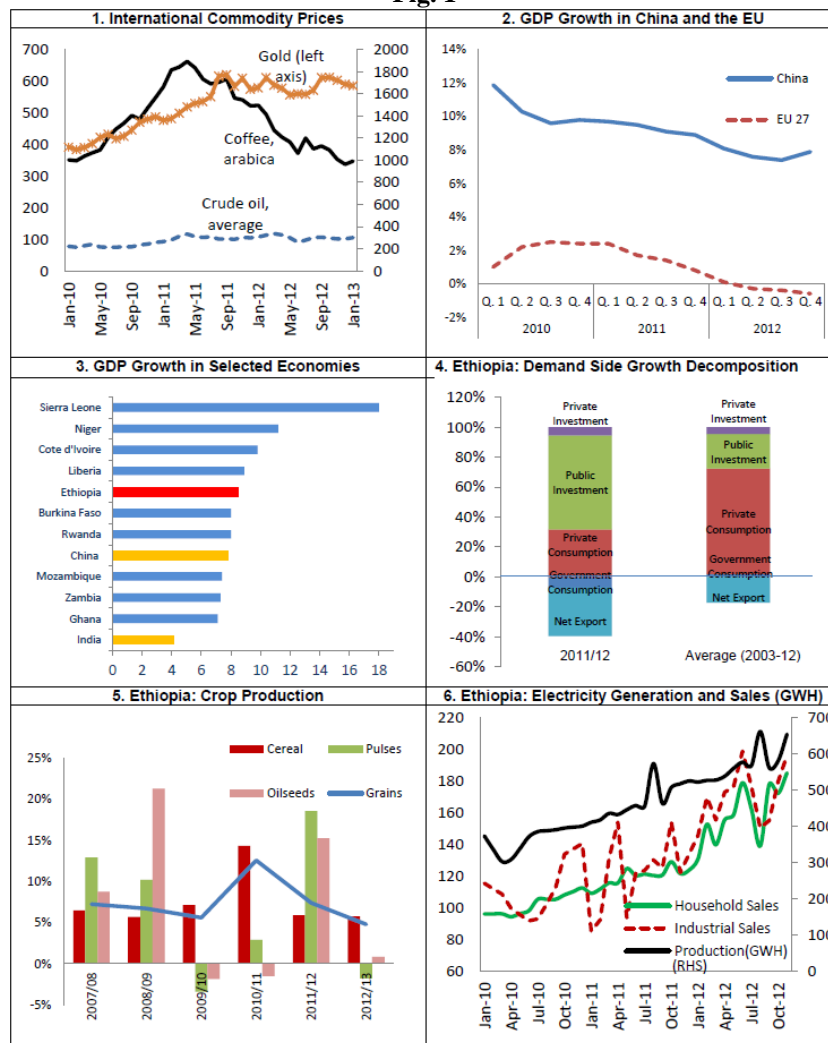

The peculiarity of the Ethiopian case lies in the fact that the process of economic growth is not driven by natural resources extraction, like Angola or Chad, neither on private sector development, like in Kenya. On the contrary, the rise of Ethiopian GDP in the last years results from public capital investments (infrastructures like roads, dams and power plants, housing projects,...).

For how long a country can count on public investments to support growth? There is no easy answer to this question. The empirical evidence in Ethiopia shows that during the last ten years this policy worked effectively. However the last economic data cast some doubts on the possibility to continue on the same path at the same pace. According to a recent World Bank analysis [5], inflation has been brought down to single digits, as a result of tighter monetary policy and a drop in imported inflation. However, financial intermediation and monetization are declining, with important negative implications for private sector development and savings. Financial and human resources are highly absorbed by State Owned Enterprises' investment activities. The external current account deficit is widening as import grows, driven by public capital imports that outpace sluggish export growth.

The relative slowdown in economic activity compared to previous years can be explained by lower crop production. Agriculture, which accounts for close to half of output, experienced a markedly lower growth rate in 2011/12 of 4.9 percent, compared to 9.0 percent in 2010/11. This was explained by a decline in crop production growth from 10.3 to 5.0 percent (Figure 1.5). Despite the emphasis in the GTP on agricultural commercialization, very limited financial resources are available for private initiatives and productivity enhancement.

A difficult external environment also took its toll on growth. Economic activity declined among trading partners, including the EU, China and neighbouring countries (Figure 1.1). International prices for coffee, Ethiopia's biggest traditional export crop, declined by about a third. Only gold prices remained high and stable in the first half of the fiscal year, though prices have dropped recently (Figure 1.2). As a result, the positive growth impulse from net exports in the two previous years converted into a drag on growth in 2011/12.

Fig. 1

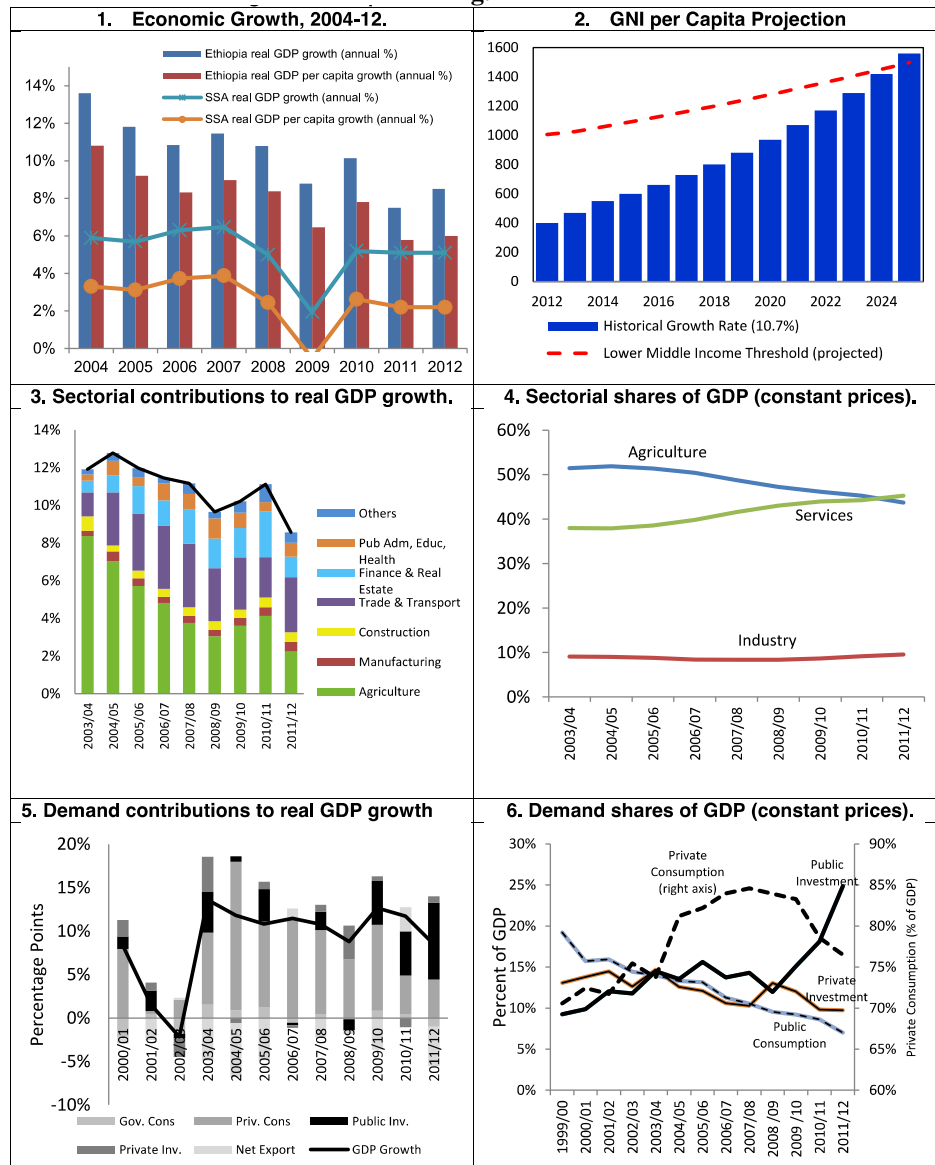

Source: 1.1: World Bank (2013), 1.2: Calculations based on MOFED data. 1.3: EUROSTAT. 1.4: World Bank. 1.5: CSA. 1.6: EEPKO. Note: Demand side decomposition uses GDP deflator for individual items. Note: Figure 1.2 prices are quoted in dollars/barrel (oil), cents/kg (coffee, Arabica), and US\$ per troy ounce (gold).

Beyond the short term macroeconomic analysis previously discussed, the examination of the economic growth sources shows a declining role of both private consumption and investment, while public investments are on the rise (Figure 2.5 and 2.6). Between 2007/08 and 2011/12, public investment increased from 14 to 25 percent of GDP. Private consumption, on the other hand, declined from 85 to 77 percent of GDP. Public consumption fell from 11 to 7 percent of GDP; while private investment fell from 13 to 10 percent of GDP with the residual being explained by net exports. Such trends might hamper the Ethiopian aspiration to become a middle income country by 2025 (figure 2.2). The next sections explore the reasons why those trends should be reverted and what role should be played by the international and bilateral cooperation to support the private sector development.

To conclude this section is worth noting that Ethiopian economic growth data are highly debated. While the government projects growth to remain above 11% annually, the IMF expects the annual growth to decelerate to 6.5% in the medium term due to limited opportunities for the private sector to leverage the large public investment, crowding out of private sector credit, and entrenched inflation expectations. The debate involves also the data gathering and the methodology to calculate the GDP and other macroeconomic variables. The accounting data used for macroeconomic purposes are considered unreliable by several international observers. The methodology used to aggregate data in the service sector is flawed by numerous duplications. The mechanism for collecting socio-economic data is altered by propaganda, the need to attract foreign investment and over-reporting to please supervisors. In the case of agricultural production, for example, the growth is systematically inflated. The phenomenon is evident when growth is checked with data on the use of fertilizers and weather conditions. Finally, in a strong inflationary context, public officials and members of the government suffer often of 'monetary illusion' and confuse 'face value' and 'real' results. Should we therefore conclude that actually Ethiopia is not growing at all? Absolutely not, we simply suggest handling official data with care and conservative attitude.

## The scope for private sector

The Growth and Transformation Plan sets clear and ambitious targets to be reached by Ethiopia in a short period of time. As mentioned before, the country aims to achieve middle income status by 2025, through accelerated growth and sustainable development. This goal cannot be achieved without an adjustment in economic policy to phase in the private sector as an additional engine of growth. Moreover, Ethiopia needs to make progress in enhancing domestic savings, and, resolving the bottlenecks of the trade logistics system.

Economic growth will require that the productivity of existing activities is increased, including a more efficient and profitable agriculture sector, and that new and diversified economic activities are developed. Both lines of effort require investments by the private sector. Evidence clearly shows a positive relationship between the share of private investment as a proportion of total investment and the rate of GDP growth (figure 3). In other words, the higher the level of private investment, the higher the rate of growth (for example Haiti, Argentina and Sri Lanka have low level of private investment and low rate of growth, while Korea, Singapore and Brazil have a high level of private investment and high rate of growth). Similarly the measure of private investment is inversely related to poverty levels (figure 4). So, if private investment is higher, poverty incidence is lower.

Fig. 3

Source: World Bank.

Fig. 4

Source: World Bank.

Nine out of ten jobs in the developing world are in the private sector. More accessible and competitive markets enable poor people, including youth and women, to find their own way out of poverty by providing more real choices and opportunities. Markets that function well have wider economic benefits too. They encourage firms to innovate, bring and disseminate new technologies, reduce costs and provide better quality jobs, goods and services to more people. According to the last Africa Economic Outlook [6], given the continent strong population growth and the necessary downsizing of the public sector in many countries, a vigorous private sector is the most important source of jobs for the young.

Moreover exports generated by the private sector expand forex earnings needed to buy inputs for building infrastructure. Similarly, the taxes that private companies and individuals pay fund core government functions such as delivering health and education services. Effective tax collection from companies and individuals builds capacity and accountability on the revenue side of public finance, as well as provides resources for public expenditure.

The structural transformation envisaged by the GTP includes a more professional and value-added agriculture sector and a progressive reduction of agriculture to the benefit of industry. These changes will be inevitably accompanied by a process of urbanization. Only the expansion of the private sector might absorb the large number of workers that are expected moving from the Ethiopian countryside to the growing towns.

For poor men and women, the private sector might offer empowerment. The poor live in the private sector – they buy and sell labour, goods and services in private informal markets. To the extent that international labour standards are applied and civil rights guaranteed, poor people who create or join an enterprise gain voice and dignity. When they earn higher incomes they increase their ability to exercise choices and reduce their vulnerability.

The private sector is not a 'sector' in the way we refer to transport or education. Private companies are part of the fabric of society and operate in all the areas important to the lives of the poor. Also, private companies, not affected by cronyism, which is actually a relevant problem in Ethiopia, can have a different performance culture to government agencies. They are often subject to competitive pressures in markets, and their owners, management and staff are rewarded according to their ability to generate profit. Since profit is an easily measured indicator of performance, it can be used to make rapid adjustments to the deployment of resources in relation to achievements. And, inevitably, companies that do not make profits go out of business. This simple feedback process is the reason why private companies are generally more efficient and innovative than their local counterparts in government service.

This is not to say that there is not an important role for a developmental state, which has already been proved effective in Ethiopia. We would like just to encourage the forging of an effective relationship between the state and private organizations based on comparative advantages in order to provide a sound foundation for successful development. The capability of the state underpins political and economic stability and helps ensure that human rights, personal safety and the security of property are respected. And the state is generally primarily responsible for the provision and regulation of infrastructure, health and education. The state also plays a critical role in providing the institutions required for private companies to grow. It sets the climate for investment and commerce through trade policy, competition policy, regulation of utilities, commercial justice systems, taxation, land reforms, labour codes and environmental management. Markets themselves can be seen as institutions with their own ‘rules of the game’ that are set by historical, political and cultural factors. It is the role of the state to arbitrate between competing claims on resources and to maintain stability.

The state plays an important role to overcome market failures. It cannot be assumed that conventional economic policies such as market liberalisation will automatically reduce poverty through a ‘trickle-down’ process. On the contrary, it is now widely accepted that specific measures are needed to ensure that the poor participate. Growth needs to be made available to all in order to address rising inequality, and provide opportunities and the capability to participate in markets. It is justifiable for donors to support government interventions in markets where there are significant failures and inefficiencies which limit private sector growth and prevent the participation of poor men and women, such as in the following remarkable cases:

- monopoly or imperfect competition. If a few producers gain sufficient market power, they can exclude potential competitors, restrict supply and charge higher prices. This is the case in many developing country markets, especially where investment costs are high. Where competition is limited or distorted, it is usually the weak and poor who lose the most.
- Asymmetrical information. Instead of all buyers and sellers having access to the same knowledge, some producers or consumers may lack information, allowing others to exploit their ignorance. Poor information may prevent producers meeting the needs of consumers, and be partly to blame for the failure of financial markets to lend to the poor, and for suppliers of consumer goods failing to meet the needs of the poor.
- Social exclusion. Markets where specific social groups such as women, ethnic minorities or castes face discriminatory barriers that prevent or discourage market participation.
- Incomplete markets. Markets in some developing countries can be either non-existent or too ‘thin’ to function properly. Because of problems such as high risks, high transaction costs, high transport costs and short time horizons of investors, markets only provide for the needs of the wealthier few. Consequently, the reach of the market is limited.
- Coordination failures. For markets to work, they often need complementary markets and functions to develop with them (for instance, rice and the supply of rice processing machinery). Where price signals fail to cause the complementary market to develop, a co-ordination failure occurs, preventing the growth of the market or causing it to be incomplete.
- Externalities and public goods. Some activities produce positive or negative effects that are not reflected in the market price. For example, the costs of pollution are not reflected in the costs of the producer. This means that the market over or under supplies some products. ‘Public goods’, such as basic health and clean air, are non-excludable and non-rivalrous. In these cases often the state can better regulate production and consumption than the market.

Having acknowledged the key role of the state to support development - we would like to stress that vibrant, competitive markets populated by dynamic private companies offer the most effective way to create wealth, productive jobs and prosperity for all on a sustained basis. Wealth creation is at the heart of development. The evidence is clear – increasing incomes amongst the poor leads to better educated and healthier poor people. The involvement of poor people in economic growth is the best way to get people out of poverty and represents the exit strategy for aid.

### **The state of private sector in Ethiopia**

The GoE is right in asserting that Ethiopia’s private sector is weak. The years under the communist Derg, with its policy of almost total state ownership, and the constant civil war, ensured that the private sector died during that period. The best entrepreneurs fled abroad. In recent years, parts of the Ethiopian diaspora have returned but the level of entrepreneurship remains low. Data from the World Bank shows that the rate of formal enterprise creation in Ethiopia is amongst the lowest in SSA.

The World Bank Enterprise database [7] shows that only a limited number of limited liability companies are registered. Taking into account other types of business does not change the view that entrepreneurship is low. The annual rate of business registration of less than 7,000 in Ethiopia contrasts with Ghana where over 45,000 businesses are registered annually. Ghana’s population is about a third of Ethiopia’s. Even when account is taken of the informal sector, the level of entrepreneurship remains low. The Ministry of Trade estimates the number of informal businesses amounting to 1.5 million. This contrasts with nearly 7 million in Nigeria, a country with less than double of Ethiopia’s

population.

Private corporations, which represent the formal private sector, generate just 27% of GDP. Much of private sector GDP (80%) comes from the informal economy, especially informal agriculture. These corporations employ just 5.8% of the workforce. The vast majority of the work force, some 88%, is informally employed. In 2011, the World Bank estimated [8] that private gross fixed capital formation accounted for just 4.1% of GDP in Ethiopia. This is well below the Sub Saharan African (SSA) average of 13.4% of GDP and less than a fourth of the 20% achieved in the Far Eastern countries (such as China, Korea, and Singapore) that GoE seeks to emulate. The low level of domestic private investment is reinforced by one of the lowest rates of net foreign direct investment (FDI) in the world. According to the IMF, FDI represents just 2.5% of GDP in 2012 [9].

There are few large domestically grown businesses in the country. Moreover, what the literature traditionally identify as 'genuine private sector', has been dwarfed by the activities of two large blocs: the Midroc 'empire' owned by Sheikh Mohammed Alamoudi, and the so-called 'party-associated' enterprises, belonging to the conglomerate EFFORT. The Endowment Fund for the Rehabilitation of Tigray, EFFORT, was established by the TPLF as a means of co-ordinating the effective developmental use of the material and cash resource in the possession of the at the end of the war with the Derg. Under the umbrella of the foundation, and sister organisations in other EPRDF-administered regions, a range of commercial enterprises and factories were established, dealing in trade, agriculture, fertilizer, cement production, textiles and garmenting, livestock and leather, ground transport, mining, engineering, and finance. Together these represent an enormously influential and strategically integrated bloc, dominating key sectors of the economy [10].

There is state monopoly or state dominance in sectors such as telecommunications, power, banking, insurance, air transport, shipping, and sugar. State-owned enterprises have considerable advantages over private firms, particularly in the realm of Ethiopia's regulatory and bureaucratic environment, including ease of access to credit and speedier customs clearance. Local business owners as well as foreign investors complain of the lack of a level playing field when it comes to state-owned and party-owned businesses. While there are no conclusive reports of credit preference for to these entities, there are indications that they receive incentives such as priority foreign exchange allocation, preferences in government tenders, and marketing assistance.

Beside these large actors, the vast majority of businesses are small, sole proprietorships. In Ethiopia, even amongst limited liability companies, the vast majority are micro and small enterprises employing less than 50 persons and with capital employed not exceeding \$300,000. There is a missing middle of medium scale enterprises [11] with a consequent limited potential to create new jobs.

Clearly, historical factors have restricted entrepreneurship and private investment. But there are constraints at present, well known from the government side, that are limiting entrepreneurship and private investment. In the occasion of the Prime Minister Investor Conference in 2012, the public private consultative forum, has identified a number of specific problems to be urgently addressed: sudden changes in regulations without any grace period, unclear and inconsistent application of regulations, inadequate coordination between Government implementing agencies, business licensing/registration problems (length of time taken to obtain a licence, requirement to obtain a licence for each specific business activity, requirement to renew it annually, no permission to manage more than one business), tax system issues (double taxation, retroactive implementation), and rise of corruption.

Responsibility and ownership for the facilitation of private sector investment remains fragmented and unclear, particularly in the agriculture sector where numerous ministries and agencies appear to have interest and/or mandates to improve investment. The Parliament has approved a new investment law in November 2012, which, however, fails in clearly outlining roles and responsibilities of the numerous ministries and government entities involved in trade and investment.

In addition to all constraints to private sector development examined so far, a cultural issue is worth to be explored in order to understand why after 20 years from the restoration of the rule of law and the market economy, entrepreneurship and private investment are still so low. Economic success in Ethiopia is regarded with suspicion. In particular among the orthodox believers (45% of the population) is still deeply rooted the idea that "making money" lies in the realm of devil's affairs. Among EPRDF politicians and top government officers, a similar suspicion stems from their ideological background in Marxism and command economy. The two phenomena magnify when combined. As a result, beyond official statements in favour of the market economy, the executive choices of the government and the attitude of the society are often not favourable towards private small and medium entrepreneurs. A clear example can be identified in recent unjustified entrepreneurs imprisonments based on sector estimation of taxes due regardless of the actual profit generated by the specific business. Unsurprisingly the culture of entrepreneurship remains poorly developed in Ethiopia.

### **A new role for the development cooperation**

For a long period of time the development cooperation in Ethiopia has focused on social sectors such as health, education and food security. Those sectors are important, but they are not enough to face the challenges and contradictions analysed above. Currently only 2% of ODA is allocated to private sector development [12]. More should be done and development cooperation in Ethiopia has to evolve to find no-distortive and sustainable ways to support the economic growth of the country.

PSD approaches have evolved over the years. Earlier programmes in the 1980s focused on providing finance and

support services to individual businesses – often with an implicit or explicit subsidy. Aid was commonly tied to the purchase of goods and services from donor countries' companies. While this enabled some businesses to grow, it did little to promote wider market development in either financial services, or in business support services. In the 1990s, as concerns about the importance of poverty reduction increased, the attention of PSD programmes shifted towards small and medium enterprises and microfinance.

More recent PSD thinking has focused on the market system as a whole and on the overall environment for business. This has led to programmes that support the improvement of the business climate, regulatory reform and enhancing market development. Despite these trends, donor support for PSD in Ethiopia remains fragmented. There is plenty of innovation but only few mechanisms that enable co-ordination and learning, among them the PSD Sector Working Group, bringing together the Government and the donors is one of the most effective. A promising additional initiative is a Multi Donor Trust Fund proposed by the Italian Cooperation and led by the International Finance Corporation (IFC), articulated in two main pillars (investment climate and access to finance) meant to bring on board and coordinate as many donors as possible. However the problem remains, given that incentives facing different donors vary widely. Bilateral donors are influenced by political priorities, while multilateral lending agencies face the need to develop and expand their loan portfolios.

Looking at the broader picture, as commercial interest in developing countries has grown, there has been a significant rise in private financial flows in the form of remittances and investment. These are now bigger than official Overseas Development Assistance (ODA) in general [13], and potentially relevant for Ethiopia. The rise of the 'BRICS' (Brazil, Russia, India, China and South Africa) reveals a shifting world order in which former recipients of aid become donors themselves. New donors, including China and India, take very different approaches. Other new entrants include private 'philanthro-capitalists' such as the Gates and Google foundations and the vertical 'single issue' global funds.

Within this environment, development partners need to address a number of key issues if they are to effectively support private sector development in Ethiopia. These include:

- forging and disseminating an entrepreneurship culture at all level in the society.
- Making the best use of an emerging common interest in sustainable development between private companies and development agencies. An example is the New Alliance for Food Security and Nutrition committed between the Government and the G8 to working together to generate greater private investment in agricultural development, scale innovation, achieve sustainable food security outcomes, reduce poverty and end hunger.
- Attracting more private sector participation in both the financing and provision of key development-related services such as infrastructure and some health services.
- Ensuring that the rapidly evolving and integrating global trade and financial systems work for the benefit of people and companies in Ethiopia.
- Increasing the private sector development performance of international agencies.
- Engaging with new and emerging donors such as China and India who are making significant trade-related PSD investments in Ethiopia or the vertical funds.
- Improving knowledge management of private sector development impacts to disseminate best practice more effectively.

Supporting PSD could lead to a substantial positive impact on development results for all the reasons that have been set out. But this will require that donors and their staff begin to think about how to incorporate PSD in all the appropriate areas of their work. For example, livelihoods advisers already look at markets and links with the livelihood opportunities for the poor. Infrastructure advisers should expand their work on private sector participation in the financing and delivery of infrastructure services. Other advisers could explore how markets and innovative public-private partnerships could improve the delivery of other core services to the poor – including health, education and environment. Labour experts should seek strong co-operation with the private sector to understand employers needs and create opportunities for young people in the form of apprenticeships and internships. Governance advisers could further examine how the state operates to improve the business' performance and behaviour.

Particular attention should be paid by the international community in all the initiatives at firm level support. Not only to avoid market distortion, but also the risk to increase the privileges of the 'cronies' above mentioned and jeopardize other initiatives for the creation of a level playing field. In this view a simple stock taking exercise of the existing support at firm level may significantly help.

Finally, the donors' strategy should build on areas that have already proven successful in PSD, such as improving access to the financial sector, market development, infrastructure financing and investment climate reform. But the strategy should also foresee continued innovation and experimentation, such as the use of challenge funds, venture capital, transparency initiatives and other facilities for developing partnerships with private firms and foundations.

Il poster sintetizza alcune delle componenti tecniche che sono state utilizzate in una serie di azioni attivate in Repubblica Dominicana per la progettazione di sistemi agroalimentari locali sostenibili. Tali sistemi si basano sulla mobilitazione di una pluralità di attori che, attraverso percorsi di partecipazione e di concertazione istituzionale, definiscono insieme uno scenario di azione comune che ha come scopo il consolidamento di sistemi di produzione e di consumo il più possibile basati su un ciclo locale.

La Repubblica Dominicana è uno dei luoghi di implementazione di approcci che i membri del Laboratorio di Progettazione Ecologica del Politecnico di Milano (LPE) hanno perfezionato in circa quindici anni di studi e sperimentazioni, combinando competenze e tecniche afferenti principalmente ai mondi delle scienze del territorio, dell'economia, degli studi istituzionali e dell'animazione sociale. Le attività in Repubblica Dominicana sono cominciate nella fase iniziale del progetto di cooperazione decentrata "Pull Down the

Line," finanziato nell'ambito del programma EuropeAid e avente come capofila il Fondo Provinciale Milanese di Cooperazione Internazionale. Tale progetto aveva una serie di obiettivi legati al miglioramento delle relazioni transfrontaliere tra Haiti e Repubblica Dominicana e basati sul consolidamento di competenze nelle municipalità e nelle loro reti.

Successivamente, grazie al supporto dello UNDP e di altri attori dominicani, gli stessi approcci sono stati perfezionati e implementati nella Provincia di Monte Plata in altre aree del paese, integrandosi a più livelli con diverse programmazioni di scala regionale e nazionale.

Con diverse declinazioni e forme di implementazione gli strumenti qui elaborati sono anche utilizzati in altri progetti sul territorio nazionale e in contesti internazionali, interpretando in senso proprio il senso delle attività di cooperazione come mutuo apprendimento a più livelli.

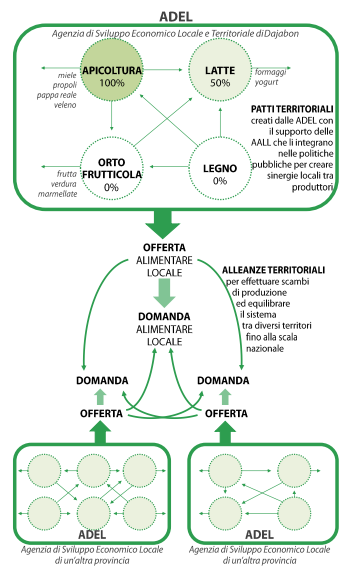

### CATENA DI VALORE TERRITORIALE

Una catena produttiva genera un valore territoriale quando interconette tra di loro servizi, attività economiche, aspetti sociali ed implicazioni ambientali generando per ciascuna di esse un valore aggiunto nel territorio.

Una catena di questo tipo comprende ad esempio: un prodotto primario; attività formative; tecnologie ed infrastrutture per la sua trasformazione; servizi di commercializzazione; mobilità; ricerca e sviluppo dei processi; l'accesso ai mercati.

Tutte queste attività aggregano valore al prodotto di base contribuendo al suo sviluppo continuo e consentono alla catena di acquisire un valore superiore alla somma dei passaggi, così da diventare una risorsa strategica per il territorio.

Questo è attuabile solo se viene creata una forte relazione tra tutti gli attori (economici, sociali ed istituzionali) in grado di consolidare nel tempo una fiducia che radichi nel contesto locale le basi per lo sviluppo.

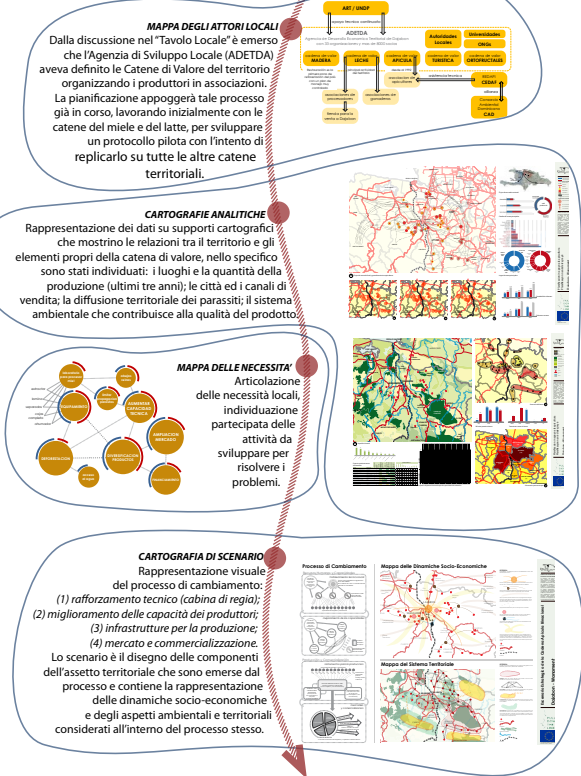

### APPROCCIO METODOLOGICO

Lo schema sintetizza la metodologia attuata per la pianificazione delle catene di valore alimentari. Gli elaborati, qui semplificati, riguardano la sperimentazione pilota attuata nella Provincia di Dajabon (progetto Pull Down The Line, capofila FPMCI, cofinanziamento EuropeAid) e poi estesa e ridefinita nella Provincia di Monte Plata con l'obiettivo di creare un Piano Rurale Strategico che garantisca la sicurezza alimentare mettendo a sistema, in modo integrato, gli apporti delle singole catene.

## “Best Practices in Microfinance: evidences from the International Award”

**Maria Cristina Negro**  
General Secretary  
Giordano Dell'Amore Foundation

**Dario Peirone**  
Assistant Professor of Management  
Department of Economics and Statistics “  
Cognetti de' Martiis”, University of Turin

### ABSTRACT

The “Giordano Dell'Amore Microfinance Best Practices International Award” promoted every two years by our Foundation is opened to institutions from any developing or transition country outside Europe involved in the delivery of microfinance and related services. The Award has 3 main objectives:

- to increase the public awareness on the importance of microfinance;
- to encourage the exchange of experiences, the sharing of thoughts and in-depth analyses;
- to highlight and make known the best experiences of microfinance that combine innovation and sustainability.

During the last two editions the Foundation received a total of 97 candidatures from 60 countries.

### OBJECTIVES

The main aim of the present work is to evidence different aspects considered as best practices based on the analysis of the experiences of the finalist

### ACHIEVED RESULTS

In terms of **innovation**, it is essential to take into account the clients' characteristics realizing a preliminary in-depth study. For example, a MFI developed an ad hoc product to promote inclusive business in the timber value chain where the sales contract represents the guarantee and the only precondition. Another element is represented by the Social Performance Management whose implementation requires a strong institutional commitment, especially at board level, and the creation of an institutional culture. A third area emerged focuses on innovative financial systems like the creation of a special *Trust Fund* to implement public works through community participation or the *cooperation agreement* with external enterprises.

Moving to **sustainability**, the main strategies toward its achievement are:

- adoption of a decentralization model where the branch offices act as independent cost and profit centres;
- use of technologies and design of products able to quick reach scale (i.e. mobile banking).

MFIs are deeply concerned about **impact** using different monitoring systems to check, measure and understand it on an ongoing basis. The assessment usually focuses on client's situation both in terms of economic and non-economic indicators; but it can also focus on the institution as a whole

### CONCLUSION

Considering the general debate on the role of microfinance, the Foundation is convinced that microfinance represents a powerful tool in the fight against poverty and social exclusion, nowadays more than ever due to the international crisis. This role can be improved adapting the methodologies and systems to the clients' needs as well as assessing the impact of microfinance on the

The selection of the 5 finalist institutions as well as the winner, which receives € 50.000, is realized by the Award Committee composed by international experts accordingly 4 criteria: innovation, sustainability, impact and replicability.

Candidatures evolution 2009-2011

institutions within the two editions of the International Award organized by the Fondazione Giordano Dell'Amore.

with a great stress on client protection; on the environment (i.e. reduction of emission) and on the society (i.e. role of new “neighborhood organizations”). In terms of **replicability**, all the experiences had the potential to be replicated even if they probably need time, determination and resources to ensure proper understanding and thus successful execution. Sometimes the same MFI provides Technical Assistance to other organizations through its senior officials.

The main characteristics of the ten experiences are:

- MFIs are *actives since '90s*.
- Most of MFIs offer *financial services* (microloans but also microsavings, microinsurance and fund transfer) and *no financial services* including groups' organization, animation and training as well as business development services or other social services.
- MFIs are small or medium-size. The average *portfolio* (excluding minimum and maximum value) is less than € 40.000 with around 100.000 *clients*.
- The *average loan size* ranges from € 100 to € 3.000 with a majority of less than € 500 showing the commitment to serving the really poor segments of the population located especially in rural area.

lives of the microentrepreneurs as emerged by the analysis of the ten finalist experiences of the two editions of the “Giordano Dell'Amore Microfinance Best Practices International Award” which are summarized in the special publication realized by the Foundation.

III CUCS Congress  
Turin, 19-21 September 2013

### COMMUNITY MANAGED MICROFINANCE EXPERIENCES IN EUROPE: THE SELF-FUNDED COMMUNITIES

Patricia Rodriguez Pulido, ACAF - Universidad Autonoma de Madrid  
Francesca Lulli, ACAF - Universidad La Sapienza Roma  
Abdoulaye Fall, ACAF - Universidad Autonoma de Barcelona

#### Abstract

The recent crisis on the financial system has opened up new opportunities for non-traditional financing models. Despite of the worldwide development of microfinance sector, we are still a long way from offering to vulnerable people and population in Europe a transparent, tailor-made and quality microfinance products and services to cover their current needs. Self-funded Communities (SFC) methodology has been designed to satisfy local demands of financial services for various types of individuals. European SFCs are usually groups of low-income people who buy shares to create a credit fund, from which they finance themselves. The target population is mainly people at risk of poverty or social exclusion in Europe. SFCs are already operating in six countries in the EU. The model is being used by the members not only for covering basic financial needs but also for fostering solidarity, social cohesion, informal learning (learning by doing and learning by sharing) and a sense of community.

#### Premise

European low-income families can and do save but they have troubles accessing safety financial services that meet their needs. SFC experience shows that organizing the communities through savings is an efficient strategy to help European low-income families to face unexpected living expenses and to make choices which will improve their lives. Learning from Southern Microfinance experiences and putting at the center the community, it shows us that the key to getting out of poverty in Europe isn't just credit.

#### Methodological approach

The SFC methodology is based on a community managed microfinance approach. The people, organized in groups (called SFCs) are able to save small amounts of money (micro savings), to borrow money (microcredit), to manage their own finances (financial education) and to earn some income at the end of the financial year (micro investment) coming from the profits of group-lending. The members of each SFC are co-founders and co-owners of the group. The decisions are democratic and the rules are written, shared and known by all the group members.

#### Achieved Results

Only in the EU, 95 groups have already been created, which means around 1600 members and around 5600 indirect beneficiaries. The rotated capital in 2012 has been around 988.000€ in 2.470 microloans, and the average return on savings stands at 12%, which means a sum of 61.985 €. The repayment rate is 98% and the mean loan is of 400€. In Spain up to 78% of the SFC's members are migrants but due to financial crisis saving groups are becoming an attractive and suitable option for young people and European families. 60% of SFC members say that the group is their only social network. In Hungary SFCs were set up amongst low-income Roma groups in rural areas and in Italy three pilots project were set up among youth (in Central Italy), migrant communities (Southern Italy) and people with mental health disorders (Northern Italy).

#### Conclusion

From a theoretical standpoint, the SFC represent a challenge that need further involvement. Real practices of community managed financial capital (strictly interconnected with social capital) implemented in developing countries stimulate a reflection on the possibility of reaching a social and economic balance in European countries, capable of recreating or extending the network of resources of those people whom the current economic system is forcing towards social exclusion and financial illiteracy. Mutualism and community managed microfinance practices in Europe could reinforce the savings culture, increase financial security and reduce vulnerabilities and barriers, fostering a safe way to save and building communities resilience and empowerment in European countries. It is definitely a way of moving towards a democratic, transparent, trustable and sustainable microfinance system.

## Immaginare culture della cooperazione: le Università in rete per le nuove sfide dello sviluppo

III Congresso scientifico CUCS  
Torino, 19-21 Settembre 2013

Economic growth, inequality and new measures of well being.  
Preliminary issues and fieldwork.  
Andrea Salustri, Tor Vergata University Economic Foundation.

### Abstract

**Quality, social justice, equitable and sustainable well-being, landscape** are all meanings that refer to the idea of **culture, cooperation and community**. A preliminary research focused on these issues inspired the development of two projects, that are still in their start-up phase: an activity of food-sharing to be implemented at the local scale in Rome (**Bread & Roses**), and an activity of life, career and business coaching that aims at reducing the vulnerability of workers and of the unemployed, and at increasing the capabilities of NEETs in order to promote their inclusion in the labour market (**Paint Your Life**).

### Achieved Results

**The interaction between the formal and the informal economy can be viewed in cooperative terms** rather than in competitive terms. The public sector can facilitate cooperation enhancing participation and improving the system of accountability in order to assign an economic value to social capital, non-profit and household production activities that might reduce income inequality and increase the individual and collective well-being.

### Objectives

Further research is needed to: 1) identify ad hoc measures of value taking into account qualitative issues; 2) collect recent experiences of projects similar to Bread & Roses and Paint Your Life in order to highlight stylized facts and best practices that might be useful to support the activity on the field; 3) define a framework of analysis to illustrate the issues of main interest; 4) Provide recommendations to participants, volunteers and policy makers.

### Methodological approach

Social networking, case studies, narrative analysis and theoretical analysis. **Further research should be dedicated to statistical analysis of economic databases.**

### Conclusion

**The financial crisis** is global and involves both the formal and the informal economy. **The rise of new sources of poverty, the increase of social inequality and individual vulnerability, and the lack of economic growth are strictly interconnected and must be faced simultaneously.**

The introduction of quality in the economic models allows to link mid term and long term issues to short term analyses. Specifically, a long term view allows to account for the "intangibles" that are behind the main determinants of economic growth and development. **Cooperation is the major issue to address in order to find a way out the economic crisis. A way out that must be equitable, durable and sustainable.**

## OPEN DATA AND OPEN ACCESS: WHICH KNOWLEDGE SHARING FOR DEVELOPMENT COOPERATION? DATA AND INFORMATION ORGANIZATION FOR DEVELOPMENT COOPERATION AND KNOWLEDGE SHARING

Susanna Sancassani\*

\*METID, Politecnico di Milano, [susanna.sancassani@polimi.it](mailto:susanna.sancassani@polimi.it)

### ABSTRACT

The significant value of Open Data and Open Access, both as transparency tools toward public opinion, and as valorization of the results achieved by the institutions, is growing on a daily basis, at global level. Even the world of university cooperation can now take the opportunity to confront with the latter.

Regarding this topic, many are the questions upon which we would like to reflect together, especially looking at what we learned in the last few years.

Which could be the advantages and disadvantages for university cooperation, originating from a more and more intense data and information sharing? Which are the tools and the most suitable channels? Which indicators or objective systems will have to be monitored as priority in the next years?

Which will be, in the short run, the system of indicators that our institutions will need in order to address their policies and to make visible, within international contexts, the manifold initiatives promoted in the local contexts?

In May 2013 in Geneva, UNESCO launched at the world summit on the Information Society Forum its new initiative for Open Access.

UNESCO is the first organization of the United Nations to make available to everyone, free of charge, its publications, with the possibility to readopt and redistribute them. Does it represent an interesting stimulus, even for universities involved in the field of cooperation? If we really were able to share methodologies, tools, approaches how much more and better could we do?

In times of abundant resources, finding synergies among work groups and projects could be considered an interesting added value; now, in a phase of more and more scarce resources, the knowledge sharing commitment could turn out to be an essential operative modality to continue guaranteeing an effective presence of universities within the cooperation field. Starting from here, the panel proposes to delineate possible answers, confronting the point of view of the universities, national and international institutions and stimulating a cooperative reflection.

### PROPOSER

Susanna Sancassani – *Managing Director METID (Metodi E Tecnologie Innovative per la Didattica), Politecnico di Milano*

### PARTICIPANTS

Lucilla Alagna – *International Affairs Dept. of CNR (the National Research Council)*

Gildo Baraldi – *General Director OICS (Osservatorio Interregionale Cooperazione Sviluppo)*

Paola Esena - *Programme Manager Polisocial, Fondazione Politecnico di Milano*

Federico Morando - *Director of Research and Policy & Research Fellow, Nexa Center for internet & Society, Politecnico di Torino*

### DISCUSSION

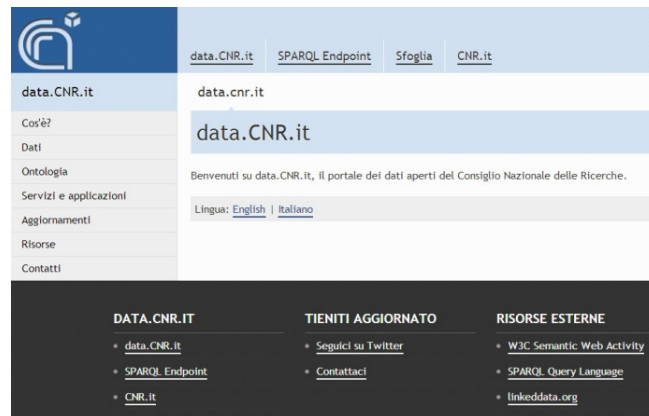

The panel opened up with an initial overview of the main initiatives on the theme of Open Data and Open Access, which have a direct impact on the Italian context.

**Lucilla Alagna** brought the experience of CNR on Open Data (<http://data.cnr.it>) and Open Access, starting from the underwriting by CNR of the *Berlin declaration*<sup>1</sup> and the *Position statement on open access to scientific research*

---

<sup>1</sup> Act which represents the European document of acceptance to the principles of open access for the research products financed with public funds and it defines the open access as an essential strategy to guarantee the diffusion and the reuse of research results from the scientific community and the civil society.

results in Italy ([http://sito.entecra.it/portale/public/documenti/position\\_statement\\_0a\\_it.pdf](http://sito.entecra.it/portale/public/documenti/position_statement_0a_it.pdf)), signed by CRUI (the Conference of Italian University Rectors) and the Italian research entities.

The motivations connected to the acceptance to the principles and strategies for OA defined within the scientific works and by the Global Research Council were discussed; more, Lucilla Alagna described the aims and actions of MedOAnet (Mediterranean Open Access Network <http://www.medoanet.eu/>), a national work group for the definition of guidelines to Open Access to research data in Italy.

The Science & Technology Digital Library (<http://stdl.cnr.it/>) project was presented; this is one of the initiatives of the Italian Digital Agenda for the use of ICT to favor growth, innovation and competitiveness, in line with the European Digital Agenda (EU Strategy 2020). The project includes the creation of a digital library which allows access and reuse of scientific data and the development of advanced technological solutions, in order of making the processes of scientific and technological research (open science) transparent and comprehensible, and the research financed by public funds (open access) available.

Afterwards, the attention was brought to a few aspects which deserve attention:

- the problem of the quality of research data in a reuse context: this means the need to keep a traceability of the sources and the process of re-elaboration of the data and researches. In this sense, it is necessary to encourage a participative approach and shared responsibility and to incentivize standard tools which could stimulate annotations made by those who own the data or reuse them;
- the identification of sharing processes which does not imply, necessarily, the free release, but which entails the study of business models able to sustain the Open Data approach;
- the possibility to create professional figures connected to such sector, arising from initiatives, projects and “lesson learnt” both national and international.

Among the strong points, one should notice that up until now a big quantity of data and research on various fields of knowledge was collected; more, exists a coherent legislation and a formal acceptance from the various research entities; the capacity of platforms implementation and data managing tools according to Open logics is concrete; there is the necessity to optimize resources.

The problems to be solved are related to the discrepancy of data and the complex interaction between the systems. This makes it difficult to create connections between different databases and the outward openness of well-organized sources.

Which are the suggestions for the future? First of all, it is necessary the study of actions which allow an always greater data circulation, homogeneity and compatibility of data and systems, and the creation of flexible indexes and search keys, universally accepted.

But even more important is the organization of moments and places, real and virtual, in which the discussion and the confrontation of the main representatives of the institutional and territorial entities connected to data management are kept alive.

**Federico Morando** shared the experience developed by Nexa Center for Internet & Society of Politecnico di Torino on the topic of Openness of public data, providing multidisciplinary insights on the good practices and on the most common obstacles. His participation highlighted the key points of a few concrete experiences, both local and international, drawing the recurring characteristics of the processes of public data access, in order to prevent or manage errors and the most common fears and highlight the opportunities of this scenario.

In particular, the reflections of Federico Morando originated from general considerations on the necessity to open data outwards in order to allow a greater new version and a better interpretation, to guarantee a stimulus of knowledge and innovation generation, and to have an impact both on the public as well as on the private sphere.

Regarding the specific context of the Italian Public Administration, it is significant to note the experience of Piemonte Region.

Data have been published in re-usable formats and organized in such a way so that they were easily searchable and re-usable without incurring in problems of misinterpretation.

The main difficulty consisted not really in the technological context - however complex, since it has to offer tools able to collect and catalogue data coming from different sources, - but from the cultural sphere. Many of the people responsible for data management involved in the process were hesitant about the publication of important data, because of the scarce overview on the possible alteration by others.

Therefore, Open Access for PA means not only a project planning of the technological tools, the re-organization modalities and data interoperability in order to allow its search ability and reuse, **but** also the design and plan of a learning path for data managers to promote a complex cultural transformation: this learning action which leads the data managers to understand that the opportunity offered by the Open Access movement is a landmark “not only to favor the private sector innovation, and a democratic participation of the citizens, but also to increase efficiency in the public administration itself” as described in the “*white book for the reuse of information in the public sector*” (<http://evpsi.org/librobianco>), by Federico Morando.

This document, in a clear, direct, explicit and exhaustive modality, highlights the given opportunities, expedients, risks and common errors briefly revisited during Federico Morando’s talk.

From the complex world of PA, the focus shifted to a similarly complex setting such as the one of cooperation for development.

**Gildo Baraldi** described the sphere of decentralized cooperation of the Italian regions, which consists in the creation and management of general partnerships between their territories and those of their foreign partners, finalized to the reciprocal social, economic, cultural and institutional development. It embraces all their International relations:

from cooperation for development to the support of international territorial processes, to the valorization of immigrant foreign communities and of the emigrant regional from and to the partner territories.

It is, therefore, fundamental to consult and inform the territory entities (ONG, universities, local entities, PMI, etc.) involved in the creation and actualization of these partnerships, to communicate their development and results, and adequately inform the citizenship on the use of public funds and the deriving reciprocal benefits.

The present economic difficulty plays a fundamental role in the cooperation: from the data elaborated by OCSE-DAC it is notable a direct relation between the crisis and the decrease of budgets that each Nation dedicates to cooperation and development. In this context it is important to understand that off-centered cooperation is not handouts, but it represents a reciprocal advantage of the partner territories. Thus, there is a synergy issue: it could happen that EU, Governments, regions, local bodies, universities, ONG support similar initiatives, therefore the effort goes toward data collection and sharing, in order to favor synergies and avoid duplications.

Starting from this context, that is wider and at the same time fragmented, it was easy to guess, how to insert with extreme “urgency” the discussion about Open Data: a free circulation of data and information, which does not spring from the collection mainly managed by the central entities, but which valorizes the input of the single local situations, could help to draw an image of a complex reality, with swamped places and resources. Open Data access can function as a stimulus for update and therefore for the acknowledgment of responsibility of the single local entities, while relieving the responsibility of the central organisms.

Numerous factors contribute to the diffusion of the Openness practice in the sphere of cooperation for development: above all, it stands out the diffusion of online services, which allow and stimulate circulation and publication of information and researches by the entities promoting cooperation and those who implement the projects.

Even in this sphere, a cultural change which stimulates a greater openness is however necessary: there is the need to understand that an Open Access Approach can lead to the creation of public and private subjects networks, active in the various territorial situations.

This was the main focus of **Paola Esena** participation who, starting from the direct experience of Polisocial (<http://www.polisocial.polimi.it/>), considered how much Open Data – hence the amplification of their impact thanks to their circulation, their reuse, and the discussion which originates around them – favors the creation of “network” contexts and project partnerships more and more effective and synergic.

Paola Esena also highlights the necessity and relevance to dispose of tools dedicated to share not only developed experiences and the related sharable and documented data, but even the new project ideas, to favor the creation of indispensable synergies to move around these complex settings.

## BEYOND GDP: DEFINITION AND MAKING OF NEW WELFARE INDICATORS, REFLECTING ON CONCEPTUAL AND METHODOLOGICAL ISSUES

Elena Camino\*

\*University of Turin, Italy - [elena.camino@unito.it](mailto:elena.camino@unito.it)

The theme of the panel was proposed by **Filomena Maggino**, a scholar expert in statistics applied to social research. Particularly, Prof. Maggino investigates on the definition and implementation of systems of indicators, on the analysis and statistical measurement of subjective data (attitudes, opinions, preferences, perceptions, skills, ...), on the construction of models and methods of social data. Prof. Maggino introduced the topic with the following remarks: *“The definition of well-being, and consequently his observation and its monitoring, has to deal with the complexity of reality, on the one hand, and, on the other, with the limit imposed by its finiteness. In this sense, the definition and adoption of new indicators to measure the well-being of the Nations requires a paradigm shift and a mentality change in all social actors; on the other hand, it raises several methodological problems related to the complexity of reality and its observation. The panel aims to show the role of the new indicators in this perspective, highlighting how closely the methodological and technical implications bring with them also conceptual consequences.”*

The conceptual consequences are inseparable from the practical consequences: the imaginaries and narratives that underpin the ideas of well-being, equity, satisfaction of needs are 'translated' into political choices and social practices that shape the people's lives.

Participants in the Panel presented various perspectives that emphasize the interplay between knowledge, technology, power and local processes of social and global transformation: transformation that increasingly records a widening of the “scissor” not only between rich and poor, but between those who can rely on natural resources and those who cannot, between those who live in healthy environments and those who are forced to cohabit with pollution and degradation.

The main theme of the presentations was a critical reflection and a profound revision of the indicators of well-being (and of the policies which follow). The speakers called attention to other cultures, respectively, the Indian and Latin American, who embody worldviews and lifestyles very different from those - currently dominant - of Western society.

### NANNI SALIO AND THE GANDHIAN ECONOMICS

**Nanni Salio** is the President of Centro Studi Sereno Regis, that since the eighties of the last century promotes a culture of nonviolence in all its forms. In this conversation Nanni Salio emphasizes the importance and relevance of Gandhi's thought, especially in the realm of economics. In 1909 Gandhi wrote a booklet, *Hind Swaraj*, which summed up his conception of nonviolence in the field of politics and economics, laying the foundations for the future “school of Gandhian economists”. In his analysis Gandhi developed a harsh criticism of the “modern Western civilization”, in anticipation of the main aspects of today's systemic crisis (economic, ecological, social), and outlined an alternative model of development and lifestyle, nonviolent and sustainable. Gandhi also introduced critical elements useful to the current debate about the role, limits and dangers of techno-science: such critical issues were subsequently developed, among others, by Jerry Ravetz, Silvio Funtowicz and Vandana Shiva. In 1935 Richard Gregg was inspired by Gandhi in his work on “voluntary simplicity”: a theme then taken up by other authors such as Schumacher and Helena Norberg-Hodge, and from the school of the “degrowth” of Latouche. Gandhi's ideas were tested in India, during the struggle for independence, thanks to the collaboration of Vinoba Bhave and Joseph Kumarappa, and were systematized by Romesh Diwan, who proposed a model of nonviolent economy, providing a clear theoretical and practical basis from which to build an alternative to the current global systemic crisis.

Nanni Salio, after pointing out that a number of experiments on a small scale towards sustainability are underway in various parts of the world (demonstrating the relevance of the Gandhian message) underlines the need for an effort by the university cooperation institution to network with these realities, that offer narratives and experiences quite different from the imaginary still dominant, which puts the techno-scientific innovation in the service of economic growth and competitiveness.

### SIMONE CONTU AND THE INTERPRETATION OF THE BIOPHYSICAL WELFARE

**Simone Contu** is an expert in the calculation of the Ecological Footprint (IE), an indicator that measures the consumption of nature on the part of individuals, communities and nations. The IE analyzes the socio-environmental relations from a point of view in some ways complementary to that proposed by GDP. The speaker presented a case study: once again, as in the previous report, the participants are invited to look to India. The vigorous economic

development of India in recent decades is recorded and measured by the conspicuous growth of GD. However recently some scholars, using the methodology of material flow accounting (MFA) to and from India during the period 1961 to 2008, have highlighted the growing unsustainability of the choices made by this country. The “development” is accompanied by a dramatic deterioration of the environment, with negative consequences especially for rural people and indigenous communities, who, until a few decades ago, were the largest component of the Indian population, which was based mainly on the social structure of “village”. The situation in India, with ever more numerous and intense socio-environmental conflicts, effectively and dramatically demonstrates the need to take account simultaneously of two boundaries within which the human communities must learn to live: the social limits that require to reduce imbalances that lead to poverty and social inequity, and the biophysical limits of the planet, which demand a careful and limited use of fluxes and transformations of natural resources.

Starting from the different visions of India offered respectively by GDP and by IE Simone Contu (in collaboration with Elena Camino) has provided a brief review of “development”, “progress”, “welfare” indicators that in recent decades have been increasingly designed, and progressively integrated with measures of environmental sustainability. In addition to illustrating some of the potential, sometimes the effectiveness, often the limits of a quantitative approach to the relationship between human communities and the environment, Simone Contu stressed the importance of the ideas that drive the imaginaries - the world views - and the responsibility of scholars to produce and / or sustain new concepts in order to translate them into measures and policy guidelines.

### LISTEN TO THE VOICES OF THE “STAKEHOLDERS”

**Paola Camisani** has recently completed one year of National Voluntary Service. She was engaged in such service, with Davide Vaccaro, between 2012 and 2013 at the Centro Studi Sereno Regis: they both carried on a research on socio-environmental conflicts underway in India. The two young people have collected video interviews, testimonies, films that express the voices and reasons of the parties involved (partly accessible on web site: [www.indiaincrociodisguardi.it](http://www.indiaincrociodisguardi.it)).

Paola continued the research, reflecting on the changes that have gradually affected the “international cooperation”, for a long time (and partly still now) committed to optimize the transfer of knowledge and technology from North to South of the planet. The imaginary of an unlimited economic growth, and the belief that the “developed” countries can teach to the “poor” or “developing” communities, has ruled the political scene and the economic choices for decades. The academic world has contributed to consolidate the idea of a guiding role of the West against culturally “backward” peoples in the South of the world.

Today, international cooperation and academic research must face problems and contradictions that have emerged as a result of the choices based on such vision of unlimited growth and technological pride: land grabbing, urban marginalization, pollution, social inequality, etc. In India, these contradictions have assumed dramatic proportions: a situation little known to the western public, and so far addressed in a fragmentary way by the actors of cooperation. Protest movements composed of women, peasants, natives are resisting to the process of a “development” that result in an increasing dispossession of local communities from their land, due to the construction of dams, mines, industrial plants. These movements are bearers of an idea of development which is quite different from the dominant one: they emphasize the dependence of mankind from natural systems and the urgent need to combine ecology and equity within a planet with evident biophysical limits. The voices of these communities should become a reference for academics and for the people and entities responsible of cooperation projects: we need to overcome the distinction between “experts” and “non-experts”, and build all together new knowledge and new realities.

**Massimo Pallottino and Salvatore Monni**, even if they refer to contexts totally different from India, arrive at conclusions that are well integrated with the previous ones: starting from a critique of liberal thought they propose to draw elements of reflection from ongoing movements in Latin America that offer a bio-centric perspective of the world, based on the recognition of Pachamama, Mother Earth. Within this perspective emerges the idea of “Buen Vivir”, a state of harmony and collective well-being (“good life”, not “Live better”). The Buen Vivir places at the centre the experience of each single people, and in so doing it differs from any perspective of a process of homogeneous globalization, that appears as one of the main features of the international cooperation approach. The practical dimension that characterizes many experiences of Buen Vivir is accompanied by interesting initiatives in the legal and institutional realm, as documented by the Constitution of Montecristi and by the National Plans of Buen Vivir 2009-2013 and 2013-2017, that represent an attempt to transfer the values of Buen Vivir from practice to norm.

While referring to research, experiences and reflections drawn from very different cultures and countries, the conclusions that emerge from this Panel converge in stressing the inadequacy not only of the development model based on unlimited economic growth and the superiority of western civilization, but of a vision of the world, typical of the Western world and increasingly exasperated by modern techno- science, which envisions humanity as separate from the natural systems. By the speakers and panelists who have offered their contribution an invitation has also emerged to the academics involved in international co-operation to move into a position of respectful listening towards other cultures, and to become aware that every international cooperation project aimed at improving the condition of “well-being” must be contextualized in a globalized world, where increasingly limited resources are should be distributed combining ecology and equity.

## FROM ENFORCEMENT TO DIALOGUE. LISTENING TO THE VOICES OF STAKEHOLDERS: A CHALLENGE FOR UNIVERSITY

Paola Bianca Camisani\*, Elena Camino<sup>o</sup>

\*Centro Studi Sereno Regis - [paola@serenoregis.org](mailto:paola@serenoregis.org)

<sup>o</sup>IRIS - [elena.camino@unito.it](mailto:elena.camino@unito.it)

### ABSTRACT

In the past the “international cooperation” focussed on optimizing the transfer of knowledge and technology from North to South. The imagery of a limitless economic growth and the certainty that “developed” countries could guide and teach to every other country (“underdeveloped” or “developing” countries) has dominated the political scene as well as economic choices for decades. The academia has contributed to strengthen the idea of identifying the Western world as a role model for those populations that are also culturally “backwards”. Nowadays, the international cooperation and the academia have to face issues and contradictions that arose as a consequence of these past choices (land grabbing, urban marginalization, pollution, inequality, etc.). In India these contradictions have assumed dramatic proportions, are not acknowledged by the public and, to date, are dealt with fragmentarily by cooperation actors. Mines, dams, power stations and industrial plants have made “necessary” the need to expropriate millions of peasants and tribals from their own villages, and have reduced the availability of land used for agriculture. Protest movements composed of women, peasants and tribals are opposed to these processes, and act with the aim to defend their territory and preserve their traditions. Such movements are carriers of a development imagery that is different from the dominant one: they highlight the interdependence of humanity with natural systems, as well as the urgent need to combine ecology and equity within a planet with obvious biophysical limitations. The authors undertaking this study have focussed on the socio-environmental conflicts currently taking place in India. The data were collected through video interviews, testimonies and films which reported opinions and motivations of stakeholders (some can be accessed on the web site [www.indiaincrociodisguardi.it](http://www.indiaincrociodisguardi.it)). The opinions of these individuals need to become a reference both for the academia and for people responsible for cooperation. There is the need to overcome the differentiation between “experts” and non-experts in order to build new knowledge and new realities together.

### A RESEARCH FROM BELOW

This research has been initiated through a partnership between the Centro Studi Sereno Regis, the ASSEFA Group of Torino and the Interdisciplinary Research Centre on Sustainability (IRIS), and involved the participation of two young people engaged in the Civil Service. In the year of volunteering (2012–2013) Davide and Paola have carried out a search for the presence and extent of socio-environmental conflicts in India. In such conflicts many local communities are involved, who adopt a variety of nonviolent protests against the subtraction of their goods and belongings: houses, land, rivers, forests, etc.. The preliminary results of this research made it possible to create a website ([www.indiaincrociodisguardi.it](http://www.indiaincrociodisguardi.it)) being now in progress. In this paper the two Authors aim to clarify the reasons that have led to the research and to illustrate some of the material already present in the website.

Several research centres and academic institutions have studied – from different points of view – the socio-environmental conflicts that since some decades are sweeping through India; they have analyzed the underlying dynamics and the social, cultural, economic, environmental impact according to an academic perspective. The sources of information most affordable and accessible are those published in international scientific journals, that are considered as most reliable thanks to the “peer –review” control.

However, despite the efforts made in recent years to take a multi-and inter-disciplinary look, and despite the growing opportunities for dialogue and discussion among scholars not only of different academic disciplines, but also of different nationalities, cultures, imaginaries, the contribution of academic studies to the interpretation of socio-environmental conflicts remains mostly theoretical and restricted to single disciplines. The knowledge - now very wide - provided by academic research have so far been largely ineffective in leading to solutions that allow to transcend the conflicts while respecting the rights of all parties involved.

The opportunity to surf the web and have access to non-academic material (we can say “biased”) offers interesting occasions to seize, through the multiplicity of points of view expressed, the complexity and dramatic nature that characterize many of these conflicts when they are placed in their real context.

We chose to start from video files, easily and freely accessible on websites, expressing “live” the voice of local

populations, the main players of most of these conflicts. We found many short documentaries, home movies, parts of TV news, in which images and words put us in direct contact with the “stakeholders”.

Starting from these documents we then deepened our investigation, searching newspaper articles, press releases of institutions, governments and firms, research papers, essays that would allow us to place the situations witnessed in the videos within a wider scenario.

In some cases we were able to download, or receive prior authorization, or even buy the films (mostly shot by Indians filmmakers, journalists, activists) that starting from specific situations supplied by the amateur video documents deepened the issue highlighting more wide connections in space and time.

This material, as a whole, represents an important evidence of the forms of nonviolent protest and opposition by local communities (mostly the inhabitants of small villages, or fishermen, or tribal groups living on the margins of the remaining forests of India) in front of the decisions of Indian or multinational companies and enterprises (often with the approval of local governments) to use the territories in which these communities have always been living to dig a mine, settle an industrial plant, build a dam or start a power plant.

## **KINDS OF CONFLICTS**

It is difficult to squeeze in few lines the complexity of such a heterogeneous reality. Actually, these situations are spread over a wide area, all over the vast Indian territory, and are different from each other, involving different actors each time. However our research led to highlight certain analogies: here we mention two of them.

- a) The time scale: they are mostly long-lasting conflicts, with alternating phases of conflict (sometimes violent) and phases in which the conflict seems “solved”, when in fact it is only dormant, ready to re-emerge, perhaps in new ways, with new subjects [1];
- b) the geographic scale: most of the socio-environmental conflicts in India have international or global relevance, because the flows of money, information, matter and energy that are moved in such conflicts involve realities and interests located in parts of the world far apart from the local context.

To a reading necessarily 'schematic' another feature shared by many of the conflicts concerns the characteristics of the two “parties”. On the one hand there are the advocates of “doing”, animated by the belief that human ingenuity can control and dominate nature thanks to the availability of advanced scientific and technological knowledge and tools, and holders of a power (not only in terms of economic and financial power, but also physical) capable to transform at an increasing rate natural ecosystems in artificial systems. On the other hand it is frequently read that the opponents are labelled as “naysayers”, as supporters of “not-doing”, by giving this term a negative connotation: stillness, inertia, idleness, longing, ... This interpretation is the outcome of a powerful collective imaginary of our society, often implicit and unconscious.

With regard to the conflicts on environmental issues, we focused on four themes: the construction of large dams, establishment of large manufacturing plants, opening and exploitation of mines, construction of nuclear power plants. In all cases, these are projects that are put forward at some central level (“top-down”) and presented as required for “progress” (intended as economic and industrial development of the country), and whose implementation implies the involvement, often adverse, of the local communities living in the selected areas (farmers, fishermen and indigenous peoples).

### **The building of large dams**

Since the 60s of last century, the Indian government has put in place ambitious programs that involve the construction of an extensive system of dams in order to meet the growing energy needs of the nation, bring water to irrigate large areas and to quench the thirst of great urban centers. Alone, the “Narmada Valley project” envisaged building 30 large dams, 135 medium and 3,000 small dams. Not all have been realized, however it is estimated that to date have been displaced - just for this program - between 16 and 40 million people [2]. For some years now the government is working on a new project that foresees the construction of an intricate system of dams on the slopes of the Himalayas. Farmers, herders, and tribal populations of the areas that are expected to be under water struggling for years against the decisions of the central government and federal in order to avoid abandoning their places of origin. Others, whose homes and land are now under water, ask to receive at least the economic compensation, which never arrived.

### **The building of nuclear plants**

To meet the energy needs of a growing population both numerically and in consumption, the Indian government is putting in place a comprehensive nuclear program. This program aims to achieve the energy availability of 14,600 MW by 2020 and provide 25% of energy needs through nuclear power by 2050 [3]. The building of nuclear power plants requires not only a huge economic effort, the occupation and militarization of a large area, the re-release into the sea of water at a temperature higher than that picked up. The exercise of a nuclear plant implies, as input, feeding with nuclear

fuel extracted from mines (uranium and thorium), and as output the production of radioactive waste whose disposal still remains problematic. Not only local groups (mostly fishermen and farmers who are directly affected) oppose against the construction of nuclear power plants: also organized groups at the international level are opposed to the production and handling of radioactive material, which can have persistent and large range effects and can be converted to military use.

### **Industrial plants**

To promote the economic development of the country, the Indian government in 2000 launched a plan that included the establishment of Special Economic Zones (SEZ): geographical areas identified in order to attract foreign capital and to encourage the installation of productive activities, which are subject to legislation substantially facilitated as regards labour and taxes. The industrial production requires huge amounts of energy and matter, and occupies large areas of land. In addition waste from manufacturing processes - often not properly disposed of - pollute the environment and spoil the landscape. Such situations lead to interfere with the economic, social and cultural life of the communities in which they are installed. As many plants require large areas of land, these are subtracted to the inhabitants, who are forced to leave their villages, or are compelled to work in the factories, with rules and working conditions often to the limits of exploitation and security. In many situations local communities rebel against this situation, often with nonviolent methods, and are confronted with paramilitaries troops and forces who, recruited by these companies, and with the consent of the government, interdict access to the areas traditionally occupied by the inhabitants, and given now in concession to the owners of the establishments.

### **Extraction of minerals**

India is a country rich in mineral resources, and is located at the top for the production of some minerals that are considered "strategic": coal, iron ore, chromite and bauxite. Most of the mineral deposits can be found in the greenest regions of the country, rich in forests and streams. The forests of the so-called 'iron belt' are inhabited by a number of Adivasi communities, indigenous peoples for whom the natural environment is not only a valuable source of livelihood, but also has an important religious, symbolic and social significance. The intensive exploitation of mineral deposits devastates the land with often irreparable damage, pollute the air and water, uproots people and communities. This gives rise to the opposition by many local populations across India, protesting against the ravages made by mining activities. Among the minerals that are mined there are also uranium and thorium, of which the Indian State need increasing amounts to feed the nuclear power plants already present and those it intends to build. The inhabitants of the places of extraction of radioactive materials since many decades are fighting to expose damages caused from the extraction, storage and transportation of these minerals on people's health and living systems of the affected areas.

### **Common traits in different conflicts**

To suffer the consequences of processes connected to industrialization and increased consumption are those who belong, according to the Western imagination, to the poorest social strata. Actually, in many cases these communities do not consider themselves poor, on the contrary: they are rich in social relations, culture, well-being, to the extent that they can draw on the produce of the land, the forests, the sea [4]. By subtracting their natural goods they are forcibly transformed into "ecological refugees", dispossed people.

The interventions mentioned above subtract land to farmers, peasants, tribal people Dalits who traditionally depend on the land for their livelihood. The ideology of development, which sees the industrialization as the means to increase the income of the people in order to achieve the 'progress', has forced millions of people to lose their homes, their small plot of land, the access to coast. As pointed out by Martinez Alier [5], to suffer the consequences of the growing ecological deficit are and will be more and more the communities who depend directly on local biocapacity, and are therefore dependent on the health and productivity of the ecosystems in which they live. In the Indian social system (and not only ...) these are low-income communities, whose assets are often not convertible into cash. Instead, those who belong to the richest sections - even if they do not have direct access to natural resources - have enough money to buy food and consumer goods, sourced locally or imported from abroad.

The conflicts that we investigated are taking place locally, but are expressions of national and transnational issues. The global nature of these conflicts is given not only by the correlations between distant realities in a globalized world, but also by the presence of several similarities.

These conflicts arise from two different visions of reality and development: one that relies on economic and industrial growth, and the other aimed at achieving equity and sustainability. The imaginary of economic development delegitimizes one of the parties in conflict, often stereotyping those who defend their territory such as anachronistic, nostalgic, struggling against the natural flow of the story.

They are asymmetric conflicts. On the one hand there is the state and / or multinational companies, with powerful economic means and control over media, on the other hand movements are composed of farmers, fishermen, women and tribal people who do not have access to financial resources or to the media.

They include forms of structural violence: the projects are imposed from without consulting the parties involved.

Any form of opposition is repressed by force and often with deployment of police forces. The more powerful party in the conflict usually stands as a champion of legality, democracy and development, accusing opponents of being violent and subversive. Often however, it is the dominant party that eludes state laws and the rights of the populations who are opposing to major infrastructural projects.

Conflicts arise for the defence of one or more ecosystems against the perspectives of intensive exploitation by the government and / or where the alleged owners who normally reside in areas away from the place. They are conflicts in which the movements fight for the recognition of needs that were previously not considered because it was assumed that they could be satisfied: having enough healthy food, clean water, shelter from the weather and so on. The reason for the conflict is not the preservation of nature as such, but the safety of some sections of nature as living spaces of some communities. In economic terms a habitat can provide important resources to the livelihood and for the production of goods, while in cultural terms it provides social and cultural meanings that transcend material aspects.

Many of these conflicts are made invisible because they take place in periphery (suburbs of the cities, remote places in the country sides, South of the world), far from the eyes (and interests) of affluent citizens. The mass media, controlled by the dominant power are able to mute the voices of dissent and to manipulate information about the nature of the conflict.

The erosion of ecosystems undermines the basis on which the livelihoods of some communities relies and in many cases it can lead to situations of extreme poverty. Poverty is not just about low income: it regards also other aspects such as the possibility to access to nature and to basic public services, and the right to participate in decision-making processes. As already mentioned, those who hold low incomes do not necessarily live in situations of poverty if they are able to rely on nature and social networks: the case of subsistence economies that are based on values other than those expressible in money terms.

## TESTIMONIES AND EVIDENCES FROM BELOW

We refer to the web-site [www.indiaincrociodisguardi.it](http://www.indiaincrociodisguardi.it) for a wider overview of the evidences that we have gathered.

In the next pages we present some case studies, introducing each of them through the voices and the images of the communities involved. Such “bottom-up”, emotional and emphatic perspective is then enriched with a historical setting of the conflict, and a reflexive overview based on essays and research articles produced by NGOs, grassroots organizations, research and academic centres. We also seek to extend the boundaries of the geographical and social context, in order to seize the international or global relevance of the issue.

### Uranium mines – Jadugoda

#### Video evidences

- a) *Buddha weeps in Jadugoda, Ragi Kana Ko Bonga Buru, INDIA, 1999.* The destruction of the natural environment and the social impact of a uranium mine in Jadugoda.
- b) *Jadugoda the black magic, by Shriprakash, India, 2009.* Documentary based on the 2007 study, Black Magic of Uranium at Jadugoda, conducted by the Indian Doctors for Peace and Development, explores the harsh realities of indigenous peoples living near the Jadugoda mine, mill and tailings dam.
- c) *Toxic Neglect, Moushumi Basu, India, 2011.* Documentary about Jadugoda narrated by the villagers themselves. It shows the impact of radiations on local population.

#### General Info

The Jaduguda Mine is an uranium mine located near Jaduguda village (Jharkhand). The exploitation of the mine began in 1967 and recently new deposits has been discovered in the area. Jadugoda is the main source of uranium for all India. In Jadugoda, there is a constant exposure to low level radioactive emission. Waste from the mines is dumped in open fields, and uranium ore is transported in uncovered dumpers. The company supplied mine tailings as construction material to the villagers. The Santhal, Munda and Ho tribes who live near the mining operation areas are badly affected: children are born with swollen heads, blood disorders and skeletal distortions.. Animals such as cows and buffaloes are suffering from rare diseases.

According to the Uranium Corporation of India Limited - UCIL (a Public Sector Enterprise under the Department of Atomic Energy), the various studies carried out by experts have proved beyond doubt that the diseases prevalent in the villages around UCIL workings are not due to radiation but attributed to malnutrition, malaria and unhygienic living conditions etc. Fear of radiation is essentially human made and mediated phenomenon by a small section of the media without checking out the facts. Most of the apprehensions are based on a false understanding of the facts

(<http://www.ucil.gov.in/web/myths.html>).

The affected communities organized many forms of protest, as stage dharnas (method of seeking justice by sitting at the door of one's debtor or wrongdoer and fasting until justice is obtained) and demand job and cash compensation from time to time.

In July 2013 the UCIL announced that new rich deposits of uranium between existing uranium mines near Jadugora have been discovered. According to the Director and Corporate Communication, UCIL: "The findings will certainly expand the life of country's first uranium mine in Jadugora by at least five to six years".

### Main stakeholders

- Uranium Corporation of India Limited (UCIL): a Public Sector Enterprise under the Department of Atomic Energy; Central and State governments.
- Groups of local inhabitants displaced for mining operations, people living in villages affected by radiations. Several NGO supporting the fight - Jharkandi Organization Against Radiations (JOAR), Jharkhandi Organisation for Human Rights and the Bindrai Institute of Research and Social Action.

### Academic sources

### The larger context

According to the Indian programme to expand the nuclear energy sector, intensive researches in the field are been done searching for new uranium mines, in order to reduce the dependence of the uranium fuel supply from other countries. UCIL signals that new projects are starting up:

- A large uranium reserve in the carbonate host rock near **Tummalapalle** (Andhra Pradesh) has been planned for development. All clearances including approval of Government of India have been obtained. Construction activities for an underground mine up to a depth of 300m and a processing plant based on alkali leaching (under pressure) technology have been initiated.
- Near **Lambapur** (Andhra Pradesh) substantial uranium reserves have been identified and UCIL is in the process of obtaining clearances for construction of three underground and one open pit mines in the area and a processing plant at Seripally, 52 k away from the mine site.

The extraction activities of uranium minerals are strictly connected to the functioning of nuclear power plants.

Conflicts related to mines are quite similar to those concerning installation and operation of power plants: one of the most recent and controversial case is that going on in Tamilnadu, near to the village of Kudankulam.

## Nuclear power plants - Kodankulam

### Video evidences

- a) *Selvi, J. Karat, India, 2013*. Selvi was 10 yrs old when she first participated in an anti-nuclear protest in Kanyakumari. In this interview, she talks about how she feels deceived and unsafe with a nuclear power plant in her backyard (<http://www.youtube.com/watch?v=R88J4sOX6A0>).
- b) *Vennila, J. Karat, India, 2013*. Vennila is a young woman who was born and brought up in Idinthakarai, the

present hub of the Koodankulam anti-nuclear protests. She describes her life in the village and why freedom is the dearest thing to her. The documentary is made by an activist herself (<http://www.youtube.com/watch?v=FvLkYVfpsNE>).

- c) *Tamizharasi, J. Karat, India, 2013*. Talks about the indifference Tamil Nadu government has shown towards the anti-nuclear protestors of Idinthakarai and how she believes that in the end, victory will be hers. The documentary is made by an activist herself (<http://www.youtube.com/watch?v=qgMCNIsKYvU>).

## General info

Uranium mined in Jadugonda is used also in Kodankulam nuclear power plant (Tamil Nadu). The plant is the result of an inter-governmental agreement made between India and Russia in 1998, establishing that the Russians were expected to provide the reactor designs and supply the major equipment. Tamil Nadu will receive 925 MWe out of the 2,000 MWe to be generated from the two reactors at Kudankulam. Karnataka will receive 442 MWe, Kerala 266 MWe, Puducherry 67 MWe and the unallocated share will be 300 MWe. The construction on the plant began on March 2002, but faced several delays due to the anti-nuclear protests voiced by locals, occasionally supported by international grouping. The first reactor of the plant attained criticality on 13 July 2013 and the plant is now operating.

According to the villagers, no public hearing was held, it is an authoritarian project imposed to people. More than 1 million people live within the 30 km radius of the plant, which far exceeds the Atomic Energy Regulatory Board stipulations. It is quite impossible to evacuate so many people quickly and efficiently in case of a nuclear disaster.

The people of Koodankulam village were misled by false promises such as 10,000 jobs, water from Pechiparai dam in Kanyakumari district, and fantastic development of the region. Fishermen claim that the warm water released from the plant can impact on the fish catch and will effect on life and livelihood of local inhabitants. Anti-nuclear protests continue to reverberate in the Idinthakarai village, the fishing hamlet which has been the ground zero for protests for almost two years. SP Udhayakumar, Convenor of the People's Movement Against Nuclear Energy (PMNAE), the organisation which has spearheaded the protests, said the protests will continue since satisfactory answers have not been given by the authorities regarding safety issues concerning the plant, which he said was commissioned in a rush.

To allay the fear of local peoples over safety of the plant, the Atomic Energy Commission had set up an expert committee which concluded in its report that KKNPP meets with all current safety requirements and is thus safe for operation [6].

## Main stakeholders

- Local populations - People's Movement Against Nuclear Energy (PAMNE).
- Nuclear Power Corporation of India Ltd. (NPCIL) - Atomic Energy Regulatory Board (AERB) - Ministry of Environment and Forests (MoEF) - Tamil Nadu Pollution Control Board (TNPCB).

## The larger context

As of January 18, 2013 in 31 countries 437 nuclear power plant units with an installed electric net capacity of about 372 GW are in operation and 68 plants with an installed capacity of 65 GW are in 15 countries under construction. (<http://www.euronuclear.org/info/encyclopedia/n/nuclear-power-plant-world-wide.htm>). 29 are under construction in China, 7 in India, 11 in the Russian Federation.

The conflict in Kudankulam is only one – the most present actually in the media – among a number of similar conflicts present worldwide. But the information on the media is scarce, perhaps due to the military and strategic relevance this issue.

Problems still unresolved at the Fukushima plant feed the hopes of those who want to abolish nuclear power plants. On the other hand, many see in nuclear energy a partial solution to global warming.

## The Renuka Dam

### Video evidences

- *A Dam Old Story, Tarini Manchanda, India, 2010.* A film about Himachal Pradesh's precious Renuka Valley - home to biodiverse forests, fertile lands and people who have been living and farming in India's northern mountains for generations. This valley lies in the submergence area for a dam project that is meant to supply Delhi with water. The film takes a look at the stakes for this dam, and asks whether Delhi needs this dam or Himachal's water, at all (<https://www.facebook.com/video/video.php?v=278815012131675>).
- *Renukaji in Delhi's taps, Kurush Canteenwala, India, 2009.* A documentary made as part of the Infochange Media Fellowship 2009 starts in thirsty Delhi and travels to the Renuka valley (Himachal Pradesh) where families in 17 panchayats will be thrown off their fertile land to make way for the Renuka dam that will supply water to Delhi. Those living in the area point to the many crops they grow and from which they make a decent living, and ask what they can do and where they can go when their land is taken away. The documentary highlights the powerlessness of ordinary people in a democracy and skewed city development that has destroyed Delhi's own water resources and causes it to prey on the resources of people 300 miles away (<http://bllip.tv/infochange/renukaji-in-delhi-s-taps-3344044>).

### General info

About 300 km north of Delhi in the Sirmour District of Himachal Pradesh, a controversy is brewing over plans to construct the Renuka dam in order to supply drinking water to Delhi at a cost of 3900 crore (\$ 860 million). The dam has been proposed on the Giri River in Himachal Pradesh and is expected to provide Delhi 275 million gallons of water a day. In 2010 concern was expressed by governmental people that further stalling of the project will jeopardise the city's water security.

In 2011 the Renuka Dam project has crossed a major hurdle with the National Green Tribunal (NGT) giving a go-ahead to HPPCL to award compensation to those whose land has been acquired for it.

The project is expected to displace 750 families in 37 villages, and about 1600 hectares of fertile land and forests (including part of a wildlife sanctuary) will be submerged. Sirmour has relatively poor infrastructure and health facilities with nearly 23% of households residing below the poverty line. A report on the project says, as a result of submerging land, there is little doubt that the dam will “directly affect the food security and sovereignty of the families”.

In 2012 the villagers protesting against the land acquisition have alleged the district collector of forcing Gram Sabhas (village councils) to pass illegal resolution in favour of the developers. In August 2013 a group of non-governmental organisations has urged Union Environment and Forests Minister to hear the local people's viewpoint on construction of this hydroelectric project.

### Main stakeholders

- Himachal Pradesh Power Corporation Limited (HPPCL).
- 750 families in 37 villages.

### The larger context

The construction of the dam attempts to solve the problem of the water supply for the city of Delhi, which has a population of nearly 14 millions (2011). Water shortage is a growing problem in Delhi, and it affects primarily slum dwellers (<http://www.youtube.com/watch?v=AcZCSEZ7JV0>). Faced with limited reservoir storage, aging piped infrastructure, and rapidly growing demand, no Indian city today has a continuous water supply. The drinking water requirements of most of the mega cities in India are met from reservoirs of irrigation/multi-purpose schemes existing in nearby areas and even by long distance transfer. Delhi getting drinking water from Tehri Dam and Chennai city from Krishna Water through Telugu Ganga Project are typical examples.

#### WHY A RESEARCH ON VIDEO TESTIMONIES

As we have shown, in tackling socio-environmental issues in India we focused mainly on direct video sources produced by amateur video makers, activists, local committees. Often images are raw, shot with mobile phones or other means of fortune, through which the various stakeholders report on their experiences and expose their views about the events in question. We believe that this approach is important for several reasons.

The reasons expressed by villagers and activists, and the opinions and reflections about the social and environmental impact reported on the web sites of the movements themselves, are the free testimony of people who live in a well known context, and want to express their point of view on the issue. A point of view which proposes a different narrative about development as compared to the most widespread and dominant view. This narrative is more attentive to the needs of local people and more aware of the impact on the environment and human health. As stated by Baviskar [7], now that the misuse and abuse of the environment are becoming increasingly contested, we need new perspectives for understanding issues socio-environmental conflicts. The analysis of the conflict from the perspective of those who suffer from these dynamics can be a useful approach to promote a deeper understanding.

Communication by means of video images represents a stark and direct expressive means. On the one hand it is an easy tool to use for those who want to communicate ideas and to witness a reality. On the other hand, mainly thanks to the images, the ideas it conveys can reach a larger and more diverse public than the written word, engaging on a rational as well as an emotional level both the academics of the prestigious universities, the interested citizens and the illiterate peasants unaware of what is happening outside their own territory.

#### A CHANGING PERSPECTIVE

Since several years actors of cooperation and scholars are critically questioning the mainstream approach to development. To name just a few among many, Escobar [8], Malighetti [9], Esteva, [10], Sachs [11], Dreze & Sen [12].

Meanwhile a radical criticism is undermining the basis of the mainstream techno-scientific approach, ever more dependent on the financial and economic power: “According to the ‘post-normal’ science perspective, the ideal of rigorous scientific demonstration is replaced by that of open public dialogue. Citizens become both critics and creators in the knowledge production process as part of an extended peer community. Their contribution is not to be patronised by such labels as “local”, “practical”, “ethical” or “spiritual” knowledge. A plurality of co-ordinated legitimate perspectives (with their own value commitments and framings) is accepted. The strength and relevance of scientific evidence is capable of assessment by citizens. All sides come to the dialogue ready to learn, or else the process is a sham.” [13]

According to this perspective, it is hoped that academia, cooperation operators and civil society undertake joint pathways of research and action, in which the distinction between ‘experts’ and the public / users is definitely removed. An example of the institutional acknowledgment of such new approach may be *EJOLT* (Environmental Justice Organizations, Liabilities and Trade), a large collaborative project bringing science and society together to catalogue ecological distribution conflicts and work towards confronting environmental injustice (<http://www.ejolt.org/>) [14].

#### NON VIOLENCE AS A MEAN AND A GOAL

A relevant aspect that emerges from the video material we have looked at is the prevalence of a nonviolent approach on the part of local communities in India. The ancient roots of India civilization resurface in the struggles that rural communities are leading, all over the country, with the aim to defend their land and culture, and the spiritual

relationship with nature.

From Gandhi to Martin Luther King, to get to the case studies that we have examined, nonviolent movements have repeatedly been shown to be able to deal with (and sometimes overcome) crises and conflicts, proposing agreed solutions based on the needs of the community at large. However, they often find themselves in an asymmetrical position with respect to the other party, represented mostly by national or super-national institutions, who enjoy a much larger financial and economic power, and exert a strict control over the media.

Since 1983 Robert Chambers [15] contended that researchers, scientists, administrators and fieldworkers rarely appreciate the richness and validity of rural people's knowledge or the hidden nature of rural poverty. His suggestion was "to put the last first". In 1997 he modified his sentence, claiming that it was necessary "to put the first last" [16]. With this in mind the leaders of international cooperation and academic research might definitely chose an approach to the problems that involves listening and enhancing the 'voices' coming from the stakeholders directly involved, and from movements active on a local basis and committed to protect the human rights and promote environmental sustainability. Such attitude might help to promote a transformation in two important areas:

- a) it would enable questioning and gradually overcoming the imaginary hold by the techno-scientific, objective "experts", who increasingly address research projects towards unsustainable scenarios, drain funds and shape the decisions of the powerful, actively contributing to social and environmental unsustainability;
- b) it would allow the imaginary of equity and sustainability to translate into narratives composed thanks to the contribution of all stakeholders' voices, promoting decisions that respect human rights and nature, based on non-violent tools and aims.

Now the voices of the rural communities are more easy to find, as we have shown: the web is a rich source of information, if one is just willing to sail on it and listen. Our website, [www.indiaincrociodisguardi.it](http://www.indiaincrociodisguardi.it), is only a little example, focused on India, but the material that we collected is really worth to be seen and listened to.

## SUSTAINABILITY: FROM THE IMAGINARIES TO THE INDICATORS...AND BACK? THE CASE OF INDIA

Simone Contu<sup>\*</sup>, Elena Camino<sup>°</sup>

<sup>\*</sup>IRIS, Interdisciplinary Research Institute on Sustainability - [simonecontu@yahoo.it](mailto:simonecontu@yahoo.it)

<sup>°</sup>IRIS, Interdisciplinary Research Institute on Sustainability - [elena.camino@unito.it](mailto:elena.camino@unito.it)

### ABSTRACT

The vigorous economic development occurred in India in the last decades has been documented by the conspicuous growth of GDP. However recently Singh et al. (2012), by quantifying flows and transformations of matter through India in the period from 1961 to 2008, highlight the growing unsustainability of the choices made by this great country. The 'development' is associated with an increasing deterioration of the environment, with dramatic consequences especially for rural populations and indigenous communities, which were, until a few decades ago, the largest component of the Indian population, mainly based on the social structure of the "village". India is home to ever more numerous and severe socio-environmental conflicts. The situation in India impressively demonstrates the need to take account of two boundaries within which human communities must learn to live: the social limits that require to reduce social imbalances that are cause of poverty and inequity (Rowarth, 2012), and biophysical constraints of the planet, that require a restricted and cautious use of humans' powered flows and transformations of natural resources (Rockstrom et al., 2009).

In our contribution we will offer a brief review of indicators and indices of "development", "progress", "well-being" that in recent decades have been increasingly compared, combined and finally twisted with measures of environmental sustainability. We will outline some of the imaginaries and narratives that characterized the academic research in this area.

In addition to illustrating some of the potentialities, sometimes the effectiveness, often the limits of a quantitative approach to the relationship between human communities and the environment, we will try to highlight the importance of the ideas that drive the imaginaries, and the responsibility of scholars in producing and / or accommodate new concepts and translating them into "scientific" measures and policy guidance.

*All dialogues have to cross borders—cultural, political and, above all, psychological. [...] Dialogue of cultures can acquire new depth if it engages communities and cultures at the receiving end of the system and reaffirms their right to intellectual—yes, intellectual, not only social—dignity. The oppressed do have their own, often-implicit theories of oppression and have no obligation to be guided by our ideas of the scientific, the rational and the dignified. They have every right to be historically, economically and politically incorrect. [1]*

### WHY INDIA? WHICH INDIA?

One of us had the chance to get to know - since years '80 of 1900 - the situation and background of some most deprived and marginalized communities of rural India. Moreover she had the opportunity to observe and somehow partner the conceptual development and the field work of a Gandhian NGO, the Association for Sarva Seva Farms (ASSEFA). ASSEFA is primarily a "movement", committed "to the up-liftment of the social, cultural and economic life of all and to establish self-sufficient, self-reliant and self-managed communities based on the principles of love, sharing and social justice" (ASSEFA annual Report 2013)<sup>1</sup>.

In recent decades, while Indian GDP (gross domestic product) was going up, rural communities involved in ASSEFA projects were facing increasing difficulties to cope with the deteriorating economic and socio-environmental conditions. Rampant urbanization, failing monsoons, declining groundwater levels, rising costs of food and commodities conflicted with the narratives of the "shining" India. In Italy a growing number of people withdrew its support to ASSEFA projects, in the belief that India was now become rich. A powerful imaginary was driving people's thinking: India was perceived as a nation moving from low to high income, from underdeveloped to developed, from "third" to "first" world partner. Indians were finally moving from backwardness to modernity, as evidenced by the growth of GDP.

<sup>1</sup> ASSEFA is based in Tamilnadu, but projects are going on in 8 Indian States. In 2013 ASSEFA staff and volunteers are 3864. The women self-help groups (SHGs) are now between 200 and 250; 629 teachers – with innovative school programs, which include yoga and non-violent education - take care of more than 15.000 students in 130 schools.

## AN IRRESISTIBLE TENDENCY TO CLASSIFY AND SORT

The dialogue – always respectful and loving – intertwined with the leaders of ASSEFA resulted in an increasing dissatisfaction and questioning with regard to many aspects of the life and culture of the “First World”. The peripheral point of view of Indian villages shed light on the peculiar characteristics of the Western thought [2]: the haunting objectifying approach to the world and the overwhelming propensity to label, categorize and sort “objects” even when they are incommensurable entities (as cultures and traditions), driven by an unwarranted feeling of superiority towards other civilizations.

The objectifying approach to the world is also at the root of the western scientific thought, together with the presumed “neutrality” and “universality” of science, and the trust that modern techno-science offers both an accurate, quantitative description of the world, as well as instructions and tools to take action in order to solve any kind of problems. The cloud of data of any sort that go mushrooming up - supported by the exponential increase in storage capacity and data handling of modern computers - show however the difficulty to reassemble the complexity of real-life contexts from data collected from a multiplicity of measures taken thanks to fragmented analytical views. According to Bateson [3: 165]: *“The continuum of nature is constantly broken down into a discontinuum of variables in the act of description”*.

The critical approach to western civilization and science was advanced in India by Gandhi more than a century ago in the booklet *Hind Swaraj*<sup>2</sup>: *“This civilization is such that one has only to be patient and it will be self-destroyed”*. (pag. 19). Such critical approach included also western science, as it was recently recalled by Anup San Ninan [4] . According to his in-depth examination of the original writings of Gandhi and his associates, the author concludes that Gandhians *“engaged science and technology as a contextually contingent social process and integrated it into a mass political movement, by identifying techno-science as a site of political action”*.

## DATA COLLECTION IN THE GLOBALIZING WORLD

Obviously data are important: specifically, as regards the efforts being made to monitor the process of globalization and to measure the consequences of the burden that the increasing human presence is loading on the planet, we are witnessing a growing amount of relevant information describing and documenting the huge transformations that are going on in the global natural stocks and flows. But while data collection proceeds fast and quickly, the gap between the ability of collecting data and the inability to take action to reverse the trend is becoming increasingly clear. Data may be collected, assembled and managed in many different ways: sometimes there are conflicting results between different disciplinary views, and even within the same field interpretations may contrast. Moreover skepticism is growing about the effectiveness of the quantitative, techno-scientific approach in offering wise solutions to the present world crisis: some authors are very much concerned about the unintended, unforeseen and unknown consequences of the human manipulation of the Earth ecosystems.

Among the many approaches suggested to cope with the uncertain future of humans on the Earth, we focus here on two strategies that are significantly divergent.

### The quantitative, objective, reliable approach

This approach points to multiply the collection of quantitative data, in the perspective of developing increasingly effective techno-scientific tools to monitor and modify eco-socio-systems. Engelman [5: 17] underlines that “metrics matter”: *“if we are to manage our way to a sound environment and a durable civilization, we’ll need to weight rigorously our progress in ways scientists can support and the rest of us agree on”*.

Experts of all disciplines are deeply involved in researches aiming to collect data in their own fields, from social to natural fields, with the aim of contributing to describe – for the first time in the human civilization – the global state of the Earth, of providing measures to deal with emerging problems and to attain “progress”. Within this imaginary, the role of indicators is growing in importance and relevance.

Perhaps the first indicator, that dates from the middle of the last century, was the GDP, the market value of all officially recognized final goods and services produced within a country in a given period of time. Even if it has been recognized as coarse, simplistic and misleading from the outset (e.g. [6], [7]) it is still largely used to classify and compare nations’ performances and to guide policy.

In the last decades the academic world produced a proliferation of ever new indicators, ranging from disciplinary - based on economic or ecological parameters - to highly interdisciplinary indicators, to the most recent “sustainability” indicators. As a recent paper underlines [8], the appreciation of the role of quantification and the setting up of reliable indicators to monitor the development of our current society grew gradually in the last decade of the XX century. Today the crucial role of indicators is evident, and their use is accepted in an increasing number of fields.

In parallel with the collection of data on single aspects, there is a growing concern to integrate analytical information within a systemic view [9]; Rockström et al. [10] focused on a number of biophysical parameters in order

<sup>2</sup> <http://www.mk Gandhi.org/swarajya/coverpage.htm>.

to trace the “outer limits” that humanity should not exceed, while Raworth [11] underlined the need to not overstep social boundaries.

However “*we have had considerable success in building measurement tools, but less in knowing how to use them, or for what ends*” [8: 1]. Authors underline “*the enormous room for innovation, tempered by the humility to recognize the limitations of our tools and the wisdom to know when their use is appropriate*” [8: 2].

As Jørgensen et al. [12] underline in a recent review of ecological indicators, “*the guiding paradigm of the indicator activities in the last 10 years has been the idea of sustainability, which strongly demands for the three pillars of environmental, social and economic aspects*” [12: 8]. But since achieving sustainability is fundamentally an ethical challenge [13] value-based indicators are needed – according to the author - to measure and motivate the ethical principles necessary to guide the transition toward sustainability. So, how to reconcile the feature of the supremacy of the scientific approach – ascribed to neutrality and objectivity of data collection – with the acknowledgment of an unavoidable “value” component?

### **The qualitative, systemic, value based approach**

The other approach to cope with the uncertain future of humans on the Earth dates back to ancient civilizations, and has barely survived to the spread of the aggressive western imaginary. It is based on a deep awareness of the human dependence on natural systems, on the need to adapt and develop resilience to ever changing conditions and evolving situations, and on the acceptance of the inescapable ignorance that characterizes human condition.

For people interested to learn from other world views, and willing to listen at the narratives of other cultures, the acceptance of the limits of human power, a cautious use of technology, a respectful attitude towards natural forms and processes have always been present. Such worldview, rooted in the distant past and evolved through millennia, allowed many civilizations to survive and develop in all varieties of ecological conditions. Qualitative, contextually rooted experience and the awareness of the inter-being of all living forms were translated into knowledge and rules governing the conduct of the communities.

### **Old and new narratives**

The mental processes of “data collection”, concept formation and retention, and worldview production among every civilization follow patterns consistent with the language used, as language shapes terms and concepts. Every society has its own understanding of how the natural world works, a repertoire of habits, skills, and styles from which members of a society construct their livelihoods. According to the level of proximity / separation disregard from the natural environment, a knowledge–practice–belief complex includes or excludes an intimacy/closeness with land, animals, and plants. It also includes /excludes institutions (rules and norms) about interacting with the environment, and it produces and conveys a worldview that shapes the way people make observations, make sense of their observations and learn. The western scientific solution has been to quantify a few of the variables, whereas the solution in indigenous knowledge has been to find ways of perceiving the continuum of nature and working with it [14].

While still fiercely contested by the mainstream of the western techno-scientific society, this world view is slowly creeping into the narratives aiming to find solutions to enliven the collapsing global civilization (e.g. [15]). Qualitative, value based approaches, respectful of a variety of view, interests and sensibilities have been proposed not only by indigenous people: many “educated” people, from the East as well as from the West, have long developed a critical look on Western imaginary and related narratives: Ivan Illich, Joan Galtung, Gustavo Esteva, Fritz Shumacher, Joseph Cornelius Kumarappa, Anil Agarwal, Madhav Gadgil, Vandana Shiva, Aurelio Peccei, Laura Conti, and many others have been committed to developing a greater awareness of the need to undertake development paths respectful of views and rights of all parties - including the natural systems that host them. Such awareness (and the ensuing decisions and actions) can be developed only through a bottom-up participatory process, where all subjects are included. In tune with such view, some authors directly challenge the dominant science epistemology based on the findings of experts: “*According to the ‘post-normal’ science perspective, “the ideal of rigorous scientific demonstration is replaced by that of open public dialogue. Citizens become both critics and creators in the knowledge production process as part of an extended peer community.”* [16]

### **Indicators...**

A recent report from the Working Group on Monitoring and Indicators [17] involved in the design and collection of data in view of the post-2015 global development agenda stated that, while goals themselves may be inspirational, numerical targets should balance ambition with realism. Forward-looking development targets should reflect a clear consensus and understanding of objectives among policymakers, civil society and the public, and factor in the need to improve the living conditions of a growing global population over the next decades. Indicators of progress towards targets may take various forms; changes in rates, ratios, percentages and differences are the most common.

As clearly pointed up by Hak et al. [8: 1] “*the directions we take will be determined in part by the indicators we choose to measure our progress. This is not just a technical debate (although finding good indicators for prosperity, well-being or happiness is a technical challenge)*”.

By reviewing the most important or most used indicators designed and applied in the last decades, one can seize clues of the implicit world view that oriented scholars (mostly researchers of western academies). A quick overview shows a steady increase from an economic vision to a socio-economic scenario, followed, in recent years, by a growing concern to incorporate environmental aspects and to extend the spatial boundaries.

GDP has been joined in the eighties of last century by new indicators, taking into account a growing variety of parameters, as life expectancy, literacy and levels of employment. Only more recently changes in less-tangible factors have been considered, such as personal dignity, freedom of association, personal safety and freedom from fear of physical harm, and the extent of participation in civil society. The Human Development Index (HDI), introduced in 1990, offered a new way of measuring development by combining indicators of life expectancy, educational attainment and income into a composite index. The breakthrough for the HDI was the creation of a single statistic which was to serve as a frame of reference for both social and economic development.

As long as environmental problems were multiplying, with the increasing scarcity of natural resources and recurring pollution incidents, the need became evident to develop indicators useful to monitor a variety of parameters, from the reduction of agricultural land to the presence of toxins in streams, to the increase of CO<sub>2</sub> in the atmosphere.

In 2002 the European Commission, stimulated by the growing concern about the environmental problems, produced a shortlist of 14 structural indicators to be developed and monitored, 6 of them labeled as regarding the environment: consumption of toxic chemicals, health expectancies, biodiversity index, resource productivity, recycling rate of selected materials, generation of hazardous waste.

From static to dynamic aspects of the environmental issues, and from local to global measures and assessment: this has been the trend in the last twenty years. Indicators have been designed based on material / energy flows as Material and Energy Flow Analysis (MEFA) or Energy Return On Investment (EROI). The human appropriation of photosynthetic production (HANPP), firstly proposed in 1986 [18], has become an important clue to measure the dependence of humanity on natural processes, and the alarming trend towards a growing difference between human demand and ecosystem supply [19].

In recent years, environmental indicators have become a vital component of environmental impact assessments and “state of the environment” reporting. This has increased the influence of environmental indicators on environmental management and policy making at all scales of decision making [20]. Niemeijer and de Groot underline the need to develop a conceptual framework that focuses on the inter-relation of indicators that puts an indicator set at the heart of the selection process and not the individual indicators. The most common frameworks used in indicator based studies are the driving force–pressure–state–impact–response (DPSIR), pressure–state–response (PSR), or driving force–state–response (DSR) conceptual frameworks, which organize and structure indicators in the context of a so-called causal chain.

While most of the indicators remained confined within research centers and government institutions, a new concept was spreading also through the civil society, thanks to the ease of understanding his meaning and of calculating (even if approximately) in a variety of conditions: the ecological footprint (EF) [21]. EF is a standardized measure of human demand for natural capital (Earth's ecosystems) that may be contrasted with the planet's ecological capacity to regenerate. In 2003 the Global Footprint Network (<http://www.footprintnetwork.org/>), a nonprofit organization, was established to enable a sustainable future where all people have the opportunity to live satisfying lives within the means of one planet. It is considered by the designers as an essential step in creating a one-planet future: by measuring human impact on the Earth we can make more informed choices.

Slowly environmental concerns began to be included in the “measure” of human well-being. According the designers (<http://www.happyplanetindex.org/>), the Happy Planet Index (HPI) measures the extent to which countries deliver long, happy, sustainable lives for the people that live in them. The Index uses global data on life expectancy, experienced well-being and Ecological Footprint to calculate this. The index is an efficiency measure, and it ranks countries on how many long and happy lives they produce per unit of environmental input.

In Italy the BES project, born from an initiative of CNEL and ISTAT, recently published the first Report on “Benessere equo e sostenibile”, centred on the monitoring of twelve “well-being” indicators, ranging from health aspects, social relations, quality of services, environment etc. It represents an innovative effort to go beyond GDP (Italian PIL) in focusing on “what really counts” for Italy ([http://www.misuredelbenessere.it/index.php?id=22&tx\\_ttnews%5Btt\\_news%5D=67&cHash=9a9cf5078476c78cecf443b9810374b7](http://www.misuredelbenessere.it/index.php?id=22&tx_ttnews%5Btt_news%5D=67&cHash=9a9cf5078476c78cecf443b9810374b7)).

The Environmental Performance Index (EPI), designed by Yale University scholars, is a method of quantifying and numerically benchmarking the environmental performance of a state's policies. This index, derived from the Pilot Environmental Performance Index (2002), was designed to supplement the environmental targets set forth in the United Nations Millennium Development Goals. The United Nations' Economic and Social Council is expected to play a major role in the preparation, implementation and follow up of a post-2015 development agenda. The team brings together the efforts of more than 60 UN agencies and international organizations. A Task Team is currently focusing its analytical work on the global partnership for development, monitoring and financing for sustainable development (<http://www.un.org/en/ecosoc/about/mdg.shtml>).

... and world views

According to Hak et al. [8], as indicators move to the centre of social and political debate, we need safeguards to ensure that the methodologies for calculating indicators and the organizations or government services that generate them are objective, trustworthy and protected from political interference. Most of the newest indicators are attempting to cope with the complexity of the socio-economic situations and the natural contexts of the involved communities, and are used not only to rank the “performance” of the countries, but increasingly to direct political action [22]. Conceptually the indicators are still deeply rooted in a western imaginary, compelling to rank and sort socio-environmental performance of incomparably different communities and contexts in a single list, according to a linear progression. Powerful international institutions are prompting to direct research areas and development projects according to a narrative that conveys a Western vision of “well-being”, “satisfaction”, “happiness”, as well as a top-down approach, centered on the “experts” advise and reached thanks to technological innovations: according to Assadourian and Prugh [23] *“If we are to manage our way to a sound environment and a durable civilization we’ll need to weigh rigorously our progress in ways scientists can support and the rest of us agree on”*. Erlich’s confidence in “scientific facts” [24] is translated into the need to find frames and narratives to convince the public to behave according to experts’ advice.

The relevance of data collection, thanks to the improvements in ITC area, is emphasized by Helbing [9: 51] *“It will take a massively data-driven approach that builds on a serious collaboration between the natural, engineering, and social sciences, aiming at a grand integration of knowledge. This approach to real-life techno-socio-economic-environmental systems is expected to enable new response strategies to a number of twenty-first century challenges”*.

The powerful imaginary of techno-science is implicit in many of the key concepts leading to the research and measure of indicators: “development”, “progress”, “modernity”, “innovation”. As Kearnes and Macnaghten observe [25: 282] the narratives associated with techno-scientific imaginaries *“are premised on a set of hopes or promises of what future social life should comprise, how the human body should be envisaged, how new transportation systems and infrastructures should be developed, how future warfare should be conducted, and how technological innovation determines particular social outcomes”*.

Finally, most indicators are seeking to measure and monitor entities, as nations, whose boundaries have by now become highly porous, in the globalized world: it is the planetary level where the environmental limits to development have now become quite evident [26], and where equity and ecology are to be reconciled [7].

INCOMPATIBLE TARGETS?

There has been an abundance of targets of all types for various phenomena from the economic to the socio-environmental sustainability domain. But not a definitive acknowledgment of the incompatibility between different targets. Yet, a plot which combines two indicators (the Human Development Index and the Ecological Footprint) gives clear minimum conditions for sustainable human development and shows how much more we need to “think inside the box.”

The goal (the green square on the upper left of the plot) is the minimum sustainable development quadrant. The concept has been recently emphasized by Raworth [11] *“Between the social foundation and the planetary ceiling lies an area - shaped like a doughnut - which is the safe and just space for humanity to thrive in. The 21<sup>st</sup> century’s unprecedented journey is to move into that space from both sides: to eradicate poverty and inequity for all, within the means of the*

planet's limited resources". *With fewer words the concept was neatly expressed by Gandhi more than a century ago: "Earth provides enough to satisfy every man's needs, but not every man's greed".*

## INDIA'S CONTRADICTIONARY ASPECTS

India – this great country that counts more than 1 billion and 200 millions people – is now shaken by two incompatible world visions and targets. A few examples illustrate the gap between the Gandhian imaginary, still present in the Indian culture and courageously witnessed and pursued by root based communities and intellectuals, and the western world view, abruptly imported in the last thirty years along with the choices of the central government in league with powerful national enterprises and multinational corporations.

### Who is grabbing the land?

A Report by Rowden [27] explores the role of Indian agricultural companies that have been involved in the recent trend in large-scale overseas acquisitions of farmland, criticised as "land grabbing". The Indian government is concerned with its long-term food and water security and has loosened regulations on Indian companies investing in overseas operations. A Governmental Working Group on Agriculture Production in 2010 suggested that, like many other countries who have shopped for land abroad for growing crops to meet consumption needs, Indian companies could also be encouraged to buy lands in other countries for producing pulses and edible oils. "We should seriously consider these options," the Working Group recommended, "for at least 2 million tons of pulses and 5 million tons of edible oil for 15-20 years".

Finally, Rowden's report gives voice to those Indian activists fighting for small farmers rights and against the "land grabbing" going on within India. As Rowden reports, for Indian citizens, local political resistance to foreign corporate takeovers of local farmland is nothing new. Communities all over India have been resisting dispossession from their villages on the grounds that they have a prosperous bio-diverse economy, where food is produced according to the needs of the people: they claim that projects aiming to convert fertile land into power and industrial plants, mines, dams would reduce bio-capacity and threaten their self-reliance.

Thousands of adivasis, farmers, labourers, forest dwellers, fish workers, hawkers, small traders, urban and rural poor from across 15 Indian states and over a hundred grassroots movements rallied in New Delhi in August 2011. These groups criticised the priorities of the new draft legislation, which considers urbanisation and industrialisation (that subtract fertile lands to rural communities) as "inevitable", but not social justice and equity as necessary.

### What is poverty, and how it is measured?

*When size of income is thought to indicate social perfection, as it does in the economic model of society, one is inclined to interpret any other society which does not follow that model as "low income". [...] As soon as the scale of incomes had been established, order reigned on a confused globe: horizontally, such different worlds as those of the Zapotec people of Mexico, the Tuareg of north Africa and Rajasthanis of India could be classed together; whilst a vertical comparison to "rich" nations demanded relegating them to a position of almost immeasurable inferiority. [28]*

As Nussbaumer et al. [29] remind us, indicators are not merely data; rather, they extend beyond basic statistics to provide a deeper understanding of the main issues and to highlight important relations that are not evident using basic statistics. Even if single indicators are straightforward to handle, such metrics present a narrow picture of the issue measured. Complex issues such as human development are multidimensional in their very nature. As a compromise between the simplicity of uni-dimensional indicators and the need to account for the multidimensional nature of some issues, composite indices were created.

One of the most debated concepts is that of "poverty", and assigning weights to such complex index can be challenging and is an arbitrary and value-driven process. Shrivastava and Kothari [30] point out that there is debate on the dominant trends in poverty in India: at one extreme are market-friendly economists who have spotted a definitive reduction of poverty over the last two decades. They are concerned with measurable changes, as the rise in wages and the growing purchase of consumer durables. At the other extreme are serious sceptics, and experienced observers of local situations, with an eye for changes in the qualitative dimensions of poverty (availability of work, security of employment, working conditions etc.): they are critical towards the dominant approach based on numerical data on income, that obscures the underlying causes of poverty, such social inequality and power relations.

According to these authors [30: 87] the widespread hunger persists in India not despite growth, but perhaps because of it: the virtual dismantling of the country's food security, land acquisition from farmers for the purpose of industrialization, diverting cultivation of food towards non food cash crops are among the causes of such situation. India is exporting large quantities of food even as hundreds of millions of people are hungry, either because they are deprived of land or/and because of price inflation of food prices. Rural poverty increased also by the increasing diversion of land for creating new infrastructures (roads, ports, power stations) and for the extraction of minerals, with horrifying ecological and social impacts [30: 125]. Tens of thousands of hectares of land have been rendered completely

barren and unproductive, mining wastes poison streams and rivers. If India is to feed its own and the world's enormous appetite for minerals, millions of hectares of its land would have to be laid waste [30: 128].

The different conceptual frameworks underlying the design of poverty indicators is evident in a new indicator recently proposed by Khandker et al [31] who take into account the need of energy. According to authors, running modern economies without energy is impossible, and improving the poor's access to modern energy sources can make an important difference to their welfare and can be a catalyst for human development (World Bank, 2000). "Modern" energy is represented by liquid fuels, such as kerosene and LPG, along with electricity, in contrast with biomass fuels (wood, agricultural residue, and dung) that are defined inefficient and risky for human health and for the planet (emission of greenhouse emissions). No mention is done to renewable as compared to non renewable fuels. The paper, as clearly stated by the authors, postulates that energy is essential not only for supporting a decent quality of life but also for continued growth and productivity.

How far is this frame of mind as compared with the personal point of view of a young peasant, to whom the scenery may appear to be totally different! Remigius de Souza [32] helped his mother to make "sheni"<sup>3</sup> from the heap of dung collected in the field.. These were stacked and stored mainly for monsoon. It was a "free" energy – fuel – for cooking; this practice still continues. *"The cow dung helped us to help grow food in the farms, helped to cook our food, and helped us to maintain our mud house; thus helped us to sustain. And finally the used cow dung went to the soil"*. Since 1996 Vandana Shiva [33] observed that two thirds and more of the power requirements of Indian villages were met by the 80 million work animals. Indian cattle excrete a huge quantity of recoverable manure, half of which is used as fuel, saving a great amount of kerosene, coal and wood. The remaining half is used as fertiliser. According to Vandana Shiva, without recognising this source of sustainable energy production, scholars and economists did not mention that if animals were replaced by tractors India would have to spend more than a thousand million US dollars annually on fossil fuels, increasing dependence and unsustainability.

## TWO ALTERNATIVE PICTURES OF THE SAME COUNTRY

Singh et al. [34] try to offer a double reading of the state of India, by comparing two view points, two imaginaries. They publish in an academic journal, *Ecological Economics*, and use the concept of social or industrial metabolism and the corresponding methodology of material flow accounting (MFA) to investigate changes in India's biophysical economy, compatible to standard monetary system of accounts. Following this approach, they aim at analysing the ecological "embeddedness" of India's socioeconomic system [35].

Their paper presents an original study based on quantifying resource use trajectories for India from 1961 up to 2008, in order to explore some of the challenges faced by India and to interpret the meaning of its development rhetoric in a biophysical sense. Some of the derived indicators calculated are also presented in relation to GDP to better understand the relationship between the economy and biophysical flows. From the presented data it is evident that the increase of GDP has been obtained at the expenses of a growing dependence both from non renewable energy input, and of an increasing dependency on imports. If India with a projected population of 1.69 billion in 2050 (UN Population Division, 2010) would have the per capita material use of an industrialized country, this would boost its demand for fossil energy carriers, ores and industrial minerals by a factor of 10 to 15. India's development alone would lead to an increase of global material use by 34%.

According to authors, India needs access to energy and key raw materials, but it is extremely doubtful that it can adopt metabolic patterns typical for industrial economies. India would need a new resource revolution...

Shrivastava and Kothari, at the conclusion of their breathtaking inquiry on the recent impressive and predatory growth history of 'shining' India, urge a fundamental shift towards a radical ecological democracy. Such new way – say these authors - has to be undertaken not by India alone, but at a global level. *"We are rapidly approaching the moment when the choices before us would be stark; an institutionalized, hazardous corporate totalitarianism at indefinite war with the people and the earth, or the consensual emergence of a radical ecological democracy... The middle ground between these two choices is already beginning to vanish"* [30: 331].

## UNMASKING IMAGINARIES AND CREATING NEW BARRATIVES

Patomäki and Steger [36] hold that a sustainable global future depends on a fundamental shift from the currently dominant national imaginary to a global imaginary. Most of human reasoning is based on prototypes, framings and metaphors that are seldom explicit; although they can be forged, usually they are merely presupposed in everyday reasoning and debates. The background social imaginary offers explanations of how "we" fit together, how things go on between us, the expectations we have of each other and outsiders, and the deeper normative notions and images that underlie those expectations.

According to Rubin [37: S40] the *"process of creating images of the future is partly intentional, but it also includes*

<sup>3</sup> "Sheni" is a 3 cm thick, 30 cm in diameter disc, made by mixing water, rice husk and chopped rice straw, pulverized by feet, and the balls of mix are pressed flat by hand, and sun dried.

*subliminal elements. We build up profound presumptions and beliefs about how things are, how they have been, how they develop, and then draw conclusions on how they will be in the future*". In society, there also may be the "official truth" of the future, held by those who have authority over people and institutions, or by people who are opinion leaders in some other way. Such images of the future may never have been revealed in all their true colours and shades, or formulated into words, so that they could be publicly analysed and discussed. However as a consequence, the future they represent exists as mere presumptions, it is never questioned, and it is accepted as such.

Which kind of imaginary, what narratives are developing academic scholars in their international cooperation projects?

Swaraj (self reliance), swadeshi (self rule), sarvodaya (the well-being of all), antyodaya (care for the "last man"), ahimsa (nonviolence) may not be old fashion, obsolete concepts, surviving within a few NGOs and backward rural communities. On the contrary, they might be the keys on which build a new imaginary of the world, and contribute to design new – qualitative and openly value-laden "indicators" - both for India and for all the communities sharing the globalized spaces of our shrinking Earth.

## CULTURES OF COOPERATION: STRENGTHENING THE NETWORK WITH GANDHIAN ECONOMISTS

Nanni Salio\*

\*Centro Studi Sereno Regis - [nanni@serenoregis.org](mailto:nanni@serenoregis.org)

### ABSTRACT

In 1909, Gandhi wrote *Hind Swaraj*, which summed up his conception of nonviolence in the field of politics and economics, laying the foundations for the future “school of Gandhian economists”. In his analysis, Gandhi developed a harsh criticism of the “modern Western civilization”, anticipating the main aspects of today's systemic crisis (economic, ecological, social), and outlined a model of development and lifestyle alternative, nonviolent and sustainable. Gandhi also introduced critical elements useful to the current debate about the role, limits and dangers of techno-science taken, among others, by Jerry Ravetz, Silvio Funtowicz and Vandana Shiva. In 1935 Richard Gregg was inspired by Gandhi in his work on “voluntary simplicity”, then taken up by other authors such as Schumacher and Helena Norberg-Hodge and the school of the “degrowth” of Latouche. Gandhi's ideas were tested in India, during the struggle for independence, thanks to the collaboration of Vinoba Bhave and Joseph Kumarappa, and were systematized by Romesh Diwan, who proposed a model of nonviolent economy, providing a clear theoretical and practical basis from which to build an alternative to the current global systemic crisis. Trials are underway in various parts of the world. In India are of particular interest those conducted by Assefa, Barefoot College, Ekta Parishad and Navdanya, all inspired by Gandhian. In the West, the movement of the “Transition Towns” is carrying out numerous experiments on a small scale sustainability-oriented, demonstrating the relevance of the Gandhian message. It should be an effort by the academic co-operation to go on-line with these realities, that from the vision “Gandhian” narrative propose and experiment with very different actions from the imaginary still dominant, which puts the techno-scientific innovation in the service of economic growth and competitiveness.

### The Talisman of Gandhi

*I will give you a talisman. Whenever you are in doubt,  
or when the self becomes too much with you,  
apply the following test.*

*Recall the face of the poorest and the weakest man [woman]  
whom you may have seen, and ask yourself,*

*if the step you contemplate is going to be of any use to him [her].*

*Will he [she] gain anything by it?*

*Will it restore him [her] to a control over his [her] own life and destiny?*

*In other words, will it lead to swaraj [freedom]  
for the hungry and spiritually starving millions?*

*Then you will find your doubts and your self melt away.*

### HIND SWARAJ

The text of the talisman was found among the papers of Gandhi after his death and can be considered a kind of testament, which summarizes *Hind Swaraj* (HS) in a short, simple and incisive way.

Both works contain a message that brings together the best of the major religious traditions of humanity and should be read, as Gandhi himself seems to suggest, as a poem, of which he is the poet, in the great tradition of classic dramas such as the Bhagavad Gita: “The key to understand that incredibly simple (so simple as to be regarded foolish) booklet (*Hind Swaraj*) is to realise that it is not an attempt to go back to the so-called ignorant, dark ages. But it is an attempt to see the beauty in voluntary simplicity, voluntary poverty and slowness. I have pictured that as my ideal”. [1]

### Development models

The structural violence caused by the current model of development has reached such levels to become a sort of pandemic, as claimed by Michael Klare [2]. Gandhi saw this very clearly: “God forbid that India should ever take to industrialism after the manner of the west keeping the world in chains. If [our nation] took to similar economic

exploitation, it would strip the world bare like locusts.” [3]

The criticism of Gandhi, of Vinoba Bhave and Joseph Kumarappa, which together form a “school of Gandhian economists” anticipates the current debate on sustainability: “(While) studying the human institutions, we should never lose sight of that great teacher, mother nature. Anything that we may devise if it is contrary to her ways, she will ruthlessly annihilate it sooner or later. Everything in nature seems to follow a cyclic movement. Water from the sea rises as vapour and falls on land in refreshing showers and returns back to the sea again ... A nation that forgets or ignores this fundamental process in forming its institutions will disintegrate.” [4]

## Industrialism

A crucial point in HS which raises many accusations is the criticism of Gandhi to the machines. Over the years he was able to return to the issue. What he refused were not the machines as such, but the craze of the machines: “The craze is for what they call labour-saving machinery. Men go on 'saving labour' till thousands are without work and thrown on the open streets to die of starvation. I want to save time and labour, not for a fraction of mankind, but for all. I want the concentration of wealth, not in the hands of a few but in the hands of all. Today machinery merely helps a few to ride on the backs of millions. The impetus behind it all is not the philanthropy to save labour, but greed...” [5] Moreover: “An improved plough is a good thing. But if by some chance one man could plough up, by some mechanical invention of his, the whole of the land of India and control all the agricultural produce, and if the millions have no other occupation, they would become dunces, as many have already become...” [6].

Gandhi invents a philosophy of “intermediate technologies” that will be resumed later by Ernst Fritz Schumacher: “My machines must be the most elementary type, which can be put in the homes of millions” [7]. And in an equally natural way the spinning wheel is described as “the science reduced to the terms of the masses” [8]. He himself recalls the moment “in London in 1909 I saw in a flash that without the spinning wheel there was no Swaraj” [9].

Gandhi's critique of industrialism is extremely clear: “You cannot build non-violence on a factory civilization, but it can be built on self-contained villages. Even if Hitler so minded, he could not devastate seven hundred thousand non-violent villages. He would himself become non-violent in the process.” [10]

To criticism of Gandhi echoed those of Kumarappa: “In economics, large scale industry is the antithesis of democracy in politics. It is not by chance that the western nations have come by their economic organization. It is a result of their way of thinking in terms of autocracy. They find themselves with dictatorships in political organization, and centralized industries in the economic field. These two go together and we cannot have the one without the other.” [11]

The “Gandhian school” does not raise negative reactions only today: it happened also in those years. In addition to Ambedkar, (leader of the *Dalits*, as he preferred to call the outcasts, rather than *harijan*, a term used by Gandhi) one of the main proponents of industrialism in India was Nehru. “Pandit Nehru wants industrialisation... because he thinks that if it is socialized, it would be free from the evils of capitalism. My opinion is that the evils are inherent in industrialism, and no amount of socialisation can eradicate them” [12].

The confrontation went on until the death of Gandhi, and in a sense even after, as claimed Gvvsds Prasad: “Nehru, during the last months of his life, realized the futility of his approach, particularly after the China war in 1962. He on a number of occasions thereafter expressed the view that Gandhi's approach to India's economic policies had unexpected merits in it. He pointed out on 22 September 1963 in a debate on planning the Lok Sabha: “Agrarian reform is basic to any plan. What is the good of an institution for a few persons here and a few persons there when millions of people in the rural areas do not have a life worth living?” He further argued that what Gandhi did was fundamentally correct. The spinning wheel was a symbol for village industries, which would be needed to serve the most backward Indian villages. Nehru said: “... taking things as they are in India, however rapidly we advance in the machine age -and we will do so- the fact remains that large numbers of our people are not touched and will not be touched by it for a considerable time. Some other methods have to be evolved so that they become partners in production even though the production apparatus of theirs may not be efficient as compared to modern techniques, but we must use that; otherwise it is wasted. We should think more of these very poor countrymen of ours and do something to improve their lot as quickly as we can. This is troubling me great deal.” Nehru was disillusioned with the slow rate of the trickle-down effect, and was groping for a new model of development... Considering its openness to conviction which we find at the end of his life, it seems more than likely that Nehru would have given up his faith in heavy industry if he had been warned of the environmental consequences of the industrial model of development at the end of the twentieth century.” [13]

In the words of Nehru there is the recognition of the failure of development policies followed and imposed by international organizations (World Bank, International Monetary Fund) for decades to come. And the “shining India” even with an annual growth rate close to 10% (before the crisis) is in no way managed to reduce extreme poverty. As stated by George Kent, Hind Swaraj “served then as the basis for building self-reliance, and thus resisting the British raj. It could now serve as a basis for resisting the rule of hunger in India” [14].

These criticisms of the capitalist economy and industrialism can be summarized in what J. Charles Koilpillai proposes to call “impossibility theorems of Gandhi” [15]:

- *First impossibility theorem*: A continuous increase of material wealth does not guarantee happiness because of the tendency that has to multiply even faster.

- *Second impossibility theorem:* It will be impossible for the industrialization to provide a satisfactory solution to the economic problems of humanity.

It is worth noting that to summarize the thought of “Gandhian school” in terms of “impossibility theorems” means to help making a substantial step forward to the economic theory and bring it closer to the rigor with which the two principles of thermodynamics establish the limits of energy transformations. This is a job that only in the second half of the twentieth century will be taken up by Georgescu Roegen [16] and by the school of bio-economy and ecological economics.

## THE “SEVEN WORDS” OF NONVIOLENT ECONOMY

The theoretical framework inspired by the nonviolent economic studies produced in India and elsewhere by some economists, in particular by Romesh Diwan, identified seven key words: self-reliance, bread labour, non-possession and non-attachment, trusteeship, non-exploitation, equality, satyagraha.

1. *Self-reliance.* This term (swadeshi in hindi) indicates the absence of dependence, and the reliance on one’s own strength: a form of self-reliant development. Gandhi would regard it as the Swaraj, that is, the struggle for self-liberation of India.

2. *Bread labour.* This term means “minimal manual labour for the production of use-values”. But in general is the job category that is interpreted in quite different terms by Gandhian economy, as compared to classical economics. In the latter, work is considered a disutility by the master who would like to produce without workers, and is often seen as a nuisance by the worker who would like to receive the salary without working. In the Gandhian concept, the work is rather conceived as a normal activity for a living, a means of self-fulfillment and service to others.

3. *Non-possession and non attachment.* Gandhi believed that only those who possessed nothing were actually immune to fear. The property and the need to enjoy and have personal property are the cause of all fears, including the fear for one’s own life. So the man who is not satisfied with the bare minimum to its physical survival cannot be “nonviolent”, at least in the Gandhian meaning of the term.

4. *Trusteeship.* Again, the meaning of this word differs much from the ideas of classic economies (capitalism, communism, mixed economies), characterized by forms of private ownership of the means of production or stalized, or mixed, which are alienating the majority of the population. To overcome alienation and conflict arising from the management of the property, Gandhi proposes the method of the trust, close to the mutual cooperation. Such method is based on the assumption that no one has any right to the property that is the result of complex social phenomena, i.e. the means of production. How to achieve this? Through the “voluntary surrender” and the satyagraha. Examples of the application of such method are the experience of “nonviolent redistribution” of land initiated by Vinoba Bhave after the death of Gandhi through the program of the “Boodhan” (gift of land) and “Gramdan” (gift of the village), that inspired the nonviolent self-management in the villages, particularly the work of ASSEFA movement in Tamil Nadu and now also in other Indian States.

5. *Non-exploitation.* Production must maximize the satisfaction of human needs. Therefore it is to be rejected any technology that, while there are unemployed workers in the community, save the manual labour and favors the concentration of wealth in few hands. Otherwise people are likely to be trapped in a spiral of greed and envy, in which the rich are getting richer and the poor get poorer.

6. *Equality.* The concept of equality is inextricably linked to that of exploitation. According to Gandhi, if the masses want to eliminate the injustices of capitalist society, if they want to change the methods of capitalism, then they must strive to achieve a more equitable distribution of the products of labour ... We should no longer take care of getting what we can, but refuse to take what not everyone can have.

7. *Satyagraha.* It literally means “the force of truth” and is the moral analogous both of war and class struggle, which turns easily into violence. To make a profound social change such as that of nonviolent economy the presence is required of a nonviolent revolutionary minority that must be able to practice the satyagraha, which can be summarized in a few points:

- we must fight for a just cause;
- the struggle must exclude violence in all its forms;
- we need to distinguish between just and unjust laws;
- we must fight without hating the opponent, making a distinction between role and person;
- we have to be able and willing to accept the sacrifice and suffering imposed by the struggle;
- there has to be a concomitant commitment to a constructive program, able to anticipate a positive outcome for all parties in conflict;
- an attitude of humility has to be assumed by those who are engaged in this kind of fight;
- we must assume an attitude of seeking truth and of a sincere acceptance of discipline during the fight.

## TECNOSCIENCE

Despite not having received a scientific education, the reflection of Gandhi and his school on “science and technology” anticipates themes of extraordinary relevance. One of the key points is their rejection of technological determinism in science, technology and politics. This anticipated the most recent debate on the neutrality/non-neutrality of science, and the field of science-technology-society (STS) studies. [17]

The action of “Gandhian school” was very concrete and practical: its proponents believed that “the basic objective of science is to enhance a sustainable co-existence of humans and non-human beings.” [18] They gave birth to initiatives to develop a program of “science for the villages”, in which the priority was the “science of charka”, but ranged from health science to that of beekeeping. The AIVIA (All India Village Industries Association), anticipate the centers of “science for the people” that are inspired by a radical proposal regarding “scientists” as “the workers of a community” [19].<sup>1</sup>

Gandhi also harshly condemned the widespread practice of vivisection. More generally, with his critical work he helped to lay the foundations for an analysis of the relationship between science, “internal enemy” (literally, “intimate enemy” according Ashis Nandy [20]) and colonial rule: a theme deepened by Ashis Nandy and other authors [21].

Report of this work deserves the contribution of Shiv Visvanathan [22], with an impressive diagram linking together vivisection, factory farms and slaughterhouses, scientific management of assembly lines (which culminated even then in Fordism), concentration camps, nuclear weapons (Hiroshima and Nagasaki), starting from a conception of the body seen as a machine and denouncing the submissive and subordinate role of many scientists, engineers and technologists in the dissemination of unheard practices of violence.

In another passage, quoted by Anup Sam Ninan [23] Gandhi addresses one of the crucial issues of his thought, the relentless pursuit of truth, putting it in relation with the scientific truth: “You should understand ... that I never refuse a scientific truth that has been established. But you should also note that in (the realm of) science what has come to be accepted as truth today is not unlikely to be proved as untruth tomorrow. Sciences founded on the deduction are always bound to suffer this basic imperfection. We cannot therefore regard it as an absolute truth.” [24]

Gandhi is aware of the fact that our human condition leads us to an endless search, a continuous approximation to the truth. His conception of truth is a relative, not absolute truth, as clarified by Giuliano Pontara in an introduction to the anthology of Gandhian writings [25]. Gandhi himself titled his autobiography “Experiments with Truth”, an expression of great wisdom and modernity, which allows us to understand why we can speak of “science of *satyagraha* and nonviolence”. If modern science is a continuous search for truth by “trial and error”, also the method used by Gandhi, on a different terrain - that of ethics - relies on the same principle in the tradition of philosophical speculation of Indian culture.

## VOLUNTARY SIMPLICITY, DEGROWTH, SUSTAINABILITY

In proposing the re-reading of HS, Aditya Nigam is inspired by the metaphor of Gandhian “angel of history”, opposed to “angelus novus” of Walter Benjamin: “A *Klee painting named ‘Angelus Novus’ shows an angel looking as though he is about to move away from something he is fixedly contemplating. His eyes are staring, his mouth is open, his wings are spread. This is how one pictures the angel of history. His face is turned toward the past. Where we perceive a chain of events, he sees one single catastrophe which keeps piling wreckage and hurls it in front of his feet. The angel would like to stay, awaken the dead, and make whole what has been smashed. But a storm is blowing in from Paradise; it has got caught in his wings with such violence that the angel can no longer close them. The storm irresistibly propels him into the future to which his back is turned, while the pile of debris before him grows skyward. This storm is what we call progress.*” [26]

This storm is manifested today in all its intensity with a multiplicity of crises (economic / financial, environmental / energy / climate, relational / existential) that create conditions of great instability and whose ultimate root is of a spiritual nature. [27]

Other scholars and social activists have realized that all the prescriptions needed for present day problems are found in Gandhi 100 years ago. Richard Gregg was probably the first in the West to propose the “voluntary simplicity”, in a paper of 1936 published by a religious center of the Quakers in Pennsylvania. [29]

Ivan Illich was one of the most significant personalities and his writings had considerable resonance in the 1970s and 1980s of the last century. Many of his works were inspired directly by HS. In a short essay [30], Illich pays homage to the choice of simplicity and voluntary poverty of Gandhi, with expressions that resemble the beautiful story of Jacques-Henri Bernardin de Saint-Pierre, *The Indian hut* [31], a story that, as recalled by Amitav Ghosh, was “a favorite of Mahatma Gandhi”.

The list of critics of industrial gigantism, which led to a huge “scale error” in the design of human societies, includes many other authors (Lewis Mumford, Lanza del Vasto, Jacques Ellul, Ernst Fritz Schumacher, Aurelio Peccei and Dennis Meadow of the Club of Rome, Wendell Berry) up to the Gandhian economics scholars (Romesh Diwan and,

<sup>1</sup> On this topic we may recall at least the action of ASSEFA, [www.assefitalia.org](http://www.assefitalia.org), the “barefoot college” of Tilonia, [www.barefootcollege.org](http://www.barefootcollege.org), the center “Navdanya”, [www.navdanya.org](http://www.navdanya.org), directed by Vandana Shiva.

in Italy, Roberto Burlando) who anticipated the proposals of the movement of degrowth of Serge Latouche.

## DEAR GANDHI

We can conclude these reflections by asking two questions: what Gandhi would think seeing what is happening in the world today, and where are those who refer to his teachings, who can be called only approximately Gandhian? We can start from a nice conversation between Dilafruz Williams and Pramod Parajuli [32]: “To talk about Gandhi today is to talk about people who eke out their livelihoods directly from the earth and do it in a way that nurtures both biological and cultural diversity.” [33]

“Gandhi's ecologism (if we can call it that) was about rural peasants eking out their subsistence and necessities from a piece of land. In short, he might not have theorized the mathematics of sustainability but he showed us how to pursue sustainable livelihood”. [34] And this is what Joan Martinez-Alier calls “ecology of the poor” which has always learned to live in harmony with nature, preserving the ability to restore. [35]

Compared to the time and knowledge of Gandhi, we are now also able to theorize a bit of “simple” math of sustainability, although Wendell Berry says with honesty that “you can't expect to think about what you don't know, and nobody knows this planet”. [36] It's therefore necessary to act “with caution”, without haste, to avoid “uncorrectable errors”.

Pramod also notes that: “We talk a lot about how Gandhi educated the Indian masses but we easily forget about what the peasants and the masses of India taught him. It seems to me that it was the peasants of Champaran ... who gave Mahatma Gandhi the first bitter taste of the reality of rural India in 1917.” [37]

In addition to Ruskin and Tolstoy, Gandhi's initiation to the problems of the lower classes took place with the direct involvement in their lives, an experience that marked him for the life. From this experience, he was able to develop a process of decolonization and “Pedagogy of the Oppressed” based on the rediscovery of a personal power founded on nonviolence that everyone, including the most simple and humble, possesses. He was able to transform the seeming “weakness” of the oppressed in a policy of small things (the *charka*, the *khadi*, a handful of salt) with which he managed to bend the English rule. “Today, if Gandhi were alive, he would have beamed with delight to know that people are organizing and mobilizing around such trivial matters as food, seeds, plants, medicinal knowledge, patents rights, human genomes, biodiversity and cultural diversity. Just as Gandhi used the *charka* (spinning wheel) and a pinch of salt as symbols of warfare on British colonial rule, today, seeds, medicinal herbs and food have become potent points of resistance and struggle against global trade and homogeneity.” [38]

Ashis Nandy has also reflected on where we can find “Gandhi Today” [39] identifying four different possibilities.

The first two, the “Gandhi of the state and of Indian nationalism” and the “Gandhi of Gandhian” are both figures of speech that contradict the “prophet who wanted to live in the slums of politics”, as defined by Arnold Toynbee. The other two figures, the “Gandhi of the dissolute and unpredictable” and the “Gandhi of the slums”, who roam the world without weapons to subvert the established order are those that induce sympathy and hope for the future.

But there's more, according to Nandy. He declares that in the last twenty years of his work he was inspired by the Gandhian sentence: “those who think that religion has nothing to do with politics do not know anything about religion or politics.” [40] And this led him to discover “a billion Gandhi” in rural populations of the villages in which ordinary people have always lived with an attitude of mutual tolerance, contrary to what happens in the big cities, venues of inter-ethnic and religious violence.

These are some signs of hope. As well as the Buddhists believe that each of us is a potential Buddha, those persuaded of nonviolence may think that in each of us there is a potential Gandhi to cultivate by practicing the teaching that he has left us: “Be the change you want to see in the world”.

## RETHINKING INTERNATIONAL COOPERATION: THE CONTRIBUTION OF PEACE STUDIES

Gianluca Brunori<sup>i</sup>, Giorgio Gallo<sup>ii</sup>, Massimo Pallottino<sup>iii</sup>

Peace building and human security have gained in the last decades an increasing attention in the area of International Development Cooperation (IDC), and are now at the core of the most recent UN elaborations for a post 2015 framework. This focus' shift is also an effect of the dramatic increase in intra-state wars and local violent conflicts following Cold War's end, as well as of the global context after the 9/11, and calls for a new role of Peace Studies in reframing the idea of international cooperation and rethinking its practices. Agencies and NGOs operate providing help both in post-conflict peace-building, and with humanitarian assistance in the midst of ongoing and resurging violence; countless human lives have been saved by international humanitarian interventions. Tensions have however arisen when linking emergency aid to longer term development processes especially for the social, economic and political implications that these interventions may have.

In exploring the relation between IDC and peace, a number of contentious issues can be raised. What contribution can the IDC bring in dealing with short and long term factors that make societies prone to conflict? How to guarantee neutrality, impartiality, and independence in a situation of violent ethnic or internecine conflict? How to be sure that the intervention does not prolong the conflict instead of reducing its duration? How to avoid that the delivered aid maintains and reinforce the very structure which is at the origin of the violence? What elements should be noted with reference to the debate concerning the 'responsibility to protect', and in wider terms, in relation to the position of the civilian population in situation of conflict? How should the issues related to emergency and humanitarian aid be linked to a wider social, political and economic context? How are these issues represented in the current discourse, and what effect have these representations on the practice of IDC?

All these questions have been raised in many occasion and have led to intense debates. It is evident that any successful intervention requires not only a critical assessment of past interventions, but also a systemic evaluation of the context in which the conflict arises, and, with reference to the conflict itself, of its causes and its development. An understanding of how different types of conflict develop and of their main characteristic is essential, as well as all the issues related to interventions in (actual or potential) conflict areas. Peace Studies and Peace Research represent an interdisciplinary field of studies that promotes the exploration of the above issues, and has developed in the last thirty years an openness to contemporary challenges arising in the post cold war period [1]. The panel proposed at the CUCS conference aimed at highlighting areas of interest where further reflection is needed, with contributions led both at practical and theoretical level.

The complexities or the inter-linkages between development and peace issues have been explored first from the point of view of their institutional implications. In his paper, Consorti considers development cooperation through the lenses of the Italian cooperation law too, where international development cooperation is said to be 'part of the foreign policy', mostly expressed in its economic dimensions. The international debate has however progressively highlighted the need for a wider perspective: in this, the Human Development Index represents an important achievement. However other authors, such as Maslow, Freire, Max-Neef, had already highlighted the importance of avoiding a consideration of human needs under a too narrow viewpoint: human needs need to be recognized under multiple perspectives, where the relational elements of the context play a key role. It is only by giving a chance for direct expression to peoples and communities often thought as mere objects and 'targets' of international development, that these elements may be fully acknowledged and sustainable improvement of life condition will be brought about. Peaceful coexistence is directly connected to a stronger integration between development, rights and peace. The question is how these concerns, particularly after the tragic experience of the WWII have progressively surfaced and have been embedded into institutional arrangements.

The fact of assuming the construction of a culture of peace as a key objective, implies a primary pedagogical commitment that is well reflected in the motto of UNESCO "Building peace in the mind of men and women". This perspective found an important thrust with Federico Mayor Zaragoza, Director General between 1987 and 1999: the Sevilla Statement, adopted because of his, among others', initiative in 1987 recognizes war and violence as 'cultural products' that can be opposed by an appropriate commitment in education. This debate paved the way for a renewal of UNESCO approaches and, in 1997 for the establishment of the program *Towards a Culture of Peace*, in which a positive approach to peace is substantiated in a series of key principles. The International Year of the Culture of Peace, proclaimed by the UN for the year 2000 builds on these premises, pursuing the aim of transforming these principles in binding commitments for the states. As Consorti remarks peace is a basic human need, to be fostered primarily through education, and IDC must assume peace-building as its own goal.

The issues raised by Bartolucci and Gallo concern the role played by development cooperation initiatives in conditions of conflict. The latter needs always to be understood as part of a much more complex system of relations and powers; international cooperation is affected by them and at the same time affects them; disregarding these complexities leads often to unintended consequences. In general terms development cooperation has an effect on the conditions in which social actors interact, often producing unintended side effects, and fostering conflicts that before the interventions were not there, or had completely different features. When looking at the issues to be considered while providing aid in situation of conflict, other elements deserve to be considered, such as the risk for aid providers of giving unintended support to one part, to the detriment of the other. The ethical message implicit in the way aid itself is administered is also important and oftentimes neglected; these may foster views of belligerence and separation rather than contributing to establish more relaxed relations among the actors on the field.

Particularly in the case of asymmetric conflicts, where a structural imbalance between the parties is part of the causes and the conditions that foster the conflict itself, the elements summarized above may produce completely unwanted effects: those of reinforcing, rather than mitigating, the structural inequalities that are among the root causes. In the case of Israeli occupation of Palestine, for example, it has been observed how the international aid system ends up supporting and confirming the status quo. International development cooperation system operates and legitimates itself through narratives, that play a role in establishing shared and 'appropriate' ways of defining needs and of acting in order to address them. According to Bartolucci and Gallo deconstructing and decoding language and discourse becomes therefore extremely important for understanding perceptions of aid and ways to improve its effectiveness, identifying real needs, as well as addressing ways of preventing escalation of conflict into violence.

De Sisto points out at the reasons that seem to play a role in prompting interventions of NGOs in the field of peacebuilding, often following the priorities dictated by the donors more than adherence to local needs and priorities. The divergence in the goals between donors, practitioners and local social actors is a matter widely debated in literature; when discussing situations related to conflict management, transformation and resolution, this divergence seems however to play a peculiar role: conflict related situations are recognized for making donors less reactive to the needs expressed by the beneficiaries, and short term activities on conflict resolution may provide a relatively comfortable area of engagement that escape the complication of a deeper understanding of local contexts.

The same tensions arise in relation to evaluation too: organizations usually fear a frank discussion about the reasons behind failures; instead, evaluation often overstates the compliance to pre-determined indicators, the importance of donors' procedures (often focused on short term output), and the possibility of generalizing the outcomes in terms of 'good practices'. All that may therefore easily lead to adopt inappropriate perspectives when critically looking at the outcomes of development interventions. Agencies trying to adhere to the 'rules of the game' of an increasingly competitive field of cooperation and conflict resolution, may easily fall into the trap of transforming the potential for peace into chances for protracted conflict, where they have found their 'ecological niche'. According to De Sisto, the only possibility available in order to improve the quality of development initiatives is to establish ground for a better understanding of the local complexities through participation that, in situation of conflict, may open room for alternative ways for conflict resolution.

The questions raised by Pallottino concern the way the interdisciplinary field of Peace Studies and Peace Research interacts with that of Development Studies. Two elements, at the turning of the Century were doomed to leave a trace on the global development scene with paradoxically contrasting effects: the 9/11, redefining the context and the priorities of International Development Cooperation in terms of security; and the Millennium Development Goals, stemming out of the Millennium Declaration and a decade of international debate on the priorities to be summarized within a globally shared agenda. These two elements changed the stage of Development Studies and Peace Studies: they contributed focusing the development agenda on the 'how' agreed-upon objectives had to be pursued; and at the same time re-defined the way peace and conflict had to be represented in the contemporary world, in terms of concerns for security.

An increasingly technocratic and facts-based approach to development issues went on somehow marginalizing the political core of the problems; and contributed pushing a somehow 'orthodox' reflection on peace and conflict towards humanitarianism, as in an 'orderly' world the conflict ends up for being conceived just as a temporary disturbance within an otherwise linear path of progress. Humanitarianism, strongly needed to save endangered lives, becomes a way of controlling the diversity: a sort of a technique for governance having a similar effect, in this regard, to traditional IDC. Development studies (and contemporary humanitarianism) are focused on the idea of a 'consensual world', where conflict is a sort of temporary disturbance; thus they do not appear to fully grasp the implication of conflict in the processes of social, economic and political transformation, and its possible violent degeneration within human societies. It is not therefore a surprise the relatively marginal position of peace related issues in the current debates on the global perspective beyond 2015, after the Millennium Development Goals' terms will come to an end. In this line, and in order to formulate a perspective that is able to respond to some of the weaknesses of the MDGs in giving a fuller account of the complexities of the social interaction, peace studies can offer insight useful to bring back into the game some missing elements.

Peace studies can contribute to future global frameworks by embracing and articulating a positive idea of peace. Peace doesn't consist merely in the conditions where violence is not there, and people is free from fear: this idea of 'negative peace', seems to be closely related to the articulation done in most of the proposals currently discussed at international level, often based on a 'peace and security' paradigm. A wider approach, focused on the features that make

social interaction conducive to a more peaceful society, has been developed by different thin tanks (such as in the case of the 'Pillars of Peace' report), but are still hardly integrated in the debate.

The reflections developed by these contributions represent only a initial move in the attempt of capturing different implications of a renewed understanding of peace and conflict, and the elements that may lead to the improvement of development cooperation practice. In addition to those, other issues should also be explored; some of them have been shortly mentioned in the debate following the presentations, and may serve as a starting point for further research.

Firstly, we should consider the actors are involved in the dynamic, and the extent to which they find room for their voice to be heard and they play 'from within' in the system of International Development Cooperation; or they play somehow independently and are therefore able to introduce some forms of renewal in that system. The independence of actors such as the NGOs is in discussion, basing on the degree of reliance on their relations with the institutions (including the degree of financial support secured through these institutions). The issue is further complicated when considering the constraints introduced by other forms of reliance, such as public support connected to media coverage of events. The role of other actors would deserve deeper understanding, such as those of decentralized cooperation, expression of local territories that develop their interests under a more 'horizontal' approach (territory with territory) rather than the perceived top-down approach of traditional development cooperation.

A second range of issues is that focused on the mechanisms that contributes shaping the landscape of development cooperation, and more particularly of development cooperation in conflict-related situations. What peculiar features are introduced in such situations? Are the existing practices really conducive to a full understanding of conflict reasons, which in many cases is the premise for establishing a path of conflict transformation? Or, on the contrary, they tend to somehow stabilize conflict situation, and the specific 'intervention domain' associated with it?

A third set of comments are those related to the issue of complexity, and the mechanisms that often reduce the ever-changing reality to an easy-to-grasp but oversimplified representation. The pressure to urgent action, oftentimes fully justified by the course of events, represents however a strong incentive to adopt a more complex approach, often perceived as a loss of time. Recent research [2] strongly highlights the need for assuming the complexity as part of the picture, and peace studies may have more than something to say at this regard.

A fourth point worth highlighting, is about the narratives used to represent situations and priorities for intervention. It is interesting to note that the process of institutionalization and mainstreaming of new (or renewed) concepts strongly relies on the construction of a new discourse. History shows that in many cases, institutionalization and mainstreaming of new concepts has been associated with instrumental and political use of these, homogenizing and stereotyping: the case of participation is somewhat paradigmatic [3]. The construction of a new narrative on peace and conflict is however needed in order to transfer into shared arrangements elements that can help reviving what now appears a too short-sighted understanding of development cooperation.

## DEVELOPMENT COOPERATION AND THE “CULTURE OF PEACE” INSTITUTIONALIZATION

Pierluigi Consorti\*

\*Interdisciplinary Center for Peace Studies, University of Pisa, Italy - [pierluigi.consorti@unipi.it](mailto:pierluigi.consorti@unipi.it)

### ABSTRACT

From an institutional point of view international development cooperation represents a governmental tool for national foreign policy related to meet foreigners needs of an economic nature. This paradigm does not include peace-building, although peace is a basic human need. International law states “Culture of Peace” as an institutional objective, so State should run their development cooperation programs in a building positive peace framework.

From an institutional point of view, “international development cooperation” corresponds to the tools that States as such, possibly supported by other non State actors – that in this way, however, are absorbed into the institutional framework - put into place to meet needs of an economic nature. In few words, international development cooperation is primarily understood as a response to basic economic needs: food and agriculture at a first level. States also use this lever as a tool of their foreign policy. Italian law stresses hardly this issue, as art. 1 of law 49/1987 expressly states «international development cooperation is a part of national foreign policy». Giving development support, States build ties and alliances. As one of the most important example we can quote the post Second World War “Marshall Plan”.

According to this context, governmental development projects have consolidated themselves through time taking a *modus operandi* very linked with political and diplomatic goals that, more in general, “international cooperation” pursue. Several criticisms have been brought up against this element, especially starting from the 70s of the last century, and especially from popular movements that were challenging - and at the same time wanted to correct - the prevailing economic approach with which governmental institutions look at development cooperation. These criticisms cannot be exhaustively examined in this paper, but can be summarized by the idea that development cannot be limited to the response to basic economic needs [1]. In fact there are needs, not always readily appreciated from the economic point of view, which must be equally satisfied, especially according to development goals. Indeed, their implementation is in certain prevail and precede purely economic interventions. A development cooperation intervention that is limited to meet basic needs (food, health, ...) is not only addictive, but it takes away its eyes from other human needs - such as education, culture, ... - that form the basis for ensuring social and economic independence, and thus future sustainability.

In the same years (more or less the seventies of the twentieth century) similar critical insights started to make their ways into the institutional structures. Paradoxically these structures, although actors of development cooperation, somehow represented the source of inequalities that development cooperation should have fought against. In other words: those who acted, accepted the conditions that legitimized their intervention. The States of the first and second world would turn to those of the “third world” in a logic of international alliances, supported by economic cooperation activities, including those «for development». So the help offered was often presented itself as a weapon of blackmail. It is not indeed by chance if in institutional terms, international development cooperation is an integral part of the foreign policy of a State.

By acting in this institutional context, even the international organizations devoted to development cooperation constitute one of the subjects with which States act at the level of international relations. This subject can be put next to traditional diplomatic activities, and even to the use of armed force as an instrument of international relations. If we consider that the war is conceived as a way - albeit extreme - to assert the good reasons of policy, it is understood that development cooperation becomes an additional powerful tool through which States pursue their sovereign interests. It is hardly necessary to observe that the development cooperation could not have been intended to “develop” the autonomy of the people, but to create conditions useful for the “development” of national interests of donors, including creating and maintaining economic conditions which in fact do not affect the substantial differences between the State which gives and the recipient of the donation. The need for the recipient States to pay their debts back to the donors constitutes a typical example of the condition of subordination in which the institutional interventions of development cooperation operate.

This economic paradigm, that does not really seem to have made significant changes with respect to North-South relations, is hard to include among the areas forms of building positive peace: namely a peace by peaceful means. Even institutional cooperation seems to be dependent on the logics of violence that characterize international relations.

Rather different is the *bottom-up* kind of development cooperation, that comes from below and which is substantiated on the response to human needs: i.e. needs understood in a broader and more comprehensive way than just from an economic or material side. This insight is based on the idea of *human development*, which as we have just hinted at the end of the eighties, was accepted by UNDP, precisely to overcome the setting of development understood as the sole economic growth. States are no longer only classified according to their GDP, but also to the presence of additional elements that contribute to build the HDI (Human Development Index), among which promotion of human rights, peaceful coexistence, democratic participation, environmental protection and sustainable development of land resources, development of health and social services with prior attention to the most urgent problems and the most vulnerable groups, improvement of education of the population, with particular attention to basic education. This was certainly a step forward; but the above mentioned items are still macroeconomic indicators.

In any case, according to HDI World Countries were divided into four equal groups: the index is counted for 169 countries, this means that we have four groups of 42 States, with “a trick” the State that advances was allocated in the highest group. Thus, although this is a less rough economic index than previous, we are still far from a good consideration of the actual elements that allow to analyze the terms of “development-to-be” of a local community.

Despite that, we are facing a significant change in cultural terms. The adoption of the HDI demonstrates that human needs are not only economic and material, and that the development cannot simply create conditions of less discomfort, but must also be completed in more comprehensive ways, taking into account human needs in complex and articulated manners.

Looking at three authors who, from different points of view, based their analysis on human needs, help us to understand how it is possible a change of paradigm that can foster the conceptualization of international development cooperation as a peace-building factor.

The first of these is Abraham Maslow, who conceives an idea of a relational and gradual needs [2]. He resonates in psychological terms and builds the so-called “Maslow's pyramid”, that shows human needs in a more complete way: it means that the development is not the result of only basic economic support, but should also take the effort on overall promotion of the human person, which obviously needs to eat and work, but this is only the first step – effectively basic – of the stairs. Development is reached only when we arrive at the top of the stairs, where we find dreams, aspirations and emotions that ask to be answered too. There is no development without answers to human needs.

A second author we can refer to is Paulo Freire. Much could be said about his work. To remain in the field that concerns us more closely, we can remember pedagogic premises that build an itinerary of thought based on the consonance between research and action, and between theory and practice. That is the so called «praxis». In his view, the theory has positive effects only if it is transformed into a praxis of democratic liberation: and this is “development” [3]. According to him, it concerns primarily the relationship between teachers and students, but more generally relations of power. According to Freire, development is the construction of new power relations that build peace through liberation from oppression; therefore, it is not conceivable a development cooperation which does not start from similar premises and is essentially based on an orthopraxis of peace.

Finally, we can look at Manfred Max-Neef. He is a Chilean economist of European origin, which insists on the idea of human development from below. His thesis is not well known in the West, but very well known among the Andean communities, who consider his thought as a fundamental reference point. The photocopies of his work already widely circulated turned in the Andes long before they were published [4]. The Max-Neef idea of development moves from an economic perspective, but in the background remains the political theme that focus on the development of local communities. This is possible only if international aids are decided with autochthonous population, and give them the skills to build their own development, according to their goals and not to the donors one.

The attention to these three different but converging lines of thought allows us to argue for the importance of human development in the practice of international cooperation, especially if we imagine international development cooperation as a peace-building factor.

These reflections can impact also in institutional terms. At first we can mention the importance assumed by the institution of the United Nations and in particular by the adoption of the Charter, that for the first time in human history imposes the prohibition of war and of its threat in the field of international relations. So that the wars - which still exist - should be always placed in the field of “exceptions to the rule”.

The profound insight of the *need for peace* by the tragic end of the Second World War impacted on the institutional history too, starting a discussion on “Culture of Peace”. These are mostly symbolic cues, but not non-existent, which link peace-building issue to human rights protections. It is mentioned both in the Charter of the United Nations and in other documents among which crucially the founding document of UNESCO, the specialized agency of the United Nations for education, science and culture organization, which motto is “Building peace in the mind of men and women”. In fact, the latter states as a premise that “since wars begin in the minds of men, it is in the minds of men that the defences of peace must be built”. The overall activities of this Agency must therefore be observed from this specific point of view, as it is an overarching objective.

In this context particular attention should be paid to the Sevilla Statement of 1986. That was produced at a conference of scholars (meeting in Seville in May 1986), which consecrated the scientific idea that violence, and war, are cultural products: such as they can be defeated by cultural actions. The proponents of that conference was Federico

Mayor Zaragoza, a Spanish biochemist, at that moment Director-General of UNESCO from 1987 to 1999, who gave a strong impetus to the peace policies of this organization, especially according to nonviolence as an hard item linked to peace- building policies [5]. So UNESCO started a new program where Culture of Peace and Non-Violence are as two legs. Walking forward the future is not possible if one of them lack.

In few words, Culture of Peace and Non-Violence is assumed as a complex commitment to peace-building, mediation, conflict prevention and management, peace education, education for non-violence, tolerance, acceptance, mutual respect, intercultural and interfaith dialogue and reconciliation. It is a conceptual as well as a normative (*soft-law*) framework envisaged to inspire thoughts and actions of everyone. Therefore, it requires cognitive as well as the emotional abilities to grapple with our own situation in a rapidly changing world as well as with the emerging world society. This aim does not entail mere factual knowledge, but also the broadening of our consciousness and the willingness to develop a new awareness, a new way of being in this world, a new “mental mapping” (the above mentioned change of paradigm).

As stated by the former UNESCO Director-General, “Peace is more than the absence of war, it is living together with our differences – of sex, race, language, religion or culture – while furthering universal respect for justice and human rights on which such coexistence depends”. Therefore, peace should never be taken for granted. It is an on-going process, a long-term goal, which requires constant engineering, vigilance and active participation by all individuals. It is a choice to be made on each situation, an everyday life decision. The culture of peace continuously brings new challenges prompting us to reconsider the fundamental principles of humanity by highlighting what binds cultures and societies to each other and from within. Since what unites us is deeper than what separates us, there is a true ethic of living together that is taking shape in the culture of peace and non-violence process.

With a view to achieve the following expectations: a) fundamental principles of peace universally shared to be appropriated by different cultures, thanks to a genuine dialogue and mainstreamed into public policies; b) tension between universality and particularism, cultural identities and citizenship in a globalized world analyzed and a better understood; c) everyday peace to be conceived as an everyday living experience, not only in periods of conflict, but also in ordinary times.

These institutional tensions have led UNESCO to adopt in 1997 a program called *Towards a Culture of Peace Programme*. It is now difficult to find online the original documents, that the UNESCO itself, in its own dossier of information CAB-99/Ws/4) summarizes as follows:

- the notion of “Culture of Peace” means that peace is much more than the mere “absence of war”. Peace is a set of values, attitudes and behaviours that promote peaceful conflict management and the demand for mutual understanding.
- Peace is the only way to live together. The term “Culture of Peace” presumes that peace is a way of doing, being, living that can be taught, developed and implemented.
- “Culture of peace” is “Peace in Action”. A long-term process that requires a transformation of both the institutional practices of as well as the individual patterns of behaviour.
- Finally, to survive and get involved with these values, a “Culture of peace” requires non-violence, tolerance, solidarity.
- The idea of peace as a consensus is sometimes misinterpreted as absence of conflict, or as a process of social approval. In contrast, to achieve mutual understanding we must admit the differences, such as sex, race, language, religion, culture. The question of mutual understanding requires the recognition of diversity.
- The coexistence of diversity cultivates values of peace, which includes, respect for others, tolerance, solidarity and openness to non-violence.

These points of view - now institutionalized - have produced, among other things, the UN Resolution 5215 of 1997, which proclaimed 2000 the “International Year of the Culture of Peace”; UN Resolution 5325 of 1998, which declared the “International Decade for the Promotion of a culture of peace and non-violence for the Children of the World (2001-2010)” (united to other useful documents, simply on-line available).

The UNESCO has further expanded its work in this area by proposing the idea that peace is the fruit of peace , as stated in The New Programme of Action on Culture of Peace and Non-violence, which “implies two essential approaches: a) to rethink the dividends of cultural diversity, as benefits of a continuous exchange between cultures; b) to promote the principle of learning to live together, the challenging Art of Unity-in-Diversity conducive to a lasting conviviality pursuing these three Main Goals: i) to develop a new political, conceptual and programmatic approach *in favour* of a strong commitment by States and civil society to nurture “everyday peace” involving women and youth (i.e. through ICTs and social media); ii) to improve the world’s global understanding and deconstruct preconceived ideas by placing emphasis on the future as a humanistic aspiration (i.e. by establishing guidelines for a global curriculum on shared values); iii) To promote a global movement in favour of the ideals and practice of a culture of peace and non-violence with emphasis on youth civic engagement and democratic participation (i.e. by creating “hubs of peace”). Looking at the complete Programme of Action of the Intersectoral Platform for a Culture of Peace and Non-Violence (including the Platform’s objectives, strategy and modalities, expected results and partners), we can find some fundamental resources, a selected bibliography and a presentation of its Main areas of Action and Flagship activities.

Taken all together, these Resolutions and activities propose a proactive dimension of the culture of peace as an institutional commitment of the States, which should improve their institutional and governmental efforts for the international development cooperation looking at “Culture of Peace” as a key. That is quite different from the above mentioned economic approach. Peace is a basic human need; international development cooperation must assume peace-building as its own goal, and according to this issue, international development cooperation could become a formidable peace-building tool.

### ABSTRACT

The connection between economic development and peace has been widely studied. It is commonly held that, at least over the long-term, development cooperation and international aid can contribute to alleviate the root causes of conflicts and help to develop institutions capable of managing and resolving disputes in a peaceful way. Although it is true that in many intrastate violent conflicts improving the economic situation may provide incentives in avoiding violence, and also may strengthen institutions capable of curbing violence and managing the conflict, this is not always the case. Actually, international aid becomes part of the context in which it is provided, and, hence, its impact is hardly completely neutral and there might be cases in which it reinforces or prolongs the conflict. This is, for instance, the case of structurally asymmetric conflicts, where the same structure of the relations among the parts is at the root of the conflict. In cases of this type economic growth per se does not change the pattern of unbalanced power relations. Moreover, an intervention which pretends to be impartial and neutral may in effect result in reinforcing the status quo and hence the unbalance of power among the parts. Tenets of Peace Studies can provide international aid agencies and NGO's with the analytical tools which are needed to understand the conflict situation in which they operate and to devise more effective and appropriate interventions. The role of language and discourse in shaping the image aid workers have of the context in which they operate, and, henceforth, in structuring the type of intervention will also be discussed.

### INTRODUCTION

A social or political conflict, whether it is a non violent or a violent one, is always a complex system, where complexity stems from many different and sometimes unrelated elements. There are the parties involved, most often much more than two, with an intricate web of relations connecting them. Correspondingly quite often the objectives are multiple and diverse, some even hidden, not defined once and for all, and evolving over time. Moreover, each conflict does not arise in a vacuum, but in a context, local, regional, or international, a context that may be changing over time with often unforeseen effects on the conflict's structure and parties [1]. "When international assistance is given [...], it becomes a part of that context and thus also of the conflict [and hence it is rarely completely neutral. It may either exacerbate and prolong the conflict or strengthen the people's capacity to find peaceful paths to conflict solution:] in some ways it worsens the conflict, and in others it supports disengagement. But in all cases aid given during conflict cannot remain separate from that conflict" [2]. Not only the intervention is not neutral and changes the situation in the field, but the type of conflict shapes the intervention itself, the way it is conceived and designed and the way the aid workers behave. Actually, the intervention is shaped more by the way the conflict is perceived, or even better by the image of the conflict we have, than by the conflict itself. Interestingly, the actual conflict and its image may be quite far one from the other. In part this is unavoidable since there is no way to know the reality independent of our mental models and our culture. From this point of view the language and discourse play a fundamental role, a role which is discussed in the last part of the paper.

Clearly the effects of international cooperation and development aid on conflicts differ depending on the type of conflict and on the context. In the following, three different cases are discussed: i) the case in which there is the potential for social, political or economic conflict; ii) the case of internecine or civil war; iii) the case of asymmetric conflicts.

In all these cases we seek to show that disregarding the systemic complexity of the reality in which we operate may often lead to unintended consequences.

### NONVIOLENT SOCIAL, POLITICAL AND ECONOMICAL CONFLICTS

Conflict is a polysemic term which is used to define completely different realities. In many cases conflict plays a positive role since it is through conflict that society changes and that development occurs. Also in cases like these the positive effects of cooperation and aid are not assured. In fact, cooperation and external aid may foster changes in the direction of a more peaceful and just society, but they may also lead to the outbreak of a latent conflict and in some

cases also to the onset of a violent confrontation. Two real life examples are provided next.

One of the authors, in occasion of a meeting with representatives of popular movements in a large town in North East Brazil, has been reported a case which in some sense can be considered as paradigmatic. In that town, a strong popular movement (*movimento dos moradores*) had arisen among the inhabitants of a large *favela*, with the objective to obtain official recognition from the municipality. The struggle had been quite successful: the *favela* had been recognised as a regular neighbourhood, obtaining a connection to water, sewage and transportation systems, street pavements and schools. Still, being a very poor neighbourhood, the *movimento dos moradores* was very active trying to further improve the life conditions of the inhabitants. In occasion of a visit to the neighbourhood, the representative of a medium size Italian NGO was impressed by the results obtained and by the large number of problems which still remained to be addressed. Thinking of setting up a cooperation project he asked which were the most urgent needs they had. As response he got a list of items for a total amount correspondent to about today's 15,000 euros, an amount considered too small for a project to be presented to a national or international funding agency. Thus, the NGO set up a project for the equivalent of over 350,000 euros. Although what arrived there, due to the NGO overhead, was only about half of that amount, it was enough to nurture conflicts. Different groups within the larger *movimento* started quarrelling on how to allocate the unexpected money, or, better, to claim larger shares of it. It appears that the Italian NGO involved had completely disregarded the inherent complexity of the situation, by which there was not a unique actor, the *movimento*, but many sub-actors, with different objectives and/or priorities, connected by a complex web of relations. This case is also an example of the common held wrong belief that 'more' (350,000 euros), if not better, is at least not worse than 'less' (15,000 euros).

Sometimes it may happen that in situations of strong social conflict development aid has the unwanted and unforeseen effect to strengthen the conflict itself, eventually leading it to the onset of violence. A case of this type has been studied by Pallottino [3] with reference to the Ethiopian Southern Lowlands. The Ethiopian Southern Lowlands are inhabited by several pastoral ethnic groups, the Borana/Oromo, cattle breeders, and different smaller Somali ethnic groups breeding mainly camels. The area is affected by a deep crisis which can be explained by focusing on different interrelated aspects: a crisis of the traditional production systems; an ecological crisis due to the interaction between human activities and a fragile environment; a social and political crisis with weakening effects on the traditional self-help and welfare mechanisms.

As it too often happens, the way a situation is described has a 'normative' value in shaping the interventions. In this case the dominant narrative was that at the root of the crisis were the nomadism itself. Pastoralist "nomads are poor and politically unstable, and that is the effect of their nomadism, which in turn is the consequence of the harsh environmental conditions in which they live. The demographic growth rate will lead to an excessive pressure on the available resources, with a further deterioration of the living conditions, an escalation of the conflicts and a growing depletion of the environment." The same definition of the problem contains the solution: "an intensification of the production systems, which implies a process of progressive sedentarization" [3]. And indeed sedentarization has been largely the goal of both the central government (with also the aim of exercising a stricter control on the population) and the international aid and cooperation actors. As result of this policy not only the living conditions of the population has steadily deteriorated, but also the overall level of conflict has been increasing. In addition, some of the international aid and cooperation workers have played the role of objective accomplices of the government's effort to tighten the control over the population.

### Violent ethnic conflicts and civil wars

In the contemporary world, which according to some analysts can be defined by the term *neo-medievalism* [4], there are many cases of cooperation operating in areas characterized by violent ethnical conflicts or civil wars. This is, for instance, the focus of the *Local Capacities for Peace (LCP)* Project, launched in 1994 to answer the question: "How may aid be provided in conflict settings in ways that, rather than feeding into and exacerbating the conflict, help local people disengage from the violence that surrounds them and begin to develop alternative systems for addressing the problems that underlie the conflict?"<sup>1</sup>. Working with agencies providing aid in conflict situations, the *LCP* Project has tried to understand the ways through which aid interacts with conflict, singling out two main interaction media: *resource transfer* and *implicit ethical messages*.

#### *Resource Transfer*

International aid always involves the transfer of resources of some kind, whether hard (money, food, instrumental goods, medicinals, ...) or soft (training, capacity building, ...). Experience shows that outside resources introduced into a resource-scarce environment, where people are in conflict with each other, become a part of the conflict: people in conflict will attempt to control and use them to support their side and to weaken the other. The types of resource transfers and their effects are many and diverse. A quite frequent case (*allocation effects*) is when warriors stole aid goods or exact a kind of fee in goods or money to allow the delivery of the goods. Such goods are then used to support the war effort either directly, using them, or indirectly, selling them in order to raise money to buy weapons. In these cases the final effect is to prolong the conflict. Another relevant and frequent effect (*market effect*) is the distortion in

<sup>1</sup> [www.donoharm.info](http://www.donoharm.info), accessed July 2013.

the market for goods and labour caused by the aid itself and also by the way the aid agencies operate, with the risk of enriching war-related activities and people, so further reinforcing the war economy. In some cases there are also so called *distribution effects*: depending on the groups which are the target of the aid, and on their position with respect to the conflict, aid can either reinforce and exacerbate the conflict or help reducing the conflict level. Aid agencies are well aware of the risk that aid may be used directly for war activities, but sometimes they disregard the *substitution effects* by which, for instance, aid is substituted for resources that would have been used to meet civilian needs, and, hence, can now be used in support of war. Similarly, the fact that aid agencies assume responsibility for civilian survival in a conflict area allows the warring parties to concentrate their efforts on warfare. All these are cases in which the aid, via substitution, ends breeding the conflict. Finally there are the so called *legitimization effects*, by which, legitimizing some people at detriment of others, aids can support either those people that pursue war, or those that try to move towards peace.

### Implicit Ethical Message

As observed by the LCP Project, while carrying the explicit message of caring for the needy, aid does also transfer some implicit messages. The aid workers are often unaware of that, but their behaviour cannot avoid delivering messages. When, and this is a quite frequent case, aid agencies hire armed guards to protect their activities, they deliver the implicit message that security and safety derive from weapons. At the same time, they legitimate the armed people that provide security, and who may be linked to one or the other of the conflicting parties. Here, the message is that arms mean power. It is not rare the case that the behaviour of aid agencies and NGO on the field be characterized by mistrust, competition and rivalries rather than by reciprocal cooperation. That delivers the idea that we do not have to respect or work with people we do not like, and that competition is an option not less acceptable than cooperation. There are cases in which aid workers use the goods and support systems provided as aid to people who suffer for their own pleasures and purposes. This is, for instance, the case when they take the vehicle to the mountains for a weekend holiday even though petrol is scarce. The message here is that if one has control over resources, he/she is allowed to use them for personal benefit without being accountable to anybody. When the aid agencies' plans in case of danger call for the evacuation of expatriate staff but not for the care of local staff, the message is that some lives are more valuable than other. When field-based aid staff disclaim responsibility for the impacts of their aid programmes, blaming others, the headquarters, the donors, or the local warlords, then the message received is that individuals in complex circumstances do not have to take responsibility for what they do or how they do it. When aid workers, nervous about conflict and worried for their own safety, approach every situation with suspicions and belligerence, or with an attitude of dehumanization of one side in a war, the message they deliver is one which risks to reinforce the modes and moods of warfare rather than helping to find an even-handed way to respond to those on all sides who seek and want peace.<sup>2</sup>

### ASYMMETRIC CONFLICTS

A case which deserves to be treated separately is the case of structurally asymmetric conflicts, that is of those conflicts whose "root causes [...] lie in the structure of relationship within which the parties operate" [5]. Conflicts of this type are, for instance, the Palestinian conflict, the West Sahara one, and the land conflicts which can be found in Developing Countries. Unless the very structure which is at the root of the conflict is not transformed, no stable peaceful solution can be reached, and what too often happens is that international aid, not addressing this point, ends up strengthening this structure, and hence making the conflict more difficult to end. While cooperation interventions which maintain the *status quo* in a symmetric conflict may do no harm, in a structurally asymmetric conflict they end always supporting the stronger part and hence taking a side in spite of the declared neutrality.

An interesting example is provided by the Palestinian agriculture. In spite of it being traditionally the most important sector in the Palestinian economy, agriculture is of little interest to international cooperation and aid. This sector is "largely neglected by donors, also mainly because it touched upon the issues of land and water use" [6]. In fact, much agricultural land falls within area C, the area (about 60% of the West Bank) under full Israeli control, which is the object of a creeping annexation process [7]. Any relevant project in agriculture would not be in accordance with Israeli territorial and strategic resource considerations and hence international aid agencies choose to avoid this sector for their projects. In contrast, it appears to be much easier to mobilize resources in the area of water and sanitation. According to Le More, this sector attracted roughly 10% of the total donor disbursement to West Bank and Gaza between 1994 and mid-1999. The interest for the water sector stems from the widespread recognition that it is a sector of critical economic and social importance, mainly considering that Palestinian water resources are extremely limited. The point which is too often disregarded is that, under the Oslo agreements, 82% of the West Bank ground water resources are allocated to Israel. Thus, although it is true that by international standards the region's water resources are limited and quite depleted, the real issue is that they are over-exploited by the Israelis, who consume much more water than the Palestinian, in particular for agricultural purposes. "While in Gaza and West Bank per capita water consumption is respectively around 60 and 80 litres per day, daily per capita water consumption reaches about 235 litres

<sup>2</sup> For a discussion on all these issues we refer to M. B. Anderson [2].

in Israel, and 400 litres in Israeli settlements” [6]. The problem is that international aid agencies avoid addressing or denouncing this situation out of concern that Israel will put more obstacles to their activity in the PoT (Palestinian occupied Territories) than those they already encounter. “Donors have been generally unwilling to challenge even the most unreasonable Israeli restrictions and obstacles, which have delayed the implementation of many crucial water projects. Rather, international donors chose to deal with the growing restrictions, by diverting significant funds from water supply and sanitation development to short-term projects, such as repairing damage caused by Israeli military attacks, or providing tankered water (at several times the cost) and other humanitarian relief to the Palestinian population” [8].

Again the final result is not only that the status quo is unchallenged, but in fact it is strengthened. Different, but with significant similarities, it is what happens with the international aid to the Sahrawi people. Like in Palestine, the aid provided by donors appears to be a substitute for direct action in the direction of the conflict solution, direct action which would create problems with the Morocco government. The focus on Humanitarian aid has created a situation of strong dependency, and most likely has contributed to the conflict chronicization, stabilizing the status quo.<sup>3</sup>

### Discourse and language

To analyse language and discourse is crucially important when devising, planning and/or implementing a development cooperation's intervention, especially in crisis situations. In fact, to analyse language and the ways in which certain situations, events, people are represented by different people in different genres (e.g. media or governmental speeches) can help to understand structural relations of power, to generate a public and intellectual space for critique, to speak and write of the subaltern voices and unsaid stories that have historically been silenced, as well as to break certain mechanisms of escalation and prevent degeneration into overt violence.

In situations of development cooperation's operations taking place in violent contexts, to focus on language and discourse can also help in devising more sustainable interventions for the benefit of the highest number of people and in decreasing the level of conflictuality among factions. For what concerns development cooperation's projects in post-conflict transitions, the main long term goal of development cooperation is to assist recipient countries in building legitimate and effective political, economic and legal institutions. However, often during peace processes, violence actually increases. At the same time, development cooperation agencies can unintentionally put in place interventions that are actually more divisive than unifying. Thus, in the context of development cooperation, discourse and language acquire a relevant importance, an importance that is nevertheless only rarely acknowledged. In the field, development cooperation's agencies and aid-workers often enter in dynamics they fail to fully grasp and sometimes unintentionally end up reproducing asymmetries of power or even they create or exacerbate tensions among the local population. In this context, the way in which the context of intervention of development projects is framed is crucial. As we already mentioned before, referring to the case of the Ethiopian Southern Lowlands, the representation of the situation and the explanation given as the cause of the crisis – nomadism – had the effect of planning and implementing projects aimed at the promotion of sedentarization, with the unforeseen and unintended consequence that the conflict actually escalated.

In other cases, development cooperation projects may unintentionally legitimise some people and some actions, while at the same time de-legitimising others. The case of children distance adoptions is paradigmatic of that. By choosing one child to be helped among many in situations of deprivation and representing him/her as the poorest among poor, may have the result of communities becoming more divisive and prone to violent conflicts. This has happened for instance in the Northern province of Burkina-Faso, Namantenga, where previously peaceful villages quickly became overtly violent for the inequality in the distribution of aid. The non-verbal language is similarly important to focus on. For instance, if an organisation in order to bring aid implicitly accepts the terms of war by negotiating passage with warring parties or it hires guards to protect the delivery, it can give the idea of bestowing legitimacy on warriors (we need arms to bring aid) and that international staff has a higher value (because it deserves to be escorted) than local people. These can reinforce animosity locally. In a different context in Morocco, development projects oriented to women promotion, although extremely important and necessary, have in some cases, unintentionally, ended up for further disempowering women. In fact, for the fact that they were represented as powerless, and in need of help in order to raise international aid, they felt both ‘used’ and deprived of any agency, with the result that often their situation was actually worst than before.

At the practical level, ways to put at the forefront the usually marginalised attention to language and discourse could include the following:

- to focus more on the study of the context and on the narratives around it;
- to do surveys and interviews about the perceptions of the situation and the adequacy of the planned intervention, and to involve many stakeholders as to have proper representation of the views of the entire community;
- to devise common spaces in which people can share their opinions and feelings about the interventions, as ways of building dialogue for common interests, starting with the right of life.

<sup>3</sup> A discussion on the effects of Humanitarian aids to the Sahrawi people can be found in <http://www.globalaffairs.es/en/humanitarian-aid-for-the-sahrawi-people-the-impact-and-limitations-of-aid-policies-for-refugees/>.

## CONCLUSIONS

It is widely assumed, even in the academic literature on the topic, that development cooperation and internal aid are designed to help putting into place those conditions necessary to sustainable development and positive peace. These interventions are also largely assumed to help managing and resolving crisis situations in peaceful ways. However, despite the good intentions, this not always happens in the field.

As we have shown in the paper, development cooperation's projects are part of the context in which it is provided, and, hence, their impact is hardly completely neutral and there might be cases in which it reinforces or prolongs the conflict. In particular, in the case of structurally asymmetric conflicts, where the same structure of the relations among the parts is at the root of the conflict, an intervention which pretends to be impartial and neutral may in effect result in reinforcing the status quo and hence the unbalance of power among the parts. Finally, it has also been stressed that, in the contest of development cooperation, decoding language and discourse becomes extremely important for understanding perceptions of aid and ways to improve its effectiveness, to identify real needs, as well as to address ways of preventing escalation into violence. As such, to deconstruct commonsensical and 'natural' representations of events, people and situations goes in the direction of building more peaceful social interactions and societies or, in other words, a more sustainable peace.

## WHY DOES INTERNATIONAL DEVELOPMENT COOPERATION NEED THE CONTRIBUTION OF PEACE STUDIES? AND WHY IS PEACE RESEARCH CURRENTLY SO MARGINAL IN INTERNATIONAL DEVELOPMENT COOPERATION?

Massimo Pallottino\*

### ABSTRACT

Peace and human security have strongly emerged as a global concern in the last years, as the post-cold war scenario made large scale confrontation between superpowers less likely. The dream of a peaceful world after 1989 animated the debate around the efforts towards the identification of a shared global development perspective. However after the 9/11, an increasingly complex scenario, where the International Development Cooperation (IDC) was confronted with new challenges and with fragmented and asymmetric conflicts, was hardly taken into account: the development rhetoric went on stressing the need for clearly identifiable outcomes in terms of global development objectives, just as if an established global consensus could be considered an uncontested element of the world order. Humanitarian circles followed the same path, interpreting the response to conflicts in terms of objectively identifiable needs that had to be urgently responded to only thanks to the establishment of a zone of humanitarian sovereignty. Peace studies and peace research, as redefined in the last decade of the 20<sup>th</sup> Century, look at the factors that make societies prone to conflict, in the attempt of developing a positive approach to the prevention of war, terrorism and violation of human rights. Their approach need to be more transformative than linear, and more careful to the quality of processes than to the quantity of outcomes; in this context, the micro-politics of social change is not seen as the constraining factor that hampers or slows down the reaching of stated objectives, but precisely as the area where a mediation between different and sometimes conflicting interests has to be found. While, following the same lines, many theorists and practitioners would support the idea that a more negotiated approach to social change is needed in order to radically reform IDC, there are reasons why the international community seems to be less receptive to these instances.

### INTRODUCTION

It is sort of a paradox that a stronger concern for peace and security emerged in the public debate after the 9/11, just as the Millennium Declaration adopted by the General Assembly of the UN, and the subsequent elaboration of the Millennium Development Goals (MDGs), boosted a new hope for a poverty-free world. The event that redefined the notion of peace and conflict in the contemporary world will be remembered along with the largest convergence on global development: 9/11 and MDGs have attracted most of the attention of decision makers during the first decade of the new millennium, characterizing the perception of a global perspective at all levels, and competing for the resources made available within IDC system. The question about the vision for a better planet for all is however an open question today, perhaps more than what it used to be at the beginning of the century. After a decade in which the most impressive economic and social crisis since the end of WWII has ravaged the planet, the international community at the eve of 2015 (the stated deadline for the MDGs) is left with an empty space in terms of shared global perspectives, and with the need for establishing a consensus about the direction to be taken in the next few years. The 'fear of the vacuum' [1] [2] can be a powerful incentive in adopting a short-sighted compromise; or the opportunity for taking into account the contradictions of the contemporary world and to elaborate a creative solution.

Neglected and marginalised by the time MDGs were initially elaborated [3], issues related to peace and conflict are today on stage more than ever. If until 1989 conflict could be understood and somehow minimised as an unavoidable effect of the confrontation between the West and the East, and after that the last decade of the XX century it could still be seen as a consequence of the fall of the wall, the Twin Towers made crystal clear that a new era of conflict was uprising. Nor the post cold war scenario ended up in a decrease of conflict at global level, as it was the hope of many: as Themner and Wallenstein [4] confirm, with the exception of the rise in the mid-nineties (mostly due to the conflicts related to the dissolution of Soviet Union), the number of conflicts in the World remained constant in the last 15 years, even slightly increasing for what the 'minor' conflicts are concerned. Some observers [5] find the situation of the world of today worst than 20 years ago, as the constant rise of the share of the humanitarian aid on the total of the

international aid seem to witnesses<sup>1</sup>.

It is not the ambition of this paper to analyze the key elements of the conflicts and the tensions that feature the world of today. Given the increasingly acknowledged nexus between peace and development, the objective that we will pursue is rather that of highlighting the importance of cross-cutting fields of research such as development and peace studies in reflecting the specific challenges of today's world. These two areas of study have developed quite independently; yet, they look at contiguous and partially overlapping areas of concern. It can therefore be assumed that they could contribute to better understand contemporary world, by introducing explanatory frameworks and by proposing renewed normative paradigms, helping to clarify the implications of global efforts in leading and directing social, economic and politic transformations.

In spite of potential complementarities however, development studies and peace studies, seem to evolve on the base of rather different and possibly irreconcilable perspectives. The relation between the two fields of study is bound to their capacity of progressively integrating new concerns, while escaping from the constraint of an increasingly 'theory binding' practice.

## **THOUGHTS ON DEVELOPMENT AND DEVELOPMENT STUDIES**

During the seventies and the eighties the contradictions in international cooperation systems seemed to lead to a deep rethinking of development concepts. This rethinking was parallel to important changes in the international economy as well as in the geo-political situation: the renewed instability in the international monetary and financial system, the oil crisis, the debt crisis were some of the elements that led to long period of uncontested economic orthodoxy, which translated in the era of structural adjustment. The human and the social costs of this approach led to some degree of rethinking, while the need for a more holistic approach to development was paving the way for the introduction of new concepts such as "participation" or "multi-faceted poverty" into the mainstream approach. Human development approach based on the seminal contribution of Amartya Sen contributed a great deal to a more complete understanding of what the idea of development would entail; the debate about global public goods raised new concerns that needed to be tackled at supra-national level along with a new consciousness about the limits of the earth's resources. The iron curtain contributed reminding that alternative pathways to development could be (more or less successfully) undertaken, and a lively critical debate explored and highlighted different views on the patterns societies could assume, even though a relatively uncontested neo-liberal orthodoxy dominated the 'official' development system.

A certain visible disenchantment about the effectiveness of IDC, and about contradictions and tensions arising in the theoretical debate of DS was counterbalanced by the events of 1989, which fostered a wave of enthusiasm for a renewed global engagement; the debate seemed then much concentrated on "what to do", through the big thematic summits that took place all along the decade. The net effect was to considerably boost the hopes for a global perspective on development, while loading an increased amount of responsibilities on the shoulders of the IDC system, although without really tackling the issue of how the additional costs would be covered. The whole process found a synthesis with the Millennium Declaration, in the year 2000, with what appears a sort of technocratic summary distilled into the elaboration of the Millennium Development Goals. In the last decade of the Century, critical voices were still able to highlight paradoxes and contradictions at theoretical level [6], but not really to grow into a critical mass for alternative. In a world where no real and radical alternative seemed possible, all the thoughts seemed to converge towards a globally shared perspective, where also otherwise alternative and potentially subversive visions find their place, and alternative development had become "... less distinct conventional development discourse and practice, since alternatives have been absorbed into mainstream development" [7]. In such a situation, there is no incentive in reflecting "around" the frameworks, which are assumed as given and unchallenged; the reflection takes place "within" frameworks. The outcome is an increasing attitude of Development Studies (DS) of being functional to IDC system (or rather to a wider 'policy related' world): how to implement policies; how to elaborate better policies towards shared objectives; or how to root new (or partially new) elements into the frameworks that serve as base for policy elaboration: as some scholars have noted [8], the horizon of DS seems increasingly functional to policy, perhaps at the expense of some general look at the issues raised.

The close link between the theoretical reflection and the practice on which this reflection is based and to which it is supposed to contribute, opens another problem, as research on development issues is increasingly linked to institutions directly involved in development, or mandated by them. As Leach and Mearns ([9]:31) remark, "...all knowledge is conditional, in the sense that it reflects the institutional context in which it is produced." Under this point of view, it is unavoidable that knowledge legitimises practice rather than orientating it, with an active engagement of development actors "... devot[ing] their energies to maintaining coherent representations regardless of events" ([10]:2). In practical terms, it is not matter of postulating the impossibility of independent research, but to seriously address the issues raised by mandates, research priorities, clearances, networks, paradigms, networks. But if the above issues are not raised, a call for 'more theory in the practice' may unexpectedly result into a more 'practice-constrained' theory, and particularly so in the case of research in situation of (potential or actual) conflict were the social networks and the access to information are more segmented than usual.

---

<sup>1</sup> Although this increase can be interpreted also in a different way, as it will be noted later.

The elaboration that took place along the 1990s, ended up pushing issues related to rights and political representation in a rather marginal position with respect to the new MDG framework [11], while the latter developed a much stronger focus on a sort of global welfare standard. But in the ambition of accommodating rather factual objectives within a wider definition of “how” human societies should evolve regardless of their diversities, MDGs had - for the first time in the era of development, and as the logical conclusion of a much longer process – established the ground for a great perspective, somehow a-cultural and non-ethnocentric in nature, in the sense discussed by Latour [12]. The identification of common benchmarks and indicators play a crucial role in establishing “what” the reality is, and how it has to be looked at, the uncontested existence of “facts” being the key assumption on which the modernity is built. This takes place just at the time that the 9/11 was disclosing the breaking up of the fundamental unity within which the world relations and interactions (including conflicts and wars) had been accommodated until then. Under this perspective, MDGs may be seen as the perfect product of the contemporary development theory; that finds its birth precisely at the time that the “modern” understanding of the world falls apart: because of the contradictions entailed within its own way of explaining (or not explaining) social facts; but even more because of the emergence of a new radical juxtaposition (real or perceived) between different “worlds”; not a juxtapositions between allegedly alternative civilisations, but in the breaking up of a no more uncontested unity.

## THOUGHTS ON PEACE STUDIES AND PEACE RESEARCH

Peace Studies and Peace Research (PSPR) in the last decade of the 20<sup>th</sup> century enjoyed some kind of revamping [13] as, after the downfall of the fear for a nuclear confrontation, new elements were included in their agenda: the conditions under which a peaceful coexistence within the human societies could be pursued became a key focus to look at for a world free from violence of any sort. This transformation was consistent with a renewed (although not uncontested)<sup>2</sup> understanding of “positive peace”, which was tackling the challenges of a deeply transformed world, where conflict had to be considered as somehow part of the global game. If tensions are unavoidable, much less unavoidable are their consequences in terms of violence and open conflict: it is on the different ways these tensions can evolve, as well as on the pre-conditions of the processes leading to a more peaceful coexistence, that the concerns of a renewed agenda of PSPR were raised.

Definitions of PSRS based on the notions of violence and conflict play a key role in defining the boundaries of this interdisciplinary field. Still, the issue of how these notions are connected to peace needs still needs to be clarified, in the seek for a better definition of what, in the contemporary world, would be needed for a reflection on “positive peace”. Among the concepts that would probably need to be discussed, there are meanings of conflict and violence under a perspective that do not only encompasses the physical dimension: although physical violence and open violent conflict is and should continue being a main concern in PSPR, the notion of structural [14] and cultural [15] violence introduced by Johan Galtung may help accounting for the situations where oppression doesn't follow (only) the path of direct physical violence; in the same context the contribution of Pierre Bourdieu about symbolic violence [16] may bring additional arguments to the perspective of widening up the scope of PRPS, connecting the idea of violence to a general theory about society.

The process of going beyond physical violence, and opening to a wider notion of positive peace, is not without obstacles. It is however an important step in connecting PSPR to a wider understanding of the social transformation processes. Positive peace, more than any other “development related” notion, is associated to the recognition of the subjectivity of the other, and to the processes needed for establishing the rules needed to manage the disagreement and the conflict, other than the oppression or the simple principle of authority. Within this perspective, frameworks are not given but have to be discussed; different stakeholders are not called to “participate” in a play that someone else has written; rather, different interests should be recognised, included, mediated. Such a position would open important areas of reflection on the way different systems of knowledge, power and value interact, and would accept the existence of discontinuities within and across communities and societies. Under this viewpoint, processes of social, economic, political transformation would not be forced into a teleologically consensual perspective [17]; on the contrary it would open a wide range of possibilities in managing differences and disagreements, and establishing the ground for a “pluriverse” [18] world (as opposed to a “globalised” one).

In such a perspective, the tension between the heterogeneity of the human societies and the need for a degree of universality stemming out of the shared belonging to humankind is not easily resolved; not as easily as it may happen with a set of traditional development objectives, which are assumed to be equally relevant for every woman and man on the earth. As a consequence, the heterogeneous representations of human societies and their transformation processes require to be made operational through a relatively complex translation, while the “welfarisation” of the objectives, well represented by the MDG process, assumes that the disagreement in the human societies is simply linked to the identification of the means through which common objectives are pursued. But, as Monni and Spaventa show well [19] the apparent neutrality of the indicators of the progress towards such kind of objectives hides an option for a pre-determined model of society, an interpretative paradigm that sets in technical terms what, on the contrary, should be the object of politically conscious choices.

<sup>2</sup> See Bartolucci [13] for a summary of the debates about “negative” and “positive” peace.

## CONFLICT, DEVELOPMENT, PEACE

The fact that development and peace are strictly related is a widely shared opinion. No doubt that the countries in conflict are also those where the development objectives seem to be furthest to be reached and that, as also acknowledged by the UN, violence and fragility have become the largest obstacle to the MDGs [20]. However, if the connection is ascertained, much less clear is the direction of the causal link: in “what” peace is a precondition for development, as it is assumed by some [21]? Or, the other way round, it is development that has to be considered as a precondition for peace? The question that we should be tackling now therefore is: how does the current development mainstream relate to the issues of conflict and peace?

One common approach to this issue is that distilled into the claim “development that brings peace”: development, the possibility for a better life would necessarily decrease the conflict within and between societies. This approach evokes a wonderful landscape of pacific coexistence in the “land of plenty”. Two question, often unanswered in the world of development, deserve some discussion. Firstly, is the idea of “peace” so much shared across the different societies? It is not, as empiric culture-aware analysis highlights: peace can entail ‘respect and inclusion’; but also “control”, or “expansion” and also some degree of “oppression” for different minority social groups involved in a specific development arena [22]. If the notion of pacific coexistence needs to be at least negotiated, will the practice of development contribute to this negotiation or propose its own interpretation of what the notion of peace entails?

There is however a second issue that deserves to be raised when observing development processes taking place in practice: can this “land of plenty”, where the satisfaction of all the needs of all the needy, be pursued within a perspective where the situation of specific individuals will be improved without ever worsening the situation of anyone else? It is not the case: we may supply fresh water to a village, in order to improve health situation, just to realise that making available that precious resource in a context where the availability of water is regulated though complicated and refined social institutions, makes the level of conflict to increase afterwards; or we may support the claims of poor fishermen communities in a specific trait of a river, just to see a steep increase of conflict with the neighbouring country’s community, relying on the same fishing resources<sup>3</sup>. It is not only matter of confining this kind of outcomes as “need for better planning” (as it could be certainly argued from within development system). It is important to develop methodologies for “conflict sensitive” approaches [23], but we should be ready to recognize that any development intervention producing benefits for someone, is bound to redefine social stakes, to modify power, to produce (intended or unintended) “victims”.

The claim “development brings peace” looks more problematic than usually thought. But another issue needs to be raised: that of “humanitarianism”. Humanitarianism and development have contradictory relations, as on one side they consider themselves as strictly related, on the other side they claim to be anchored to very different perspectives: immediately saving human lives, and ensuring a shared long term development for all in the second case. How to connect emergency relief, rehabilitation and development? How to move from a case where the identification of the needs has to be fast, neutral and technical, to a case where the only thing that matters is what comes out from the negotiation among the social actors? The connection what may appear to be as different phases of intervention has taken various forms: the ‘continuum’ between emergency relief, rehabilitation and development; then the “contiguuum”; than again more recently the approach Linking Relief Rehabilitation and Development (LRRD). These are all conceptual constructions that do not seem to completely solve what at the end seems to be a radical alternative: is the “need” objectively (and urgently) identified though “expert knowledge”? Or is the expressed “need” nothing but the dynamic and temporary outcome of the interaction of the social actors, and more specifically of those whose voice can be expressed and heard in the process? Practitioners from humanitarian and development fields also often claim and reinforce the differences between the two groups, as if the two worlds were really somehow alternative.

But are they? According to Mark Duffield [8] there is not really a difference between humanitarianism and development: the latter is the natural other side of the coin, as part of an emerging system of global governance. According to this author, it was during the latter part of the 1980s that humanitarianism claimed its position as a universal right, above politics that “...caused wars and famines and, at the same time, created delays and bureaucratic difficulties that hampered the relief of suffering. ... Placing humanitarianism above politics, as a right in itself, became a compelling critique of the inhumanity of the rigidities of the Cold War and of its suffocating political etiquette. For this reason, apart from saving lives, a neutral humanitarianism appeared radical and progressive; at the same time, it had widespread public support.” [8: 77] The merging of humanitarianism and developmentalism took place during the first half of the 1990s, with the new institutional arrangements that allowed aid agencies to work in situations of ongoing conflict and to support civilians in war zones. The limited success of the operations led under this perspective brought about a major shift: from simple ‘saving lives’ to conflict resolution and post-war reconstruction. As Duffield puts it, “[i]nstead of revolving around humanitarian assistance per se, the new humanitarianism has invested developmental tools and initiatives with ameliorative, harmonising and transformational powers that, it is hoped, will reduce violent conflict and prevent its recurrence.” [8: 11] It is there that humanitarianism succeeds in expanding its perspective (and way of knowing the social facts) to development world, with a real project of “social engineering” that, after all is perfectly consistent with a view of a “harmonic development”: nothing different from introducing the “applied tool”

<sup>3</sup> Both examples are drawn for the author’s experience : the first case summarizes the outcome of the evaluation of a water development project in the South of Ethiopia, where the author was involved; the second is a case from Guinea.

needed to bring this harmony in a world of disorderly transformation. The same kind of transition may be viewed in the recent success of Disaster Risk Reduction methods and approaches, aimed at building ‘resilient’ societies. But “resilient” to what kind of events? If the answer is “all of them”, then this approach is supposed to encompass elements to face earthquakes, floods, but also wars, conflicts, just as if the political choice of a society could be limited to a technical optimum, needed to make societies “resilient”; but insofar this technical optimum on preparedness touches “any” possible adverse event, it soon becomes an all encompassing prescription on how the society should be.

Of course, it is not matter of denying the importance of the way societies react to external shocks (as it was not matter of doubting about the importance of offering appropriate humanitarian assistance at needs). The point, in this context, is rather to show what kind of operational devices are generated within the development world in order to deal with the disorder brought in by conflict and violence, establishing a system of humanitarian governance [24] that has been observed in action in many areas of the planet. Interesting to say in all these debates, conflict appears as something of substantially “a-historical”: either the traditional “development industry” is assumed to bring peace regardless from the roots of the conflict itself; or in the humanitarianism and related development lines, the urgency of “saving lives” leaves very little room beyond anecdotic recognition of the root causes.

It should be however clear how problematic could be to derive peace building concerns directly from humanitarianism: the shared concern of ‘saving lives’ conceals important differences. Humanitarianism-related peacebuilding is bound to confine outside of its concerns all the elements related to the deeper roots of the conflict, and will operate with as if no political implications could be drawn from the assumed “neutrality” of humanitarian interventions. While the position of those who observe the conflict uniquely from the viewpoint of the victims is necessary, the point to be raised in whether a look on the whole situation where the humanitarian intervention takes place, may help avoiding those adverse effects on longer term peace prospects that have been documented by many observers [25]. Again, this kind of counter-effects are confined within “failures of planning and implementation”: no one doubts that that they could be minimized through a more careful analysis of the reality; the contradictions rooted in the assumptions behind the whole humanitarian / developmental framework are more often dismissed without much scrutiny.

## PEACE AND CONFLICT IN THE POST-2015 DEBATE

Said in short, DS and IDC do not appear to have fully taken into account the issues related to conflict and violence. And to understand what possibilities are there for a new perspective about peace and conflict to be included in the debate, we should refer once again to the MDGs and post-MDGs processes, that represent the common ground for the elaboration of a vision for the future at global level. As Brück [3] reminds, none of the MDG actually refers to peace and security, yet no conflict-affected country has achieved MDGs. In the debate about future prospects, while recognizing the limitations of MDG in responding to issues related to peace and conflict, the latter appear in some cases just as a “sub-topic” of security related concern, or somewhere between sort of “preconditions” for the MDGs themselves to be attained [20], and an objective as such. The world leaders seems in search of a globally shared perspective: which is not as such something negative, as far as the pursuing of this homogeneity does not blur the diversities within a rhetoric that risks to be nowadays far less convincing than what it could have been thirteen years ago [26]. A “new narrative” for development is invoked. But no one dares leaving the old one aside.

Some attempts have been led for innovating the way issues related to peace and conflict may contribute to the formation of a global framework. In this wake, a more substantial contribution has been brought in by the initiative about the Peacebuilding and Statebuilding Goals (PSG), that has aggregated the consensus of a more than forty countries around the Dili Declaration [34]. Saferworld [27] tries to summarize elements arising from the different pieces of policy analysis looking at peace and peacebuilding as a primary focus (including the already mentioned PSG framework), finding a number of elements on which all these peacebuilding frameworks agree. The elements that are widely recognized as being conducive to a peaceful society, are summarized as it follows:

- All social groups have access to decent livelihoods
- All states are able to manage revenues and perform core functions effectively and accountably
- All social groups can participate in the decisions that affect society
- All social groups have equal access to justice
- All social groups have access to fair, accountable social service delivery
- All social groups feel secure
- The international community is effectively addressing the external stresses that lead to conflict

In the perspective emerging from this kind of a synthesis there is a strong concern for equity: an issue unanimously recognised as absent from the MDGs perspective. Equity concerns are evoked with expressions that seem to recall dimensions of mediation, political participation, inclusion. A point that could be raised is about the theoretical implication of using a relatively undefined notion of ‘social group’ as primary holder of the rights here above mentioned (at the place of the individuals). Still one could doubt that the issues put forward by Saferworld could be expressed in terms of “objectives”. But in the current global debate , it looks like as if something could not be considered

“important” if it is not expressed in terms of an objective.

In the attempt of shading some light on the conditions within a society that are more often associated with a peaceful coexistence, mention should be done of the recent “Pillars of Peace Report” [28]. The report tries to isolate the positive factors which sustain and reinforce peaceful societies, basing on a complex statistical work, that ends up building an eight-part taxonomy which consists of:

- a well-functioning government;
- a sound business environment;
- an equitable distribution of resources;
- an acceptance of the rights of others;
- good relations with neighbours;
- free flow of information;
- a high level of human capital; and
- low levels of corruption.

Most of the issues highlighted would deserve some level of further clarification, which to some extent the report does; and clearly enough some of the concepts involved are sufficiently fuzzy to generate discussion. The merit of this taxonomy is the fact of being somehow de-linked from immediate policy objectives. The Pillars are based on existing data-sets, which may stimulate a reflection on what kind of data would be needed to refine further the analytical framework.

## CONCLUSIONS

Let us now to summarize some elements to answer to the questions asked at the beginning of this paper. Why IDC needs the contribution of the PSPR? And why will this contribution be so difficult to accept? Some of the issues summarized above have tried to draw the attention on the fact that the marginal position of peace and conflict concerns may not be only because of the absence of a lobbying platform in the international *fora* that are reviewing the issue [29]. If we consider the four areas where Brück [3] recognises important knowledge gaps that PSPR should contribute addressing<sup>4</sup>, we see many issues that development studies have analysed in deep, both in technical and in institutional terms. In at least some of these areas there is perhaps room for the two interdisciplinary domains to learn cooperating. However there are some aspects that PSPR seem more prepared to look at than DS, for the simple reason that, in a way that can be more or less functional to the identification of policy option (and PSPR claim to a certain extent a sort of “militant” approach [13]), the object of PSPR is rather the whole society; while in IDC (and often in DS) the focus tends to be those externally induced transformation processes, sublimated into the intervention itself (be it defined in terms of projects, or programmes or policies), and more so as the DS develops in connection with IDC or policy systems.

Seen from the viewpoint of DS, the issue is to be more fully aware of the political implications of any initiative of IDC, and to try to de-link research efforts from the immediate needs of the latter while tightly keeping under observation the way policy an project induced changes interact with the social, economic, political environment. Or in other words, to be practical, to keep some degree of freedom when conducting research, in order to be able to keep an eye on the context, widening the scope of development research into the area of relevance, and relation to the context, as some scholars have tried to suggest [30]. PSPR may be more able to look at the whole picture of the social transformation, somehow re-composing the hiatus between IDC objectives described in narrow term and wider stakes that risk to remain in the shadow. This is what would be needed in order to avoid the “Maghreb/MDG paradox” : those countries that were considered excellent MDGs performers just immediately before seen the starting of the so called “Arab springs”. This attention to the context, beyond those aspects that are deemed functional for ‘development’ to take place, is based on the capacity of having a look on the whole, without losing key details because of the narrow focus we are constrained on, and recognizing what Zupi [2] calls the “complexity of the whole”. This requires the acknowledgement that the change is not “simple” in the sense of the “impact chain”: the inherent complexity of the change is something that requires a different thought on society, change, and also planning.

Looking at the interrelations between peace, conflict and social change, a specific contribution of PSPR can therefore be the conception of “conflict”, and an approach capable to address the need of transforming tensions and disputes within and between communities in something different than the violent confrontation: conflict not as something “temporarily perturbing” the landscape, but as something that requires understanding of its deeper roots, and its incorporation as an issue at stake. Introducing the “parties” and their different and perhaps irreconcilable stakes into the game would lead then towards a more profound transformation: a sort of “post-humanitarian consensus” precisely about the fact that consensus may not be there, at least at the beginning, and that it could possibly be built only if the areas of disagreement are explored, the rights are recognised, and the right mediation is found. Even if DS are based on

---

<sup>4</sup> The drivers of insecurity, conflicts and fragility; trends in security, conflict and peace; the consequences of violent conflict and insecurity; interventions and institutions for security and peace.

the idea of a sort of mechanistic transformation, it is perhaps possible to introduce into it an element of constructivism, to say it with a post-modern conceptualization [12]: no more Needs to be addressed through and appropriately Optimal Technique identified by rationalist modernisers, but social priorities need to be negotiated by those that Latour calls “diplomats”. It is the same difference William Easterly [31] finds between planners and seekers, perhaps losing a bit of the “relational” element that the idea of “diplomat” embeds. This rather abstract idea could be expressed in much more practical terms: promoting for example “mediation and inclusion”, and going beyond mainstream participation, often conceived as a sort of token to be paid within completely predetermined policy frameworks; avoiding the “technical optimum trap”, and perhaps using the knowledge more in terms of highlighting the trade-offs every choice is bound to imply; allowing for the time needed for the processes to develop [32], instead of being constrained by the tight schedule of outputs and objectives.

IDC is in a deep crisis, which sometimes is expressed as a “resource crisis”, but that it is more a “representation crisis” [33]: it is the way through which IDC looks at the world that is not any more able to describe the reality. The “non self consciousness” about the reasons of this crisis, pushes most of the efforts of IDC industry towards operational performance rather than towards a better understanding of the world. Development scholars could raise the question of how useful is to remain so closely (and predominantly) linked to policy oriented approaches<sup>5</sup>. In one sense this closeness “justifies” the very same existence of DS, but paying a price in terms of institutional embeddedness of any knowledge produced. It is somehow a complete reframing of the way IDC understands the transformation of the societies, and its role within it. What is needed is a bit of “self-reflectivity” that DS, described in a bit too clear-cut manner in the previous paragraphs, have from time to time generated: so far not enough, perhaps, to radically transform attitudes of theorists and practitioners.

## DONORS' CONDITIONALITY IN CONFLICT SCENARIOS: THE DIFFICULT RELATIONSHIP BETWEEN GRANT AID AGENCIES AND BENEFICIARIES

Federica De Sisto\*

\*Trinity College Dublin, Ireland - [desistof@tcd.ie](mailto:desistof@tcd.ie)

### ABSTRACT

Macrae [1: 170] states that external aid ability in conflict management/resolution is highly compromised because aid “remains an instrument of foreign policy, and therefore must conform to the analysis and priorities of individual donor governments, and multilateral organizations that play a political role, such as the United Nations”. This paper intends to show current reality of relationships between donors and beneficiaries - with a focus on the NGO sector, specific to conflict resolution efforts. It will briefly explore aspects of the relationships that can be improved in situations when a gap exists, as well as methods for addressing this imbalance in a way that is meaningful to peace work.

### DONORS' CONDITIONALITY: OVERVIEW

Some years ago, I wanted to acquire some significant experience abroad, so I found myself on a plane to Ethiopia excited by the idea of working for a prominent international NGO in the field of human rights protection. It did not matter that it was an unpaid internship. What I did not know yet on that plane, nor did I expect, was that I was going to be considered, at my first work experience, the human rights expert of that NGO branch in Addis Ababa. Until that point in time, the organization had run only development programmes on agriculture and when I joined their team, it did not have human rights advisers on board. The reason for enlargement of its focus was very practical; the NGO worried about the lack of funding in the sector of its specialization and planned to direct some of its programmes towards better financed areas of development.

This is not an isolated case. Referring to the NGO world in particular, Aall [2: 379] points out that: *Managing commitment in the face of financial uncertainty adds to the complexity of establishing effective partnerships among official and nonofficial third party intervention in a conflict situation.*

Funding and the lack thereof, undoubtedly affects long-term commitment in conflict areas, and not only; more and more often, the lack of funds especially for the NGO sector, is likely to slant grant applications' proposal “towards what they think the funding source is looking for” [3: 112]. The field of conflict management, conflict transformation and resolution and peacebuilding are the areas an increasing number of organizations, governmental as well as non-governmental, are looking at [4]. For Ropers [5] this is particularly noticeable in long-term post-conflict reconstruction phases, where a large number of NGOs are at work and a marketplace situation develops with a demand and supply of conflict-management services.

Because of the economic situation, the market is less oriented to the needs in conflict areas (however defined) but more on the interests and the assessment of the Western donors. This has the consequences that activities get primarily promoted that abide by the rules of the donors for distribution. This may mean short-term education in conflict resolution, which can be evaluated easily by the number of trained multipliers [5: 525].

Moreover, an extraordinary amount of staff time goes to keeping projects funded; as a result, the time and capacity of these actors to actually perform the necessary services are greatly diminished [3]. At the same time, the attitude of changing focus for survival, particularly common among medium-small organizations especially in the Global South, accounts for a further reduction of aid potential and, even worse, it increases the risks of unintended outcomes [6: 5]. As very clearly expressed by Galama and Van Tongeren [6: 30]: *Local agencies engaged in competition for funding may be drawn into attempting actions which seem unlikely to succeed based on their own understanding of the situation, both because they want the funding and because they hope the donor may know something they don't know.*

Similarly, many scholars note that a significant difference exists between the perceived goals of donors, practitioners and target communities when it comes to the evaluation of a project [7; 8; 9; 5]. On the one hand, donors' evaluation agenda is generally based on the establishment of predetermined and verifiable indicators of change. Diamond and McDonald [3:111] assert that: *The rigidity of bureaucratic structures makes flexibility and innovation difficult. In addition, bureaucracies prefer tradition and are not eager to change... The world is changing, however, so foundations are finding themselves bound by old priorities and procedures that do not necessarily make sense given the current global scene. Although many are now reconstructing their programmes and reexamining trends and priorities, that process can take so long that they are always a little out of date and behind the curve.*

Funders are also usually looking for an efficient, timely, coherent, sustainable and quick outcome, “a measurable result within a specific time frame and a tangible, durable product” [3: 112]. Finally, the inevitable culture bias and

worldview of the funders are bound to have an effect on their funding priorities [3]. From the other side, stakeholders involved in the activities may consider the quantitative measures of the initiative's success used by the funders as secondary to other more immediate needs - such as essential service delivery, and assistance to refugees and displaced people [5]. Similarly, many scholars note that donors' evaluation agenda is generally based on the establishment of predetermined and verifiable indicators of change [7] [8] [9] [5].

The following brief paragraphs and their at times overlapping contents, aim to show how issues and problems are inextricably tied together. They also represent an attempt to establish better relationships between aid actors in conflict situations and thus improve their ability to deliver meaningful results.

## **OPENNESS TO LESSONS LEARNED AND WILLINGNESS TO ALLOW MISTAKES TO HAPPEN**

There is often apprehensiveness on the part of beneficiaries about possible negative consequences of reporting on unsuccessful or less successful interventions. With fierce competition for scarce resources, an honest discussion of a disappointing outcome can have serious unwanted consequences for the community the programme aims at helping [6]. Learning from failures is just as important as learning from successes. The development of good practices can then become a learning tool in conflict resolution interventions.

### **Lesson learned and best practices**

Although both terms “*lessons learned*” and “*best practices*” are often used within the international field of conflict resolution, the definition of these terms has not been often debated. It is therefore fundamental to ask what constitutes a lesson or best practice. There are different levels of lessons learned or best practice, some specific to the context and project, some more generalizable and applicable to a variety of situations and contexts. According to Church and Shouldice [10: 44-45]: *To date there is no transferability requirement that determines the evolution of a practice to the level of “lesson”. It would also appear that there are varying evidential requirements for stating that something is a best practice or lesson, which creates further confusion about the terms.*

Closely linked to this point and to the need to address the issue of whether new terms have to be developed in addition to refining the use of current terms, is the argument below, related to modalities for evaluation of projects.

## **CONCERN WITH METHODS OF PROJECTS EVALUATION**

Donors should be more concerned with how projects are evaluated, especially those involving “soft processes” of dialogue or conflict resolution. There are different interpretations of what should be considered success because of the lack of clear agreement on time frame and criteria [11]. Time is only one basis for comparison. The benefits of conflict resolution processes may take many years to come to fruition [3]. Hence, quantitative evaluating tools appear to be inefficient. The number of people trained for instance, does not necessarily imply a change in attitude in all of them, as many factors influence conflict dynamics and their softening. Rather, there is a need for rich longitudinal datasets that follow individuals over time and hence permit monitoring of cumulative dynamics and efficiency of measures used to alleviate it. This paper suggests that further research is needed to develop focused, cost-effective sets of agenda for research, data collection and evaluation.

Diamond and McDonald [3] maintains that some sectors do not have an internal culture or a history of evaluating their own activities; others might be exploring the use of more creative evaluation modes where the evaluation process itself is part of the intervention. Still others are making use of both qualitative and quantitative methods to demonstrate effectiveness. For Jeong [11], points of reference for success can be found in commonly accepted goals and objectives. Criteria for evaluating a success can therefore be formulated according to maximal and minimal approaches to peacebuilding. Maximal approaches are oriented towards the achievement of positive peace: a peace filled with positive content such as restoration of relationships, social justice, creation of social systems that serve the needs of the whole population and constructive conflict resolution. On the contrary, negative approaches to peacebuilding simply refer to the absence of direct use of force, although all the tensions that break out in an open conflict may still exist. It becomes clear that the measurement of achievement of maximal goals requires a longer time frame.

Moreover, it is to be noticed that peace is not only unlikely to be achieved in a linear time frame but cannot be reached with a single area focus.

## **FOSTERING DIALOGUE AND MUTUAL UNDERSTANDING**

Both parties, donors and beneficiaries, should be able to sit down together and discuss what goes well and what goes wrong or badly wrong in a funding practice; what some practices facilitate and what impedes the collaboration needed for creating a network of effective actions. Lack of both communication and fair confrontation, strengthen the position of donors, whose understanding of the dynamics of conflict and interventions could remain incomplete and,

from the donor's side, correct. There seems to be no evidence to suggest that conditionality is generating effective incentives for faster implementation of reforms. On the contrary, it is undermining the quality of dialogue, generating unnecessarily high transaction costs and diverting attention away from the fundamental issues. In fact, conditionality has led to a dialogue that is "superficial" and "confrontational", weakening the potential for more strategic and constructive dialogue that would be an indication of a more genuine partnership.

## **PAYING MORE ATTENTION TO LOCAL NEEDS**

It is fundamental to collaborate more genuinely with the people locked in conflict. In the end, locals must be the protagonists of their history. A growing number of scholars agree that local actors are an indispensable ingredient in a viable and sustainable peace process. If efforts to prevent, resolve and transform violent conflict are to be effective in the long term, they must be based on the strong participation of local civil society groups committed to building peace [11] [12: 13]. No societal transformation can occur if local actors are not interested in the peace process or if they do not pro-actively participate in it; only if the peace process belongs to the people will their willingness to make it work be greater [14].

The concept of local participation is also the basic premise of "track-two" diplomacy: the expertise for dealing successfully with conflict and peace-making does not rest merely with governments but also with citizens, from a variety of backgrounds and with a variety of skills, who have something to offer and can make a difference [3]. As originally conceived by Joe Montville, the terms "track two" or "citizen" diplomacy refer to unofficial contacts between people—usually ordinary citizens— which can later pave the way for official diplomacy, the so called "first track" or "track one" [15].

Cockell [13: 23] suggests that "successful peacebuilding evolves from indigenous societal resources", meaning local institutions and actors, a belief found also in Galtung and LeBaron. The former [16] affirms that peace is not a condition that endures if the protagonists of the conflict are not proactively engaged in its sustainability, while the latter [17: 275] maintains that "all attempts to address conflict need to fit the people and the context involved... Conflicts evolve and shift over time; at the centre remain relationships". Lederach [18] stresses the fact that relationships are at the heart of conflict transformation; they form the context in which violence happens and also generate the energy that enables people to transcend violence. Lisa Schirch [19], in her case studies, describes ways in which communal acts among members of conflicting groups (e.g. eating a meal, dancing, fishing, and looking at a photograph) were central to transforming parties' understanding of themselves, their "enemies", and their conflict.

This is one of the main frustrations and tensions, as locals often feel impelled to make their particular wisdom heard by the decision makers. Deeper analysis of the socio-political-cultural context in which the intervention operates, information about the needs of the people on the ground and new ideas for its resolution, may not be heard by those who make decisions and thus do get transmitted into viable policies [3].

## **PROMOTING EXPERTISE IN THE FIELD**

Funding-driven projects generate unprepared aid staff and initiatives that fail to produce the hoped-for outcomes. The more beneficiaries and their funders are concerned about their own status and the status of their organizations, the less likely they are to be effective. Reality shows that it is not unusual that their understanding of the situation is partial or wrong, especially when funding is the driving force for the intervention [20]. Training of NGO staff involved in the project is fundamental although sometimes lacking. More time and financial resources should be used to address this fundamental aspect.

## **CONCLUSION**

This short paper intended to show that in the field of conflict resolution, that is quickly becoming competitive rather than co-operative, organizations have a major chance to transform the potential for peace in protracted conflict. Limited funding and the desire to survive can convert agricultural organizations into human rights agencies. Aid staff with insufficient skills in the field of work they are assigned to, and who lack in-depth analyses of cultural and social understanding of peace and conflict are the unwanted results. Paying attention to all of the aforementioned issues can contribute to bring changes in priorities in donors' policies – if and when needed – and to guarantee a more accurate correspondence of aid efforts to the need of local actors. More often than not, it seems that the aid system uses a top-down approach, where the donors assumes a control function, whilst NGO beneficiaries became donor-driven and, to certain extent, distant from the people they claim to represent.

## DEVELOPMENT COOPERATION AND INTERNATIONALIZATION OF UNIVERSITIES

Angelo Stefanini\*, Alessandra Bonoli\*\*

\*Centro Studi e Ricerche in Salute Internazionale e Interculturale (CSI), DIMEC,  
Alma Mater Studiorum University of Bologna, Italy - [angelo.stefanini@unibo.it](mailto:angelo.stefanini@unibo.it)

\*\*DICAM, Alma Mater Studiorum University of Bologna, Italy - [alessandra.bonoli@unibo.it](mailto:alessandra.bonoli@unibo.it)

This panel arises from the need to share experiences of integrating international development cooperation in the strategic process of internationalization of universities in all their functions: their teaching, learning and research policies and in the organization of services and administration. The internationalization process, which most universities are embarking on as no longer avoidable, provide them with the opportunity to acquire the tools and the attitudes essential to ward off an otherwise inevitable loss of relevance in contemporary societies. Internationalizing the university through both “cross-border” mobility of students and faculty, and changes to curricula, means integrating the international, intercultural and global dimensions in their central functions (research, training and services) in order to transform society. To gain a broad perspective, an uncommon sensitivity and a high capacity of inter-cultural and trans-national communication is needed not only for teachers but also for the culture of the institution. The end product of such an approach should be the development of a “global perspective” that will lead to the emergence of professionals / citizens of the world. The “global citizen” is one who sees the world and its inhabitants as interdependent and works to promote both his own interests and those of the most disadvantaged populations, anywhere on the planet. Equipped with the appropriate tools, those who leave the university can contribute to the best achievements in their professional role within the community, at home as well as abroad.

Cooperation with low- and middle-income countries provides a fundamental contribution to universities looking for a global perspective and gives new perspectives on issues related to local development and innovation. The exposure of teachers and students to development cooperation, both for reasons of ethical and of personal and professional growth, is very conducive to the acquisition of new skills and generates particular understanding to appreciate diversities and combat prejudices, to manage change and the dynamics that shape society. The ultimate impact of the beneficial dialogue between development cooperation and internationalization of the university is mutual: it is no longer knowledge transfer and “developing the other” but innovating through knowledge exchange and growing together.

This panel intended to gather evidence from the field in the form of proposals or theoretical elaborations, with the view to facilitate the integration and mutual enrichment between the experience of international cooperation and the process of university internationalization in all the different actors of the exchange.

Focussing on the important, global issue of sustainability, Alessandra Bonoli and Francesca Cappellaro’s paper [1] discusses how current international programmes in this field aim at supporting “universities to commit themselves to principles of sustainability and give the impulse to start with implementing sustainability into every day processes.” After reporting on the numerous and extremely variegated international experiences, the distinctive example of the University of Bologna is presented as a case in point with its geographically decentralised approach and complex organization; its diverse initiatives are described in their social and environmental sustainability impact. According to the authors, the University of Bologna’s experience of implementing sustainable practices into the university structure can act as a model “to demonstrate the theory and practice of sustainability” and thus become a “living laboratory of sustainability” leading to real changes.

In his paper [2], Angelo Stefanini argues that, in strengthening their approach to development cooperation, universities should be guided by a process of internationalization aimed at social transformation. From their privileged position and power status, higher education institutions are well equipped to address “the difficulties and contradictions related to poverty-alleviation policies and development paths” through the production, the reproduction and the application of knowledge in fields related to human development, such as environmental sustainability, peace, health, gender equality and quality of life, within a common framework of human rights and social justice. “In short,” the author contends, “universities should emphasize the identity and importance of IDC [international development cooperation] activities through their recognition as a statutory objective of university work, their inclusion in strategic plans, the creation of institutional bodies to promote and manage them, and the existence of tools and dedicated funds for their implementation.” This goal can be promoted by a process of internationalization leading to the development of a “global perspective” within the university organisational culture, which means for staff and students becoming aware of the ties that exist between their lives and that of others in the global context, and “developing the skills, attitudes and values that enable [them] to work together with other people from different countries and cultures in search of a more just and sustainable world.” The experience of the Centre for International Health of the University of Bologna is described as a telling example of an educational action-research in deconstructing current development cooperation’s mainstream narrative with the view to re-construct it with different type of knowledge. As the author concludes,

problems may arise when universities will decide to engage in the process of building an institutional ethos and provide a learning framework to students and faculty in order to keep awake critical thinking: the latter is in fact the best tool to avoid disasters in planning and implementing international development projects.

Simona Epasto [3] discusses the role of public consultations in building a post-2015 global agenda for the Millennium Development Goals (MDGs). Acknowledging the difficulties faced by the creation of a global partnership for development (MDG n.8), she reports on an international research aimed at analysing the contribution of these consultations to the global debate in order to “help to reveal people's priorities and to provide key inputs to the discussion of a post-2015 future development program.” The problems encountered by what is seen by some observers as an attempt to threaten the entire global health governance, are both in relation to the “difficulties for the main actors of the cooperation for development policies to converge on common goals through constructive dialogue” and to “the need to define new forms of cooperation that would start from the comparison and the involvement of the non-institutional actors of civil life.” Since consultations are currently on-going, it is “still too early to define concrete goals and targets for the post-2015 development program of the United Nations.” Perhaps it is also too optimistic to expect from such an exercise a reliable, all-embracing and momentous response to the following questions: will the private sector (in the form of food, beverage, or pharmaceutical corporations and private foundations dominated by enlightened “philanthro-capitalists”) should and, indeed, could have a role in guiding international and human development? Should the answer be left to a hard, lengthy, demanding though truly globally democratic process such as only a revived and strengthened United Nations Organization can ensure?

These considerations may probably be taken as a fair compendium of the number of problems raised by the institutional engagement of universities into the system of international development cooperation. A genuine effort to contribute to a real development for all human beings within the framework of human rights and social justice, beginning from those in most need, cannot avoid to face the hard questions of “whose development?” and “who gain and who loses?” Social institutions like universities, having responsibility for upholding the values of scholarship and social transformation, necessarily bear a tremendous and difficult burden, which cannot be underestimated and reduced exclusively to the task of implementing technical projects in poor countries just like a charitable organization. The kind of expertise that universities should equip development professionals with, therefore, should be meant “not to provide people with answers, but with the means to organize themselves and produce solutions to their own problems”.

## INITIATIVES TO START WITH IMPLEMENTING SUSTAINABILITY PROCESS INTO UNIVERSITY OF BOLOGNA

Alessandra Bonoli\*, Francesca Cappellaro\*

\* DICAM, University of Bologna, Italy - [alessandra.bonoli@unibo.it](mailto:alessandra.bonoli@unibo.it)

### ABSTRACT

In the recent years, voluntary sustainability campus programs are growing worldwide. Regional and international conferences, higher education associations and intergovernmental organizations, such as UNEP and UNESCO, have developed a variety of agreements, declarations and charters on university sustainability with the aim to help, coordinate and strengthen campus efforts. As at 2011 there were more than 30 such international agreements, signed by more than 1400 universities globally (i.e. COPERNICUS Alliance, European Network on Higher Education for Sustainable Development, EAUC, the Environmental Association for Universities and Colleges, UK). Furthermore there are also initiatives working at international level, such as the International Sustainable Campus Network (ISCN) and the Global University Leaders Forum (GULF) or the Global Universities Partnership on Environment and Sustainability (GUPES): an intergovernmental platform launched in 2010 that engages universities globally in responding to the challenges of sustainable development, by supporting innovative and relevant approaches to education. All these programs and initiatives aspire to help universities to commit themselves to principles of sustainability and give the impulse to start with implementing sustainability into every day processes. In its more than 900 centuries of history, University of Bologna has been geographically expanded through the city acquiring more and more separate buildings instead of being concentrated in few campuses. Hence University of Bologna is complex, multi-faceted entity with diverse organizational subcultures, traditions and concerns. The transitory nature of university life for the bulk of the campus community can mean that the real impacts of the institution remain unacknowledged. In the paper a first attempt to collect some University of Bologna initiatives in sustainability field is reported. The actions are categorized by social and environmental sustainability issue.

### THE CONTEXT: UNIVERSITY SYSTEM

Currently, there has been a large globally growth of voluntary sustainability campus programs. These programs help universities to commit themselves to principles of sustainability and give the impulse to start with implementing sustainability into every day processes. The different and particular ways of how to bring sustainability into action create a common knowledge that enables universities to build strong sustainability communities. By pooling this knowledge of best practices, solutions and lessons learned, the transfer of experiences in a vital network becomes substantial for successful transformation of higher education institutions into places of sustainability. There is a lot of potential for further development in this field on the technical or the behavioural site. Associated to research and education, the environmental profile also encompasses the environmental performance of the University as an organization.

Implementing sustainable practices into university structure can help to demonstrate the theory and practice of sustainability. The campus itself can develop a feedback mechanism for the teaching and research practices through taking action to understand and reduce the unsustainable impacts of their own activities.

### Sustainability transition approach applied at university system

Universities are complex, multi-faceted entities with diverse organizational subcultures, traditions and concerns, and the transitory nature of university life for the bulk of the campus community can mean the real impacts of the institution remain unacknowledged (Lozano, 2011). There may be individual high quality initiatives aimed at addressing these impacts, but where these are restricted to one or a handful of organizational units they inevitably end up ad hoc and uncoordinated. In addition, limited funding and multiple calls on capital budgets favour short-term fixes over green investments with long-term paybacks.

Transition approach can be a useful support in finding the correct approach on how to deal with sustainability at university. Applying transition theory to the specific case of university could be an interesting example on how to put in practice a successful transformation of higher education institution into place of sustainability and it also can contribute to better understand radical innovation processes (Markard and Truffer, 2008).

Several transition concepts have to be considered in setting up a framework for sustainability planning and

management of university system. As university is a complex system, it can be examined with a multilevel perspective (Rip and Kemp, 1998; Geels, 2002; Schot and Geels, 2008) or with arena of development approach (Jørgensen, 2012). A promising approach adopted in the urban field that could be applied at university level is the Urban Transition Management, UTM [Drift, EUR, 2010] that identifies an interesting approach to achieve sustainability innovation.

UTM identifies 5 phases for urban sustainability innovation:

- Phase 1: Preparation & Exploration
- Phase 2: Problem Structuring & Envisioning
- Phase 3: Backcasting, Pathways & Agenda Building
- Phase 4: Experimenting & Implementing
- Phase 5: Monitoring & Evaluation

In conclusion it can be said that Sustainability Transition can certainly provide the basis for the definition of a concept and a roadmap of sustainable initiatives at university, setting priority with the aim at helping to enhance the sustainability of the campuses.

## PRACTICAL STEPS FOR IMPLEMENTING SUSTAINABLE CAMPUS

In the following a first attempt of defining a pathway for sustainable campus is provided:

1. *Status quo analysis of sustainability projects and actions.* The first step consists of investigating the status quo and the activities in the sustainability field at university (Internal analysis). In addition an overview of international and/or national sustainability initiatives, networks and projects with special focus on universities can be useful to identify support leading colleges, universities, and corporate campuses. An example is International Sustainable Campus Network (ISCN) is a global forum or the exchange of information, ideas, and best practices for achieving sustainable campus operations and integrating sustainability in research and teaching.
2. *Engaging the university communities.* Staff and students have heavy workloads; limited time and multiple expectations as to how that time is used can make it problematic to initiate, maintain, complete and evaluate projects, and compound natural resistance to change. Usually, the demands of teaching and research results in the structural separation of academic staff from campus management. This has led to the view that focusing on campus issues is a distraction from the core mission of the university. Moreover, universities generally lack the incentive structures necessary to promote changes at the individual level. As shown in Fig. 1, UNEP (2012) proposes an interesting approach for engaging the university and wider communities.

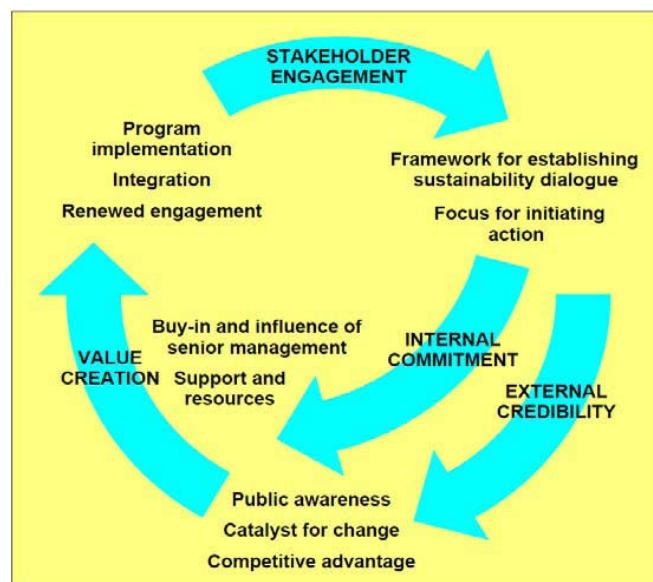

Fig. 1 - The “virtuous cycle” of stakeholder engagement (Partridge, 2005; UNEP, 2012).

As campus sustainability programs become more sophisticated, there is an urgent need for a unified approach for sharing experiences, including measuring and reporting performance. This requires on-going conversations in networks of leading scholars and practitioners.

3. *Create a vision of the campus as living laboratory of sustainability.* The campus can become a living laboratory where to apply strategies and actions and transform itself into green. The results could be the

capacity to reduce its carbon footprint, increase resource efficiency, enhance ecosystem management and minimize waste and pollution. A sustainable university can help to catalyze a more sustainable world. But for realizing this ambitious result it is required the creation of a common vision of sustainable campus among all the stakeholders.

4. *Creation of Strategic Green Niches.* The role of green niches is crucial in sustainable transition process [Smith, 2007]. Providing proposals for starting with a "bottom-up" sustainable initiative (niche-experiment) could help to improve the awareness and to engage all the stakeholders. As in other sustainability transition processes, niche is a concrete way to put in practice a sustainability system also into university system.
5. *Sustainability reporting.* The final result of the previous sustainability process could be the development of sustainability report. Sustainability reporting could be a beneficial initiative involving the whole university, setting targets, goals and performance and informing on sustainable campus progress. It could help to overcome some weaknesses and to improve the strengths already existing. The main benefits to implement a sustainability report could be summarized:
  - to bring together actions, to join the forces and to identify objectives and priorities toward sustainability;
  - to fix a set of indicators in a way to check the progress and to quantify the sustainability performances;
  - to improve the existing knowledge and to introduce new research issues.

## SUSTAINABLE INITIATIVES AT UNIVERSITY OF BOLOGNA

In its more than 900 centuries of history, University of Bologna has been geographically expanded through the city acquiring more and more separate buildings instead of being concentrated in few campus. Furthermore, in the last 20-25 years the Romagna campus (Rimini, Cesena, Ravenna and Forlì) has been also added to University of Bologna.

Basically University of Bologna is complex organization and the implementation of sustainability process is a big challenge to experiment and to implement a real change towards sustainability. In the following, a first attempt to collect sustainability initiatives within University of Bologna is reported. The actions are categorized by sustainability issue.

**Tab. 1** – Sustainable initiatives at University of Bologna.

<i>Category</i>	<i>Action</i>	<i>Location</i>
Energy	Photovoltaic plant	Bologna Campus via Terracini
Buildings	Green roof	Bologna Campus via Terracini
Buildings	Leed Certificate Process	Bologna Campus via Terracini
Waste Management	Waste separate collection system	Bologna Campus via Terracini and via Risorgimento
Waste Management	Compost plant	Bologna Campus, University Botanic Garden
Waste Management	Informatic Electric and Electronic Equipment Waste (IWEEE) Management and Recovery	Allcampuses of Bologna, Forlì, Cesena, Rimini

As describe in table 1, most of sustainable initiatives are located at School of Engineering and Architecture in via Terracini, Bologna. An important achievement will be that the campus could become a living laboratory where apply strategies and actions to transform itself into green. The final result is to improve the capacity to reduce the university's carbon footprint and increase resource efficiency.

### Terracini Campus as Transition and Sustainability Laboratory

Engineering and Architecture School in Terracini is a recent plexus that includes classrooms, offices and laboratories. Also common areas and spaces for students are present, such as reading classrooms, library, cafeteria. Terracini Campus Engineering and Architecture School has been chosen as a laboratory for Transition and Sustainability for University of Bologna. Of course other initiatives have been started also thanks to several other department, but in this paper we refer to our own experience. For a Transition and sustainability "lab" it can be applied an "holistic approach", as suggested by the International Sustainable Campus Network (ISCN, 2013) using a nested hierarchy encompassing individual buildings, campus-wide planning and target setting, and integration of research, teaching, outreach and facilities for sustainability (figure 2).

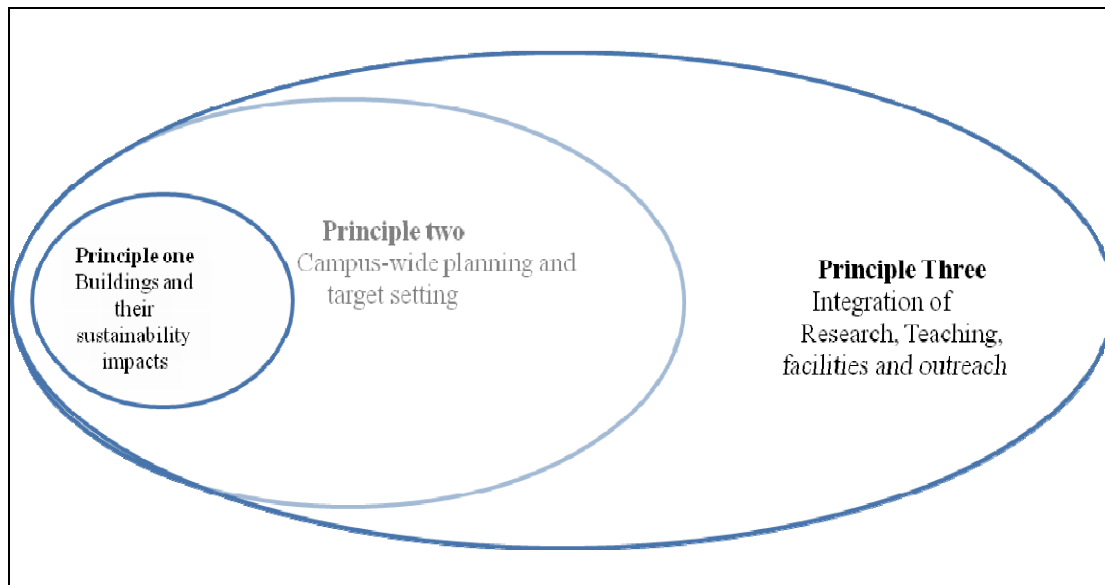

Fig. 2 - The International Sustainable Campus Network (ISCN) holistic approach for sustainable transition projects.

The main goals of that experimental approach are:

- implement good practices in progress;
- involve all the stakeholders of Terracini campus in order to improve the way to the sustainability;
- promote the integration between all different aspects in teaching, research management and decision activities;
- encourage innovative best practices and solutions that can have a good “fall out” not only from an environmental, but also from social and economic point of view.

Most of interventions have been designed and some are already realized with positive effects from environmental, economic and social point of view. In order to facilitate the implementation of interventions through a technical and management approach, a transversal and interdisciplinary team has been created for the coordination, the exchange and the operative discussion on sustainability initiatives of Terracini campus. That team includes researchers and professor, master and PhD Students, technicians, managers and administrative staff.

The actions that have been improving are listed in the following.

*Green roofs and vegetated walls.* These elements represent helpful components to reduce energy consumptions in buildings. Other important environmental benefits concern the rain water collection for a reuse inside the building and the improvement of the comfort and life quality. A pilot green roofs on the Engineering laboratories of DICAM, located in Terracini, has been constructed in July 2013 and it is one of the first green roof in the city of Bologna.

*Urban Waste Separate Collection.* Two years ago a project of separate collection has been improved in order to reduce the total amount of undifferentiated waste. The project aims to separate recyclable fractions (paper, plastics, aluminum, organic, etc.) and to promote a correct approach in urban waste management.

*Informatics Electronic Equipment Waste Management.* A new approach in Informatics WEEE (IWEEE) management has been imagined. University offices and departments produce yearly a very big quantity of Informatics waste in relation with the growth and upgrade in informatics and the necessity to exchange old equipment with the most updated. An overview has been made in order to evaluate the quantity of IWEEE produced, their operating state and their re-usability. Then it has been imagined the possibility of a centralized collection center at Terracini Campus, involving student associations, for the recovery and the preparation for re-use of IWEEE. A trashware activity will continuously recover the disused equipment that in their “second life” will be used inside the university or given to the local community (no-profit associations, schools, social and community centers, etc.), with economic benefits and social added value.

#### Future actions and initiatives

Other actions are in progress and will be achieved in the near future.

- LEED EBOM certificate for the main building of Via Terracini.
- Reduction of water consumption of all bathrooms, throw flow controllers and timers.
- Introduction of “Water Drinking Fountain” in order to guarantee public drinking and mineral water distribution for students and other people that work in Terracini.
- Creation of some areas and spaces for students constructed with non-conventional building materials.
- Proposal for sustainable and local high quality food supplying for canteen and cafeteria.

Further activities will also propose for next year, in particular in relation with training and dissemination activities for improving sustainable transition knowledge. Workshops, training days and stages could be planned out for teaching staff, technical and administrative staff and students in order to raise awareness on sustainability issues.

Some of expected benefits towards sustainability could be energy and water consumption reduction, use and management of technological systems improvement, reduction of maintenance requirements, increase of the value of the buildings, improvement of the monitoring of energy consumption, reduction of air emissions, savings in energy cost, improving of the work quality, comfort and safety, increasing the involvement and the empowerment of staff and students.

All these actions could generate virtuous transformation for the promotion of sustainability initiatives both inside and outside of Unibo, thus an overall increase of the sustainability awareness and skills will be achieved.

## EXPECTED RESULTS AND CONCLUSIONS

Achieving a sustainable path at via Terracini headquarters of the School of Engineering and Architecture leads to improve by economic and environmental point of view and to have a positive impact on research, teaching and life itself of people using this structure. The plexus via Terracini can become a “living laboratory of sustainability”. Through the implementation of best management practices of natural resources (energy, water, etc.), waste and environmental impact reduction and the realization of experimental measures (e.g. roof green or LEED certification) there is the chance to experiment and implement a real change towards sustainability. The described project is based on concrete actions, but at the same time allows to involve researchers and to explore new research fields, such as the identification of methods for the benefits and environmental impacts assessment. The involvement of the administrative staff is crucial for the success of the initiatives, especially for what concerns the operational management of facilities such as offices and laboratories. Finally, the participation and the training of students on sustainability issues can allow them to make a direct experience of sustainability and to improve their skills providing the possibility to build a correct way of living sustainability.

## ACKNOWLEDGMENT

The authors would acknowledge the Technical Office Staff of the University of Bologna (AUTC) for their support in all their projects towards sustainable transition.

### ABSTRACT

Universities are regarded as key institutions in the processes of social change and development. As such they are well positioned to be oriented to cooperation and technical assistance, with all that this implies (research, development education, human capital formation, etc.). They need however to carve out a more important space in the arena of international development cooperation (IDC) and adopt strategies more coherent to their social responsibility. IDC, from its part, may provide a fundamental contribution to universities that, through a process of internationalization, intend to acquire a global perspective and lead to consider under new perspectives the issues of local development and innovation. The exposure of students and faculty to IDC, both for ethical reasons and personal and professional growth, may create new skills and generate special sensitivity to appreciate diversity, combat prejudice, and manage change and the dynamics that shape society. On the other hand, universities should provide students and faculty with an innovative educational framework suitable to enable professionals to meet the realities of poverty, exclusion and inequality in the South as well as in the North of the planet. To ensure that this task is not reduced to a mere transfer of knowledge and technology, in a sterile act of charity or indeed neo-colonialism, a process of “deconstruction” is needed of the many clichés and stereotypes that are part of the conventional “underdevelopment” and “development aid” discourse. A guided process of internationalization aimed at social transformation may empower universities in this undertaking. Building on the experience of the Centre for Studies and Research in International and Intercultural Health (CSI) at the University of Bologna, this paper discusses the need for a paradigm shift supporting an innovative educational practice that lead to deconstruct IDC’s mainstream narrative in order to re-construct it with other, different types of knowledge.

### BACKGROUND: THE REALITY OF INTERNATIONAL DEVELOPMENT COOPERATION (IDC)

Before embarking in words and concepts open to different interpretations, some background information is needed. First of all, I’m using the term international (or global) development in the holistic and multi-disciplinary context of human development, i.e. the development of a greater quality of life for humans, and not simply economic growth. Secondly, the Development Aid Committee of the Organisation for Economic Co-operation and Development (DAC-OECD) defines international cooperation as a broad concept that encompasses all kinds of activities carried out jointly and in coordination by two or more sovereign States and/or by these and international organisations, whatever their area or aim. According to this definition, international development co-operation (IDC) may involve processes related to financial aid, governance, healthcare and education, gender equality, disaster preparedness, infrastructure, economics, human rights, environment and other. In this sense, it is specifically composed of institutions and policies that arose after the Second World War and mainly focus on alleviating poverty and improving living conditions in previously colonised countries. IDC may then be defined as a form of international co-operation that makes contact between countries with different levels of development seeking mutual benefit. [1: 9]

A distinction should be made between IDC and international development aid. In fact, “To co-operate implies sharing work or a task, doing something with others in a coordinated way, in conformity with a plan, and to a certain degree, voluntarily, encouraged by some type of mutual interest or benefit, which may be established as well between unequal partners, as between equals. Aid is something different from co-operation. It still has a social content, since it presupposes a relation between partners, but it does not imply sharing. [...] In principle, one can help someone who is passive or even someone who refuses to be helped.” [2] The term IDC is therefore used to express the idea that a partnership should exist between donor and recipient, rather than the traditional situation in which the relationship is deeply asymmetrical and dominated by the wealth, power and specialized knowledge of one side.

In reality, the term “development cooperation” is often used interchangeably, as a euphemism for “development aid”; whatever that is, its achievements on records are hard to digest. After several decades of what is known as Official Development Assistance (ODA) accompanied by plenty of rhetoric of cooperation and partnership, 1.22 billion people, the equivalent of 20.6% of the population in the developing world, live in extreme poverty (under \$1.25 a day). [3] In 1970, the world’s rich countries agreed to give 0.7% of their Gross National Income as official international

development aid, annually. Since that time, their actual promised targets were rarely met. Furthermore, aid often comes with a price of its own for developing nations, i.e.:

- aid is often wasted on conditions that the recipient must use overpriced goods and services from donor countries;
- most aid does not actually go to the poorest who would need it the most;
- aid amounts are hindered by rich country protectionism that denies market access for poor country products, while rich nations use aid as a lever to open poor country markets to their products;
- large projects or massive grand strategies often fail to help the vulnerable as money can often be embezzled away. [4]

A possible conclusion is that, looking for solutions to the current problems of poverty and underdevelopment one cannot expect that these will be from aid or from international co-operation as it has been understood so far. Much wider and coherent policies are needed at international level, embracing international trade and investment, environmental protection and technical innovation, migration and arms control. On the other hand, although condemning the “aid system” for its inefficiency is legitimate, to say that the inhuman life conditions of billions of people are a consequence of the failure of the “aid system” is short sighted and the hypocritical search for an easy scapegoat. “Reforming the ‘aid system’, which is not a ‘system’ but a sort of cauldron containing almost anything, from good to bad and worse, is a long and slow process. What remains is the unbearable injustice of the iniquitous inequalities between those who have and those who have not. What remains is the intrinsic goodness of the idea that those who have must promote a change leading towards more justice, towards a more bearable human condition for all.” [5] What this change should consist in, and how it should be achieved, is the real issue facing IDC. We can speak about four modes of IDC, i.e. financial cooperation, food aid, humanitarian aid and technical co-operation. To narrow our approach I shall focus exclusively on the last.

## UNIVERSITIES AND IDC: WHAT UNIVERSITIES SHOULD BE DOING

Universities are regarded as key institutions in the processes of social change and development. They not only, in fact, serve as centres of production (through research), reproduction (through education) and implementation (through assistance and services) of scientific knowledge. They are as well integral part of society, engaged in a 'social contract' governing their mutual relations. In addition, during periods of radical change, universities and their constituencies have often played an equally important role in creating new institutions of civil society, in promoting new cultural values, and in educating members of the new social elites. [6] Academic institutions have also been a favourite instrument for promoting Western world values and the neo-liberal ideology in the developing world as in the case of the Rockefeller Foundation and other large philanthropic initiatives. [7]

In recent years, universities have acquired an increasingly important role in IDC as part of a process that has led to the increase in the number and types of social actors providing international support for greater equality and human, sustainable development. We have gone from a situation where only a few specialized organizations, such as international non-government organizations (NGOs), United Nations agencies and private foundations, were devoted to the task, to one in which many other institutions and social groups have begun to engage in development cooperation programs and projects in various fields and in different countries. This has given rise to a great diversity in cooperative efforts and working methods. In this context, it is not surprising that contradictions and problems have arisen in the way IDC is understood and applied into practice. [8]

Education in general, including higher education, is an essential component of the process of expanding opportunities for freedom to people and societies and for human development. As a result, strengthening the university system and promoting access to the higher education are essential objectives of universities engaged in IDC. Similarly, a role universities might play in IDC is to work together to try and resolve the difficulties and contradictions related to poverty-alleviation policies and development paths, and to promote research in fields related to these goals, such as gender equality, strengthening women's capacities and autonomy, environmental sustainability, peace, health and quality of life, within a common framework of human rights and social justice. From this perspective the place of IDC within the university system cannot be regarded simply as one of the functions of a generic process of international collaboration between universities of the North and the South of the planet, a sort of exotic appendix to embellish academic institutions and their faculty's CVs.

Universities entering the IDC system should aim at enriching humanly and academically the people who participate in this effort and the structures that compose it, in a spirit of selfless commitment to solidarity. This may be facilitated by adopting the ‘decentralised cooperation’ approach, which embodies the principles of solidarity and equitable and sustainable development among peoples, founded on participation, promotion of human rights and fundamental freedoms by strengthening capacity and powers of decentralized actors and in particular of the most disadvantaged social groups. Decentralised cooperation is founded on commitment of citizens, government, NGOs, associations and local groups, trade unions, cooperatives, businesses, and educational institutions, including universities. Decentralization and participation are the key words. “Non-state actors and local authorities in development” is a

specific European Commission's thematic programme aiming at encouraging non-state actors and local authorities, both from the EU and in developing countries, to get more involved in development issues.

As an essential part of the university's social commitment, therefore, IDC cannot be understood like a sort of extra-curricular activity or be limited to individual obligations. It should rather be integrated into all activities that characterize it. This means that the university should be institutionally involved in this role and support it with technical, human and financial means, avoiding to delegate tasks only to more socially conscious individuals and groups, or allowing it be considered simply as a moral option of an individual nature, alien to academic work and institutional activities. In short, universities should emphasize the identity and importance of IDC activities through their recognition as a statutory objective of university work, their inclusion in strategic plans, the creation of institutional bodies to promote and manage them, and the existence of tools and dedicated funds for their implementation.

## **UNIVERSITIES AND IDC: WHAT UNIVERSITIES HAVE BEEN DOING**

Although the theme of IDC has long been on the agenda of government agencies, NGOs and institutions, in a number of Italian universities only in recent years it has begun to be viewed as an important aspect of the educational and research processes. Despite a variety of undergraduate and post-graduate programmes on development-related issues being quickly born, IDC's progression into university life has often been a slow process and no clear policy on IDC have been spontaneously generated. This can develop only by a series of organizational strategies, a central administrative agency is needed to coordinate, plan, manage, evaluate and monitor the various actions and, finally, programmes and international activities are only generated within a meaningful international framework of education, cooperation and interchange. Mobility, above all, is the area in which universities have incorporated international cooperation in their activities. It should be noted, however, that to have a significant number of foreign students coming from poor countries or to hold training courses on IDC-related topics does not necessarily mean for an institution 'to do' IDC. Moreover, the activity "international" is hardly perceived as an axis cross-cutting all the undertakings of the academic institution. More frequently it is seen as a space of action of the university, which does not connect directly nor visibly improve the quality of processes. Neither, in the end, there seems to be a clear definition of what the desirable levels of investment are or should be, based on the characteristics of institutional support projects and the benefits expected from the IDC. Instead, IDC is often perceived as an object of unnecessary expenditures, an obligation or merely an activity of prestige (for some), and certainly regarded as one of the least needed in times of budget cut-backs. A number of universities have successfully incorporated IDC in their institutional structure, have a dedicated office with a definite plan of action, and carry out a series of international activities. But can it be said that they really 'do' IDC? [9]

So, what are the reasons why universities have been weak in, or indeed absent from the whole system of IDC? Might it be because another actor filled their role? Is it perhaps a short sighted and distorted understanding of the institutional role and social responsibility of the university that prevented a more forward-looking and comprehensive interpretation of the true mission of the university? The academic institutions are well positioned for cooperation and technical assistance with all that this implies (i.e. research, development education, human capital formation, etc.), but they need to carve out a more important space in the arena of IDC and adopt a more committed and solidary approach than many NGOs have shown in the past decades. The question is how can they be supported to embark in such a transformation amidst the storm brought about by the current globalization process?

## **IDC AND THE INTERNATIONALIZATION OF THE UNIVERSITY**

As globalization continues to evolve, universities are called upon to modify their policies and programmes to respond to the changing realities and avoid losing social relevance. A guided process of internationalization is widely viewed [10] as a way of helping them in this task. According to Knight, the internationalization of a university is "the process of integrating an international, intercultural or global dimension into the purpose, functions [i.e. research, teaching and services] or delivery of higher education at the institutional and national levels." [11: 21] The internationalization of higher education is however inevitably affected by different views of the world. On the one hand, it may be seen as the institutional process by which universities can compete on a global level to achieve a competitive advantage in the global market of higher education. Another way to see internationalization is as an example of global cooperation, of international and intercultural sharing in an ideal "global village". A third model of internationalization aims at social transformation through a critical analysis that rejects the supremacy of the market and recognizes the reality of marginalization of populations produced by the neo-liberal globalization. [12] Regardless their ideological position, the existence of different models indicates that universities are organizations based on values and, as such, able to facilitate a transformation of the social order. Be it explicit or implicit, the choice of the model is itself of great importance as it raises the question of the social responsibility of the university in its various expressions. It is apparent, for instance, that for the second and third model the concepts of cooperation, collaboration, solidarity, sharing and fairness are crucial.

The natural outcome for the universities engaged in a process of internationalization should be the development of a “global perspective”. According to the Development Education Association [13], acquiring a global perspective in education means becoming aware of the ties that exist between our lives and that of others in the global context; increasing the understanding of the economic forces, and social policies that affect our lives; developing the skills, attitudes and values that enable us to work together with other people from different countries and cultures in search of a more just and sustainable world. In short, the “global citizen” is one who sees the world and its inhabitants as interdependent and works to develop the capacity to promote its own interests as well as those of the most disadvantaged populations, anywhere. The Commission on the Education of Health Professionals for the 21<sup>st</sup> Century, chaired by the Dean of the Harvard University School of Public Health and the President of the China Medical Board, maintains that the root of the failure of medical education in creating this type of professionals is the poor attention of curricula to the ‘global dimensions of health’. Part of this ‘culture of indifference’ is reflected in the lack of awareness of the importance of the university as a fundamental social institution. [14]

Hanson [15] has explored the main issues related to how individual courses and their instructors might foster what she calls “engaged global citizenship”. Reporting on a 6-year outcome evaluation, she discusses the impact and potential of transformative pedagogies. Building on Paulo Freire’s pedagogy [16] whereby education is viewed as never neutral and having either an instrumental or an emancipatory purpose, she acknowledges that “if educators do not encourage the oppressed (or the learner) to question, to challenge, and to see the exercise of unjust power as problematic, they enable the oppressed to accept it, adapt to it, and engage in its reproduction.” And she asks, “How can educators in a university setting utilize both the internationalization process and their course curricula to catalyse personal and social transformation and foster global citizenship?” She quotes Bond and Scott [17] as arguing for a model of internationalization that may counter “a naive tendency toward the promotion of what they call intellectual tourism, involving the application of traditional academic knowledge and practice to new cultures with no attention to critical self-reflection or the discourse of development.” Educators are then encouraged to do more than create international placement opportunities or just use global examples.

What is needed is “not only culturally sensitive professionals or clinical practice, but also personal transformation and extended understanding of, and commitment to social change”, particularly in a field like medicine and health where renewed global emphasis is emerging on the social determinants of health, health inequities [18] and social accountability [19]. Such an approach calls for recognition of the reality that globalization leads to increased marginalization of significant groups of people around the world. This calls for a model of internationalization that is mainly about prioritising those research and educational activities that increase knowledge and awareness of inequalities both within and between nations. An internationalization that is “guided by principles of mutuality and reciprocity.” [20: 73]. Universities supporting social transformation models of internationalization should then introduce educational practices that facilitate learning outcomes beyond the walls of classroom learning and professional practice, and leaders and educators who work “tactically inside and strategically outside of the system”. [20: 85]

In conclusion, this model of internationalization may provide a fundamental contribution to universities wishing to engage into IDC equipped with a global perspective. On the other hand, abundant literature shows that exposure of teachers and students to field-based IDC creates new skills and generates special sensitivity to appreciate diversity, combating prejudice, manage change and the dynamics that shape society. [21] [22] [23]

## CSI AND IDC

The Centre for Studies and Research in International and Intercultural Health (CSI) at the University of Bologna is an academic centre founded in 2006 by a small group of health activists unhappy about the pervasive lack of social commitment in medical practice and education. The aim of CSI is to reaffirm health as a “fundamental right of individuals and interest of the community” [24], to address the power relation between the medical profession and the community as a potent determinant of health, and to engage in working practices for addressing it. By adopting a self-reflective approach, the CSI has been explicitly developing counter-hegemonic methods, and providing a participatory, non-hierarchical academic workspace managed by unanimity, open to faculty, students, health professionals and anyone sharing common goals. Currently it is composed of more than thirty volunteers and scholars from different areas (public health, medical anthropology, economics, and other), is delivering a solid package of participatory and multidisciplinary teaching, and is engaged in community-based research in collaborations with health promoting institutions, at home and abroad. The main problems encountered are related to the conservative attitude of the faculty when confronted with the need for change; the difficulty of health professionals to effectively address in-house power relations; the obstacles perceived by physicians to embrace multi-methodological approaches and to work in multi-disciplinary teams.

As an academic body, CSI views research and teaching as a tool for social change and health promotion. CSI’s general approach to IDC is embodied in the title of an elective course, “The destruction of certainties”, offered only once and then incorporated into CSI’s regular teaching. In order to be able to support IDC, the argument goes, the university should, firstly, open itself to complexity. In the words of the sociologist Edgar Morin, “[T]he 20th century produced gigantic progress in all fields of scientific knowledge and technology. At the same time it produced a new kind of blindness to complex, fundamental, global problems, and this blindness generated countless errors and illusions, beginning with the scientists, technicians, and specialists themselves. [...] Fragmentation and compartmentalization of

knowledge keeps us from grasping ‘that which is woven together.’ [...] It means understanding disjunctive, reductive thought by exercising thought that distinguishes and connects. It does not mean giving up knowledge of the parts for Knowledge of the whole, or giving up analysis for synthesis, it means conjugating them. This is the challenge of complexity...”[25: 19] What is needed is a trans-disciplinary and multi-methodological approach, which relies on the contributions of both social sciences and humanities and natural and biomedical sciences. A model of internationalization that brings together an international network of practices for human development is most suited to provide universities with the tools necessary to address IDC’s current, complex issues such as global coordination, the power of “new global players”, donor dependence and the role of “beneficiary” national governments.

Secondly, teaching and learning in the university should be focused on “processuality”. Universities which have committed themselves to a meaningful IDC should be unwilling to propose their own, turn key outcomes to less endowed partners; they should rather join their partners’ experiences by participating, through teaching, research and field projects, to their struggle to reclaim their right for a self-directed, human-oriented development.

Thirdly, to suitably and credibly enter into equitable IDC with poor partner countries, most often former colonies, universities should make all efforts to denaturalize historical processes, and analyse their impact. The “aid system” is a case in point. As mentioned earlier, development aid to poor countries, often benevolently presented as IDC, is usually charitably given and thankfully received on the basis of solidarity, economic interests or political affiliation. What used to be a donors “hidden” agenda (i.e. mere self-interest) today is widely acknowledged and unashamedly disclosed. Less debated is, instead, the extent to which donors reflect on, feel accountable (on political, ethical and legal grounds) and conscientiously accept full responsibility also for the unintended effects of their well-intentioned interventions.

Fourthly, it is therefore paramount to deconstruct current IDC’s mainstream narrative in order to re-construct it with different type of knowledge. For example, IDC is often an instrument of creation of economic, political, cultural or simply healthcare dependence. This is where the role of universities would really be unique and priceless by, for instance (a) developing mechanisms to hold donors and powerful Northern partners into account; (b) providing knowledge and expertise to support national leaderships and strengthen local capacities; and (c) studying and learning from South-South collaboration both bi-laterally, between emerging powers and low-income countries, and multi-laterally, through clubs and coalitions, perhaps one of the least explored areas by academics. [26]

## CONCLUSION

Linking his personal experience of deinstitutionalisation of psychiatric hospitals in Italy to that of IDC, Luciano Carrino, a former IDC official at the Italian ministry of foreign affairs, offers the following inspirational comment: “[It is important] to stimulate critical thinking, making it the main instrument of work and at the same time giving it a sort of ethical value [to refrain from being] complicit in inhuman acts and from falling into the deception of clichés and science. [...] The motivation for what we did first of all was ethical, but we also had the belief that, in this way, we would have approached more the ability to better treat the patients.” [27]

According to Carrino, building an international network of practices against social exclusion has political and technical values. A political value of the network is the fact that it serves to give strength to groups which, if not connected, would remain more easily unheard and vulnerable. His technical value is in the fact that today, more than ever, it is not enough to have the desire, the “good intention” [28] to help a community in trouble. Rather, people themselves must know what actions are actually able to change their situation. To empower them, IDC’s partners should know how to reduce their dependence on strong groups. What is important therefore is not to provide people with answers, but with the means to organize themselves and produce solutions to their problems by analyzing their own needs and set their own priorities through a participatory approach. The outcome of such a process is that partner communities regain confidence on their capabilities and build higher self-esteem. They realize that the solutions are in the community not in the IDC.

In order not to be reduced to a mere transfer of knowledge and technology or to a sterile, neo-colonial exercise of charity, IDC activities should be integral part of an internationalization strategy oriented toward social transformation and involving a process of “deconstruction” of the many clichés and stereotypes that make up the current, conventional “underdevelopment” and “development aid” discourse. Probably the most difficult task for universities engaging in this process is to build an institutional ethos and provide a learning framework to students and faculty as well “to keep awake critical thinking, to avoid fall into the illusion of having solved all problems, to be able to be irreducibly consistent, in action, with the ethical impulse that unites us all as human beings.” [27]

## NOMENCLATURE

CSI	Centre for Studies and Research in International and Intercultural Health
IDC	International Development Cooperation
DAC-OECD	Development Aid Committee of the Organisation for Economic Co-operation and Development
ODA	Official Development Assistance
NGOs	Non-Governmental Organizations

## GLOBAL PARTNERSHIP, PARTICIPATION AND DEVELOPMENT COOPERATION: THE ROLE OF PUBLIC CONSULTATIONS LAUNCHED BY THE UNITED NATIONS IN BUILDING A POST-2015 GLOBAL AGENDA AIMING AT A MULTI-DIMENSIONAL AND MULTI-SCALAR DEVELOPMENT

### ABSTRACT

The MDGs represent a concerted project that gave birth to unprecedented synergetic efforts. Ever since their enunciation, they became the focus of political discussions and actions in the field of economic and social development, meetings and conferences were held regularly in order to reaffirm their importance, their effort and to evaluate the accomplished progress.

Among the Goals, the creation of a global partnership for development is often considered the weak link in the chain, whether in relation to the difficulties for the main actors of the cooperation for development policies to converge on common goals through constructive dialogue aimed at efficient and effective actions, or for the need to define new forms of cooperation that would start from the comparison and the involvement of the non-institutional actors of civil life. In this perspective, the UN urged the adoption of a public and a participatory process bottom-up aimed at analyzing the progress and the achievements in relation to the development and the elaboration of new proposals, in such a way as to shape the priorities by creating a stronger sense of belonging to the community. For this purpose, a series of consultations has been initiated to meet the request for greater participation in the formation of a new agenda for the post-2015 development, which is an innovation and an achievement for the adopted methods and for the aroused interest.

This research aims to analyze what the contribution of these consultations to the global debate is, which help to reveal people's priorities and to provide key inputs to the discussion of a post-2015 future development program. At the same time, it explores the potentialities of a synergic cooperation as the fundamental link between international development cooperation, decentralized cooperation and territorial cooperation, a source of renewal in the conception of development based on participation, rights and freedoms, strengthening territorial capacity in the global context and the creation of a network of exchanges that constitute the platform for the construction of new multidimensional development policies.

The Millennium Declaration stands for an agreed project which aims to create the foundation to construct a global interest in order to form a solid ground for future actions all over the world. During the last thirteen years, the MD and the Millennium Development Goals have represented the fundamental keys to political and economic debates that concern the development in the North and in the South. Conferences and Meetings were held regularly in order to confirm their caliber and their effort also to assess the achieved progress.

The eight Goals aimed to halve the rate of extreme poverty, to stop the spread of HIV and to provide universal primary education, represent a concerted project between all countries and major institutions in the world that have given birth to unprecedented synergistic efforts in order to satisfy the needs of the world's poorest. They were adopted by acclamation, through a procedural innovation - called "consensus" - that diverges from the United Nations' tradition who has always considered necessary that texts of this type were carefully prepared and discussed at length in the Commissions. Nevertheless they have not been exempt from criticism, sometimes even ferocious, like the one of the Egyptian economist Samir Amin, author of an irreverent article that disassembles, literally, the enthusiasms [1].

His critique at the limits of irony, begins with the observation that the procedure of adoption by consensus, outlines a change in the international balances, as the Global Triad would prove able to exercise its hegemony also on the UN. Even though the scope and value of the goals might, at first sight, appear unexceptionable to the economist, he dismantles them one by one, highlighting that they are not the result of an initiative of the poor countries, but of the three usual suspects assisted by the World Bank, the International Monetary Fund and the Organization for Economic Cooperation and Development. That simple fact, according to Amin, creates the doubt that this is an ideological cover for neoliberal initiatives; with hardly objectionable motives, however, he comes to the hypothesis that they are a subtle and a refined tool for the creation of an *apartheid* on a global scale, the extension of the liberal system, reproduction and an in-depth study of the global polarization.

If the extreme simplicity and conciseness of the objectives, on the one hand, led to an immediate impact on the

collective consciousness, on the other it is seen as one of the additional weaknesses, exacerbated by a reductionist approach and the difficulties of measurement.

An additional limit concerns the application of the objectives. They were conceived as targets of a global nature, which can hardly be carried out without an approach that would assess the specific territorial, cultural, economic and political conditions of each country. It seems to be imperative, therefore, to adapt the global objectives to national contexts and to make a global comparison on the basis of territorial surveys.

An additional factor, as mentioned, is that the monitoring and data collection create many problems especially in situations in which the statistical revelation systems do not appear adequate to evaluate the progress and to make comparisons.

Among the Goals, the creation of a global partnership for development is often considered the weak link in the chain, whether in relation to the difficulties for the main actors of the cooperation for development policies to converge on common goals through constructive dialogue aimed at efficient and effective actions, or for the need to define new forms of cooperation that would start from the comparison and the involvement of the non-institutional actors of civil life [2]. In this perspective, the UN urged the adoption of a public and a participatory process bottom-up aimed at analyzing the progress and the achievements in relation to the development and the elaboration of new proposals, in such a way as to shape the priorities by creating a stronger sense of belonging to the community. For this purpose, a series of consultations has been initiated to meet the request for greater participation in the formation of a new agenda for the post-2015 development, which is an innovation and an achievement for the adopted methods and for the aroused interest [3] [4].

In 2001 Kofi Annan, General Secretary of the United Nations at the time, launched within the framework of implementing the Declaration of the Millennium, one of the eight MDGs appears as a powerful tool to mobilize the international community and raise the public awareness about global emergencies. The global partnership for development remains one of the most central nodes to the achievement of other objectives. The themes behind the new system of partnership are fundamental, perhaps even more than it could have been predicted in 2000, nevertheless, as repeatedly pointed out by the UN, the connection between the various goals, the choice of the goals and the use of detection indicators are rather fragmentary. When the MDGs were set in 2000, the contribution of the private sector towards their achievement has not been fully understood, causing an impairment of the sensitivity and global responsibility towards their achievement by 2015.

Some of the most ambitious challenges, such as partnership and the adaptation of different goals to different local contexts, continue to commit the international community after 2015; other detectable limits correlated to the responsibility for the implementation certainly could have been avoided if a public, territorial and more inclusive consultation process had been carried out, before the enunciation of the goals themselves. The choice, in fact, even if preceded by a series of UN conferences, was an exclusive prerogative of a small group of politicians and academics [5].

For these reasons, the UN Secretary-General Ban Ki-moon called for a bottom-up and participatory process aimed at highlighting the priorities of the people, to create a greater sense of belonging and to find answers that reflect the aspirations of the people around the world [6].

Currently the national consultations are underway in 83 countries to whose governments, the UN provides support. Covering a wide range of subject areas and involving the people in most countries of the world, such consultations may provide key inputs for the discussion of future development programs. With the start of consultations three years before the MDG deadline, it is hoped that they will contribute to the efforts of the Member States of the United Nations to agree upon a framework for an actual, effective and efficient development. Finally, it is also hoped that the consultations could deepen and broaden the feedback and the actions of national governments by January 2016.

## THE VARIOUS LEVELS OF ONGOING CONSULTATIONS

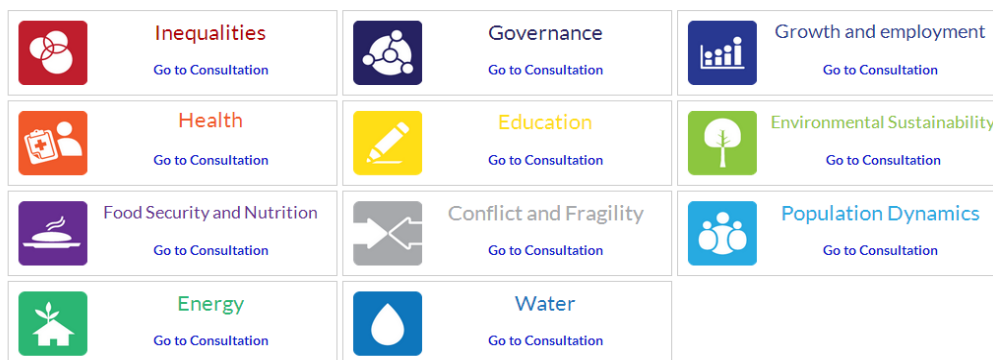

The national consultations, as mentioned, are underway in 83 countries, with the aspiration to reach 100 countries by the end of the 2013. Organized by the national headquarters of the UN, under the leadership of the Resident Coordinator of the United Nations, they saw the inclusion of many interested parts such as the governments, the civil society, the private sector, the media and the universities. The countries that were selected to participate are a representative sample of the different territorial dimensions. The following list shows the countries currently committed to this effort, but it does not preclude the support to other countries (Tab. 1).

**Tab. 1 - Source:** United Nations Development Group, The Global Conversation Begins.

AFRICA	ASIA AND THE PACIFIC	LATIN AMERICA AND THE CARIBBEAN	ARAB STATES	EASTERN EUROPE AND CENTRAL ASIA
Angola	Bangladesh	Bolivia	Algeria	Albania
Benin	Bhutan	Brazil	Djibouti	Armenia
Burkina Faso	Cambodia	Colombia	Egypt	Azerbaijan
Burundi	China	Costa Rica	Iraq	Belarus
Cameroon	India	Cuba	Jordan	Kazakhstan
Cape Verde	Indonesia	Dominican Republic	Morocco	Kosovo <sup>49</sup>
Central African Republic	Iran	Ecuador	Sudan	Kyrgyzstan
Côte d'Ivoire	Mongolia	El Salvador	Yemen	Moldova
Democratic Republic of the Congo	Pakistan	Guatemala		Montenegro
Ethiopia	Philippines	Honduras		Tajikistan
Gabon	Papua New Guinea	Jamaica		Turkey
Gambia	Samoa	Peru		Serbia
Ghana	Solomon Islands	St. Lucia		Turkmenistan
Kenya	Sri Lanka	Suriname		Ukraine
Liberia	Thailand	Uruguay		
Mali	Timor-Leste			
Malawi	Viet Nam			
Mauritania				
Mauritius				
Mozambique				
Niger				
Nigeria				
Rwanda				
Senegal				
South Africa				
Tanzania				
Togo				
Uganda				
Zambia				

Thematic consultations were polarized on 11 topics covering the main challenges in terms of sustainability: conflict, violence and disasters, education, energy, environmental sustainability, food security and nutrition, governance, growth and employment, health, the fight against inequality, population dynamics, and water (Fig. 1).

**Thematic Consultations**

**Fig. 1 - Source:** [www.worldwewant2015.org](http://www.worldwewant2015.org).

Some thematic discussions are accompanied by action-oriented initiatives, such as energy sustainability; at the same time, recent developments in the field of measurement have allowed great strides. Many have commissioned background papers by people from a cross-section of the globe, while the majority has undertaken a series of e-discussions and held meetings of “leadership” to convene leading thinkers in various fields around the world. Table 2 contains a complete description of the 11 thematic discussions’ process.

**Tab. 2 - Source:** United Nations Development Group, The Global Conversation Begins.

THEMATIC CONSULTATION	CO-LEADERS	SPONSORING OR ASSOCIATED GOVERNMENTS
Addressing Inequalities	UNICEF and UN Women	Denmark and Ghana
Conflict, Violence and Disaster	UNDP, PBSO and ISDR	Finland, Indonesia, Liberia and Panama
Education	UNESCO and UNICEF	Canada, Egypt, France, Germany, Mexico, Senegal, South Africa and Thailand
Energy	UNIDO, DESA and World Bank	India, Mexico, Norway and Tanzania
Environmental Sustainability	UNEP and UNDP	Costa Rica and France
Governance	UNDP and OHCHR	Bangladesh, Brazil, Egypt, Germany, Philippines and South Africa
Growth and Employment	ILO and UNDP	Japan
Health	UNICEF, WHO	Botswana and Sweden
Hunger, Food Security and Nutrition	WFP and FAO	Colombia and Spain
Population Dynamics	UNDESA, IOM, UNFPA and UNHABITAT	Bangladesh and Switzerland
Water	UNICEF, DESA and UN Water	Hungary, Jordan, Liberia, Mozambique, The Netherlands and Switzerland

Additional financial support has been provided by: the Hewlett-Packard Foundation, Republic of Korea, United Kingdom and the United States.

A global online conversation is taking place on the site [worldwewant2015.org](http://worldwewant2015.org), on Facebook and other forums in various countries, as well as through the investigation “my world”, that enables individuals to rank their priorities. Through online and offline methods, the site asks the people about which of the 16 problems would lead to a change in their lives, offering also to the interviewees the ability to write suggestions. The 16 options were identified through existing research and voting exercises that cover the existing MDGs as well as sustainability, security, governance and transparency issues (Fig. 2; Fig. 3). The initiative has been developed by the United Nations with the support of more than 230 partners around the world.

**Fig. 2 - World trends.** Source: [www.worldwewant2015.org](http://www.worldwewant2015.org).

Fig. 3 - Source: [www.worldwewant2015.org](http://www.worldwewant2015.org).

**THE TERRITORIAL SCALE OF CONSULTATIONS**

In order to create a common basis for consultations and implement participation and inclusion at the national level, the Task Team of the UN has provided to national governments a set of guidelines that has been adapted to national contexts. Country Teams of the UN, of governments and of civil society partners have designed their consultations on the basis of stakeholder groups, involving, therefore, groups that usually do not participate in political discussions [7]. A prime example is provided by Iran where the consultations have seen as participants teachers’ associations, women health workers, Shora Yari volunteers in Tehran Municipalities, Education and Social Work research institutions and student organizations, among others, to reflect the concerns of the most vulnerable part of the population represented by children living and working on the streets and drug addicts [8] (Fig. 4).

## CONSULTATION RESULTS

Priorities for the Global Development agenda:

- Peace, Tranquility & Security – End to Hostilities
- Supportive Socio-Economic Development – Decent Jobs
- Regional Targets
- Sustainable Development

In India, civil society, trade unions and industry cooperate with the government for the elaboration of answers about the needs of the population. Turkmenistan involved in the national consultations, also, entrepreneurs, farmers, youth and even the disabled. In Ecuador and Peru, the UN teams have drawn especially the attention of children, youth, women and people living in the Amazon region, or those groups usually excluded from the definition of the agenda of development and planning processes. Other examples relate to realities such as Turkey and Bangladesh, where consultations with stakeholders have identified the issues on which polarize discussions on the basis of previous conversations of public policy. It should be added that many countries (Jordan, Moldova, Serbia and Uganda) are using innovative methods to raise awareness such as SMS or media platforms like Google, Twitter and Facebook to involve as many people in the consultations. National consultations tend not only to fuel the debate and implement global post-2015, but they are also leading to decentralized actions of adaptation of global issues through national development strategies as occurred in Honduras and Albania, where governments are interested in using the results of consultation to inform future national development strategies. Then, the case of Bhutan appears emblematic; national consultations are implementing discussions that are already afoot about the concept of Gross National Happiness, using the results to make it even more relevant to specific regional assessments about the citizens' happiness.

## THE REGIONAL CONSULTATIONS ON THE NEW DEVELOPMENT AGENDA

The regional commissions of the United Nations and other UN partners, as mentioned, have activated a series of consultations with representatives of the government, the civil society, the private sector and the academic world. The consultation process is slower in Asia and in Africa. From data provided by the UN Economic Commission for Africa three sub-regional consultations in Accra, Ghana, Mombasa, Kenya, and Dakar, Senegal have been convened. At the same time for Asia and the Pacific, sub-regional consultations have been set up on the MDGs and prospects in Almaty, Kazakhstan, for Central and Eastern Europe, in Nadi, Fiji, in the Pacific, Bangkok, Thailand, for the South-East Asia, and Dhaka, Bangladesh, in South Asia. The Economic Commission for Latin America and the Caribbean, along with the Government of Colombia and the Regional UNDG, held two consultations in Bogota to take stock of the MDGs and to outline future development scenarios. What is important, for our purposes, is that these dialogues concerned:

- consultations with civil society;
- consultations with the private sector, including those coordinated by the Global Compact;
- research carried out by focus groups in all parts of the world, including Southern Voice, the Overseas Development Institute, Brookings Institution, North-South Institute, Korea Development Institute, International Centre for Governance Innovation and the World Resources Institute;
- consultations led by the High Level Group of the Secretary General on Agenda post-2015 development with the civil society, the private sector, the industries and the youth;
- the search for solutions for the sustainable Network Development Solutions;
- consultations planned by the Cities and Local Governments.

## THE SITUATION IN EUROPE

Governments, civil society groups and UN bodies across Europe are conducting consultations on the agenda post-2015 placed on the development agenda. The European Task Force Beyond 2015 campaign, which reunites almost 200 organizations, supports national resolutions of Denmark, Finland, Ireland, the UK, Spain and France. Further consultations are planned in Netherlands, Italy and Baltic States. At the end of 2012, the European Commission conducted an online survey that gathered input from more than 100 organizations of the civil society on the benefits of the Millennium Development Goals, the feasibility, the potential field of application and the shape of a future order of the day. As part of a major consultation on the development policy of France, between November 2012 and March 2013, the French Ministry of Foreign Affairs also organized a consultation on the post-2015 development agenda. National Committees for UNICEF in the United Kingdom, Germany and Belgium are conducting online and in person consultations. For example, UNICEF UK has pledged 600 young people under the age of 25 between December 2012 and February 2013. The United Nations Millennium Campaign in Spain has also conducted a consultation with 400 people representing 100 organizations of the civil society (Fig. 5).

Fig. 5 - Europe trends. Source: [www.worldwewant2015.org](http://www.worldwewant2015.org).

## GLOBAL CONSULTATIONS

All these processes are expanding the space for an unprecedented global discussion, which allows the sharing of different points of view in order to reach an understanding not only of priorities, but also of the areas of consensus and the means of implementation and measurement of development aims. This must imperatively, in our opinion, be taken into consideration by representatives of individual states that are preparing to intensify intergovernmental negotiations near the end of 2015.

The consultations started in September 2012 by the UN involved approximately 200,000 persons in most countries of the world [9]. The global conversation online [www.worldwewant2015.org](http://www.worldwewant2015.org) is growing day by day, with 3,000 persons who actively contribute and over 50,000 members. At the moment these online consultations have reached more than 1 million persons. The peculiarity of these online consultations is the scale, because the contribution is voluntarily outside city, regional or national contexts, and it concerns global and general perspectives. The data provided by the organization indicate that about 130,000 persons have contributed to the national dialogue, of which nearly 50,000 in Eastern Europe and Central Asia and more than 20,000 in the Asia-Pacific region. For example in Uganda only 17,000 took part in U-report, a free SMS based service, designed to give Ugandan youth the opportunity to express their opinions on the main issues. It is important to note that in most countries people of urban and rural areas participated, with a good gender balance. In Jordan, for example, out of 1000 persons engaged in consultations, 43 percent live outside the capital, and 45% are women.

In addition to the websites consultations on access to water, health and education have given rise to discussions in all regions. The central challenge of the post-2015 development program of the United Nations is to ensure that globalization becomes a positive force for all the peoples of present and future generations in the world. In our opinion, globalization offers great opportunities, but its benefits are currently shared unequally. The constant race to the increase in material well-being and GDP threatens the resilience of ecosystems. The persistence of inequality and the struggle for resources are key determinants of growing conflict in many regions of the world. At the same time poverty, hunger, lack of access to water resources, insecurity and violence are key factors that hinder human development and efforts to achieve sustainable development from the economic, human and social point of view [10] [11].

The interdependence of the challenges that they face needs a new, more holistic and multidimensional approach. As evidenced by the reports of the UN Task Team on the Development Agenda post-2015, the fundamental issues are:

- a vision for the future that is based on the fundamental values of human rights, equality and sustainability.
- The definition of the ultimate goals and concrete objectives, reorganized according to four fundamental dimensions characterized by a more holistic approach:
  - o inclusive social development;
  - o inclusive economic development;
  - o sustainability;
  - o peace and security.

In the realization of the “future we want for all”, a coherence policy seems to be fundamental on a global, regional, national and sub-national scale. Beyond the global aims, a large space for designing national policy and especially the adaptation to local conditions is needed, without omitting an overview and the fundamental principles. Recently the UNDP has focused attention on development through a new approach called Decentralized Governance for Development (DGD), assuming that local development as an important factor of progress towards the achievement of the Goals of the Millennium, since - here it highlights the difference of the meaning- it is not only a local development, but a process that capitalizes on the comparative and competitive advantages of the territories, mobilizes the specific natural, economic, social, political and institutional resources, and it is integrated into national development strategies; in this perspective, decentralization, local governance and participation are the key concepts for the promotion of a balanced development and for the adoption of efficient and effective policies [12] [13].

The program of post-2015 development of the United Nations should be conceived as a global agenda with shared responsibilities for all countries. As a result, the Global Partnership for development would also need to be redefined towards a more balanced approach between all development partners that will allow a real change based on equity and sustainable development. This should also lead to reforms of global governance mechanisms. It is still too early to define concrete goals and targets for the post-2015 development program of the United Nations. In addition, the initiated inclusive consultations are still in course and they will be fundamental to the definition of a shared vision [14].

The immediate challenge is to reach consensus on a development that meets the needs of present and future generations, that is able to define clearly the priorities and that would provide the basis for aid and guidance for coherent policy on a global, national and regional scale.

## FROM A DONORS/BENEFICIARIES RELATIONSHIP TO MUTUAL TRANSFORMATION: IMAGINING AND EVALUATING THE RELATIONAL DIMENSION IN DECENTRALIZED COOPERATION INITIATIVES

Egidio Dansero<sup>o</sup>, Stefano Rossi\*

<sup>o</sup>University of Turin, Italy - [egidio.dansero@unito.it](mailto:egidio.dansero@unito.it)

\*Training Centre for International Cooperation, Trento, Italy - [stefano.rossi@tcic.eu](mailto:stefano.rossi@tcic.eu)

New approaches to international development cooperation, focusing on the so called “decentralized cooperation” (i.e. cooperation between communities, territorial systems, co-development etc.) emphasize the relational dimension and the processes of mutual transformation between the subjects belonging to “donor countries” and those belonging to “beneficiary countries”.

Can we speak about a mere statement of principles or rather of processes actually taking place? Has this perception been developed only in the so-called “donor countries” or is this also a theme debated in the discourse and practices of the so-called “beneficiaries countries”?

How decentralized cooperation initiatives change the perception of those involved about issues such as the idea of “cooperation”, “development” or the evolution of paradigms such as “local development” or “sustainable development”? How is the relational dimension weighed and evaluated in the decentralized cooperation projects? How are the dimensions of the relationship and the mutual transformation imagined, experienced and evaluated in the University cooperation initiatives?

These questions have stimulated six presentations in the CUCS Congress, on the basis of which papers were prepared that have been collected in these acts, encouraging a lively discussion between the authors of the papers, the panel coordinators, Local Authorities’ s representatives and NGO practioners.

The papers, together with participant’s interventions during the panel, r presented a retrospective analysis of experiences and tried to highlight those elements related to the issue of “relationships” that are generally considered to be the added value of decentralized cooperation, but that are, at the same time, very difficult to understand in a evaluative analysis.

Participants, as the panel discussant Andrea Stocchiero suggested, have offered contributions that can be ordered on the basis of a scale of action going from projects (micro level), to programmes (meso level) to policies (macro level) of decentralized cooperation.

At the macro level, the contribution of Stocchiero himself, presente and critically reflected Cespi analysis on “What is the future for a policy of Italian territorial cooperation integrated with the Western Balkan countries?”. In terms of the meso level, three contributions focused on decentralized cooperation regional programmes (in Trentino and in Piedmont) as well as the associative dynamics in the context of decentralized cooperation in Tuscany.

The presentation by Stefano Rossi (with the contribution of Capuano, De Marchi, Franch and Rosso) analysed “Decentralised cooperation as a policy change for local and international partnership: the experience of Trentino in the Balkans and in Mozambique”, while Nadia Tecco considered “La dimension relationnelle de l’ “ici” dans les initiatives de coopération au développement. Réflexions sur les effets au Nord de la coopération décentralisée des aires protégées du Piémont”. The last contribution at the meso level of analysis given by Berti, Capineri and Nasi focused on the “New social pathways: Voluntary Organizations for Development and International Solidarity in Tuscany”.

At the micro level two analysis were presented. The first was “Entre théorie et pratique: Université de Turin et coopération décentralisée piémontaise. Quinze ans de recherche dans le domaine des déchets” which focused on decentralised cooperation activities in the field of solid waste management was presented by Roberta Perna, and considered also the collaboration between universities and local authorities in this area. The second was “Compétences et pratiques de coopération internationale en Sénégal sur la route des Talibés” and focused on a decentralized cooperation project, presented by Julia Gozzelino.

Looking more specifically at the contributions, Cespi presentation analyzed the intertwine and overlapping of decentralized cooperation and territorial cooperation promoted by the Italian regions with the Balkans, hoping for a more explicit integration of these two policies that could have important implications for decentralized cooperation which increasingly focuses on cooperation between territorial systems.

The analysis of Trentino decentralized cooperation policy presented experiences that require a constant monitoring of their objectives at the operational level, and particularly how they relate to the more ambitious and intangible goals of decentralized cooperation such as the creation of regional networks and relationships between territories. The importance of knowing how to read the characteristics of the territories in which one operates was highlighted, both in relation to the territory “here” and the “elsewhere”, in order to be able to identify the priority areas where the cooperation should focus.

From the presentation of the Tuscany development cooperation voluntary organisations emerged an interesting map of the relationships between organizations, indicating the difficulty of cooperation between local actors even within the

same territory. This contribution also highlighted the importance that organizations attribute to the issue of training/education as a tool to improving the quality of their action in Tuscany as well as in other countries.

The study of a project on Talibé which fits within the Piedmont decentralized cooperation in Senegal brought an interesting contribution on the skills required by Italian volunteers who work in the field in terms of project management, cultural mediation and conflict management.

The presentation of the Piedmont cooperation on the issue of waste management in Benin offered the opportunity to capitalize the results of previous studies on the same programme, showing whether and to what extent the recommendations of previous studies have been taken into account.

The presentation on the cooperation experiences started by the parks in Piedmont focused on the concepts of “respect” and “reciprocity”. In particular, it was highlighted that the links characterising the experiences, initiated thanks to personal relationships, have over time been mediated by the Piedmont development cooperation associations.

The panel ended with a closing speech by the Director of Piedmont Region development cooperation office, Mr. Garelli, who stressed the importance for each decentralized cooperation actor (Local Authority, NGO, missionary group, university, etc.) to be able to assume its own specific role within shared programmes. He also expressed satisfaction that a topic such as decentralized cooperation, generally neglected at academic level, has been object of several studies.

In conclusion the panel showed the intangibility of a key feature of decentralized cooperation, namely the relationship and exchange of knowledge between regions and within the same territory.

The risk of slipping into a rhetorical discourse, as suggested by the title of the panel, is real and it represents a challenge for those who work in this field and for those who study it. From the different interventions the following issues emerged: the gap between the ambitious goals of decentralized cooperation and its real outcomes; the tension between the construction of networks and systems of actors at the local and regional scale in both the North, in the South and in a trans-local dimension; lastly, the challenges associated with the fragmentation of interventions, with maintaining relationships alive and producing, reproducing and accumulating knowledge on local contexts and actors.

Thanks to these contributions, several interesting elements in terms of experimentation and innovation were shown as well as the role of research in and on decentralized cooperation and its capacity to generate collective learning processes.

## NEW SOCIAL PATHWAYS: VOLUNTARY ORGANIZATIONS FOR DEVELOPMENT AND INTERNATIONAL SOLIDARITY IN TUSCANY

Fabio Berti\*, Cristina Capineri\*, Lorenzo Nasi\*

\*University of Siena, Italy - [cristina.capineri@unisi.it](mailto:cristina.capineri@unisi.it); [bertif@unisi.it](mailto:bertif@unisi.it); [lorenzo.nasi@unisi.it](mailto:lorenzo.nasi@unisi.it)

### ABSTRACT

The contribution carried out by the research group of the Department of Political, Social and Cognitive sciences of the University of Siena and funded by Cescvot (Centro Servizi per il Volontariato in Toscana), aims at identifying the structural and organizational characteristics of Tuscan organizations working in the international arena; the values, culture and social missions of these organizations; the human, material and symbolic resources available to them; and the rules governing the actions of people both when they are working within the organizations and towards the outside world.

In particular the research attempts to identify the pathways, the types of activities carried out, and the number and quality of the networks which have been set up, highlighting whether and how these activities fit into the complex system of decentralized regional cooperation.

### 'INVISIBLE' VOLUNTARY ORGANIZATIONS

Voluntary organizations are one of the most dynamic elements in contemporary society. However, although we know a great deal about the services they provide, often supplementing or even in some cases replacing state welfare services, paradoxically we do not at present have sufficient understanding of the ways in which voluntary organizations intervene in other contexts, in particular in the areas of international solidarity and cooperation for development.

Despite the fact that international voluntary organizations have been active in Italy for several decades, little scientific attention has been paid to the ways in which they carry out their activities "beyond the borders" and studies of this part of the voluntary sector have been very limited<sup>1</sup>. In particular, the overall picture of Italian associations that work to improve international solidarity is highly diverse in character and generally divides into two areas whose limits are ill defined and constantly shifting [19] [20]. From a formal point of view, the essential division is between those organizations that are recognized by the Ministry of Foreign Affairs and those that are not. Beyond this, however, as Vanna Ianni has noted, "a significant number of organizations occupy an intermediate position, both as regards their structure and their methods of operation, that to some extent forms a bridge between the two areas" [28: 9].

### AIMS OF THE RESEARCH

The contribution carried out by the research group of the Department of Political, Social and Cognitive sciences of the University of Siena and funded by Cescvot (Centro Servizi per il Volontariato in Toscana), aims at identifying the structural and organizational characteristics of Tuscan organizations working in the international arena; the values, culture and social missions of these organizations; the human, material and symbolic resources available to them; and the rules governing the actions of people both when they are working within the organizations and towards the outside world. In particular the research attempts to identify the pathways, the types of activities carried out, and the number and quality of networks and links, highlighting whether and possibly how these things fit into the complex system of decentralized regional cooperation.

The basis for these aims is the idea that, precisely because of their diversity, both operational, organizational and in terms of values, the Voluntary Organizations that make up this vast area of inquiry can be placed between two poles of a continuum, with at one end an approach based on international solidarity and at the other one that is targeted towards cooperation for development. This is not an easy matter, considering the lack of clear differentiation of the two

<sup>1</sup> The literature on this topic is generally outdated and confined to the world of NGOs or to specific experiences: Tarozzi A., (1985), *Per una Sociologia del volontariato internazionale*, Fosciv, Milano; Borghese E. (1989), *Un ponte tra nord e sud. L'azione volontaria per lo sviluppo*, Quale Sviluppo, 12, Asal, Roma; Oecd (1986), *Le Ong per lo sviluppo*, Quale Sviluppo, 1, Asal, Roma; Scidà G. (1987), *L'utopia concreta. Indagine sulla associazione Mani Tese*, Franco Angeli, Milano; Ianni V. (1995), *Nascita di nuove forme di azione dell'associazionismo di solidarietà internazionale negli anni Novanta. Il caso di U.Co.De.P. di Arezzo*, I Quaderni di Movimondo n.2, Roma; Baraldi G. (1993), *Le Organizzazioni non governative di cooperazione internazionale*, Mimeo; Boccella N., Tozzo O. (2005), *Le organizzazioni non governative. Risorse e modelli di organizzazione*, Ed. Universitarie di Lettere Economia Diritto, Milano; Serra F. (2004), *Le Ong protagoniste della cooperazione allo sviluppo*, Ed. Universitarie di Lettere Economia Diritto, Milano; Rognoni M.S. (a cura di) (1995), *Organizzazione non governativa e governi: un tandem per lo sviluppo*, Asal-L'Harmattan Italia, Roma; Nasi L. (2006), *Alla periferia del villaggio globale. Sviluppo e valutazione nelle comunità indigene dell'Ecuador*, Franco Angeli, Milano.

concepts, but using an innovative approach which allows a clearer identification of the particular character of the sector enabled us to discover pathways that until now have not been much explored.

The University's research group was assisted in the development and administration of the questionnaire by researchers from the Centro di Ricerche Etno Antropologiche di Siena (Crea), whose role was subsequently expanded to carry out qualitative research by means of four focus groups with participants drawn from voluntary organizations.

As regards take-up, out of 150 VOs identified at the start, 92 completed the questionnaire.

## METHODOLOGY

In order to achieve the aims described above, the research took place in different phases using quantitative and qualitative methods.

The results of the survey refer to the VOs that included international solidarity and cooperation for development in their constitutions, either as main or secondary activities. The research was carried out using a structured questionnaire consisting of 56 questions designed to gather information in a way that could then be subjected to statistical analysis. The questionnaire was divided into seven themed sections representing the most important areas of the research. The first section was designed to gather basic information, in order to obtain the necessary 'biographical' and structural information needed to describe the VO.

The other sections were designed to gather information about particular areas including: how work is organized; sources of funding; communications; reporting structures; training. The final section concerns problem areas in the sector and participants' expectations of development and growth.

## RESULTS

Using the information obtained through the research it was possible to identify a situation in which different organizations are moving at different paces. On the one hand we find many small and even tiny isolated groups, disconnected from any kind of general strategic or political framework of reference, or from any analysis of the role of international solidarity beyond the simple binary logic of "here and there". At the other extreme there are organizations that act in networks with other similar groups and operate in a way that attempts to follow a coherent strategy of efficacy, efficiency and sustainability.

Between these two extremes we find a third group, undoubtedly the most numerous, whose members swing between attempting to boost their own effectiveness through cooperation and trying to preserve their own identity.

In order to try to give some kind of overall view, however, it is possible to refer to the main areas explored in the research.

Our research has been focused mainly around three themes which have stimulated and encouraged us throughout this fascinating journey.

First, identifying the characteristics of an area that is as yet not well known, if only as one of the many that characterize the way in which VOs operate; secondly, the presence of possible pathways that mark the VOs' operations; finally, the dynamics of these VOs which, as well as having their own internal logic, exist within the well-defined context of decentralized cooperation as set out by the Tuscan Region.

As regards the first of these themes, what emerges from the analysis of the data is a voluntary sector that is extremely fluid, one of the fruits of the 'liquid condition' that seems to be the outcome of postmodernity and is transforming every area of life.

This is a sector with very varied origins, methods, and visions of its own mission where there seems to be no fixed *modus operandi*. Everything is highly variable, changing according to circumstances. There seems to be no well-defined paradigm for action but rather a changeable and fluid approach, dictated more by expedience than by a search for the value that is added by participation and shared aims.

This makes for a picture that is not easy to interpret, one that has a thousand facets reflecting a world within which the preferred tendency is to travel alone or in small groups, within limits but trying to 'defend' one's own 'territories' and one's one particular identity.

It is also a very young environment (in terms of the dates of creation of the VOs) and one which in many cases is struggling "grow up"; one where the prospect of growth in the organization is still unknown territory and often not viewed with favour. The voluntary ethos (with all its virtues but also its limitations) and the fact that people work for nothing are fundamental and they represent the main ingredient with which to face the challenges of solidarity.

An analysis of the replies shows, firstly, that this is a sector which, from the demographic point of view, can be divided into two big families: the first group, making up 45% of all VOs, can be defined as *millennials*, that is, groups that came into being during the third millennium (and so have been active in the area of international solidarity for between 4 and 10 years), while a further 7% have been in existence for less than 3 years. The second large group, 48%, has been active for more than 10 years and thus started up in the 20<sup>th</sup> century or at the latest in the very first years of the 21<sup>st</sup>. This seems to be in line with the national tendency: a survey of voluntary organizations by Istat [31] showed that 70% of organizations engaged in international solidarity were set up after 1990. VOs in Tuscany have an average age of

49, whereas those dedicated to international solidarity are on average less than 11 years old, with a maximum age of 29 and a minimum of 3 [29].

This is a young sector, then, the outcome of a set of dynamics that characterized the last decade of the 20th century and the first one of the 21<sup>st</sup> in particular.

We should not, however, be misled by the relative youth of this sector, in Tuscany and elsewhere in Italy. In the context of the history of voluntary associations, the international sector has been and continues to be today one with the longest operational experience, having been active for over 30 years, the result of an increase in esteem and recognition both in terms of relationships with institutions and on the operational models used in pursuit of cooperation as a tool for increasing solidarity between peoples in different parts of the world [34].

Another significant aspect of the 'biography' of these organizations is that they generally come into being as a result of independent initiatives by groups of citizens, in contrast with the traditional route of affiliation with national voluntary bodies, or with higher level or church-led bodies. 69% of the VOs interviewed in fact stated that they were not local branches of any national organization. This is in stark contrast with the results of other surveys [26] [27] which showed that 63% of Tuscan voluntary organizations were dependent organizations, affiliated or federated with national voluntary organizations. The international voluntary sector however, more than any other (but similarly to cultural organizations and those aimed at protecting human rights), is a product of active citizenship, characterized by the formation of increasing numbers of groups by citizens organizing themselves to deal with matters and problems that arise in their own communities. The growth of so many small independent units, while on the one hand indicating increasing levels of fragmentation, on the other can be seen as constituting something new in voluntary action, directed as it is towards new needs and novel forms of activism by the people involved, as well as perhaps indicating a certain level of dynamism in the sector and thus a maturation process that is already underway. Another factor to note is that these spontaneous voluntary structures are part of a sector that is increasingly lay and non-religious in nature (the number of VOs with a clear religious basis was already falling in 2001), showing that for members the mission and aims of the group are more important than the cultural background it springs from.

As regards particular areas of interest within the vast edifice of international charitable activities, the area we investigated showed itself to be very fragmented, with interests in a number of sectors. In view of this fact, respondents were able to indicate more than one area of interest within a particular question. Three main sectors that are of interest to the vast majority of VOs emerged: they are education (for 79% of VOs) health (70%) and social matters (63%). Only a third of organizations were involved in agriculture, traditionally the most typical focus of international cooperation. This fact might support the idea that it is possible to draw a distinction between VOs whose activities are motivated purely by international solidarity and those whose interest is in cooperation for development. Another sector that interests 33% of VOs is that of culture. Of less interest are commerce and credit (25.6%), crafts (21%), environment and emergencies (both with 18.9%). Only 8.9% say that they are interested in strengthening Institutions and Governance.

Having seen the areas of activity and the typical beneficiaries of this part of the voluntary sector in Tuscany, which are the areas of the world in which it has the greatest presence?

The vast majority of Tuscan VOs (66.3%) are active in Africa, followed by Latin America, where almost half the organizations surveyed are active.

It is not an accident that these are the two main areas of intervention. Leaving aside their social and economic problems, these two parts of the world have been the focus of interest and presence for the majority of VOs ever since the early days of international solidarity in the 60s and 70s.

Other areas in which our VOs are active, albeit to a lesser degree, are Asia (with 27%), the Mediterranean and the Middle East (26%). Paradoxically, areas that are closer to Italy and more easily reached (from all points of view) such as the whole of eastern south-central Europe, are those that have a smaller presence. This may be explained by the fact that it is difficult to operate in areas that are less well-known or whose vulnerabilities are less obvious, or it may simply be due to the fact that our VOs' ideas about poverty and inequality are still focused around the North/South axis.

As regards their presence in specific geographical areas, we can state that our VOs are active in 75 countries of the world.

These VOs are 'born,' 'live' and frequently 'die' as a result of the impulses of charismatic individuals who catalyse and channel their values, ideas, vision and mission. Often it is a trip, an experience, an encounter, an event that kindles the light of curiosity and then leads people to want to find out more, to become more aware and finally to commit to a cause.

The other particular feature of the picture is the high degree of fragmentation: there are many small VOs acting in an area that they engage with little and not always constructively, especially as regards other VOs working in the same area.

Just as the universe is made up of billions of stars that form themselves into galaxies, this 'universe' too is made up of many tiny stars aggregated into separate galaxies.

This atomization is reflected in the dispersed and fractured nature of interventions in developing countries, leading to the existence of an 'army' that lacks any overall command.

If on the one hand the growth of so many small independent units may lead to greater fragmentation and thus to lower levels of effectiveness and efficiency, on the other it may also represent a novelty in the voluntary sector, because of its orientation to new needs and novel forms of activity for the people involved as well as showing the richness of a social fabric, of a civil society with a strong spirit of active citizenship, and thus the strength and dynamism of the sector as it moves towards maturity.

In an area of such pluralism, visibility is a problem. Voluntary groups need to succeed in communicating, in making the organization's activities known, in order to emerge from the undergrowth of a sector that is already of its nature "niche" but also "crowded", so that they become visible, known and findable. All these activities involve considerable expense and require a degree of professional intervention that these small groups cannot afford, or they may simply decide that resources are better spent in areas they regard as more strategically important.

In general terms, we can stress that it is the group's history, its experience in the field that is the most influential variable affecting the way in which it works. As well as producing an implicit acquisition of competences that are gradually strengthened by the addition of those whose expertise can fill technical gaps, this accumulated experience increases the sensitivity and maturity that are needed to deal with complex situations and enable new approaches to be continually developed. Nevertheless groups experience a series of difficulties with applications for financial support: problems with forms, excessive bureaucracy, legal requirements, lack of clarity, leading to the need to invest a lot of time with few results.

Another common element is that - while most groups suffer from a chronic lack of funds (like the rest of the voluntary sector) - the economic dimension, although it undeniably exerts strong pressures on the "project strength", presence on the ground and logistics of the activities, does not seem to act as a discriminant as regards the approach to development problems. The slogan might be "the *mission* is not a matter of money": using one approach rather than another does not seem to depend on the economic resources available; rather it seems to be a matter of 'representation', of a voluntary and willed prefiguration of one's role in choosing to approach development in the most authentic and disinterested way possible, almost 'immature', in a very informal way that results in an equally informal presence on the ground.

By constructing indices we were able to identify a number of "ideal types" of VO, even if the range of the dynamics complicates the life of a researcher who attempts to 'model' these associative realities.

In the light of the data obtained we were able to identify three models: the first relates to an approach based on international solidarity, the second is focused on cooperation for development and the third is a mixture of the other two.

There are three different ways of looking at development problems and thus three different intervention practices. In order to further clarify the meaning and features of the three approaches we will use the interpretation developed by Korten [32] [33] in order to describe the generational development of NGOs. However while Korten's model follows an evolutionary scheme (in fact a generational one), our attempt uses the characteristics of individual generations to provide a (static) description of the VOs that fits the models we have identified.

The international solidarity approach can be explained in terms of the typical characteristics of the first generation, for which communal action represents a demonstration of solidarity and short term commitment, based on humanitarian values of peace and justice, where the role of the actor is that of 'donor' in a situation of scarcity through a purely logistical management of the intervention.

In this model the pair "development-aid" remains central, following a logic of solidarity and humanitarian assistance that could be summed up by the African proverb "the hand that receives is always beneath the one that

gives”.

In contrast the orientation of cooperation for development is more ‘mature’, structured, profound, identifiable with those generations defined by Korten as a development of the first generation in their approaches and methods.

This picture is confirmed by the qualitative analysis, from which there emerges a clear intention by these groups to position themselves in the more ‘informal’ area of international solidarity rather than the more structured one of cooperation, which is seen more as a complex, closed, bureaucratic and inefficient system. The perception is due in many cases to previous very negative, if partial, experiences which push them towards an orientation which in many cases heralds an approach that is still paternalistic.

The third horizon towards which our research was directed was that of attempting to understand how VOs behave within the regional system of cooperation.

The Tuscan Region has attempted to develop the idea that marks out decentralized cooperation, that is of getting different subjects to participate in project, devising and promoting the creation of a “Tuscan system” of cooperation. In order to achieve this one of its strategic priorities has been to encourage and promote collaboration between all the Tuscan groups engaged in cooperation for development, initiating collaborations with local authorities in order to create a model of decentralized cooperation characterized by the ability to create networks, coordinate and encourage collaborative relationships between very different organizations based both in Tuscany and in the developing countries [41].

Our research showed that this ‘system’ as it is known is struggling to take off. Many of the organizations that should take part in it remain outside, whether as a result of their conditions or characteristics, or through choice. Thus in many cases groups have chosen to remain on the outside, thus avoiding the creation of situations that might be complex, problematic and difficult to manage, with the aim of continuing to be strictly local in nature (something that is very important to those who belong to and participate in these groups) without any desire to ‘expand’. This is why the Region is seen as an organization that is very remote from the day to day reality of the VOs, even as it is recognized as being the body that more than any other has an important role to play in creating cooperation. Thus the majority of VOs continue to exist in their own little area, with their own experiences, their own projects, their own presence within a virtual system in a detached and unconditioned way, where the presence or otherwise of others is a matter of only tangential interest.

What seems to be lacking in our VOs is any awareness that they are part of a system, which they regard as an area reserved for the large VOs rather than as an opportunity for all to become involved in.

Thus the regional authority tends to be seen as a source of finance like any other, and not as an entity that can represent added value in developing areas of activity, sharing information and promoting homogeneous and coordinated growth. This tendency has produced a gulf between different VOs in terms of policies, values and even behaviour. The three models identified earlier may be useful in explaining why attitudes towards the system of decentralized cooperation are so different; the difference comes not only from the experience and degree of maturity but also the political will of the VOs; the latter, however, is often lacking because of the structure of the organizations themselves, meaning that at best they can only stand on the doorstep of the system rather than accessing it fully.

The situation we have just described creates obvious difficulties also in forming relationships with other local authorities; these relationships, where they exist, are limited in time and tend also to be limited to specific cases and to the initial phases of the association’s activities.

What we have then is a picture of an institutional dialogue that is struggling to become established, especially in the case of the smallest organizations, and that in any case is aimed mainly at obtaining the funds needed to run projects. The notion of a partnership with local authorities that goes beyond mere financing is still a long way from being fully understood: it is the search for funds that drives these VOs to seek to make contact even when the relationship, rather than being an institutional one, is initially formed through direct relationships and acquaintanceships.

It is only the more organized and structured groups that succeed in making a more considered ‘systemic’ approach, that attempts to share experience more widely.

Naturally the type and intensity of the relationship and dialogue with institutions is closely connected and directly proportional to the capacities, competences, willingness and potential of the individual VOs: the more ‘mature’ they are, the greater the opportunities they have to establish collaborations and partnerships that will last.

Although the qualitative analysis reveals a strong desire to create networks and synergies (even if the connections come about mostly on the basis of affinities between people and organizations), as Salvini [44: 131] maintains (and as the research data confirms), many of the VOs in this sector are linked by a common ‘radicalism’; an ethical-political tension that develops into activities that are themselves relatively exclusive and that, while constituting an undeniable asset for the development of the voluntary sector, makes the building of external collaborations somewhat impractical both in formal-conventional terms and above all in terms of ‘networking’. Consequently what we see is the activation of dyadic relationships (with Cescvot, with the local authorities, etc...) for individual initiatives, but without any notion of creating systematic networks. What emerges above all from the qualitative analysis (but is confirmed by the responses to the questionnaire) is the need that is felt to preserve and defend one’s own autonomy, protecting one’s own ‘creation’ from any kind of outside ‘contamination’. On the basis of previous negative experiences, participants stressed the risks and difficulties of sharing projects, ideas and activities with others. On this point we need to clarify something, even if it is fairly obvious. This radicalism is typical of VOs operating in the area of international solidarity. This is due not so much to competitiveness as to an individualistic vision of the work done by their own group based on a strong sense of

ownership of the activities and projects that they carry out.

It is in fact easier to establish synergies with VOs in different sectors, with whom they set up collaborations, occasional initiatives to raise funds, awareness and visibility. Rather than being based on a “networking spirit” the relationship is one of mutual help, partly to optimize the use of organizational resources, partly as a result of the need to access new channels in order to obtain economic resources that are otherwise unavailable.

A partial justification for this approach to networking that is suggested and agreed is the size of the group; tiny groups that are fully engaged in their work to the extent that they have no strength or resources left over for networking. In this situation we can identify several pathways, different ways of moving around within a larger system, where everyone finds the route that best suits their characteristics, needs and view of the world.

From this point of view we can not identify one particular ‘pole of attraction’ even from the purely perceptual point of view, but rather a constellation of more or less recognized actors, the result of a partial and limited perception of their own area of activity. A world that instead of looking outwards, is ‘folded in’ on its own experience.

## LA DIMENSION RELATIONNELLE DE L' "ICI" DANS LES INITIATIVES DE COOPERATION AU DEVELOPPEMENT<sup>1</sup>. REFLEXIONS SUR LES EFFETS AU NORD DE LA COOPERATION DECENTRALISEE DES PARCS NATURELS DU PIEMONTE.

Nadia Tecco\*

\*Département de l'agriculture, des forêts et des sciences alimentaires, Université de Turin, Italie - [nadia.tecco@unito.it](mailto:nadia.tecco@unito.it)

### ABSTRACT

Le processus de coopération décentralisée entrepris par les aires protégées de la Région Piémont, en partenariat avec leurs homologues et non, a développé dans certains pays en développement et avec le temps, une certaine complexité de relations par rapport au nombre d'acteurs, leur typologie, l'échelle d'action et le rapport avec les contextes locaux au Nord comme au Sud du Monde. L'intervention mettra l'accent, en particulier, sur les relations développées à partir du point focal constitué par l'aire protégée du Piémont (dans son contexte territorial) afin d'analyser la capacité de mobiliser ressources et acteurs de ce nouveau et pas conventionnel acteur de la coopération décentralisée.

### INTRODUCTION

La coopération décentralisée entre 13 aires protégées mise en œuvre depuis 1999 par la région Piémont de l'Italie avec certains pays du Sud (Burkina Faso, Sénégal, Tanzanie.) revêt une importance particulière dans le champ des études sur la coopération décentralisée et sur le développement local et ce, pour au moins deux types de raisons.

D'une part, le cas piémontais représente l'expérience la plus significative (en termes de nombre de projets et de diffusion sur le territoire) d'interventions de coopération décentralisée entre aires protégées dans le contexte italien<sup>2</sup>, étendant ainsi aux aires protégées la sphère des acteurs décentralisés qui participent à cette activité. D'autre part, compte tenu du haut niveau d'engagement qu'elle a su obtenir du territoire, cette expérience représente une occasion intéressante pour comprendre le contenu des relations entretenues non seulement entre les deux principaux acteurs du partenariat (aire protégée au Nord et du Sud), mais aussi (également au Nord comme au Sud), au niveau local, entre l'aire protégée et les acteurs du territoire qui participent avec elle à différents titres aux initiatives de coopération [1].

Le cas de étude va à montrer que, par rapport aux autres coopération, la forme « décentralisée » pas seulement met explicitement au premier plan le rapport avec le territoire, vu dans la dimension du lieu de destination de l'aide, mais grâce à une effet boomerang, aussi dans le lieu de le départ.

Jusqu'à présent, cet aspect n'a été abordé qu'en partie par la littérature, qui s'est essentiellement concentrée sur la valeur ajoutée dérivant de la dimension trans-territoriale des rapports de partenariat [2] [3] [4] ou sur ses contradictions et ambiguïtés [5] [6] et qui a moins approfondi les caractères et les retombées de ces processus au sein des partenariats au Nord. Il faut probablement attribuer ce fait au caractère fragmenté et à l'hétérogénéité spatiale de cette forme de coopération [7] qui peut rendre difficile la reconstruction de la dynamique du processus dans le contexte de provenance.

Il devient toutefois important de comprendre comme en plus de la création des systèmes des relations «de territoire à territoire» (entre le lieu de destination e d'origine de l'aide), il y aussi le développement des systèmes locaux relationnels entre les respectives contextes territoriales. Comment s'articulent et distribuent les bénéfices de la coopération décentralisée dans le contexte d'origine?

Nous avons donc décidé d'explorer le niveau de mobilisation territoriale exprimé par la coopération décentralisée des aires protégées, sa mise en relation d'une pluralité d'acteurs (souvent éloignés du monde de la coopération) et de les lier au territoire d'appartenance et aux partenaires dans un rapport entre systèmes territoriaux dans la Région Piémont.

<sup>1</sup> L'article est un extrait du chapitre de N. Tecco, Il "qui" della cooperazione decentrata delle aree protette piemontesi, in (réalisé par), [1].

<sup>2</sup> Parmi les autres expériences de partenariat des aires protégées italiennes au niveau extra-européen [8] on peut citer :

- le Parc national Gran Sasso Monti della Laga dans les Abruzzes avec le Parc Wadi El Rayan en Égypte;
- la Réserve Naturelle du Monte Rufeno dans le Latium avec le Parc National des Monts Udzungwa en Tanzanie;
- le Parc Lombardo della Valle del Ticino en Lombardie avec les Aires protégées pour la Paix au Costa Rica et au Nicaragua;
- le Parc Adamello Brenta dans le Trentin avec le Parc national Los Glaciares en Argentine;
- le Parc Régional Migliarino San Rossore en Toscane avec le Central Pine Barrens aux États-Unis;
- le Parc National Dolomiti Bellunesi avec le Parc Ethnobotanique d'Omora au Chili.

## LA METHODE D'ANALYSE

Pour l'analyse des processus de coopération internationale ne pouvant être séparée de celle de leurs objectifs, nous avons voulu essayer de reconstruire ces motivations, et de comprendre les dimensions du territoire qui se sont faites promoteur de ces interventions de coopération décentralisée. Il a tout d'abord fallu disposer d'informations exhaustives sur les projets entrepris par les parcs piémontais

Dans ce sens, pendant la phase initiale du projet, nous avons collecté le matériel disponible sur les projets de coopération décentralisée. Les principales sources utilisées ont été constituées par la documentation relative aux demandes de financement que les différentes aires protégées ont présenté à partir de 1999 au Secteur Affaires Internationales de la Région Piémont, à travers la participation aux appels d'offres du Programme Sécurité Alimentaire ou en faveur d'initiatives de coopération décentralisée des collectivités locales. Parmi les autres sources utilisées, on peut citer les décisions des directions des aires protégées, ainsi que les divers supports de communication produit par les aires protégées et par la Région sur ce thème. Après cette phase de collecte, une fiche de description synthétique des divers projets réalisés par les parcs a été élaborée. Après une analyse documentaire, nous sommes passés à une analyse sur le terrain. Celle-ci a concerné, entre octobre 2007 et avril 2008, l'ensemble des aires protégées piémontaises ayant participé à des projets de coopération décentralisée à partir de 1999, ainsi qu'une sélection de certains des autres acteurs du territoire engagés dans ces projets. Quand on parle d'acteurs, on se réfère à la double nature de leur engagement, institutionnel (le parc, l'association, l'école), et individuel (le directeur, le technicien...).

La collecte des informations a été réalisée à travers un questionnaire semi structuré, composé d'une majorité de questions à réponse ouverte et de quelques questions à réponse fermée. Dans le cas des questions à réponse ouverte, des classifications construites d'après les réponses obtenues ont été effectuées lors du traitement. Les questions portaient sur les motivations, les particularités, de l'engagement territorial en termes de réseaux, les modalités d'interaction, les ressources et de l'évolution du processus de coopération décentralisée des aires protégées piémontaises.

## LE ROLE DES AIRES PROTEGEES ET LE PROCESSUS DE COOPERATION DECENTRALISEE

La décision des parcs piémontais d'entreprendre des activités de coopération décentralisée prolonge une série de relations préexistantes qui liaient en quelque sorte le contexte (restreint ou élargi) du parc piémontais et celui du parc partenaire dans le pays du Sud. Ces relations peuvent être décrites et simplifiées à partir de l'image d'un réseau mono centrique [9] dont les limites s'élargissent progressivement à partir de relations qui naissent directement à l'intérieur du parc (par exemple, des contacts entre les personnels du parc) puis qui s'étendent au territoire limitrophe de l'aire protégée (par exemple des contacts entre associations situées dans les Communes où se trouve le Parc), ou encore au contexte régional (relation entre ONG piémontaises), voire au contexte national plus vaste (relations entre ONG italiennes).

Les expériences de coopération analysées soulignent le fait que, dans plusieurs cas, un redimensionnement s'opère entre les principes initiaux de la coopération décentralisée et la réalisation concrète des interventions. Par exemple, si l'on considère que la coopération décentralisée doit associer des institutions exactement comparables, les cas étudiés montrent des situations de partenariat plus diversifiées. Sur un total de 17 relations de coopération décentralisée créées depuis 1999 à ce moment, 10 associent des organismes homologues (aire protégée du Piémont avec aire protégée du pays du Sud. Cependant, la catégorie du parc partenaire, présente une certaine variété d'acteurs selon le niveau de décentralisation qu'ils représentent. Dans 4 cas sur 10 seulement, il se produit une coïncidence complète en matière de décentralisation administrative entre les parcs impliqués (parc régional du Piémont avec parc régional du Sud), alors que pour les 6 autres situations, les autorités de parc partenaires relèvent de différents niveaux administratifs. En revanche, les 7 autres relations de partenariat ont impliqué des acteurs de diverse nature, notamment des collectivités locales, des villages, des associations, des communautés de missionnaires. Dans le cas du Parc Naturel Orsiera Rocciavère et du Parc Naturel des Lame del Sesia, justement, le partenariat a été réalisé avec deux acteurs, respectivement Naturama et Ageref, issus des communautés qui vivent autour du Parc de Kabore Tambi et de la forêt classée de la Comoe-Leraba en Burkina Faso. Le substrat commun du partenariat semble donc outrepasser la simple recherche de un partenaire homologue.

Dans le cas des aires protégées et des villages environnants, le partenariat pourrait être interprété comme la recherche d'une union du principe de la conservation de l'intérieur du parc avec les exigences de développement dans sa zone périphérique.

Quoi qu'il en soit, là où le contenu de la relation n'a pas été explicité depuis le début du partenariat, des difficultés se sont présentées pour le maintien de la relation et la définition des activités de projet. Elles ont été surmontées dans certains cas à travers l'identification d'un nouveau partenaire appartenant au même territoire où étaient réalisées les précédentes activités. Dans ces occasions, certains parcs piémontais ont essayé de préserver un lien avec le territoire à travers la collaboration avec partenaires considérées plus compatibles du point de vue des activités menées du point de vue des activités menées. En particulier, à partir d'une collaboration avec la Direction Régionale de l'Environnement, des eaux, des forêts et des cascades et en particulier l'Unité de conservation de la Comoe Lerabà (DREEF), un organisme décentralisé du Ministère de l'Environnement, le Parc des Lame del Sesia a noué une collaboration avec une association locale (AGEREF) au Burkina Faso, tandis que le Parc des Laghi di Avigliana, à partir d'un partenariat avec

la Réserve de la Ciénaga de Zapata, a continué ses activités avec la Province de la Havane. Le Parc naturel du Lac Majeur a abandonné la coopération avec la Direction Nationale des Parcs (DPN) du Sénégal, mais il continue sa collaboration avec le Parc de Djoudj et la Réserve de la Langue de Barbarie, à travers un projet de coopération décentralisée appelé « Teranga » de la Ville de Turin ; dans ce cas, le partenaire de référence du projet a changé ainsi que le rôle joué par le Parc du Lac Majeur, qui est passé de chef de file à partenaire, mais la relation avec le territoire se poursuit [10].

Les interventions réalisées peuvent être distinguées selon deux typologies différentes: une typologie à caractère technique, étroitement liée aux compétences de l'Autorité du Parc, et une typologie à caractère socio/économique, qui reflète des préoccupations plus larges, notamment les relations de l'aire protégée avec sa périphérie et sa contribution à son développement.

À travers l'apport de ressources financières et les acquis liés à la mise en relation, les interventions ayant comme destinataires l'acteur homologue ont essentiellement concerné les domaines de l'éducation à l'environnement (8 interventions), de la formation (7 interventions), de la construction des petites infrastructures (5 interventions), de la gestion de la faune et de la cartographie (4 interventions), alors que celles qui sont réalisées en faveur de la population (graphique 9) se sont principalement concentrées dans le domaine du tourisme et de l'artisanat (5 interventions), de la fourniture de services tels que la distribution d'eau potable ou la santé (4 interventions). Les projets n'ont ainsi pas représenté seulement une occasion de renforcement relationnel et de suivi, ils ont aussi souvent permis la réalisation effective des petites infrastructures et d'activités. Les parcs piémontais semblent alors avoir privilégié des domaines où les acteurs locaux sont en mesure de jouer un rôle central dans la réalisation concrète et surtout dans la gestion future des actions engagées.

En termes de contribution au partenariat, les parcs des pays du Sud semblent avoir apporté des ressources pouvant être assimilées à celles du partenaire homologue au Nord, même si la ressource représentée par la rédaction des projets présente souvent des carences. En général, les parcs au Sud n'ont pas contribué aux projets en termes financiers. On peut toutefois citer quelques exceptions concernant les communautés locales impliquées, qui se sont parfois fortement mobilisées. Par exemple, dans le cas du dernier projet développé par le Parc *Alpi Marittime* à partir de 2003, l'association de Maasaï et Meru de Mkuru en Tanzanie chargée de la gestion des activités de tourisme responsable, le *Mkuru Safari Camel Group*, a financièrement contribué au projet grâce aux bénéfices réalisés avec les précédentes activités mises en œuvre par l'intervention du parc piémontais [11].

Selon les personnes interviewées, la recherche et la création des partenariats entre égales, fixent les conditions pour éviter les asymétries fondamentales qui président aux relations entre donateurs et receveurs de l'aide en général.

## **LE CONTENU DES PARTENARIATS: ENTRE PRATIQUES DE TERRITORIALITE COMPAREES ET RECHERCHE DE RECIPROCITE'**

L'analyse des processus révèle qu'à travers les activités de coopération décentralisée, les parcs piémontais ont réussi à mobiliser bon nombre d'acteurs appartenant au territoire. Parmi eux, citons les collectivités locales, les universités et les instituts de recherche, les ONG, les écoles, des associations locales, les associations de migrants et de particuliers, soit au total un engagement de 88 groupes ou institutions du territoire piémontais. Sous certains aspects, il émerge une connotation territoriale spécifique de l'expérience, liée au concept de territoire vécu par les aires protégées et leur rôle dans le contexte d'appartenance.

Les parcs sont des organismes qui naissent par définition avec un lien étroit avec le territoire d'appartenance et de compétence, mais sont peu voués à des activités à caractère international ou du moins de coopération. Quand nous leur avons demandé quelles étaient les motivations à l'origine de leur participation à des processus de coopération décentralisée, ils se sont révélés porteurs d'une réflexion significative, qui a peu à peu mûri dans le temps avec la reconnaissance progressive et l'appropriation de ces activités de coopération comme des fonctions propres à les parcs, en qualité des acteurs institutionnelles.

Bien que les 13 parcs examinés aient eu la possibilité de s'exprimer librement à ce propos, ils ont fourni des réponses très similaires les uns des autres. Ces dernières se différencient seulement par le poids relatif attribué à tel ou tel aspect de la coopération décentralisée. Ces aspects ont été regroupés en 3 catégories. La plupart des parcs (5/13) se réfèrent à la coopération décentralisée comme à une activité qui permet d'obtenir un renforcement réciproque de type institutionnel. D'autres (4/13) insistent sur les avantages de type relationnel, d'autres encore (4/13) réservent une attention particulière à la possibilité de développement pour le bénéficiaire du projet. Dans ce dernier cas semble prévaloir une vision plus unidirectionnelle par rapport à la bidirectionnalité implicite liée à l'échange d'expériences ou à la création de relations avec un partenaire institutionnellement similaire, mais qui se distingue par sa position dans un autre contexte territorial, duquel dérivent des priorités et des exigences de développement différentes. La réciprocité est à chaque fois présentée comme un enjeu important. On attend également de la relation de coopération entre les acteurs de deux territoires qu'elle contribue à un renforcement institutionnel des parcs piémontais eux-mêmes. Paradoxalement, pour nombre de personnes interviewées, la présence d'un objectif placé hors du territoire d'appartenance simplifie et renforce la cohésion des relations au sein de leur propre système. L'expérience de coopération décentralisée a notamment favorisé la valorisation des activités en matière d'éducation et de sensibilisation à l'environnement de l'aire protégée réalisées au Nord (par exemple à travers le projet "Parco chiama Parco") ou de la Région elle-même (à travers

le projet cofinancé par la Commission européenne “Des Alpes au Sahel” [11], où le réseau essaie de s’élargir et comprend parmi les partenaires du projet la région française Rhône-Alpes).

La présence d’une recherche et d’une présence effective de réciprocité est également confirmée.

Les déclarations des opérateurs des parcs à propos des contenus du rapport apportés par le partenaire du Sud dans la relation de partenariat mettent en évidence le rôle central des relations personnelles qui se créent autour de la réalisation des projets. Ces rapports de nature plutôt personnelle, et pas seulement institutionnelle, deviennent un véhicule de connaissance d’une réalité différente, qui représente surtout une ressource du point de vue de l’enrichissement culturel, et créent un terrain de partage et de réciprocité entre les acteurs du réseau qui, bien qu’appartenant à des contextes territoriaux différents, s’occupent des mêmes thèmes, à partir de compétences semblables.

Ensuite, lors des entretiens, nous avons essayé d’entrer plus dans le détail pour explorer ce que signifie «faire de la coopération décentralisée» pour un Parc. Les réponses se sont concentrées sur deux aspects qui concernent, d’une part, l’objectif général d’harmoniser les exigences d’une aire protégée avec celles des populations qui vivent dans les territoires limitrophes, et d’autre part, l’objectif plus spécifique (et dans un certain sens plus technique) concernant l’apport que peut représenter de l’intervention d’un organisme comme un Parc dans le cadre d’un projet. Les deux réponses sur ces deux aspects semblent complémentaires car elles concernent à la fois le domaine et les modalités d’intervention des parcs comme institutions de coopération décentralisée. Elles partent de la définition et de la vision de ce qu’est la territorialité et la compétence d’une Autorité de Parc dans le système piémontais, pour s’étendre à la compréhension des objectifs de gestion des aires protégées partenaires situées dans les pays en voie de développement, évoluant dans une collaboration avec les communautés locales.

## SUPPORT PAR LE TERRITOIRE ET SUPPORT DU TERRITOIRE

Bien que le rapport qui constitue le partenariat soit caractérisé par un lien fort, à travers la réalisation de microprojets dans une logique «d’approche programme» [12] le rôle de support joué par les acteurs du contexte territorial et par les compétences mises en jeu par ces derniers, non seulement dans le contexte au Sud, mais aussi, comme nous avons pu l’observer au cours de la recherche, dans la gestion des dynamiques de la coopération décentralisée au Nord, a été et continue d’être fondamental. En effet, il faut rappeler que les acteurs engagés dans des interventions de coopération décentralisée entre aires protégées ne sont pas des “coopérants de profession” mais des acteurs qui opèrent dans un autre secteur. Si, d’un côté, cela favorise potentiellement une mobilisation de compétences techniques nécessaires, notamment en matière de planification et de sauvegarde de l’environnement, d’un autre côté cela signifie, pour de nombreux acteurs, embrasser le monde de la coopération de manière accidentelle, avec une grande motivation personnelle, mais avec un manque d’expérience et de capacité d’analyse des contextes d’intervention qui peut soulever bien des difficultés dans la gestion des projets et les rapports avec les partenaires du Sud.

Coordonner les relations entre les participants du projet au Nord tout en stimulant le partenariat avec la communauté partenaire au Sud requiert une dépense considérable aussi bien en termes de temps que de ressources financières. En effet, créer des “réseaux de projets” signifie investir dans la construction de rapports de confiance, en se confrontant avec des positions et des exigences qui reflètent souvent histoires et contextes. Ainsi, si le temps et les financements font défaut, si les projets sont constitués de micro interventions et si les rapports entre partenaires sont discontinus, il n’est pas rare que la constitution de réseaux locaux se réduise à l’engagement formel de certains acteurs, limité aux phases de définition du projet.

Le temps à consacrer à la connaissance du contexte d’intervention au Sud, à l’approfondissement des rapports avec le partenaire, à la définition conjointe des projets au Nord comme au Sud, est souvent soustrait à la réalisation d’autres activités. Les interventions en sont d’autant plus pénalisées que les organismes impliqués sont de petite taille, comme c’est le cas des parcs en question. Le partenariat risque dans certains cas de se réduire à des rencontres formelles et à des échanges de visites entre délégations partenaires, voire à de brèves missions, que les acteurs concernés sont les premiers à considérer comme inappropriées pour acquérir une connaissance réciproque adéquate et garantir un suivi effectif des interventions et un accompagnement progressif du partenariat. La consolidation d’un rapport continu et de confiance entre partenaires, le partage progressif de codes communicatifs et de pratiques de projet, l’apprentissage à partir des expériences vécues et l’accompagnement de “coopérants de profession” se sont avérés des aspects importants pour la bonne réussite des partenariats analysés.

Dans notre cas spécifique, un rôle de tout premier ordre a été joué par les ONG du territoire du partenaire du Nord, notamment le Consortium des ONG piémontaises (COP) pour les parcs piémontais qui coopèrent avec le Sénégal et le Burkina Faso. Ce rôle peut s’expliquer à travers toute une série de considérations qui se réfèrent à un rôle plus vaste joué par la coopération non gouvernementale dans les processus de coopération au développement [13] [14]. Premièrement, les ONG représentent des acteurs qui ont une expérience consolidée aussi bien dans le contexte du Piémont elles sont donc en mesure de répondre aux conditions de mise en œuvre de la coopération décentralisée. Deuxièmement, l’enracinement et l’expérience offrent justement des garanties par rapport à la réalisation des interventions selon des modalités et des délais prévus, assurant ainsi une visibilité positive à l’organisme financier qui doit répondre de son action vis-à-vis des contribuables. Cependant, dans une stratégie d’autoreproduction, pour assurer

leur survie et le maintien des emplois, le rôle des ONG peut dans certaines occasions empêcher de fait l'engagement dans les projets d'autres acteurs qui ne sont en mesure d'offrir les mêmes garanties [15].

De plus, l'intervention des ONG peut réduire l'engagement actif de l'organisme du Nord à celui de promoteur/financier d'interventions, au risque de limiter leur implication effective dans les partenariats.

En ce qui concerne les cas étudiés, les aires protégées piémontaises semblent être parvenues à garder un rôle autonome et actif dans les projets, en valorisant positivement le support fourni par les ONG. La présence et la coordination du COP ont été particulièrement importantes pour soutenir, faciliter et maintenir vivant l'engagement du réseau des parcs piémontais et des autres sujets impliqués. Il s'agit d'un cas où la valorisation d'expériences et de compétences déjà présentes sur le territoire est devenue une ressource mise à disposition du réseau et garante de son fonctionnement. Par ailleurs, il faut rappeler la volonté politique de la Région de promouvoir la coopération décentralisée entre aires protégées. Le choix d'insérer les activités de coopération coordonnées à leur tour par le Secteur des Aires protégées dans le cadre d'une ligne spécifique de financement régional, a jeté les bases de la création du réseau qui est né, au fil des années, de ces partenariats, notamment dans le Piémont. Pour certains parcs, cette expérience a représenté la première occasion de coopération mais aussi de collaboration avec des collègues du territoire.

## CONCLUSIONS

La littérature scientifique et le vaste débat au sein du monde des "spécialistes de la coopération" a souligné le fait que l'un des points forts de la coopération décentralisée réside dans sa capacité de mobilisation territoriale, dans ce qui a été défini comme "valeur ajoutée territoriale" par rapport à d'autres formes de coopération, surtout au Sud [14]. L'analyse de la coopération décentralisée des aires protégées piémontaises nous révèle qu'il est possible d'identifier une valeur ajoutée territoriale à partir des dynamiques et des retombées de ces processus également au Nord. Il suffit de penser, comme l'on l'a vu, aux 80 acteurs (institutions publiques et organisations diverses) du territoire piémontais, en plus des parcs, qui ont été impliqués pendant ces années d'expérience (en considérant aussi les parcs de l'Amérique Latine et les autres parcs en Afrique). Il s'agit là d'une donnée qui peut surprendre les "spécialistes" eux-mêmes. Mais cette réflexion ne veut certes pas s'arrêter aux chiffres des acteurs impliqués. Notamment au Nord, cette particularité et cette richesse de la coopération décentralisée ne sont pas toujours perçues en termes absolus et donc considérées comme une valeur en soi. Dans son caractère intrinsèque de fragmentation, de dispersion, de maigre coordination, le risque est de perdre la signification, les contenus et les retombées offertes par ces relations. Il devient donc particulièrement important de faire émerger et d'analyser de manière critique ce tissu relationnel qui représente à la fois une richesse et une potentialité (pour les raisons indiquées ci-dessus).

Dans ce contexte et en adoptant une perspective partielle dans la tentative de distinguer les motivations et des retombées territoriales, exprimée par et dans le système Nord, les caractères saillants de la coopération des aires protégées piémontaises peuvent être synthétisés dans les points suivants [16]:

- un processus d'origine territoriale; il s'agit d'un processus qui s'est développé à partir de la dynamique du territoire et qui a impliqué, au cours des années, un nombre croissant d'acteurs (parcs et autres);
- un contenu territorial; il s'agit d'un processus visant à valoriser l'ensemble des réseaux sociaux, culturels et professionnels qui forment la communauté au Nord et les compétences acquises au sein de celle-ci;
- des objectifs territoriaux; ce processus se fixe comme objectif un développement plus équilibré du territoire de l'aire protégée au Sud (enracinement et légitimation), à partir de la vision ce qu'est la mission des parcs dans le contexte piémontais;
- une absence de correspondance institutionnelle stricte au Sud, alors qu'elle l'est devenue dans le système au Nord ; le processus a vu l'engagement d'organismes préposés à la conservation de manière non exclusive ; les communautés riveraines de l'aire protégée en ont non seulement été bénéficiaires, mais dans certains cas elles sont devenues partenaires de projet. Dans certains partenariats, la coopération décentralisée a pris une dimension "locale" sur son versant Nord, en concentrant ses contributions en faveur d'acteurs locaux piémontais engagés de manière stable au Sud (par exemple des missionnaires);
- la présence d'un système de coordination régional entre les parcs; le rôle de la Région Piémont a été déterminant dans la mobilisation du processus, à partir de possibilités latentes liées à un programme régional (opportunité institutionnelle); la collaboration du Consortium des ONG piémontaises l'a relayé. Toutefois, la gestion des projets de coopération décentralisée au sein des parcs n'est pas sujette à des influences politiques; l'attribution des ressources varie d'un parc à l'autre, mais n'est pas conditionné par des facteurs politiques. Elle tient largement à la motivation personnelle des acteurs impliqués;
- des retombées positives au Nord; le processus favorise la concertation et la coordination dans la gestion du système des aires protégées au Piémont et la valorisation des activités d'éducation et de sensibilisation à l'environnement de l'aire protégée réalisée au Nord;
- un processus multi-acteurs et multi-niveaux; on observe une composante collective publique-privée des relations et des réseaux territoriaux aux côtés d'une composante individuelle de chaque acteur de la coopération décentralisée (institutionnelle-personnelle/solidaire);

- un moteur de développement local; elle permet non seulement d'exporter de la valeur économique à partir des ressources locales dont l'utilisation n'endommage pas les habitants et les producteurs locaux, mais aussi d'importer un capital de connaissances de nature économique, culturelle, sociale et environnementale, qui permet de valoriser l'enjeu initial, afin que ce processus devienne un laboratoire de réciprocité.

En effet, à travers la coopération décentralisée peuvent se développer des relations par la création de nouveaux réseaux transversaux ou la naissance de nouveaux carrefours au sein de systèmes relationnels préexistants. De plus, à travers les relations permises par la coopération décentralisée, l'aire protégée est potentiellement en mesure de consolider des rapports existants entre acteurs du niveau local (comme les collectivités locales ou les associations de base) ou d'en développer de nouvelles, pouvant ainsi jouer un rôle dans les dynamiques du développement local.

La valorisation de ces dynamiques – et, si possible, une tentative pour la quantification – surtout en temps de crise de l'aide et des contraintes économiques des collectivités locales, qui affectent aussi la Région Piémont, pourrait certainement être un bon argument pour continuer à soutenir la coopération décentralisée et son effet boomerang.

## ENTRE THEORIE ET PRATIQUE: UNIVERSITÀ DE TURIN ET COOPÉRATION DÉCENTRALISÉE PIÉMONTAISE QUINZE ANS DE RECHERCHE DANS LE DOMAINE DES DÉCHETS

Roberta Perna\*

\*Université de Turin, Italie – [roberta.perna@unito.it](mailto:roberta.perna@unito.it)

### ABSTRACT

À partir des années 1940, depuis que la coopération est rentrée dans les discours politiques nationaux et internationaux, les modalités d'implémentations des interventions réalisées ont été plusieurs, ainsi que plusieurs ont été les acteurs engagés dans le jeu de la coopération. Dans ce contexte, la soi-disant « crise de la coopération » a été le résultat de l'incapacité de comprendre en profondeur les mécanismes qui définissent les liens entre les sociétés locales et leur territoire. Par conséquent, il faudrait projeter des interventions de coopération en s'efforçant de saisir les différentes géographies qui sont présentes sur le territoire des projets, pour favoriser sans bouleverser les stratégies de sa gestion.

Sur la base d'un parcours de quinze ans de recherches, cet article veut présenter l'importance du rôle de l'Université de Turin dans une collaboration toujours plus forte entre recherche académique et interventions de coopération décentralisée dans le domaine des déchets, en soulignant la nécessité de comprendre les territoires, en tant que destinataires des interventions de la coopération, ses acteurs et leurs relations, ses nécessités et désirs, ses langages et significations.

### INTRODUCTION

À partir des années 1990, la coopération décentralisée piémontaise et les ONG du territoire ont fixées toutes les deux leurs attentions sur la thématique des déchets dans les pays Africains, en particulier à partir de l'initiative « *Da rifiuto a risorsa* »<sup>1</sup> (De déchets à ressource). Ce projet a été réalisé au sein du « Programme pour la sécurité alimentaire et la lutte contre la pauvreté en Afrique sub-saharienne », cofinancé par la Région Piémont et lancé en 1997 par la Mairie de Turin. Cette initiative, née comme projet d'échanges scolaires entre sept écoles secondaires du Burkina Faso, du Sénégal et de l'Italie, a été progressivement étendue à un réseau d'acteurs plus vaste (ONG turinoises - Lvia, Cisy e Mais; villes de Turin et de Chieri en Italie, villes de Louga, Parcelles Assainies et Mbour au Sénégal, villes de Ouagadougou et Tenkodogo au Burkina Faso; Université de Turin et Université de Saint Louis; AMIAT - *Azienda Multiservizi Igiene Ambientale Torino S.p.A* – qui s'occupe de la gestion des déchets dans la ville de Turin). À partir du 2001 en particulier, cette initiative a mis l'accent sur la question des déchets, identifiée comme problématique collective capable d'impliquer à la fois les villes du Nord comme celles du Sud du monde: l'idée a été celle de construire un réseau d'acteurs dans les différents territoires qui puissent élaborer des plans d'action et répandre des bonnes pratiques pour renforcer la participation locale.

Dans le projet, la gestion des déchets a été abordée non seulement en termes purement techniques, mais en tant que problématique qui implique l'ensemble des citoyens. En conséquence, on a compris la nécessité de parvenir à un changement culturel face aux déchets: c'est-à-dire, « Des déchets aux ressources ». Ce thème a été discuté par les étudiants, les associations, les administrateurs locaux, les chercheurs, les techniciens de déchets: une pluralité d'acteurs qui a stimulé le dialogue et le débat, dans une confrontation dynamique qui a permis de tisser des réseaux entre des territoires lointains, qui ont trouvé des solutions spécifiques pour des problèmes communs.

Quelle est la raison de cet intérêt dans le domaine des déchets par la coopération décentralisée? Quel est son rôle, son sens, quelles sont les opportunités mais aussi les menaces qui peuvent caractériser des interventions au sujet des politiques publiques dans les pays Africains et, spécifiquement, dans la gestion des déchets? Le présent papier a pour vocation de répondre à ces questions, en présentant, dans le premier paragraphe, soit le potentiel et la rationalité des interventions de la coopération dans la gestion des déchets soit ses risques. Dans la seconde partie, ces questions ont été appliquées à l'étude de cas de Ouidah, une petite ville dans le sud de la République du Bénin où, entre 2000 et 2011, plusieurs interventions de coopération se sont succédées dans le domaine des déchets.

## GESTION DES DECHETS ET COOPERATION DECENTRALISEE: SENS, OPPORTUNITES ET MENACES

### Gestion des déchets et Objectifs du Millénaire

Le premier aspect clé est lié à la motivation des interventions: quelle importance peut avoir un projet de coopération au sujet de la gestion des déchets dans des contextes caractérisés par une très forte pauvreté et des fortes inégalités économiques et sociales?

Il faut éclaircir que la gestion des déchets ne met pas en cause seulement des questions de nature esthétique, avec des images des décharges sauvages à ciel ouvert qui brûlent en plein air aux périphéries des villes des pays Africains. En effet, si nous croyons encore valables les Objectifs du Millénaire, au moins dans leurs principes, nous pouvons mettre en évidence une pluralité de connexions entre la réalisation de ces derniers et la gestion des déchets, au-delà du lien intuitif avec l'Objectif de la préservation de l'environnement et de la réduction de l'exploitation des ressources.

Par exemple, en rappelant le premier Objectif, celui d'éliminer l'extrême pauvreté et la faim, nous pouvons affirmer que la gestion des déchets offre des possibilités d'emploi à différents niveaux, du nettoyage des rues au management de l'activité, ainsi que toutes les activités liées au recyclage des matériaux utiles. Ou encore, en référence au troisième Objectif, celui de promouvoir l'égalité des sexes et l'autonomisation des femmes, souvent les femmes sont exclues du processus de prise de décision dans leur communauté; toutefois, en même temps, les femmes sont souvent impliqués davantage que les hommes dans l'intérêt de leur communauté locale et dans la préservation des conditions environnementales entourant leurs familles, et elles tendent à être beaucoup plus efficace dans la fourniture des services pour la collecte des déchets au sein de leurs communautés. Ainsi, la participation des femmes dans les activités qui sont directement liées aux intérêts et aux besoins de la communauté peut représenter un outil pour promouvoir leur autonomisation. Encore, nous pouvons définir un autre lien avec le quatrième Objectif (celui de réduire la mortalité infantile et post-infantile) si nous considérons que la dysenterie est la maladie qui provoque chaque année le plus grand nombre de décès chez les enfants de moins de cinq ans dans les Pays en Développement; et bien sûr, la présence de décharges à ciel ouvert est directement impliquée dans la propagation de cette plaie infantile, puisque les mouches, vecteurs de la maladie, se reproduisent facilement dans les tas d'ordures en décomposition dans les rues des villes ou dans les cours d'eau [1].

### Gestion des déchets et coopération décentralisée

Ayant mis en évidence les motivations des interventions au sujet des déchets, en résumé liées à l'amélioration de la qualité de vie dans les villes des pays Africains, la question suivante est liée au rôle et au potentiel de la coopération décentralisée dans le cadre de leurs gestion.

En premier lieu, il faut tirer au clair que une gestion durable des déchets doit impliquer entièrement soit la population que les acteurs privées, ainsi que les institutions locales, selon les principes de la gouvernance urbaine intégrée, caractérisée par des partenariats entre les secteurs public, privé, la société civile et la population, dans le but d'offrir une gestion des déchets efficace [2].

Sur la base de cette logique, il est possible attribuer un sens additionnel au lien entre gestion des déchets et coopération décentralisée: en effet, soit la rationalité de la gouvernance soit celle de la coopération décentralisée sont liées à la structuration des réseaux dans le territoire, en créant des partenariats entre la variété des acteurs potentiels; dans le cas de la coopération, il s'agit de créer des réseaux entre le Nord et le Sud du monde, entre milieux urbains qui, bien que différents, agissent dans le but commun de rendre leurs communautés protagonistes de l'amélioration de leurs conditions de vie.

En effet, bien que partageant les objectifs généraux de la coopération au développement, il y a des points clé qui distinguent la coopération décentralisée d'autres formes d'intervention: l'instauration des formes de partenariat entre communautés locales impliquant l'ensemble du système territorial; la réciprocité des intérêts, également en termes d'échange continu et de communication entre plusieurs acteurs; la participation pleine des communautés locales et des population, dans une optique de participation par le bas; l'idée du local comme niveau d'échelle le plus approprié auquel se référer pour identifier besoins et priorités; la promotion des capacités, des compétences et des ressources territoriales, dans le but de permettre l'appropriation des projets et la prise des responsabilités par les acteurs impliqués; le dialogue durable, lié à favoriser l'apprentissage mutuel et continue des connaissances et expériences.

À travers la coopération décentralisée on ne veut pas simplement définir et réaliser des projets isolés dans les pays Africains, mais contribuer au changement de chaque acteur impliqué, en favorisant un processus de décentralisation et démocratisation à travers la participation active des institutions publiques locales et de la société civile. Le but est celui de créer des formes de complémentarité, de coordination et des collaborations qui valorisent les ressources et les connaissances de chaque participant, soit du Nord soit du Sud du monde. Ce rapport d'échange continu porte à la création des réseaux internationaux qui permettent l'intégration des groupes marginaux en partenariats locaux, donc des partenariats entre territoires [3]. Conséquemment, ce qui change ne sont pas les

objectifs, mais l'approche. Il ne s'agit plus de flux d'aide unilatérales, mais d'interaction et d'apprentissage mutuel entre les partenaires impliqués, en se référant aux sujets donateurs aussi bien qu'aux sujets bénéficiaires.

### Risques et menaces des interventions

Quand on analyse les interventions dans les pays Africains, il ne faut jamais sous-estimer les menaces et risques, liés surtout à la capacité des sujets intervenant de lire la territorialité des milieux destinataires des projets. En effet, à partir des années 1940, depuis que la coopération est rentrée dans les discours politiques nationaux et internationaux, les modalités d'implémentations des interventions réalisées ont été plusieurs, ainsi que plusieurs ont été les acteurs engagés dans le jeu de la coopération. Dans un contexte jusqu'aujourd'hui ainsi caractérisé, une réflexion effective sur les stratégies d'interventions qui se sont succédées a manqué, malgré la conscience des profondes inégalités entre le Nord et le Sud du monde. En effet, à partir des années 1950 et 1960, des approches souvent opposées ont dessiné les lignes des interventions, en privilégiant tantôt des influences de nature technique, tantôt de nature économique, idéologique ou humanitaire. «Se sont à leur tour opposés, ajointés, alternés les interventions planifiées de nature marxiste, les politiques des grandes réalisations, la philosophie des micro-projets, des expériences isolées, les stratégies rigoureusement économiques-financières, la période des grands travaux publics et le retour à l'engagement du secteur privé, le tout en versant un fleuve de ressources financières souvent desséché au premier contact avec la réalité territoriale des zones d'intervention.» [4].

De plus, le manque des résultats réels malgré les efforts importants a conduit à ce qui a été défini « la crise de la coopération » des années 1980 (Minca C., 1994), liée à certains éléments clé. En premier lieu, l'inadéquation des outils techniques et des modèles de style occidental a été identifiée comme la cause majeure; en effet, ces outils ont été appliqués sur des contextes fondés sur des «territorialités autocentrés extrêmement vulnérables, ou au contraire peu perméables» [5], qui ont souvent annulé les effets positifs des projets, en favorisant la prolifération des soi-disant cathédrales dans le désert<sup>2</sup>. Une autre cause de la crise de la coopération est liée à l'incapacité d'introduire les interventions dans un cadre théorique solide mais, en même temps, capable de s'adapter aux diversités des cas. Par exemple, les programmes d'ajustement structurel ont impliqué l'utilisation des modèles standardisés, déliés des considérations sociaux et territoriaux capables de considérer les particularités locales: il s'agissait de programmes a-territoriaux mais qui pesaient fortement sur les territoires de destination.

C'est alors que toutes les interventions 'a-territoriales'<sup>3</sup> de coopération au développement, ainsi que la recherche des technologies qui se sont démontrées inappropriées ont été le résultat de l'incapacité de comprendre en profondeur ces mécanismes qui définissent les liens entre les sociétés locales et leur territoire. Par conséquence, il faudrait projeter des interventions de coopération en s'efforçant de saisir les différentes géographies qui sont présentes sur le territoire d'un projet, pour favoriser sans bouleverser les stratégies de sa gestion. Donc, la nécessité d'une collaboration toujours plus forte entre recherche académique et interventions sur le terrain devient évidente: «Les *practitioners* reconnaissent d'avoir besoin de sortir de la – présumée – autoréférence du monde de la coopération pour puiser la connaissance produite par le monde académique ; les chercheurs reconnaissent d'avoir besoin de sortir de la – présumée – autoréférence du monde académique, pour traduire en actions les résultats des propres recherches, en collaboration avec qui travaille de plus longtemps sur le terrain dans l'actuation des politiques de coopération au développement.» [8]. Il s'agit alors de promouvoir des interventions *bottom-up* qui, soutenues par la recherche participative, permettent de donner une impulsion à la production des processus de territorialisation autocentrés. Le début de tous projets dans les territoires du Sud du monde devrait être celui de «apprendre sur les territoires locaux [...] la reconnaissance réciproque entre acteurs, en encourageant l'émersion des nécessités et des désirs, en activant les connaissances, les langages et les sens, en identifiant les ressources et les moyens existantes et mobilisables, en protégeant les biens territoriaux (sociaux, politiques, environnementaux), en rassemblant les garanties demandées et les contraintes perçus : en lisant la territorialité» [9].

En souhaitant une plus forte collaboration entre le monde de la recherche et celui de la coopération, on propose un «terrain commun» d'action entre deux différents perspectives: celle des recherches théoriques, sur la notion de développement, de transformation sociale et sur le monde de la coopération dans le domaine de la doctrine de l'aide; et celle de l'élaboration et implémentation des stratégies d'interventions de la coopération, pour promouvoir le développement dans ces plusieurs acceptions, en se référant aux méthodologies participatives, à travers lesquelles les populations bénéficiaires sont impliquées dans tous les phases du cycle du projet [10].

Ce problème peut être bien présenté en référence au cas de Ouidah, une petite ville dans le sud du Bénin, caractérisée, d'un côté, par une croissance exponentielle de la population et une forte urbanisation, et, de l'autre côté,

<sup>2</sup> Minca se réfère à la théorie de la territorialisation du géographe italien Angelo Turco, qui parle de territorialisation autocentrée en relation aux processus pour lesquels « la culture qui s'exprime en tant qu'agir territorial est fabriquée, et en tous cas gouvernée, par des acteurs ou des groupes qui se reconnaissent comme partie intégrante d'un corps social unitaire. » [6]. Alors, la territorialisation autocentrée possède les caractères de la culture à laquelle fait référence et est partie de ses stratégies de reproduction. Par contre, il parle de territorialisation éterocentrée quand il y a « une rationalité territorialisant qui exprime et soutient une rationalité sociale mûrie ailleurs, c'est-à-dire au-delà du contexte cultural et spatial de la société qui on est en train d'observer » [7]. Conséquemment, la logique qui soutient cette territorialisation n'est pas orientée à la reproduction de la société dans laquelle elle se réalise, mais de laquelle qui la produit.

<sup>3</sup> Avec cette définition, on veut désigner tous ces interventions et programmes qui ont impliqués l'utilisation de modèles standardisés, déconnectés de considérations sociales et territoriales relatives aux particularités locales, mais qui ont fortement affectés les territoires de destination.

par l'inefficacité de l'intervention publique dans la gestion des déchets; ici, de 2000 à 2011, quatre initiatives de coopération décentralisée, gérées par la ONG CISV<sup>4</sup> et financées par la Région Piémont, ont été réalisées, orientées vers la création d'une filière des déchets, dans le but d'améliorer les conditions de vie du milieu urbain.

## LE CAS DE LA VILLE DE OUIDAH, AU BENIN<sup>5</sup>

### Ouidah : entre urbanisation, pauvreté et décentralisation administrative

Située à 45 km à l'est de Cotonou, dans le département de l'Atlantique, Ouidah s'étend sur une superficie de 364 km<sup>2</sup>, et compte une population totale de 76.555 habitants qui, selon une étude de l'INSAE [12], continuera de croître dans les années: en effet, elle a estimé une croissance de la population du 144% du 2002 au 2039. Au même temps, cette croissance a impliqué une très forte tendance à l'urbanisation, lors que les arrondissements urbains concentrent la moitié de la population de la Commune sur moins d'un cinquième de la superficie. Il se révèle donc évident qu'un tel rapide processus d'urbanisation nécessite l'implémentation de politiques urbaines liées à répondre aux instances d'une population toujours croissante. En plus, cette exigence se reporte aussi aux conditions de vie de la population: si le Bénin se trouve à la 167ème position sur 187 dans le *ranking* de l'UNDP en termes de développement humain, la ville d'Ouidah même présente de données plutôt inquiétantes: si on considère l'indicateur de la pauvreté monétaire adopté par l'INSAE<sup>6</sup> [13], en 2011 le 54,03% de la population de Ouidah se trouvait au-dessous de la ligne de pauvreté, un pourcentage bien inférieur à la moyenne du département (39,01%).

Et si ce contexte, avec sa vulnérabilité, nécessite de l'implémentation de politiques publiques urbaines, de l'autre côté il doit faire face aux difficultés croissantes enregistrées par les Municipalités en termes de prestation des services publiques. En effet, le processus de décentralisation administrative, réalisé à partir des années 1990 à la suite des programmes d'ajustement structurel du FMI adoptés pour réduire la dette publique (1989-1991; 1992-1994; 1995-1997), a amené, d'un côté, à l'augmentation des devoirs des Communes et, de l'autre côté, à un manque de ressources financières octroyées par l'État aux Communes mêmes. En effet, à partir du 1997, le cadre administratif du Pays a été entièrement réformé, en le structurant hiérarchiquement en Départements, Municipalités, arrondissements, villages ou quartiers de ville. Conséquemment, les devoirs des différents niveaux ont été parement reformés: en particulier, les Municipalités sont responsables de l'administration du territoire, avec la définition de programmes visant à assurer la protection économique, social, sanitaire, culturel et scientifique et de l'environnement; de toute évidence, il s'agit d'une série de domaines politiques très larges, en touchant tous les aspects de vie d'un territoire<sup>7</sup>. Toutefois, comme dans d'autres villes, le chevauchement de toutes ces tâches a laissé la ville d'Ouidah dépourvue des fonds pour répondre à ses devoirs [14].

En bref, la croissance de la population, l'augmentation de l'urbanisation et le processus de décentralisation administrative ont tous contribué à la création d'une situation de dégradation dans la ville, en particulier par rapport aux conditions hygiénique-sanitaires et environnementales. Face à cette situation, la gestion durable des déchets a constitué une priorité pour la ville de Ouidah. C'est alors dans cette dynamique que plusieurs acteurs de la société civile ont endossé un rôle actif dans leur communauté, en concentrant leurs efforts sur la promotion des services à la population pour contribuer à l'amélioration du niveau de vie et santé des villes et, conséquemment, à leur développement. Grâce à l'appui de l'ONG CISV, quatre associations locales (Action Plus, GATOM, IRADM, Aywou), au fil du temps ont pris en charge officiellement la gestion des déchets à Ouidah, en constituant le consortium USIRTO (Union des Structures Intervenant dans le Ramassage et le Traitement des Ordures).

### USIRTO et la filière des déchets dans la ville de Ouidah : les changements dans le temps

Pendant les interventions, en particulier en 2006, une étude réalisée par Fabiana Di Lorenzo, étudiante de l'Université de Turin, avait montré que, malgré la création d'une chaîne de collecte et d'élimination des déchets, avec la participation de quatre associations locales impliquées dans la collecte, réunies dans un consortium, USIRTO, engagé dans la séparation des déchets (entre composante organique pour la production compost et composante non récupérable pour la décharge), il y avait encore deux problèmes majeurs qui menaçaient d'annuler les résultats obtenus. D'une part, une partie de la population continuait à jeter les déchets dans des décharges illégales. D'autre

<sup>4</sup> La CISV (*Comunità Impegno Servizio Volontariato*), est une association communautaire, à but non lucratif, laïque et indépendante, créée en 1961 et engagée dans la lutte contre la pauvreté et en faveur des droits de l'homme. En tant qu'organisation non gouvernementale (ONG), elle réalise des projets de coopération internationale avec l'objectif de favoriser l'auto-développement des communautés locales comme soutien aux organisations paysannes et à la société civile. Elle est reconnue par le Ministère italien des Affaires Etrangères et par l'Union Européenne.

<sup>5</sup> Les informations présentées dans ce paragraphe sont issues des mémoires de maîtrise de l'auteur [11].

<sup>6</sup> L'INSAE analyse la pauvreté monétaire en termes d'incidence globale de la pauvreté, c'est-à-dire le pourcentage de population qui ne réussit pas à couvrir ses exigences alimentaires et non alimentaires, représenté par le seuil de pauvreté, égal à 120.839 FCFA par an et par habitant en 2011 (environ 235\$ par an).

<sup>7</sup> Pour ce qui concerne la gestion des déchets en particulier, les Municipalités sont responsables d'assurer la fourniture et la distribution d'eau potable, la collecte et la gestion des déchets solides ménagères et industriels, la collecte et le traitement des déchets liquides, la gestion du réseau d'eau pour l'évacuation des eaux usées et des eaux pluviales, et toutes les autres tâches pour assurer l'assainissement et la salubrité de la ville (*Loi n°97-029 du 15 janvier 1999, portant Organisation des Communes*, art 3).

part, un sujet n'avait pas été inclus dans la stratégie d'intervention, les artisans récupérateurs, à savoir la partie du secteur informel engagée dans la valorisation des déchets. [15]

L'étude de Di Lorenzo a montré que le premier problème était lié au fait que la population continuait à percevoir les déchets en termes de rebuts, de problèmes à résoudre. Par rapport au deuxième problème, le manque de considération des artisans était lié au manque de considération des stratégies précédentes de gestion des déchets, celles locales, qui accordait une grande importance aux activités de récupération gérées par le secteur informel. Il s'agit notamment de ferblantiers, qui fabriquent des plats destinés aux fours en récupérant des canettes; de chaudronniers, qui récupèrent l'aluminium pour fabriquer des casseroles; de forgerons, qui construisent des outils de travail en utilisant les carrosseries des voitures; ainsi que de cordonniers, qui récupèrent des pneus pour fabriquer des sandales, ou de *Gohoto*, à savoir groupement de femmes récupératrices de bouteilles. En toute évidence, il s'agit d'activités qui ne peuvent pas être considérées simplement comme marginales, secondaires ou informelles, mais elles sont des véritables sources de revenus pour une partie significative de la population de Ouidah, et fondamentales pour «compléter» la filière de façon productive.

Cependant, cinq ans plus tard, acquis ces problèmes dans la logique des interventions de coopération, il y avait eu des transformations importantes. Tout d'abord, en ce qui concerne la perception des déchets par la population: si aux yeux d'un technicien cet aspect peut paraître sans aucune relevance, en réalité il revêt une importance fondamentale cependant, l'attribution d'une signification de rebuts plutôt que de ressources aux déchets implique une approche à leur égard totalement différent (par exemple, d'enfouissement plutôt que de mise en valeur). Dans le cas d'Ouidah, il a été constaté un changement radical dans l'approche aux déchets, qui ne sont plus considérés du point de vue de «problème» mais purement en termes de «ressource», à la fois en termes d'emploi (avec des possibilités travail fournis soit par les quatre associations locales soit par le consortium, qui pendant la recherche embauchait cinquante employés à son cœur, dont 10% étaient des femmes), ainsi que pour la mise en valeur (avec la production de compost utilisé dans les activités agricole locaux) ou pour le recyclage (par les artisans récupérateurs).

C'est alors que dans la ville d'Ouidah, la gestion des déchets s'est développée au fil du temps comme une véritable filière: en effet, en naissant comme activité de collecte porte-à-porte des déchets destinés à la décharge finale, aujourd'hui elle est structurée et développée sur plusieurs étapes (Figure 1).

D'abord, les déchets sont ramassés et enlevés par les lieux de production (habitations, bureaux, écoles, rues et autres lieux publics) avec charrettes métalliques traînées par les charretiers des quatre ONG et associations locales, en relation au plan de zonage des dix arrondissements de Ouidah, stipulé chaque année entre les quatre associations, le consortium USIRTO et la Mairie de Ouidah. Cette première phase est déroulée en autonomie par chaque association/ONG sur les arrondissements relevant de sa compétence, en employant son personnel et en servant les structures abonnées au service<sup>8</sup>. Ensuite, les déchets sont amenés aux trois points de regroupement construits au sein de la ville, gérés par le consortium USIRTO dans son ensemble. Dans les points de regroupement, les employés de USIRTO, munis de gants et de cache-nez, trient manuellement les déchets entre: a) matière organique, destinée à la valorisation à travers la production du compost chez les fermes d'Action Plus et d'Aywou, et utilisée par les maraîchers dans leurs activités agricoles; b) déchets réutilisables ou recyclables (plastique, aluminium, carrosseries des voitures, pneus, ...), vendus aux artisans récupérateurs de la ville; c) déchets solides non recyclables, acheminés vers la décharge finale d'Ouessé.

On peut donc constater que, grâce aux interventions réalisées par la CISV, la gestion des déchets dans la ville de Ouidah est aujourd'hui organisée en terme de filière, où les concepts de Récupération, Réutilisation, Recyclage, mais aussi Valorisation, sont éléments essentiels du cycle des déchets, pleinement entrés dans la conscience des acteurs engagés et de la population, grâce aussi à l'organisation de journées de sensibilisation et formation dans le domaine de l'assainissement par la CISV et USIRTO en commun.

D'autres transformations ont eu lieu au niveau du management de la filière et de la gestion des déchets où, au-delà de la création du consortium USIRTO et la mise en réseau des ONG locales, a permis de structurer des réseaux durables au niveau local. En effet, l'expérience de Ouidah représente un exemple évident de gestion pluri-actorielle des services urbaines, qui implique la participation de plusieurs acteurs (Figure 2).

En premier lieu, le consortium USIRTO représente l'acteur central de la filière, qui est engagé entièrement dans la gestion des déchets, en poursuivant le but d'améliorer le niveau de vie de la population d'Ouidah grâce à une gestion du service adéquate et efficiente, et qui favorise la participation active de la population dans le ménage des déchets.

D'autre part, un rôle indispensable est joué par les quatre association locales, lesquelles constituent le consortium et, au-delà de leur participation dans la gestion des déchets, déroulent d'autres activités qui visent à améliorer les conditions de vie de la population, en particulier gérant des interventions dans les domaines sanitaire, scolaire et de tutelle environnementale; en plus, les ONG Action Plus et Aywou promeuvent la valorisation des déchets dans leurs fermes à travers la production du compost. En particulier, dans la ferme d'Action Plus, entre 2010 et 2011 USIRTO et la CISV ont organisé des cycles de formation dans le domaine de l'entrepreneuriat agricole et le compostage destinés à 33 jeunes en situation démunie. Ces cycles étaient liés à favoriser la capitalisation des connaissances et compétences dans le domaine de la valorisation des déchets et de la revalorisation des activités agricoles, compte tenu du fait que la zone de Ouidah est caractérisée par un terrain très favorable à l'agriculture. Ces

<sup>8</sup> La collecte des déchets est réalisée en correspondance des habitations ou structures abonnées au service, en relation à la dimension de la structure; le tarif moyen mensuel est de 1000 FCFA, tandis que le tarif minimum est de 500 FCFA.

activités ont eu pour but celui de relancer l'emploi des jeunes sur le territoire, en évitant ainsi la forte émigration des jeunes vers la ville de Cotonou, beaucoup plus développée économiquement.

Fig. 1 - La filière des déchets à Ouidah.

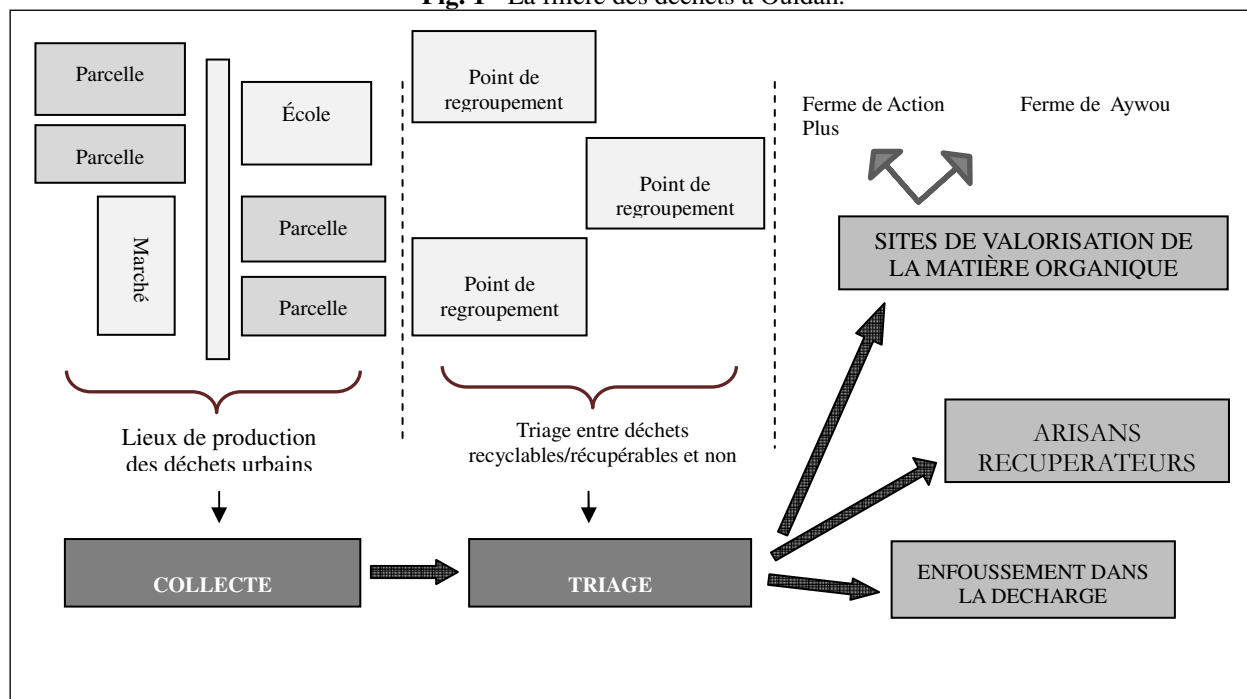

Fig. 2 - Les acteurs locaux et internationaux engagés dans les projets.

Ensuite, un autre acteur clé de la filière est aujourd'hui la Mairie de Ouidah ; en effet, depuis 2008, la Mairie a reconnu officiellement USIRTO comme partenaire privilégié dans le ménagement du service; en particulier, sur la base d'une convention, stipulée pour la première fois en 2008 et renouvelée chaque année, les obligations de la Mairie sont ces d'assurer à USIRTO un soutien économique en relation aux disponibilités financières municipales, et de veiller à ce que les engagements du consortium soient tenus, en contrôlant l'état des travaux et en analysant périodiquement les performances d'USIRTO.

Les artisans récupérateurs de la ville constituent désormais un autre acteur de la filière des déchets, car ils récupèrent verre, plastique et d'autres matériaux par les points de récupération pour en fabriquer des nouveaux outils; en ce faisant, ils contribuent à «compléter» le cycle des déchets de façon productive.

Encore, l'ONG CISV a joué un rôle fondamental pendant les années d'intervention, pas seulement pour la contribution financière liée aux projets de coopération décentralisée piémontaise. Au fil du temps, la CISV a constitué une sorte de lien entre le territoire de Ouidah et celui de Turin, en agissant comme intermédiaire pendant la réalisation des projets entre les acteurs béninois précédemment cités et ces italiens. Il s'agit de la Région Piémont, en tant que bailleur des interventions de coopération décentralisée; de certaines entreprises turinoises qui gèrent des activités de recyclage des déchets et de production du compost dans la province italienne, qui ont participé à d'expériences d'échange pendant les années des projets (par exemple, la société GAIA s.p.a.); de l'Université de Turin, engagée depuis des années dans plusieurs projets de recherche dans le domaine de la gestion des déchets dans les pays du Sud du monde. Pour ce qui concerne l'Université en particulier, elle a joué un rôle fondamental, grâce aux recherches réalisées par les chercheurs et les étudiants impliqués dans les projets pendant dix ans: en effet, comme on a souligné, elle a contribué en termes de soutien à la CISV pour une meilleure compréhension du territoire, de ses acteurs, des relations entre eux, des points de force et de faiblesse du contexte dont le projet a été réalisé, et de ses transformations pendant le temps.

## CONCLUSIONS

La structuration de la filière de Ouidah, avec ses acteurs, devient explicative du passage d'une approche technique-administrative - centralisée, avec des monopoles publics-privé, caractérisée par l'application de technologies souvent inappropriées aux territoires de référence, et qui fait face aux déchets en termes de problématique à éliminer - aux formes de gouvernance locale, où on expérimente l'intégration entre objectifs d'efficacité économique, de tutelle environnementale et d'*empowerment* des capacités locales - caractérisées par la pleine participation des *stakeholders* impliqués, l'adoption d'une approche de filière aux déchets, vus en termes de ressources [16]. En particulier, l'enracinement social et territorial des sujets promoteurs et leur capacité à développer des réseaux de relation avec des acteurs publics, privés et avec la population, a représenté la clé de la réussite du projet. En d'autres termes, c'est la capacité à s'ouvrir et à interpréter les demandes en termes de gestion des déchets de la part du territoire qui détermine la valeur ajoutée que le projet a offert à la ville.

Toutefois, il faut toujours considérer que, quand on parle des interventions, on considère toujours des projets nés au sein des programmes de coopération, et ainsi conçus, organisés et promus par des acteurs extérieurs aux territoires destinataires des interventions, porteurs des logiques qui, quoique partagées par les acteurs locaux, reflètent toutefois une idée et un projet de territoire différent, une autre territorialité. C'est alors que, en général, les interventions de la coopération peuvent conduire à des territorialisations éterocentrées, c'est-à-dire des territorialisations qui se produisent quand il y a «une rationalité territorialisant qui exprime et soutient une rationalité sociale mûrie ailleurs, au-delà du contexte culturel et spatial de la société qui on est en train d'observer» [17].

Conséquemment, c'est face à ce risque que le rôle de l'Université, et de la recherche en général, devient central : tel qu'indiqué dans le premier paragraphe, si le début de tous projets dans les territoires du Sud du monde devrait être celui de «lire la territorialité», les chercheurs ont la tâche de comprendre le territoire, ses acteurs et leurs relations, ses nécessités et désirs, ses langages et sens. C'est alors que «une logique externe peut être aussi porteuse de nouvelles opportunités pour le territoire, dans une perspective de logique autocentrée et pertinente, si ces opportunités sont filtrés à travers un système de règles qui les tiennent en compte, tout en préservant le caractère préexistant du territoire.» [18].

## NOMENCLATURE

ONG	Organisation Non Gouvernementale
LVIA	Lay Volunteers International Association
CISV	Comunità Impegno Servizio e Volontariato
MAIS	Movimento per l'Autosviluppo, l'Interscambio e la Solidarietà
INSAE	Institut National de la Statistique et de l'Analyse Economique
PNUD	Programme des Nations Unies pour le Développement
FMI	Fonds Monétaire International
GATOM	Groupe d'Assainissement et Traitement des Ordures Ménagers
IRADM	Initiative pour la Recherche et les Actions du Développement Mondial
AYIWOU	Mot en langue Fon, qui signifie « agir avec conscience »
USIRTO	Union des Structures Intervenant dans le Ramassage et le Traitement des Ordures
FCFA	Franc de la Communauté Financière Africaine

## COMPETENCES ET PRATIQUE DE COOPERATION INTERNATIONALE EN SENEGAL SUR LA ROUTE DES TALIBES

Gozzelino Giulia\*

\*Scuola di Dottorato in Scienze Psicologiche, Antropologiche e dell'Educazione, Université de Turin, Italie;  
Associazione Renken Onlus - [g.gozzelino@unito.it](mailto:g.gozzelino@unito.it)

### ABSTRACT

La présente contribution s'inscrit dans le débat sur les démarches et sur les acteurs qui renforcent la culture et l'efficacité de la coopération et ramène l'analyse d'un parcours développé à Malika (Sénégal) par l'Association Renken Onlus et plusieurs collaborateurs locaux sur le thème des enfants de la rue talibés (élèves des écoles coraniques).

La recherche, conduite entre Décembre 2011 et Août 2013, a prévu:

- l'analyse du contexte physique et social des *daaras* (écoles coraniques) et des *routes des talibés*;
- l'observation participante des échanges entre les acteurs coopérants sur le thème des enfants qui mendient à Malika durant les rencontres de coordination et au cours des activités;
- la rédaction de notes ethnographiques sur les interprétations fournies par les gens avec des comptes rendu linguistiques formels et informels;
- la relecture des verbaux des assemblées et des dossiers des projets avec les sujets impliqués.

Cinquante sujets ont été inclus dans le procès de conception et de développement de l'initiative et dans la recherche: les coordinateurs du projet *Talibé*, les bénévoles italiens et sénégalais de l'Association Renken, les maîtres coraniques des écoles et les représentants des groupes et des collectivités locales de Malika.

Une enquête a été conduite sur les compétences qui ont accompagné le procès opératif et la transformation réciproque des sujets parmi lesquelles émergent les compétences de médiation (communication, écoute, empathie, gestion des conflits, résilience) et les compétences d'organisation (projets, définition et partage des objectifs, gestion des espaces, des temps et des ressources humaines, créativité).

Les observations ont amené à une discussion sur le sens et sur l'interprétation locale de la pratique de coopération, du travail de réseau, des stratégies d'*empowerment* et de la conception dialogique et ont amené à intéressantes conclusions sur la dimension relationnelle des initiatives de coopération internationale.

### CONTEXTE DU PROJET DE RECHERCHE

#### Les écoles coraniques et la figure du *talibé*

Présente dans tout le territoire national, une myriade d'écoles coraniques est active - *daaras* - (non censée ni réglementée par l'Etat) et directe à la mémorisation des vers du livre sacré. Elles sont les traditionnelles structures éducatives musulmanes et ont représenté le premier système scolaire rependu du pays [1].

Destinée à former de bons musulmans, l'école coranique trouve sa légitimité dans la foi et s'appuie presque exclusivement sur la mémoire, la ritualité, le rythme des prières.

Exclues du système officiel, les écoles coraniques surgissent sans contrôle sur tout le territoire sénégalais. Dans les dernières années, en Sénégal la progression numérique des écoles coraniques a perdu le crédit aux yeux des musulmans à cause de la dégénération de l'enseignement et à cause de l'accumulation des richesses et de l'abus du pouvoir de quelques enseignants. Le marabout, maître et guide de l'école coranique, ne perçoit pas le salaire parce que sa mission est vue comme partie intégrante des obligations religieuses et sociales; pour cela, pour garantir sa propre survie et celle de ses élèves a le droit, selon la tradition, de les engager dans le travail des champs, dans travaux domestiques ou de les envoyer à mendier. Pour différentes raisons les écoles gérées par maîtres sans aucune compétence dans le milieu de l'enseignement se diffusent depuis quelques décennies avec comme seul objectif celui de gagner en obligeant les enfants à mendier.

Ils n'existent pas des statistiques sûres et fiables sur le nombre d'enfants *talibé* en Sénégal, mais il s'agit de centaines de milliers de mineurs qui mendient sur les routes du pays. Selon l'UNICEF [2] et l'Human Right Watch [3] les enfants de rue sont au moins 100000 et la plus grande partie est composée par les "étudiants du Coran" soumis à des conditions d'esclavage et obligés à mendier dans les écoles coraniques. Les *talibé* conduisent un rythme de vie non naturel et forcé, ils se réveillent tous les jours avant l'aube pour faire des exercices de mémoire et les prières du matin ;

ils mendient pour au moins six heures par jour en différentes tranches, retournant chaque fois pour reprendre l'étude et pour donner au maître la somme journalière tirée au nom des valeurs musulmans de charité et humilité. Beaucoup de *talibé* dorment par terre les uns à côté des autres, ils n'ont pas de vêtements propres et ne reçoivent pas les soins médicaux de base dont ils auraient besoin. Ils reçoivent un enseignement limité à l'apprentissage par cœur des vers coraniques, et ne sont pas préparés à la future vie d'adultes en société.

La presque totalité des talibés est originaire des régions périphériques et rurales du Sénégal ou des Etats qui confinent avec lui, séparés de la famille et des villages d'origine, les talibés victimes de traite sont obligés à vivre en conditions insalubres, dans la pauvreté, ils sont malades, ils mangent mal, ils sont l'objet de sévices physiques et psychologiques s'ils ne rejoignent pas le chiffre journalier en mendiant et ils risquent d'être victimes d'accidents sur la route, d'enlèvement, de pédophilie.

En analysant les conditions de vie des enfants dans des différentes écoles coraniques de Malika nous avons identifié des droits ratifiés par la Convention des Nations Unies relative aux droits de l'enfant de 1989 qui sont frappés et vexés directement et indirectement par la condition de mendiants forcés des enfants *talibé* en Sénégal. On va rappeler:

- le droit de l'enfant de préserver son identité, la nationalité, le nom et les relations familiales reconnues par la loi, sans ingérences illégales (art. 8);
- la tutelle de la partie de l'état pour empêcher les déplacements et les non-retours illicites des enfants à l'étranger (art.11);
- le droit à la liberté d'expression, de conscience, de pensée et de religion (art.13 e 14);
- la tutelle de l'enfant contre chaque forme de violence, outrage ou brutalités physiques et mentales, d'abandon ou de négligence, de mauvais traitements ou d'exploitation (art.19);
- le droit au repos et au temps libre (art.31);
- le droit à ne pas être victimes d'exploitation économique et à ne pas exercer un travail dangereux qui nuit à l'éducation et au développement de l'enfant (art. 32);
- la tutelle de toutes les formes d'enlèvement, vente et traite (art.35);
- le droit à être protégé de toutes les formes d'exploitation (art. 36).

Evidemment il n'y a pas un lien intrinsèque entre l'enseignement coranique d'un côté et, de l'autre côté, le fait que les enfants mendient et ont des conditions de vie misérables. Les *daaras* ont été créés il y a des siècles et le fait de mendier a toujours joué un rôle modeste dans le financement de leur gestion et dans l'enseignement de l'humilité aux enfants. Cependant aujourd'hui le phénomène de la mendicité forcée dans la daara est diffusé et en cours d'expansion et les causes sont nombreuses et complexes. Les plus importantes [4]:

- la pauvreté des parents qui ne peuvent supporter le paiement des taxes scolaires;
- la pauvreté des maîtres et au même temps la volonté de quelqu'un entre eux de s'enrichir;
- l'influence politique et culturelle des maîtres du Coran en Sénégal;
- la volonté des familles que leurs enfants apprennent les valeurs de l'Islam;
- l'obligation religieuse et culturelle de l'aumône;
- l'inaccessibilité et l'insuffisante présence de l'école publique et l'absence à son intérieur de l'enseignement religieux;
- l'action inefficace du gouvernement et des institutions locales dans la protection des enfants talibés des abus, dans la protection de leurs droits et dans la réglementation de la conduite des maîtres du Coran et la gestion des écoles.

**Fig. 1** - Les étudiants de la daara de Malika, qui ont donné naissance au projet *Talibé Renken* en 2009.

## LE PROJET TALIBE DE L'ASSOCIATION RENKEN

Le Projet Talibé est né pour développer et soutenir les interventions de formation et de sensibilisation envers les habitants de la commune de Malika pour prévenir et réduire la mendicité des enfants Talibé.

Le projet est caractérisé par différentes aires d'action:

- une grande campagne de sensibilisation développée à coté des associations du territoire et de la commune de Malika ;
- la requalification et le soutien de certaines écoles coraniques présentes à Malika avec des actions de rénovation, avec des cours d'alphabétisation en français et avec le soutien sanitaire pour les enfants du *daara* ;
- l'ouverture du centre d'écoute et d'accueil pour les talibés qui mendient dans les rues de Malika où ils peuvent être accueillis, soignés, protégés pendant la journée.

### Finalités et objectifs

L'association Renken avec ses partenaires, afin de contribuer à la lutte contre la mendicité et contre l'analphabétisme, s'est mise les objectifs suivants:

- mettre en place un réseau d'opérateurs, des institutions et des associations locales qui opèrent à Malika contre la mendicité forcée des enfants;
- améliorer la qualité de l'offre formative franco-arabe du quartier et la rendre majoritairement accessible pour répondre aux besoins que les familles expriment en envoyant les enfants dans les écoles coraniques traditionnelles ;
- créer un lieu qui assure les conditions essentielles pour la protection et pour la santé des enfants de la rue de Malika ;
- accompagner la croissance des talibés avec des interventions éducatives et des parcours de formation.

**Fig. 2** - Le centre d'écoute pour les enfants de la rue Renken -UNESCO inauguré au mois de Novembre 2012.

### LES SUJETS IMPLIQUES

Le projet a vu participer aux activités une pluralité d'acteurs.

En premier lieu, 15 volontaires italiens de l'Association de coopération et solidarité internationale Renken. Renken Onlus, indépendante et pas confessionnelle, née en Octobre 2006, poussée par les valeurs de solidarité et d'amitié, a

entrepris l'idée et la réalisation du projet *Talibé*. L'association (dont le nom dans le langage djola, signifie «ris!») est composée de jeunes qui mettent à disposition leurs compétences pour conduire les activités de l'association afin de promouvoir et soutenir les droits des enfants, des jeunes et des femmes et de favoriser leur accès à l'assistance sanitaire, à l'éducation et à la formation. Les sujets impliqués dans la recherche sont des femmes et des hommes entre 25 et 35 ans qui habitent dans la province de Turin et qui participent activement aux activités associatives en Italie et à Malika.

En deuxième lieu, 15 volontaires de l'Association Renken Sénégal impliqués dans le projet, chargés des initiatives éducatives de proximité des daara du territoire de Malika, du rapprochement des enfants et dans la gestion du centre d'écoute.

En troisième lieu, 20 collaborateurs locaux liés aux institutions, aux associations et au réseau du territoire comme les volontaires du Club UNESCO CRE de la rue de la Plage (qui ont accueilli les activités du centre d'accueil pour talibé et qui ont participé à la création des cours d'alphabétisation pour les enfants), les entraîneurs de l'AS Malika (qui ont intégré le projet de l'animation sportive), les Maîtres du Coran de la Mairie, le maire et ses collaborateurs, les femmes de la Fédération de femmes, les scouts.

## LA QUESTION DE LA RECHERCHE

Nos observations se sont concentrées pour cette contribution sur les compétences qui ont accompagné à Malika les acteurs de la coopération dans le projet et dans le processus de réalisation des initiatives pour les enfants *talibés* de Décembre 2011 à Janvier 2012.

Quelles compétences ont permis la collaboration entre les différents sujets impliqués? Quelles compétences ont accompagné la pratique du travail du réseau, les stratégies d'empowerment, la conception du dialogue? Quelles compétences ont favorisé la transformation réciproque et le développement de la dimension relationnelle dans les projets de coopération décentrée développés sur le thème des talibés à Malika?

Suivant Milani [5] la compétence se trace avec les caractères hétérogènes mais bien définis:

- son *dynamique* et *évolution* comme tendance à rester ouverte aux contributions de la science mais aux apports et à la confrontation sur le terrain (...);
- la *processualité* (...);
- le *caractère cognitif* puisque demande, pour être mis en œuvre, une interprétation qui n'est pas le fruit d'une lecture individuelle exaspérée, mais il est le résultat d'une *construction* (...);
- le *trait sociale* (...);
- la *contextualité* (...);
- sa *complexité* qui permet de discuter d'une notion *stratifiée et polyédrique*.

La notion de compétence – suivant Wittorski [6] – se situe à l'intersection des domaines de la biographie, de l'expérience professionnelle et de la formation du sujet. Les compétences se produisent et se transforment dans ces trois champs: d'un côté la socialisation, l'histoire de vie du sujet, le parcours personnel auquel il a dû faire face pendant sa croissance, les personnes qu'il a rencontrés et tout ce qu'il a appris, les stratégies de *problem solving* qu'il a acquises, le courant professionnel auquel il s'est lié; et finalement sa formation et ses connaissances théoriques et pratiques accumulées.

La compétence ne peut jamais être considérée une phase, mais elle représente un processus, elle n'est pas statique mais en évolution continue, elle peut changer *in itinere* et elle n'a jamais été une entité apart. Pour cela, notre analyse n'a pas recherché une enquête exhaustive de toutes les compétences nécessaires à la réalisation d'un projet de coopération, mais elle a ciblé l'enregistrement de ce qu'il est né dans les périodes de notre observation dans les relations spécifiques passées entre les sujets participant au projet Talibé à Malika.

## METHODOLOGIE ET METHODES

Notre contribution est le fruit de trois périodes d'observation et de participation déroulés à Malika entre Décembre 2011 et Janvier 2012, dans le mois de Novembre 2012 et pendant Aout 2013 et de deux années de *monitoring* du projet Talibé de l'Association Renken Onlus.

Durant la première période au Sénégal nous avons eu la possibilité de suivre de près les premières actions du Projet Talibé à Malika, en développant des journées d'observation dans les écoles coraniques et franco-arabes de la Mairie, assistant aux cours d'alphabétisation à l'intérieur d'une *daara* et aux visites de proximité des volontaires. Entre Décembre 2011 et Janvier 2012, suite à ces observations et les rencontres avec les volontaires, les enseignants, les familles du quartier, la volonté d'élargir le projet s'est renforcée et s'est tournée vers les enfants de la rue, augmentant les actions de sensibilisation et de modernisation des écoles franco-arabe de la zone et ouvrant un centre diurne d'écoute et d'accueil. Les rencontres ont commencé avec les représentants des associations du territoire et des institutions locales

(le maire de Pikine, le responsable de l'aire sociale du DAAS di Pikine) et les visites à certains projets de succès présents sur le territoire, qui nous ont conduits à vivre et observer le cœur de cette réalisation.

Dans le mois de Novembre 2012, grâce à la bourse Uni.Coo de l'Université de Turin, nous avons participé à l'ouverture du Centre d'écoute et d'accueil Renken pour les enfants de la rue à Malika au sein du CRE UNESCO de la Rue de la Plage. Cette période a permis d'observer les actions de sensibilisation à l'intérieur de la daara di Malika pour impliquer les enfants dans les activités et obtenir le consentement de leur responsables; mettre en place la période de programmation et d'essai du centre d'écoute et permettre l'identification entre les volontaires des référents pour les actions d'alphabétisation et de formation, des responsables de l'animation, des activités sportives, de la gestion de l'hygiène, des médiateurs pour les rapports avec les marabout (maîtres coraniques). Au mois d'Aout 2013 et pendant la longue période de monitoring à distance nous avons pu suivre le développement des activités dans la petite et moyenne période, enregistrer les moments critiques et les tentatives de résolution des conflits internes de l'équipe et les stratégies de *problem solving* mises en place par le groupe pour faire face aux urgences, émergences et difficultés. La contribution suivante a été donc élaborée grâce à l'observation des échanges entre les acteurs coopérant sur le thème de la mendicité des enfants à Malika pendant les rencontres de réalisation, de programmation et de coordination et pendant les activités.

De Décembre 2011 à Aout 2013 notre participation aux activités associatives concernant le thème des talibés a été accompagnée par la rédaction de notes ethnographiques sur le vécu et sur les interprétations fournies par les personnes avec des comptes rendus linguistiques formels et informels.

Un autre apport a été fourni suite à la relecture des échanges épistolaires (e-mail), des verbaux des réunions et des fascicules des projets concernant les objectifs fixés pour chaque phase, les listes des actions et des matériaux nécessaires, les conventions de partenariat et les contrats individuels de volontariat et de collaboration.

## RESULTATS

En ce qui concerne les résultats de notre parcours d'analyse entre Italie et Sénégal nous soulignons le rôle joué sur le plan individuel et sur le plan collectif par deux groupes de compétences qui se sont révélés indispensables:

- les *compétences de médiation* qui mettent les bases pour la coopération, pour la création de partenariats et pour la condision de projets et pratiques;
- les *capacités organisatrices* fondamentales pour la réalisation, le développement et la coordination des projets et des campagnes de sensibilisation.

Parmi les compétences de médiation il y a la disposition au dialogue et à la recherche d'une synthèse, l'empathie, les compétences de gestion des conflits. Chaque acteur impliqué dans le projet a dû montrer de bonnes capacités d'observation et d'écoute, a dû mettre en place son intentionnalité, sa détermination et au même temps il a dû se montrer flexible et ouvert au changement.

D'un point de vue de l'organisation, les opérateurs italiens et sénégalais ont exploité dans la meilleure façon leur esprits prépositif et créatif (toujours accompagné par un fort sens de la réalité), ont développé une capacité d'analyses des situations, des objectifs, des modalités de partage des pratiques opératives et de l'identification des ressources ciblées à la définition d'un plan pour la résolution des problèmes. Tous ensemble ont montré une grande force de volonté et au même temps la disponibilité au changement, à l'échange, au marchandage, en s'enrichissant à travers les lectures divergentes de la situation effectuées par les différents sujets avec un esprit critique et une ouverture mentale.

Les compétences relationnelles (écoute, dialogue, compréhension, empathie, médiation, ouverture à l'échange, résilience) ont été rapprochées de celles pour l'organisation (conception du projet, analyse, définition des objectifs, des espaces et des temps, créativité). La fantaisie, la réalisation, les intuitions, les différentes cultures et les connaissances complémentaires ont permis à l'équipe mixte d'être innovatrice et ouverte, prête au changement, mais aussi efficace dans la réponse à la communauté à laquelle les services sont tournés. Le fonctionnement de l'association est contraint par le développement des compétences qui permettent la collaboration, le partage et l'organisation démocratique et coordonné: des liens solides et de participation entre les membres du groupe permettent un échange de connaissances, d'expériences, de perceptions et de représentations se sont créés. Le groupe est vu comme une source d'alternatives: il permet aux différents regards d'évaluer avec plus de clarté les situations avec une observation plus profonde qui va bien avec une conception éducative. La valeur est le résultat de la somme des compétences qui peuvent contribuer à la création et à la poursuite de projets ou à la résolution des problèmes, de l'hétérogénéité des expériences et de la possibilité de confrontation entre elles ainsi que de la mise en place en réseau de la connaissance.

Les compétences indiquées précédemment (et dans la table 1) sont retenues, dans la dernière analyse, indispensables à une conception du projet sociale et éducative de type coopératif. Elles ont permis le dépassement des situations critiques et de la gestion d'urgences et d'émergences sur le terrain pendant le processus opératif. Elles ont permis de maintenir ouvert l'échange entre les acteurs en jeu et de maintenir vive la transformation réciproque en mettant en discussion et donc en rénovant continuellement la pratique de la coopération internationale.

**Tab. 1** - Les compétences en synthèse.

Compétences communes à tous les operateurs	Communication	Connaissance d'une langue pont, gestion des canaux de communication à disposition, capacité d'implication.
Compétences des coordinateurs du projet	Mise en place du projet	Capacité d'agir dans un horizon de sens en partant de la dimension axiologique pour arriver aux objectifs concrets et aux stratégies opératives.
	Analyse des ressources	Configurer tous les éléments présents sur le champ, identifier les compétences des personnes impliquées, rechercher les points de force et les manques du territoire.
	Gestion des espaces et du temps	Conscience du changement, du devenir et de la durée des phénomènes que le projet déclenche, la gestion des espaces en relation à la perception locale des distances qui séparent et rapprochent les personnes.
	Depassement des frontieres	Capacité de dépasser les frontières réelles et vivre dans les frontières de la réciprocité à travers la reconnaissance de l'autre dans sa totalité et dans ses fragilités, capacité et richesses.
Compétences des volontaires italiens et sénégalais de l'Association et des collaborateurs locaux	Empatie	Capacité d'accueillir et accepter l'autre, comprendre a réalité, et y s'identifier.
	Dialogue	Disponibilité à se mettre en discussion, à s'ouvrir à de nouvelles propositions, à se confronter. Capacité à mediatiser les conflits.
	Creativité	Possibilité d'agir avec fluidité, flexibilité, originalité et élaboration dans un nouvel contexte en combinant les éléments présents dans le terrain et maintenant un haut niveau d'internationalité.
	Resilience	Capacité de résister aux frustrations et de faire face aux différentes situations contraires mettant en jeu les ressources nécessaires.
Compétences des observateurs privilégiés impliqués (représentant des associations, réseau et institutions locales)	Ecoute et participation	Ecoute attentif et actif, disponibilité à comprendre de nouveaux horizons de sens et possibilité de contribuer au développement des projets.
	Mediation	Capacité de médiatiser les conflits et d'introduire des idées et des objectifs de développement dans la population.
	Gestion des ressources locales	Connaissance du territoire et des compétences des personnes, de l'espace disponible. Capacité à mobiliser des ressources, de créer des liens et des partenariats.

## CONCLUSIONS, LIMITES ET POINTS DE FORCE

La participation aux activités de l'Association Renken nous a permis d'observer deux ans de mise en place du projet eu monitoring et de participer à certaines périodes de pratique sur le terrain dans le cadre du Projet Talibé. Cela nous a conduit à certaines conclusions concernant les compétences qui accompagnent le processus opératif, le développement des partenariats et le travail du réseau. Nous avons enregistré l'importance des compétences de médiation et d'organisation dans le milieu associatif et la centralité d'un style dialogique qui permet d'accompagner la mise en place et la réalisation d'actions internationales. L'importance de la co-intentionnalité a été remarquée lors de nos relecture, dans une dimension d'échange, de négociation, d'ouverture de l'entière équipe, prête à accueillir les compétences et les ressources des autres, à accepter la partialité des ses propres idées et des ses propres paroles. Beaucoup de moments de crises pendant notre période d'observation ont été dépassés avec une approche non invasive et non caritative, à travers des stratégies de *empowerment*, en développant toutes les attitudes capables de mobiliser les ressources de la communauté, d'augmenter les connexions entre les organisations et les agences présentes sur le territoire et de faciliter le développement d'une collectivité compétente.

Cette contribution ne termine pas avec un parcours de recherche complet, mais elle reflète la synthèse d'une phase préliminaire d'observation et d'étude du cas, qui sera suivie par une collecte de données plus amples à travers *focus group* et entretiens semi structurés. Les limites évidentes relevées dans l'échantillon et dans la méthodologie de recherche peuvent donc être reportés à la nature des actions décrites précédemment comme premières étapes d'un plus grand projet.

Quand même, nous estimons cette première contribution comme précieuse. Tout d'abord parce que elle offre un regard attentif sur les dynamiques d'exploitation et de violation des droits développés à l'intérieur des écoles coraniques sénégalaises dans les dernières décennies. Ensuite car la recherche a permis une première analyse des compétences qui ont accompagné la dimension relationnelle de cette initiative, permettant d'ajouter une voix au débat actuel sur la pratique et sur les acteurs qui renforcent la culture et l'efficacité de la coopération.

## NOMENCLATURE

Daara	Structure traditionnelle éducative musulmane présent en Sénégal avant la colonisation française et représentant le premier système scolaire diffusé du pays. Destinée à former de bons musulmans, l'école coranique trouve sa propre légitimité dans la foi de la personne et se base exclusivement sur la mémoire, la ritualisation, la scansion du rythme des prières.
Marabout	Maitre et guide de l'école coranique, pratique de l'enseignement grâce à la collaboration des disciples du niveau supérieur. Elle ne perçoit pas le salaire car sa mission est vue comme partie intégrante des obligations religieuses et sociales ; pour cela afin de garantir sa propre survie et de ses élèves a droit, selon la tradition, de les occuper dans le travail dans les champs, dans les travaux domestiques ou les envoyer à la mendicité.
Talibé	Etudiants du Coran affiliés à une école coranique et confiés sous la tutelle d'un enseignant.

### ABSTRACT

Local Authorities have assumed an innovative role in international relations and in particular in development cooperation. The literature available identifies among the main features of decentralised cooperation the leading role of LAs, the involvement of different types of actors in both territories and the establishment of relationships between actors of distant communities/territories based on mutual exchange/learning and ultimately on reciprocity. The study focuses on the decentralised cooperation policy implemented since the late nineties by Trentino in three municipalities in the Balkans and in a rural district in Mozambique, which is currently still on-going. Aim of the research is to assess whether the ambitious assumptions of decentralised cooperation policies have been put into practice and to what extent. The paper draws attention on how local authorities and non-state-actors interact in defining decentralised cooperation policies, setting priorities and implementing programmes. In particular the paper analyses the evolution of the ambitious objectives set within the four case studies, the extent to which priorities were set in a spontaneous way, often not explicit, and how they changed over time, influenced by the ideals motivating each organisation involved. The research shows also that while most of the criteria commonly adopted for defining decentralised cooperation were put into practice, the concept of mutual exchange remained less operational within programmes and projects. The research identifies exceptions in those cases when the actors developed professional interest in establishing a partnership with local counterparts.

### INTRODUCTION

Since the early nineties decentralized cooperation (DC) has become increasingly relevant at international level as an approach to development which can encourage and support democratic and decentralised governance, can propose an idea and practice of international cooperation less focused on the paradigm of aid and more inclined to promoting relations and the mutual interests of the local communities that, though living in far-apart places, are facing the same challenges of globalization and post-modernity.

DC lacks to date a definition unanimously accepted. Based on the literature available the goal of DC is the promotion of sustainable local development through strengthening the capacities of local actors and its main characteristics are: 1. the leading role played by LAs; 2. the involvement of different types of actors in both territories (LAs, NGOs, schools, associations, universities, business, ...); 3. the direct responsibility of "recipient communities" in setting priorities and implementing the actions; 4. the presence of mutual exchange/learning and ultimately to reciprocity (mutual benefits) [1][2][3].

The reasons leading to the spread of decentralised cooperation can be found within and outside the development cooperation sector. The process of decentralisation that has taken place in the last 30 years in many developing countries has increased the devolution of political and economic power to local governments. Moreover, since the late eighties local authorities began to play an increasing role in international relations and in particular in international development. The European Union has assumed a leading role in this process and the main milestones of the process were the IV Lomé convention in 1989, the European Charter of Local Self-Government in 1985 (first and unique international legal instrument ensuring the principle of decentralization), the European Urban Charter in 1992 and the Council Regulation on decentralised cooperation in 1998. Since 2007, when the EC development cooperation programme *Non-State Actors – Local Authorities* was launched, the EC has written two communications promoting the role of local authorities in development cooperation: *Local Authorities actors for development* in 2008 and *Empowering Local Authorities in partner countries for enhanced governance and more effective development outcomes* in May 2013. In 2008 it also contributed to the establishment of *Platforma*, a network of European local authorities aiming at increasing the political recognition of their activities in development cooperation and promoting decentralised cooperation programmes.

This research contributes to the literature on decentralised cooperation policies and practices. It aims at analysing if, how and to what extent DC initiatives promoted by Trentino in the Balkans and in Mozambique were able to comply

with the characteristics commonly associated to DC in terms of mutual exchange and transformation.

This work gives a contribution to a research area with low and scarce studies despite the large number of operations implemented by local authorities and the policies developed by international agencies and donors. On the one side, there is limited scientific research on the increasing role of cities in a globalised world, and in particular on key issues such as city diplomacy and city role in global governance [4][5]. On the other side, the research available is on the issue of cities twinning (City 2 City cooperation, C2C) focusing on city units with high density urban issues [6][7][8]. Limited studies are available on “non city” territorial units like Trentino, a mountain region with low population density, scattered settlements, need for coordination of different levels of local authorities and high value of natural capital.

**CONTEXT**

Trentino is an Italian autonomous province with one of the highest per-capita income and public expenditure at national level. As a result of its special autonomy status, the local government is responsible for all public sectors except defence, justice and (most of) foreign policy. Over the last 15 years, which is the life span of the DC programmes hereby analysed, Trentino experienced high political stability and continuity (moderate left coalition). Trentino is highly committed to international development due to its historical background and in particular a high rate of migration from Trentino in the late nineteenth and first half of twentieth century, the strong presence of the Catholic Church and high number of missionaries who kept strong ties with their communities of origin in Trentino and lastly the widespread presence of social enterprises (cooperatives) which are commonly seen as the socio-economic mechanism which has promoted the exit from poverty in Trentino in the last 50-60 years. Cooperatives in Trentino are very active in different fields particularly agriculture, credit, commercial distribution and social services. Their presence in almost all economic sectors makes Trentino a “cooperative district” like few others in the world.

On a national level, the Province of Trento paved the way for DC adopting in 1988 its own legislation on the matter. Thus, international cooperation has represented one of the areas in which Trentino tested its autonomy. Since the early nineties it has invested a significant and growing share of economic resources in international cooperation (see Fig. 1). According to the law of 2005, the Province is committed to allocating at least 0.25% of its budget to the field of international cooperation. Trentino has invested in international development an increasing amount of funds reaching a yearly contribution of about 11 million Euro over the last 5 years. Growth was observed also in the number of associations supported financially by the Province in the last twenty years and in the workforce of the provincial office in charge of international cooperation.

CASE STUDY

The research studies four experiences of DC promoted by Trentino together with the municipalities of Prijedor (Bosnia Herzegovina), Peja/Pec (Kosovo), Kraljevo (Serbia) and the district of Caia (Mozambique). In Trentino these programmes take the name of *cooperation between communities*, in order to stress the relationship dimension of the cooperation and in particular the involvement of different actors in each community/territory involved (see Fig. 2).

Fig. 2 - The five territories where Trentino Con has taken place.

These four programmes have involved five territories: besides the four “elsewhere” territories they have worked to facilitate a process of exchange between the four “elsewhere” and the “here”, i.e. Trentino. Long-term multi-sectoral programmes with a strong focus on building the capacity of local partners have been developed in the four “elsewhere” territories while in Trentino local authorities and civil society organisations have been involved in local partnerships and networks. The research brings together the four experiences and analyses each of them separately and jointly, as the outcome of a single DC local policy characterised by a high level of creativity and experimentation and that constitute a learning environment of approximately 50 cumulative years (see Tab. 1). In fact, if we add the duration of each process the following numbers are reached. In order to describe the complexity and layers of these experiences, in the research the following lexicon is adopted: the Trentino DC policy, composed of four programmes (Trentino with Prijedor, Trentino with Kosovo, Trentino with Mozambique and Trentino with Kraljevo) is addressed as “Trentino with”.

Tab. 1 - Timeframe of each programme of “Trentino with”.

Programme	Timeframe covering birth and development	Length (years)
Trentino with Prijedor	1996 – 2012	17
Trentino with Kosovo	1999 – 2011	13
Trentino with Mozambique	2000 – 2012	13
Trentino with Kraljevo	2001 – 2011	11
<b>Total</b>		<b>54</b>

The programmes have been implemented on behalf of the Province by four civil society organisations based in Trentino; they have developed specific identities and features while at the same time sharing some common principles being rooted in the same territory.

The research focused on something highly intangible and not something tangible like assessing projects and evaluating results. It has been an opportunity to evaluate a decentralised cooperation policy and particularly to

document the historical evolution of these programmes going from personal fragment stories and interpretations to a common platform of knowledge. This research represents an opportunity to have an open door research laboratory on decentralized cooperation; a way to undertake evaluative research based on case studies and real situations, so as to get, as added-value, an assessment focused not so much on the results but on the process and dynamics of communication that it manages to activate [9][10][11][12].

## METHODOLOGY

The research took place in 2011 and 2012 and was structured around two stages. Given the lack of a systematic collection and organization of information, the first one was focused on the reconstruction of the historical evolution of the four experiences highlighting the main stages and milestones. This first stage was regarded as fundamental in order to understand the current situation. The second stage focused on a more in-depth analysis and evaluation of the experiences. Therefore, the first stage consisted in the collection and reading of documentation, in meetings and interviews with the major actors and in field visits. 34 focus group were organized as well as 70 semi-structured interviews in Trentino and 131 during field visits in Mozambique and in the Balkans. The second stage focused on major questions that were not set a priori by the research team but identified in the course of the study and in dialogue with the stakeholders according to the criterion of self-relevance, that is to say the most frequent and prominent topics emerging from active exchanges between the stakeholders. The topics over which the research was developed are: 1. the organisational arrangements, 2. The evolution and coherence of the system of objectives, 3. the partnerships and relationships between distant territories, 4. the roles played by Trentino provincial authority.

The methodological approach chosen for the research focused on facilitating learning for the stakeholders involved rather than assessing the results of the projects. In line with this research approach a participatory approach was adopted, conscious of the fact that learning happens during an evaluation process and not only from an evaluation report [13]. A challenge faced in the implementation of the research was therefore to keep a balance between structuring the process (defining the research scope, the evaluation questions, the methodology and tools) while at the same time maintaining the flexibility required by an approach focused on participation and learning: definition of a MoU, ToR, overall methodological note, data collection tools vs. on-going redefinition and fine tuning of the methodology and tools during the evaluation process [14][15].

## OBJECTIVES AND PRIORITIES

“Trentino with” is characterised by a complex system of ambitious objectives: 1. promoting collaboration between international development actors in Trentino so they could influence and create synergies between each other, enhance the impact of the projects of single associations and focus their effort in limited geographical areas; 2. facilitate the involvement of Trentino territory and especially of civil society in international development activities; 3. create relationships between Trentino and the partner territories; 4. implementation of multi sector and long term programmes in Bosnia, Kosovo, Mozambique and Serbia; 5. contribute to building a culture of solidarity and openness (attention) to the values of the “other” in Trentino.

The research shows high degree of the correspondence between these objectives of “Trentino with” and the objectives of the provincial government regarding international cooperation. The analysis suggests that a relationship of trust and an intense dialogue between the local authority and the civil society was established and led to the definition of the priorities of “Trentino with” through a process of cross-fertilisation. These experiences, subsequently adopted by the provincial law on international cooperation, were developing in synchronism (often implicit) with the provincial debate on local development<sup>1</sup> and with that on decentralised cooperation [16].

In the evolution of the objectives of “Trentino with” we can identify some common phases that despite differences of denomination can lead us to codify a process. First there is an explorative phase that, depending on the experiences, is called “pretext projects” (Kosovo) or “tip toe entrance” (Mozambique). This phase is about starting projects that are coherent with the knowledge of the territory and implementing activities that reflect the logics of the territories rather than those of the organisation. This initial explorative phase is then followed by the proliferation of objectives: a better knowledge of the territory and the development of a network allows for the opportunity to work in different sectors in an experimental way. There is a testing of the adequacy of the interventions and the stability and capacity of local organisations. Subsequently there is a focusing and consolidation of actions on some priority areas.

Implementing complex and long term programmes requires the ability of putting together strategic visions, ever-moving future scenarios, updated analysis of variable contexts. The four experiences analysed did not define nor adopt

<sup>1</sup> It is worth pointing out that between the nineties and the first years of 2000 Trentino saw the development of a series of local development policies that facilitated the debate within civil society on concepts like territory and the role of communities in local development. These are the years when the Province, in an innovative way both in Italy and in Europe, elaborated a first set of indicators for sustainable development and an official policy on sustainable development (2000). Also in these years the Territorial Pacts and the revision of the Provincial Urban Plan (2003) were started. These policies shared with “Trentino with” the same discourse, key words and approaches even though such potential exchanges and synergies were not formalised.

any master plan or strategic plan defining long term goals (ten years), proposed different scenarios, identified priorities and compared alternatives. There was not a technical contribution, an incentive on the importance of adopting such instruments. The provincial government gave a lot of flexibility which did not help to focus on the importance of developing long term planning. The four experiences worked on two different levels: one, of the principles, and the other of short and middle term activities. A bridge was not built between these two different levels and therefore different parts of the organisations, in different moments, filled or abandoned the conceptual space for strategic planning. It is important to point out that since 2012 “Trentino with” has activated strategic planning processes (three year programmes).

The awareness of working in contexts where the conditions are not predictable, even in the short term, requires particular sensitivity when defining strategic plans with a medium and long term perspective. It is necessary to be flexible when identifying actions in order to make them feasible and to adapt them to a changing context, if necessary. The context of intervention therefore deeply influences the type of planning developed by the four experiences. A more structured planning can fit into an existing system, like in the case of Trentino with Mozambique where, in spite of the limits of the decentralisation process, there were clear connections at different geographical levels with political priorities as well as with existing LAs. The programme in Mozambique can work to consolidate two administrative levels: district and province, contributing also to their strengthening, to dialogue between existing institutions, to the decentralisation process and to the involvement of civil society. In the case of the Balkans the institutional context did not facilitate this consolidation and led the three experiences to keep a high level of flexibility in their approaches. Priority is given to the support of civil society in the post-conflict transition, the building of local authorities (Prijedor and Peja/Pec) and the need to develop a dialogue between local administration and civil society (Kraljevo).

The ambitious goals set by “Trentino with” were not in contradiction to each other but were not automatically synergistic. Creating a network of Trentino’s actors, establishing long lasting relationships with an “elsewhere” territory and implementing complex multi-sector programmes are three objectives that cannot be pursued at the same time and effectively with a single instrument and with a single organisational choice. The research highlights that the objectives that had higher priority were those linked to the programmes implemented in the “elsewhere” territory rather than in Trentino. Contrary to the analysis of the organisational arrangements that shows how more attention was focused on organising the participation in Trentino, the analysis of the objectives shows an attention and interest shift towards the “elsewhere” territories. This peculiarity of the objectives can be observed in all the experiences and shows little coherence with the principles of decentralised cooperation (between communities) which requires a significant role in the mobilisation of the Trentino territory.

### **Participation in “Trentino with”**

In terms of organizational arrangements the research highlighted a shift in all experiences from an initial confederal model (*Tavolo* or *Roundtable*) towards consortium-like organisational solutions. These solutions, in an attempt to adapt participation, coordination and effectiveness, have in reality increasingly tended to strengthen the ability to act with respect to the dynamics of participation. It should be recognised that rather than a limitation of space for participation, a progressive weakening and spontaneous exhaustion of said participation is observed with the passage of time. According to a link not necessarily of causal relationship, this corresponds to the evolution towards a more structured organizational arrangement that we defined as consortium model. The organisational model of a consortium was particularly suited to the management of complex, long-term multi-sector programmes. However, it has shown limitations in its ability to promote the effective sharing of a programme developed in a collegial and synergistic manner by a variety of Trentino actors. Consortium arrangements mostly have a limited membership base. The participation and the involvement of a larger number of actors then is facilitated by the creation of local networks and working groups that hover around the associations even if they are not directly part of them.

The reasons that have led to a progressive weakening of the confederal organizational arrangement are due to the following: 1. the ceasing of the emergency (in the case of Kosovo); 2. the increase in complexity of the action; 3. the perception of a removal and reduction of the active role of the Province of Trento, particularly in cases where it had played a key role in launching the operations (Mozambique and Kosovo); 4. the evolution and weakening of the Roundtables’ functions corresponding to the process of moving to the “consortium” model with the creation of second level associations; 5. specialisation and selectivity of projects: some members of the Roundtables find it difficult to identify a “useful” place within the programme.

In all cases there is a network of actors that revolves around the “consortium” (second level) association which serves to coordinate the network. In the Balkan experiences the second level associations initiate and manage Trentino based local networks with a planning and operational connotation that facilitate the mobilisation of local skills and expertise relevant to the projects. In the case of Mozambique the network is structured primarily through thematic working groups related to the areas of intervention. In both cases, the reasons that lead entities of the Trentino region to participate in groups and / or a network are diverse; they are generally linked to an interest of a professional nature, the willingness to know the “other” and engage in an exchange with similar counterparts. Compared to the network, participation in working groups theoretically requires a greater commitment: the participant from Trentino is, in fact, placed in a group that tends to need a greater investment in terms of both time and capacity to mediate and negotiate with the other members of the group.

The motivations that underpinned the participation of Trentino based public and civil society actors changed over time. In the beginning the reasons why actors from Trentino came into contact with counterparts from the “other” territories were generally connected to the desire to share values, test approaches to international cooperation, respond to humanitarian crisis situations or know and engage in an “other” context. With time, the impetus that led to the consolidation of these relations took a more definite and at the same time more solid shape: professional reasons with the ambition to trigger stronger and lasting relationships come into play and become prevalent. The participation of entities from Trentino was most effective in cases where there is a professional interest and / or a clear benefit to participate in the programme and establish a relationship with people in the countries in which such a programme operates. Some examples are the University of Trento, social cooperatives, museums, rural banks. In cases when the interest went hand in hand with the identification of concrete opportunities for collaboration on specific activities or projects, an element of reciprocity tended to be present since the interaction was of benefit to both the organisations from Trentino and to those in the partner countries and this offered more guarantees in terms of sustainability and persistence over time of newly established relationships. Where the interest and usefulness to the organisations from Trentino were weaker, it was more difficult to maintain high participation and sustain the relationship between counterparts over time. In the four experiences, however, the participation of actors from Trentino in the programmes and especially the maintenance of relationships with counterparts in partner countries are still dependent on the presence of the Trentino based second level associations and the role they play in terms of facilitating interaction with particular aspects of the programmes and therefore with counterparts “elsewhere”.

In summary, with regard to participation, from the study the following characteristics of “Trentino with” emerged: 1. participation is more effective and lasting when it comes from active involvement in specific projects. If the participation starts instead from a stimulus of an institutional nature which does not lead to concrete applications it is likely to be of short time duration; 2. with time a transition occurs from participation in the entire programme to involvement of a professional nature by stakeholders interested in providing a technical contribution to individual projects relevant to their areas of expertise (through the network and working groups).

### **Priorities of “Trentino with”**

The research identified three key factors contributing to the priority assigned to each objective of “Trentino with”. The initial motivations at the starting of each programme influenced its design first and subsequently the priorities that were given in term of objectives to pursue. While all four experiences tried to pursue all the five objectives highlighted, the genesis determined that the programme in Mozambique started in the context of the decentralised cooperation component of UNOPS Programme and gave priority to the activities conducted in Caia. The multi sector programme achieved significant results in terms of innovative and effective projects such as the urban and district land use planning, opening of a rural bank and the establishment of a farm and an agro zootechnical school included in the formal education system providing professional education to young people and training to local farmers. The programme in Kosovo started in order to ensure coordination of the Trentino NGOs interested in working in Kosovo at the end of the war and it maintained a strong focus on coordination. The main cross fertilisation among member NGOs was conducted in the field of conflict resolution, which became a cross cutting issue present in all projects of Trentino with Kosovo. The programmes in Bosnia and Serbia, though started in very different contexts, were initiated by the Trentino peace movement and maintained over the years a political approach achieving significant results in terms of strengthening civil society in Prijedor and Kraljevo, facilitating the involvement of Trentino civil society and public authorities and creating relationships between them and counterparts in Bosnia and Serbia (example: twining between Trento and Prijedor municipalities, twining between Trentino and Kraljevo nursing homes).

The second factor contributing to the priority assigned to each objective was the decision to focus on a limited geographical area, which had a significant influence in terms of the achievement of results. Basically all programmes since the beginning chose to work in a district or a municipality. Choosing to work in a limited geographical area for a sustained number of years allowed for the strengthening of the relationships between territories (both formal and informal) and for greater effects and impact in partner territories and in Trentino. In recent years while maintaining the primary focus on Caia, Kraljevo, Peja Pec and Prijedor, the civil society organisations implementing the programmes have started to widen the geographical focus initiating activities in neighbouring districts and in other areas.

The third factor has been the decision to work in post conflict and fragile contexts which presented both opportunities and challenges. Trentino DC worked in the complex transition from post conflict reconstruction to local development, playing a role in terms of processes of institution building at different levels. This allowed for the development of expertise in working in such fragile contexts. In Mozambique in the context of a discontinuous but nonetheless present process of decentralisation, Trentino gave priority since the start of the programme to the interaction with the local government and played a significant role in terms of accompaniment of the local authorities and of strengthening the capacity of the administration and its different departments. In Kosovo and Bosnia, on the other hand, at the start of the programmes local authorities were either not present (in Kosovo there was a UN interim administration) or complicit in war crimes (Bosnia) and therefore Trentino gave priority first to supporting the birth and strengthening of local civil society and only when the conditions for the interaction with new local authorities were mature did it begin to interact with them and support them in their role of governing authorities of a territory. At the same time working in such fragile and unstructured contexts presented challenges in terms of pursuing and achieving

some objectives, in particular those related to the creation of relationships and partnerships between homologous actors based on reciprocity. Working in contexts where both local authorities and civil society were very weak did not facilitate the identification of common grounds on which to create and sustain partnerships between Trentino based actors and counterparts in the partnership territories. Many of the relationships established were essentially about the Trentino based actors sharing their expertise and providing technical support to the counterparts in the partner territories; the flow in the other direction though present in some cases was in general less evident.

The study of the objectives of “Trentino with” shows several examples of achieved goals even when they were not always specifically predetermined. This led to the accomplishment of important results although the process or the result had not been previously planned, highlighted and communicated. It is a set of experiences based on several implicit elements that could operate on the one hand because of the flexibility at different levels and in different contexts and on the other hand because of the creation of open meeting places and learning environments that allowed for the experimentation of innovative practices [17]. The organisational structure of the experience in Mozambique presents constant characteristics from its start until today, while the experiences in the Balkans, with different intensity between each other, presented more significant changes in their structure and in their organisation. The most evident case is the Kosovo one. The organisations that represent themselves as actors in constant change, capable of adapting to external variation and at the same time to promote learning, can be described as learning organisations. This concept of “organisation able to learn” is associated with organisations that constantly change and promote learning for their members [18]. The Balkan experiences are attributable to this type of organisations, characterised by a strong predisposition to change. However the study highlighted limited reflection on the change processes and consequently a limited ability to capitalise/build on matured experiences. Two possible explanations of this approach have been pointed out: on the one hand the difficulty of the operational roles to abstract from urgent and contingent matters, and on the other hand a very marginal role or a discontinuous presence of those who should have a strategic role (Roundtables, Boards, Presidents). The experimentation happens therefore mainly outside of a “context of sedimentation of experimentation” which would allow the systematization of what was planned, elaborated and realised.

## OPEN ISSUES

The system of cooperation between communities has generated the belief that there must be an almost “symmetrical” correspondence: here → there vs. there → here. The research shows that the focus is mainly on the dynamics here → there. The four programmes, in fact, give priority to the development of organisational forms and tools in Trentino and establish a system of objectives focused on operations in partner countries. The concept of there → here was addressed much less over time, presuming or taking for granted the possibility of having “something” flowing towards Trentino, which would have maintained an active participation and substantiated the principle of reciprocity placed at the centre of the system of “co-operation between communities”. It is about a “something”, still not well defined, which requires further analysis, starting from practice, of the theoretical dimension of reciprocity in cooperation between communities.

The research analysed the roles the Province of Trento played over time in “Trentino with” in respect to six key areas that characterise the relationship between the Province and the DC programmes: participation, political-institutional support, funding, definition of procedural and management aspects, technical assistance and provision of expertise, provincial coordination. From the research emerges the opportunity to re-open the reflection and the debate on which could be the most appropriate roles for the PAT in “Trentino with” and more in general in the context of decentralised cooperation.

The research identifies constraints within the provincial administration which limited its possibility to provide technical assistance. On the one hand, as it is the case among Italian local authorities, the Province does not have in the international solidarity office staff with specific thematic-sector skills and did not develop sector policies and strategies in international cooperation. On the other hand, the availability of personnel of other offices and services is limited because of restrictions linked to employees’ contracts. These restrictions significantly limit the participation of local administration personnel in decentralized cooperation initiatives like “Trentino with”. The analysis did not go into the details of these restrictions and observed that if Trentino wants to overcome these obstacles and make available to international cooperation the expertise that it has developed, also thanks to its autonomous situation, it should try to adopt organisational schemes that are compatible with the national legislation and that are able to facilitate interaction between public and private (local authorities and associations).

The financial commitment from the Province to “Trentino with” has been significant, continuous in time (over 12.7 million from 1998 to 2012) and it has given the possibility to implement complex programmes that have achieved significant results and that distinguish Trentino DC on national and international levels. These programmes are not self-reliant economically and therefore require support by the LAs. The current economic situation implies a decreasing amount of funds allocated to the sector, therefore representing a challenge for the sustainability of the programmes analysed. A dialogue has begun between the Province and the civil society organisations implementing the programmes to define the next phase of cooperation. It is important that this next phase is defined in such a way so as to ensure that a gradual reduction in the financial support of the Province facilitates the consolidation of the results achieved and the sustainability of the services.

## WHICH FUTURE FOR A POLICY OF ITALIAN TERRITORIAL COOPERATION INTEGRATED WITH THE WESTERN BALKAN COUNTRIES?<sup>1</sup>

Andrea Stocchiero\*

\*CeSPI-Centro Studi di Politica Internazionale, Rome, Italy - [andrea.stocchiero@cespi.it](mailto:andrea.stocchiero@cespi.it)

### INTRODUCTION

Italian foreign policy towards the Western Balkan countries strongly supports their process of integration within the European Union (EU). There are numerous initiatives aimed at this, in the fields of political, territorial, development and economic cooperation.

In the field of the political cooperation reference has to be made to the Adriatic Ionian Initiative (AII) and the Central European Initiative (CEI)<sup>2</sup>. Regarding the territorial cooperation, it is about the achievement of the third objective of the EU social cohesion policy connected to the enlargement policy through programs of cross border cooperation at transnational and bilateral levels (IPA and CBC programs<sup>3</sup>). The Italian cooperation for development is the traditional form of contribution to socio-economic integration of the Western Balkan countries<sup>4</sup>, after the phases of humanitarian aid and of peace building, it has supported investments in infrastructure, in small and medium businesses and in social inclusion, with particular regards to the resettlement of refugees. The economic cooperation regards the various forms of support to trade and to the Italian investment in the area.

These various modes of cooperation, complementary between themselves, have been coordinated in an integrated approach with the Italian law 84/01 "Disposition for Italian participation in the stabilization, reconstruction and development of the Balkan area countries". A law however that only worked for a few years after which it was no longer financed. This is in order to signal right from the beginning that just like the various initiatives, the various cooperations, lack, still today, in 2013, of a common programming at national level, in the framework of a general overview tied to the objective of European integration.

In the case of development cooperation, an important role is carried out by the local authorities and civil society organizations through the so-called decentralized cooperation. The SeeNet<sup>5</sup> program, from which this policy paper draws cue and support, was an attempt of putting on a network of many local initiatives undertaken from various local authorities (regions, province and town halls) and organizations, on some thematic lines of participation: economic, social, environmental and institutional.

The actors of the decentralized cooperation are, practically, the same ones involved in the territorial cooperation. In effect, the development cooperation in the Balkan area completely overlaps with the enlargement policy of the EU. That means that the prospect of integration is the objective and the principle engine in the relationship between Italy and the Western Balkan countries.

### THE CRISIS OF EUROPEAN INTEGRATION AND THE WESTERN BALKAN COUNTRIES

If the prospect of the EU enlargement cannot be disregarded, then the future of the territorial and development cooperation, and in general of the Italian policy must be considered within the context of the actual financial, economic, social and political crisis that Europe is experiencing. The crisis represents a period of caesura of great weight in order to understand which scenarios will open for the future: from the most catastrophic of an arrest and recess of integration, to one of a slowing down and relative weakening of the adhesion, to one of re-launch of the prospects in a more or less differentiated way.

The crisis is deepening and widening the so-called "fatigues" of the enlargement<sup>6</sup>. The first fatigue obviously refers

<sup>1</sup> The paper has been produced in the framework of the Seenet programme: a trans-local network for the cooperation between Italy and South East Europe. Horizontal Action C – Research; and of the Euborderregions project supported by the 7<sup>th</sup> Framework Programme of the European Commission (<http://www.euborderregions.eu/>).

For a description of the problems of enlargement please see the research reports realized by CeSPI for the program SeeNet: An overview on governance for local development in SeeNet territories, First research report,

to the fact that in a context of reduction of the public (and private) resources, it is difficult to increase the political commitment towards the enlargement. The negotiation of the new EU budget for the period 2014-2020 has partially reduced, with respect to how much the European Commission proposed and to the previous period, the resources dedicated to favour the admission of the candidate and pre-candidate countries.

Another fatigue highlighted is that of the absorption, that is of the difficulty of the candidate and pre-candidate countries to proceed in the reforms necessary in order to respond to the *acquis communautaire*. With the crisis there is a greater attention on the part of the European Commission to scrutinize the reform processes, while on the part of Western Balkan countries there is a greater difficulty to implement them, above all if they ask for reductions in public expenses and institutional restructuring in a crisis context.

But, the most important fatigue regards the enlargement per se, the political outlook of the EU member states that, in a crisis context, is scarred by new conflicts and divisions, that echo in less attention towards the enlargement or, worse, in the procrastination of the admission, because first of all it becomes necessary to recompose the deepening framework of the EU, in order to face the inner problems.

Also in terms of public opinion, and therefore of political consensus, the crisis puts the integration process at risk because a division has occurred between countries of North and South Europe, between the virtuous countries and the so-called PIGS<sup>7</sup> (PIIGS with the inclusion of Italy). The diversities are lived like divisions, and give place to a fresh outbreak of nationalism and xenophobia, against the fundamental rights of the EU citizens. Leading to a crisis of democracy, and to distrust in its institutions. In all this the Western Balkans countries are also involved, because on one side they could be included in PIIGS, and on the other, they themselves, fear a EU “stepmother”, that together with the European Central Bank and the International Monetary Fund (the Troika), impose austerity measures without development prospects, as highlighted in the case of their neighbour Greece and then with Cyprus.

In addition to this, strongly nationalistic positions between the populations, inter-ethnic tensions, the élite interested in maintaining the autocracy, continue to persist in the various Western Balkan countries. The European integration processes are not progressive and unilinear, but they show delays, downfalls, returns, crisis. For example the case of Macedonia that, if in 2005 was considered a success for overcoming inter-ethnic problems, today instead suffers a deeply divided society and the lack of positive political dialogue<sup>8</sup>.

The crisis marks however a deeper crisis of the integration and development model supported by the EU. A model that does not manage to respond to one of the basic objectives of the EU itself and to the promise of enlargement, that is to say the progressive convergence of all the territories and for all the citizens, to a homogenous level of well-being and access to their rights. The credibility of the convergence narrative and the success of integration of countries such as Greece, has been brought back into discussion with the crisis<sup>9</sup>.

If this model has its gaps, between the first to worry should really be the Western Balkan Countries because they are the periphery of the periphery<sup>10</sup>. With the transition to a market economy, the Balkan countries have progressively increased their dependency on Western Europe. The economic integration works in two ways: in a positive way when the European motor stimulates greater commerce and flows of capital, but in a negative way when entangled in the crisis it increases deficits and debt. In this last case the process can turn out to be reversible, leading to disintegration.

According to the European Bank for the Reconstruction and Development the countries of this area are facing difficulty and very serious risks, “currently there are no internal or external growth motors”, “it is more and more recognized that the region will have to rely on their own resources and on an important agenda of reforms, if it wants to move onto a path of sustainable growth”<sup>11</sup>.

Since 2008 moderate poverty has increased from 22 to 26% in 2012, just like the inequality, signalling how the crisis has hit the lower-middle classes harder. The situation of unemployment is serious hitting the young people above all, generally graduates, with record rates in Bosnia-Herzegovina, Serbia and Macedonia (more than 50%)<sup>12</sup>, while the unemployment total is attested on an average of 22% against that of the EU of 11%<sup>13</sup>.

There is the danger that the Western Balkans, but above all some of its countries, the weaker ones like Kosovo, Bosnia-Herzegovina but also Albania, just like some territories of Italy, follow a path of super-periphery founded on low skill productive specializations (low-skill path) (see figure 1) and therefore with poorer societies<sup>14</sup>.

In spite of that, the process of the enlargement continues with some important successes. Between these in the first

## WHICH NEW MODELS OF INTEGRATION?

If the actual model is passing a structural crisis, because it highlights “fault lines”<sup>16</sup>, which guidelines can be followed in order to resume the road of integration for the Western Balkan countries and for countries “at risk” like Italy, and above all for Southern Italy?

The criticisms against the adoption of the austerity policies, which risk even further undermining the prospects of integration and social inclusion, are numerous. In the same European Council summits they continue to try to find a laborious compromise between the demands to get the finance in order and the requirement to face the increasing unemployment. The Growth Compact has been placed side by side the Fiscal Compact. But the signals of an upturn continue to be weak, while the disaffection of the public opinion, inner and external, towards the EU grows.

In the analyses and proposals it seems one way out prevails. The EU crisis and particularly of the Euro zone is due to a structural imbalance between the strong Germanic model oriented towards exports that produces surplus, and the countries in trade deficit and in continuous need of the flow of resources. It is underlined how the responsibilities should be shared between debtors and creditors in a prospect of re-balance and convergence in the medium-long period. The austerity policies are short-sighted and risk killing the patient. It is necessary to instead support the structural transformations in order to correct the fundamental imbalance of productive capacity, the differences of productivity, favoring the catching up of the more underdeveloped economies, through investments and innovations on the quality of productions along a path oriented towards *high skills*. It is necessary therefore to relaunch the Strategy 2020 and specifically at a territorial level investing on the *smart specializations*<sup>17</sup>, so as to favour absolute and comparative advantages of the various territories, and a greater and better interdependence between them. This policy should be worth a lot to Italy, and above all Southern Italy, as much as to the EU adhesion candidates, in order to come out from their super periphery, and in order to resume the convergence path.

This process should moreover deal with the race to the bottom in the competition between territories in order to attract foreign investments, which cause delocalization processes and risk putting one country against the other neighbouring countries. The case of the FIAT investment to Kragujevac in Serbia is clear, derived in great part from the

<sup>15</sup> Fouéré, 2013, op. cit.

<sup>16</sup> For the Fault Lines please see the analysis of Raghuram G. Rajan, “Financial Earthquakes. How the hidden fractures still threaten the global economy”, Einaudi, 2012. According to this author, Fault Lines include trade imbalances between countries, originating from non sustainable growth patterns at the level of the international financial system. This is also the case of the European crisis between countries in structural deficit and surplus (Germany in particular), which also involves the countries of the Western Balkans.

<sup>17</sup> For an explanation on the smart specialization strategy please see the European Commission Fact Sheet (European Commission, Fact Sheet: Regional Innovation Strategies for Smart Specialization, Directorate General Regional Policy, Policy coordination), the dedicated site: (<http://s3platform.jrc.ec.europa.eu/home;jsessionid=LNzXSJYXchjW1YLZns0dXDIZwYWgq2g1TGNLGVy2nvryk13MDF0!-248139239!1377065111039>); and the related guide: European Commission, Guide to Research and Innovation Strategies for Smart Specialization (RIS 3), May 2012.

State Aid as well as from the lesser labour costs, against the closing of the Termini Imerese plant<sup>18</sup> and the stalling of Mirafiori<sup>19</sup>. The competition between countries and territories can turn out as a zero-sum game, except for those that must however truly draw some advantage in order to remain competitive at an international level, such as the multinationals. The need for a harmonization of processes and interests between territories demands a transnational strategy. The EU should truly respond to these problems.

The integration model therefore calls for more solidarity between the member states and the EU accession candidates, in order to face the structural imbalance, as much as a greater cooperation and subsidiarity, so that there is the possibility to identify the various specializations and opportunities for a diversified and more balanced interdependence. This requires a sharing of the responsibilities, in order to create work and to give a new start to democracy and the pro-European ideal. The Western Balkan countries should be involved in this process, tying closely the IPA funds to Strategy 2020, and clearly showing its effects on people's lives (*people first*)<sup>20</sup>. And this is already partially happening with the definition of the South East Europe 2020 strategy (SEE 2020)<sup>21</sup>.

All of this presupposes a common vision that rests on a social market economy oriented by competitiveness. But, does this vision allow spaces for various models of development and local welfare? Is a Europe opened to the diversities beyond the single standard model or the feared germanization possible? A Europe that recognizes the free choice of different lifestyles, different speeds, and therefore differentiated integration? These profound questions come from various critical perspectives, from the de-growth to liberalism, nationalism, or to regionalism and transnationalism.

Regarding differentiated integration, it is interesting to remember, with particular reference to the issue of the enlargement, the analysis by Jan Zielonka on the nature of an enlarged Europe, that is interpreted as a new form of emergent Medievalism. This because it is exactly the diversity between the territories and the countries, the presence of important minorities, the abundance of different forms of governance, economic structures and cultural identities, that contrasts with the creation of a EU based on the Westphalia state model, while instead it requires a great flexibility and a "high degree of superimpositions between territorial and functional borders." A model of plurilateral, multilevel and multicentered governance turns out to be more adapted to the European reality<sup>22</sup>.

On the other hand with the crisis the necessity to strengthen integration has emerged, the union of rules and institutions in order to govern finance, both private and public, taxation and spending, with more effectiveness, above all with reference to the Euro zone. Alongside this greater financial and fiscal integration, also the political one should be supported in order to bridge the democratic deficit, the existing differences between the Europe of the Markets and the Europe of the People.

That makes the constant tension in the EU between deepening and enlargement, between conformity and differentiation to once again emerge, and therefore the design of a multi-speed EU with concentric circles from a strong, increasingly German core to the virtuous Nordic peripheries to the Mediterranean ones. The Western Balkans are involved in this tension as is Italy in its various territorial conformation, from the regions mainly convergent with the European heart to the more marginal and peripheral ones of Southern Italy.

The indication, in a short and schematic way, of some of the main issues that question an eventual relaunch of the prospect of European integration for the Western Balkans, but also for the same Italian territories, is important in order politically place the analysis of the cooperation, with particular reference to the decentralized and territorial one. What are the roles that these cooperations should carry out? Within which perspective? For the promotion of the diversities and for a "people first" cooperation? Or for greater conformity directed at the recovery of international competitiveness? Or for a dynamic equilibrium between the two, or other, perspectives?

## **CAPITALIZE DECENTRALIZED AND TERRITORIAL COOPERATION AND THE QUALITATIVE LEAP IN THE POLITICAL DEBATE ON EUROPEAN INTEGRATION**

In the last 10 years the Italian cooperation has tried to support the process of European integration of the Western Balkans. In particular, development cooperation, among which the decentralized one, and territorial cooperation, have financed numerous projects to contribute in reducing the wealth gap. Beyond the single projects it has also been tried to adopt a systemic approach, in which the various actors shared a common programming, complementing social, economic and environmental initiatives. CeSPI has been able to analyze, through appraisals of strategic characters, three meaningful experiences of this type: the realization of the art.7 of law 84/01<sup>23</sup>; the support program for regional

<sup>23</sup> Andrea Stocchiero (edited by), Italy-Balkans Territorial Partnerships. Strategic appraisal of the decentralized cooperation supported by art.7 of law

cooperation in the Mediterranean and the Balkans put into effect through the Framework Program Agreements (FPA)<sup>24</sup>, and the SeeNet program. From these analysis various indications are emerged. Here we are reminded of various positive aspects but also diverse criticalities which serve to nourish a debate that takes into account the previous issues.

In all three experiences good results have been recognised in terms of networking of actors, where the regions have carried out a central role of coordination under the direction of the national ministries. The projects have been part of a progressive accumulation of relations and acquaintances with the local partners. A transnational social capital is then structured, a strengthening of long term partnerships between local administrations, civil society organizations, intermediary institutions, in short between territories. The long term partnerships between territories have given greater sustainability to the change process, which however depends fundamentally on the level of ownership of the local partner.

Moreover the importance of the partnership results from various cooperation appraisals. For example here we can reference the Paula Pickering study that, reviewing the appraisals carried out from various cooperations, emphasizes that “forging a genuine international-domestic partnership in which domestic officials helped to determine the policy agenda and took jointly reform initiatives would improve the community impact of reforms.”<sup>25</sup> And it highlights that the more genuine partnerships, where the locals indeed have a more central role and are beneficiaries of the cooperation, are those formed with nongovernmental organizations and local authorities, rather than with large international organisms and their commission agents.

Through the projects, the relations, the partnerships, it has been possible to develop local development models, where the territory and its actors are central. The theory of the change that supports the undertaken initiatives refers to the territorial approach to development, the concept of territorial cohesion, and to the processes of decentralization of the democratic power<sup>26</sup>. Above all comes the evaluation of the endogenous capital, of the partnerships and the local knowledge, in search of a balance between a broad base growth of productivity and income through chains and networks of small and medium businesses, its redistribution with new models of welfare mix, and environmental safeguard in order to guarantee the long term reproducibility. This approach (see also the theory of “place-based” change or of “local economic development” (LED)<sup>27</sup> or “area-based” in the case of the rural development<sup>28</sup>) endorses the territorial potential and the diversities between territories, it’s not closed and localistic but it is open to exchange with external actors and other territories. An exchange careful not to create dependency but a symmetrical, as much as possible, interdependence. Here we can make reference to the concept of cooperative internationalization, where the commerce and the foreign investment are not of a merely “extractive” and exploitation character, without considering fair standards of work and environmental protection, but they result compatible with the growth of a diffuse and social economy. Trying to settle the unavoidable tensions between international competition, social cohesion and solidarity between territories, and environmental sustainability.

But, at the foundation of this approach, there are assumptions to which weak and underrepresented conditions correspond. According to the critique of Will Bartlett “institutions of local governance are weak in the Western Balkans and there are few examples of functioning policy networks which could mobilize endogenous development potential at a local level, outside the capital cities.”<sup>29</sup>. The decentralization processes have in some cases divided the distribution of the competences too much, without distributing resources and recreating adequate administrative capabilities.

This analysis is in part supported also by the case studies conducted by CeSPI in the SeeNet program where some situations of insufficient capabilities, separation and absence of multilevel dialogue have been identified, in particular in Bosnia-Herzegovina, Kosovo, and partially in Albania and Montenegro. On the other hand there are other cases, like for the Istria Region in Croatia and the Vojvodina Province in Serbia, where the vertical collaboration between central government and local authorities is relatively good, and where the latter have acquired an optimal administrative capability that allows them access to international networks and resources<sup>30</sup>. Bartlett’s evaluation therefore needs to be reshaped and reconsidered depending on the context. It is certain that the Western Balkan scenario, beyond presenting itself “randomly”, displays some situations of great difficulty for a possible territorial approach to development, like in Bosnia-Herzegovina and Kosovo; difficulty that depends in a substantial way on issues of political, nationalistic and

ethnic order.

The creation of the necessary conditions and change processes, that follow the “place-based” approach, requires a great deal of time. External assistance can stimulate and accompany, but it’s difficult that it can provoke the change, if it is not established on the ownership of the local actors and if it is not at least contrasted by superior levels exercising power. At the same time, the long times of the LED contrast the short times of finance and market dynamic requirements, which favour instead the polarization of the resources in the capitals and some intermediate centers functional to the *export-oriented* model and foreign investments. “The dual process of transition and access to the EU has radically altered the spatial organization of the economy, leading to combined cases of economic decline, increase of the inequality and polarization. A great concentration of physical and human capital in the main urban centers, together with a great tendency towards de-industrialization in the periphery and the collapse of business spaces (...) has created urgent problems of local development and spatial cohesion”<sup>31</sup>.

The experience of decentralized and territorial cooperation partially confirms this analysis. Many projects are focused on the creation of networks and above all on capability building actions. The evaluation from the local partners themselves is positive: the technical assistance, the training and the exchange of good practices are essential in order to learn the know-how necessary to undertake activities for the local, institutional, social, economic, environmental, development. The issue is that, to this necessary action of strengthening abilities, a suitable effective change does not correspond, the end results (increase in social and economic well-being thanks to the services implemented) are not being met, or in an insufficient or difficultly replicable way, the times are long, and the performance is insufficient. A common problem is that of the so-called mainstreaming (integration) of good practices in the plans of local development, normative amendments, authorities budgets, the routines of the bureaucracies, the strategies and the daily management of the local actors. This, while at local level the citizens ask for concrete changes, a visible social and economic impact, effective investments in welfare and creation of occupation.

Until now a weak consideration has been experienced, a nonexistent capitalization, on the limits of these models and this cooperation, and particularly on the coherence between the adoption of the territorial approach to development and the Western Balkan national policies of international competitiveness established on the *export-oriented* model and of attraction of foreign investments. There is the need for the discussion on the programs of cooperation and their feasibility, pertinent to local contexts, sharing with the local partner, sustainability and effectiveness to be brought to a political level. Otherwise, the decentralized and territorial cooperation risks being only an experience of sharing of an ineffective approach both for political and for intrinsic reasons. The analysis of art.7 of law 84/01 had in fact already highlighted how the cooperation was established more on the offer of given practices rather than on the application and choice of local partners in order to understand which eventual hybridizations are possible.

The consideration on the decentralization processes underway in the various Western Balkan countries (just as “federalism” in Italy), on their positive and negative aspects should be very important. This, above all, because decentralization is an issue of great political emphasis assuming a division of powers between diverse administrative levels, between territories and also between various actors, being potentially functional to nationalistic and ethnic interests, processes of secession and reconfiguration of the borders, or being able to be a neo-liberal form of strategy in order to favour the privatization of public assets. According to some authors decentralization risks worsening the ethnic divisions, worsen the conditions of the minorities or marginalize them, and to be potentially contrary to democratic requirement of the balance between the powers<sup>32</sup>. The problem is not only of the western Balkans: the case of the independence of Kosovo has highlighted in fact how there are member states within the EU that have not recognized it because it can be connected to their national issues.

Decentralization therefore brings us back to the question of the local and national development models in the European political framework of reference for the adhesion. An informed public debate should be opened, capitalizing the experiences of territorial and decentralized cooperation, and moving from a project level to a political one. The debate would have to be oriented to discuss the issues of local development and decentralization, and of the requirements of the partnerships in the enlargement process framework.

## THE OPPORTUNITY OF THE EU STRATEGY FOR THE ADRIATIC-IONIAN MACRO REGION

The enlargement of the EU towards the countries of oriental Europe, moving the borders, has resulted in the adoption of adhesion and neighbourhood policies. Therefore a new geopolitics has been created that has opened opportunities of relations and integration with countries previously “distant” and even rival due to the iron curtain and the Cold War between the western bloc and the eastern bloc.

In this new geopolitical a greater attention is also being asserted towards the territorial aspects for which integration does not happen only through politics between States but it involves the relationships between adjacent territories and that belong to a same geographic area and, just for this, introduce common challenges and opportunities. Due to this

<sup>31</sup> Monastiriotis V. e Petrakos G., *Local sustainable development and spatial cohesion in the post-transition Balkans: in search of a developmental model*, GreeSE Paper n. 29, Hellenic Observatory Papers on Greece and South East Europe, LSE 2009; cited in the third CeSPI research report for SeeNet.

<sup>32</sup> Please see the second CeSPI report for SeeNet on decentralization, in particular page 26.

numerous CBC programs have been started, diverse Euro regions have been established, and the new strategies of the EU for the macro regions were born. In 2009 the strategy for the Baltic macro region was established, and in 2011 the one for the Danube area<sup>33</sup>.

At the same time an important Italian diplomatic action has been deployed that brought the European Council of December 2012 to the decision of giving the Commission the mandate for the creation of the strategy for the Adriatic-Ionian macro region<sup>34</sup>, between whose salient characteristics involve the western Balkan countries (except Macedonian)<sup>35</sup>. The strategy should be adopted during the Italian semester of EU presidency in 2014. It can represent therefore a relaunch opportunity for Italian cooperation and foreign policy with the western Balkans. The various cooperations interwoven in the area should refer to this, having to bring to adoption an integrated Action plan where diverse programs and funds are coordinated and aligned. In this regards it is important to remember what the main characteristics are and the added value of the strategy.

The Commission has clarified that the macro regional strategies are a new transnational instrument in order to favor European integration. They should support the progressive convergence in the EU of the various territories. A convergence that is made strong by the territorial diversities, of their different patrimonies. A transnational strategy different from the traditional cooperation aimed, above all, at the sub-national local autonomies, in particular the regions, pertaining to a same geographic area, because it involves primarily the national governments but maintaining a multi-level approach, that therefore continues to foresee the link with the sub-national authorities.

The strategies adopt a functional territorial approach. The strategies are functional in reaching objectives such as environmental protection, the social and economic development of a geographic area that introduces common challenges and opportunities. Their functionality characterizes the geographic spaces to involve, that don't have to correspond to geographic units established at a political-administrative level. And that can therefore also go beyond the frontiers of the EU, extending to the EU adhesion candidates and neighbouring countries. The boundaries of macro-regional area are variable depending on the functionality taken into consideration.

For example, if on the one hand the protection of the Baltic Sea involves first of all the territories that surround it (but also those of the tributaries), on the other hand, the development of research and innovation for small and medium-sized enterprises of the wood industry includes technology centers and SME networks, which can be found in geographic locations distant from each other while belonging to the same area.

The strategies, as a political instrument, are characterized by "three noes": they are not fixed by rules, do not rely on ad hoc institutions, do not have their own funds. It then presents a paradox that should be the added value of macro regional strategies: on the one hand these three noes appear to greatly limit the freedom of action of strategies, it seems almost that they define their irrelevance; on the other hand, just as a result of these limitations, the strategies should be based on their ability to integrate the norms, institutions and funds that already exist in a common transnational framework. The effort that is required is therefore primarily of political will on the part of the diverse actors, starting from national ones.

In this way it seems to establish a new form of governance in the EU framework that lies between that of the EU and that of the individual member states, transnational, open to the multi-level participation of sub-national authorities. The transnational level corresponds to large scale geographical areas, which refer to natural characterizations, such as seas and reservoirs. A governance that therefore has a spatial specificity, however relatively variable as written above, in literature these areas are called "*soft spaces*"; and that provides itself a light, flexible and multi-level institutional organization, establishing itself as a "*soft institution*". It is a new form of governance that responds to the attributes specified by Zielonka, because it is multi-centered, multi-leveled and transnational, with "*soft borders*". Macro regional strategies are therefore a way to combine the spatial diversity with the construction of the EU. It 'a way to recover the democratic deficit through participation methods complementary to those of a traditional representative character. The strategies are in fact based on consultation processes and the active participation of various actors in defining the action plans and in their implementation.

The experience of the Baltic and Danube macro regions highlight some difficulties however, especially with reference to the multi-level governance and effective participation of the citizens. The Commission's report on the implementation of the Baltic strategy<sup>36</sup> in fact indicates the need for greater involvement of the citizens and better multi-level governance ("groups of key actors, such as regional and local authorities, NGOs and the private sector should be involved"), as well as greater political commitment to align funds and issues with respect to the 2020 Strategy, and a strengthening of institutional coordination (in particular priority area coordinators and their steering groups). These indications are aimed towards paying greater attention to informed public debate (also see the need to define indicators to measure the results of the initiatives) and the study of the comparison of development models or better of transformation process and territories.

<sup>33</sup> See: <http://www.balticsea-region-strategy.eu/pages/what-is-the-eusbsr> and [http://ec.europa.eu/regional\\_policy/cooperate/danube/index\\_en.cfm#2](http://ec.europa.eu/regional_policy/cooperate/danube/index_en.cfm#2) and <http://www.danube-region.eu/>.

<sup>34</sup> See: [http://ec.europa.eu/regional\\_policy/cooperate/adriatic\\_ionian/index\\_en.cfm](http://ec.europa.eu/regional_policy/cooperate/adriatic_ionian/index_en.cfm).

<sup>35</sup> For the description of the Adriatic-Ionian macro region creation process and the relevance of the new macro regional strategies in the territorial cohesion policy please see, respectively, the second and third CeSPI research report for, as well as the papers by Stocchiero and Cugusi downloadable from the CeSPI website.

<sup>36</sup> European Commission, Report from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions, on the Implementation of the EU Strategy for the Baltic Sea Region, COM(2011) 381 final, Brussels, 22.6.2011.

With the Adriatic-Ionian macro-regional strategy, the integrated approach, already experimented in part by the Italian experiences with art.7 Law 84/01 for the reconstruction of the Western Balkans, the FPA for regional cooperation for development in the Mediterranean and SeeNet for local sustainable development can also be reaffirmed. The occasion of the preparation of the Italian Presidency of the EU in 2014 is an important window of opportunity to build the strategy capitalizing on what has been done.

Nevertheless, a danger is obvious, namely that the qualitative leap required to adopt a real integrate approach, is too demanding in a crisis situation, the organizational conditions are very challenging in the face of scarcity of resources, and this above all in respect to the situation and the capability of the Western Balkan countries. It is therefore more likely that the definition of the macro-regional strategy action plan is limited to a negotiation of the different national and regional interests, identifying some minimum common denominators such as priorities for action. To date (July 2013) the informal draft of the Action Plan identifies two horizontal priorities (research and innovation, and SMEs development) and four vertical priorities (transport and energy infrastructure and connections, environment and natural resources' management, blue economy and regional attractiveness).

Faced with this situation, a stronger effort is needed of the Italian government, as well as the different actors involved, and the formation of a governing body open to local authorities and civil society organizations willing to invest. The relevant partnership should refer not so much to the general requirements of representativeness, but rather the quality and capacity of the actors, of practical experience on the ground. From this point of view, the actors of the SeeNet program can find a way to contribute to the debate, bringing results and prospects of integration.

Is India really so small???

## To look at development from a gandhian perspective. Cultural exchanges, educational opportunities and twinships between schools

Elena Camino, Maria Ferrando, Maria Elena Bo IRIS e Gruppo ASSEFA Torino

What about changing frame of mind?

### Abstract

Since 1968 exchanges of loving mutual support take place between two realities geographically far away, and culturally and socially deeply different: the ASSEFA Group of Torino and the Indian NGO ASSEFA (Association for Sarva Seva Farms). Exchanges of documents and mutual visits have offered to the italian partners the opportunity to be witnesses of the achievement of a gandhian development model, inspired by concepts as sarvodaya, swadeshi, swaraj, nonviolence, antyodaya. Twinships between schools carried out over thirty years allowed italian students of primary and secondary level to come in touch with a context that is not only culturally different, but testifies the possibility of a 'development' based on cooperation, empathy, reverence for nature and respect for the environment. Meanwhile students of the indian villages felt appreciated and developed greater confidence in themselves.

### Aims of the twinship

- ✓ Italian students – with the help of their teachers – may succeed in challenging the idea that western society is more 'developed' and leads other cultures towards 'progress'. Moreover they may learn to respect and appreciate world views and cultural frames different from theirs.
- ✓ Students of ASSEFA villages have a precious opportunity to increase their self-esteem, as they get in touch with peers who appreciate and respect them. Moreover they deepen they knowledge about world issues and other civilizations.

### Methodological approach

The opportunity was offered to start a twinship with no rules except the willingness of teachers to learn about ASSEFA movement and gandhian thought, and to promote a respectful dialogue among peers. Continuous feedback and reflection of the research group was carried on, based on the exchanged documents, the meetings with italian teachers, the dialogue with indian ASSEFA staff, the reading of the relevant literature on India and on 'nonviolent and sustainable education.

### Brainstorming of some italian teachers about 'progress'

- ✓ development, freedom, respect
- ✓ civility, culture, peace
- ✓ well-being, improvement, happiness

### Achieved Results

The twinship experience achieves a higher educational value when integrated within an interdisciplinary and multicultural program. Italian students enjoy the experience and show great motivation in preparing the material to be sent to Indian friends. The perception and evaluation of the 'differences' by students is heavily influenced by the awareness of the teachers.

To keep the future open to all potentials, alternatives and dissenting possibilities, it is necessary to envisage alternative futures from different civilisational and cultural perspectives (Ziauddin Sardar)

## **A safe place for the victims of domestic violence: support to autonomy and development of local resources in the Balkans area (since 2006)**

Maria Perino, Miranda Proso - Istituto di Ricerca Sociale

Dipartimento di Giurisprudenza e Scienze Politiche, Economiche e Sociali, Università del Piemonte Orientale "Amedeo Avogadro", Alessandria

The project fulfilled in Zavidovići, a central Bosnia Herzegovina town, has developed initiatives to support the victims of domestic violence and to face a culture which originates and legitimates violence itself.

During the last six years, a local network (several schools and associations, Dom Kulture, the Health House) and a Bosnian association - *Sigurno Mjesto* - were created through a program of decentralized cooperation in which several Italian and Bosnian institutions have been involved as partners.

### The Department

- realized an exploratory field action-research on access to basic services of the Zavidovići Local Communities (young local researchers were formed as interviewers and data collectors)
- backed and monitored the planning and the implementation of the preventing and training activities (workshops, focus groups, etc.) in Italy and in Bosnia Herzegovina.

### Reasons of the intervention

- Lack of direct experience on these forms of social tutoring.
- Need to build specific competence for a direct relationship with the victims.
- Need of spaces to apply and verify work models and competences.

### 2012. Specific outcomes in Bosnia Herzegovina

- **prevention:** analysis of the gender relationships through diversified actions, according to methods and to target groups
- **support:** intensifying tutoring activities for the victims of domestic violence referring to the association
- **support:** resources activated to get a partial economic autonomy to some women victims of domestic violence
- **interaction:** development of local and international territorial networks to keep opportunities of exchange and training. Widening of the intervention to the rural areas

### ... and in Italy

- **enhance competences of the Italian operators:** critical analysis and evaluation of the Italian social work model, improvement of the skills to undertake and manage complex social ambience
- **development and consolidation:** direct relationship between Social Services of Alba and of Zavidovići and between *Sigurno Mjesto* and the Italian associations

**Methodological approach:** • Experts identified by Università del Piemonte Orientale, by Ser.T Alba Bra and by local trainers carried on tutoring activities for the members of Bosnian association • Social workers and members of local associations participated to official and technical missions in Bosnia Herzegovina to grant a direct bi-national relationship.

**An intervention model:** the experience has produced an efficient work model which, through the synergy of different involved subjects, with different roles and in different stages, allows to activate long lasting processes supported by periodical micro-actions.

FUND FOR COOPERATION AND KNOWLEDGE

Andrea Pichelli

University of Pavia - International Relations Office

### Abstract

The University of Pavia (UNIPV) launched the 'Fund for Cooperation and Knowledge' in 2009. The Fund was intended to finance scholarships for students of Developing Countries wishing to study in Pavia and for students of UNIPV aiming at spending some months in a Developing Country to study, to carry on researches, or to do an internship. The Fund and the selection of the students are managed by a Joint Committee composed by students, professors and administrative staff of UNIPV. Resources for the Fund come from UNIPV and from its students, who pay each year 2 Euros together with the tuition fees.

### Achieved Results

Since 2009, 32 students from Developing Countries and 52 UNIPV students received a scholarship.

### Objectives

Increasing student mobility to/from Pavia University and to/from Developing Countries; giving students the chance to have an experience abroad, to improve their skills and to widen their knowledge; strengthening university cooperation with Developing Countries.

### Methodological approach

Candidates awarded with a scholarship are selected by the Joint Committee, who examine their application and evaluate their CV and academic skills. Selected UNIPV students go through an interview too.

### Conclusion

After four editions, it is clear that the idea of the Fund works and it is a kind of scholarship programme which could be implemented in other Italian universities too.

### MULTIDISCIPLINARY AND INTERDISCIPLINARY SKILLS AT THE SERVICE OF DEVELOPMENT COOPERATION: THE ACTIVITY OF THE CISAO OF THE UNIVERSITY OF TURIN

Carlo Semita ([carlo.semita@unito.it](mailto:carlo.semita@unito.it))  
University of Turin-CISAO ([www.cisao.unito.it](http://www.cisao.unito.it))

#### Abstract

The CISAO (Interdepartmental Centre of Research and Scientific and Technical Cooperation with Sahelian and West African Countries), that includes internal and external staff of the University of Turin, professionals and experts, holds together multidisciplinary and integrated expertise with the task of facilitating and coordinating **educational and scientific exchanges** with similar institutions in **West Africa** and in the **Sahel**, in particular. The concerned countries are **Benin, Burkina Faso, Cape Verde, Mali, Niger, Senegal**. Institutionalized in 2004, the CISAO was established since 2000 by a group called "Uni-Sahel" which grouped together researchers with common interests of investigations and cooperation with the Sahel, which over the years have woven intense relationships with African counterparts.

#### Objectives

**Main objectives:** food security promotion, extreme hunger and poverty reduction.  
**Specific objectives:** improvement and sustainable management of natural resources, animal and vegetal productions, with environment and biodiversity preservation; knowledge sharing and appropriate technologies; institution of north-south and south-south networks.

#### Achieved results

- Establishment of a **network** in which researchers from different scientific fields, such as economists, sociologists, anthropologists, geographers, geologists, agronomists, veterinarians, etc... can meet and share their experiences, even with the support of the Piedmont Region, which promoted decentralized cooperation initiatives through the program "Food security and fight against poverty", since 1997.
- Improvement of **actions** in 4 main strands, concerning animal and vegetal productions, energy facilities and socio-economic and educational issues.

The results of the activities are exposed during **congress** with the participation of Italian and Sahelian academics:

NIGER: dairy Kouri cattle farmers

MALI: horticulture practices

NIGER: sellers of traditionally produced honey

MALI: training of solar cookers technicians

#### Methodological approach

In relation to the approach proposed by the Piedmont Region, many actions have been promoted, sharing expertises in different fields and a close cooperation with similar institutions, involving also civil society, for the promotion of a mutual cultural enrichment and to create the conditions for self-sufficiency of the involved countries.

#### Conclusion

In recent years, there has also been attempted to merge some interventions according to the issues explored and the countries and partners involved to make more effective the actions planned and carried out. This new method stimulates the search for greater interdisciplinarity and an integrated approach to the issues and problems and will be applied in the project RUSSADE (**ACP – EU Edulink program**) that involves a group of researchers of CISAO.

## AGRICULTURE IN DEVELOPING COUNTRIES BETWEEN LOCAL RURAL DEVELOPMENT POLICIES AND INTERNATIONAL MODELS OF “LAND GRABBING”

Francesco Costamagna\*

\*Department of Law, University of Turin, Italy - [francesco.costamagna@unito.it](mailto:francesco.costamagna@unito.it)

The papers presented in this panel focus on large-scale acquisitions of lands for agricultural or agriculture-related uses in developing countries. ‘Land grabbing’ is an issue that cuts across all these papers, as they try to shed more light on a controversial phenomenon that has attracted considerable attention in recent years. Each paper addresses the issue from a different disciplinary angle, offering a different analytical perspective.

More in general, the papers build on the ongoing debate – which sees the active participation of academic scholars, international development agencies and civil society’s representatives – on agriculture and rural development in developing countries. This debate touches upon focuses on a number of key issues. First, the role of agriculture that, although long neglected by public policies, can be an engine for development and economic growth. Secondly, the need for greater support for small-scale producers, increasing their productivity and strengthening their focus on the global market. Thirdly, the need to solve all the issues concerning land property/access, especially with regard to women, and local population’s customary land rights.

These issues have a profound impact on food security, which is threatened by global phenomena that put in jeopardy the survival of people living in the poorest areas of the world (Sub-Saharan Africa is one of the most hit areas). These countries host large-scale land investments by other States and transnational or local private actors, driven by many factors such as raw materials and food rising prices, growing demand for biofuels and timber, mineral extraction, speculation and so on. The data and evidence available are still scanty and often contradictory, but it appears that in the majority of cases land deals can be considered as a form of land grabbing rather than land investments. They reproduce, under new clothes, old solutions that have already showed their inability to provide any meaningful response to food scarcity. These solutions are primarily geared toward gaining control over strategic natural resources and they are, thus, inconsistent with the cooperation paradigm. Therefore, an intense debate has developed on their efficacy as a way to promote development in the host countries.

This panel aims at contributing to the debate on the developmental role of agriculture and large-scale land acquisitions, by adopting a multidisciplinary approach and combining micro and macro analysis that take into account both the local and the global dimensions.

The paper of Hans Holmén seeks to shed more light on the notion of ‘land grabbing’, by challenging some commonly-held convictions about the scale of phenomenon, its causes and consequences. In so doing, it starts from observing the huge surge in attention that characterized the phenomenon in recent years. Quite surprisingly, this surge rests on an uncertain definition of the phenomenon, as the notion of ‘land grabbing’ is often used to describe a diverse array of situations just to hit the headlines. Furthermore, the paper highlights the lack of reliable data on the magnitude of land acquisitions, as estimates about land grabbing tend to diverge one from another in a quite sensitive manner. Lastly, the author critically points to the ‘politicization’ of the analysis on land grabbing, which often leads to overemphasize the role of foreign enterprises and States in this sector, as well as inflate the impact of the phenomenon on the population. This is not to deny that land deals may constitute a problem in some cases. However, this phenomenon needs to be better assessed and to be placed in a much wider context, taking into account all the problems that affect agriculture in Africa. Low productivity is the main one, at least according to Holmén’s paper. African governments have a huge responsibility in this regard, as their policies have been often misdirected and ineffective. The role of African governments has been much discussed during the panel, as many participants argued with Holmén’s position that this emphasis on foreignization tends to obscure the active involvement of African élites in the adoption of land policies that are far from serving the public interest.

The paper of Davide Cirillo offers a different perspective on the definition of the phenomenon, by trying to locate land acquisition on a continuum between a development opportunity, on the one end, and land grabbing, on the other. In so doing, it highlights, as done by Holmén, the lack of reliable sources and data. In any case, it tries to define land grabbing by seeking to go beyond the dichotomy cost-opportunity that lies at the core of the definition elaborated by many international institutions. To this end, he relies on the concept of ‘food regime’ elaborated by McMichael, which tries to explain the strategic role of agriculture by making reference to specific power configurations. Moving from these theoretical premises, the paper examines the neo-liberal approach, highlighting its contradictions and its negative impact on the sustainability of the land regime. The second part of the paper looks at the role of transnational peasants’ movements and other civil society’s organization in shaping and resisting this phenomenon. The analysis focuses on the evolution and main features of Via Campesina, which has been created in 1993 to bring together several instances of resistance against the commodification of food. Moreover, it also looks at the *International Planning Committee on Food Sovereignty*, which is a network composed by transnational peasant movements, agricultural commercial entities and NGOs.

The paper of Stefano Montaldo keeps the attention on the actors that participate to what may loosely be defined as land governance, by approaching the issue from an international law perspective. In particular, the analysis takes into consideration the attempts by some international actors, such as international organizations or other informal *fora*, to establish a more coherent legal framework governing large-scale land acquisitions. The paper looks at FAO, which has been actively involved in trying to establish a more coherent international legal framework for land since the *World Conference on Agrarian Reform* held in Rome in 1979. More recently, it has adopted the *Voluntary Guidelines on the responsible governance of tenure of land, fisheries and forests*, a non-binding document that should represent a framework for natural resources-related policies. The World Bank has adopted an equally active stance on the matter and in 2003 it has contributed to the launch of the so-called *Equator Principles*. This instrument is defined as a credit risk management framework for determining, assessing, and managing environmental and social risk in project finance transactions. The 2012 reform of the Principles has led to the insertion of a specific reference to land access and, in particular, one of the Principles recognizes the impact of land acquisitions of local communities. The paper also takes into consideration the *Roundtable on sustainable biofuels*, which is a platform composed by UN agencies, oil companies and other multinational enterprises. The initiative has a voluntary character and it should contribute to the adoption of more socially-sensitive policies by the actors involved. Voluntarism, and the lack of credible enforcement mechanisms, is the issue that took the centre stage during the debate. This feature, which is common to most of the initiatives taken at international level so far, is one of the main causes of the perceived inadequacy of the response offered to the phenomenon of land grabbing and to the threats it poses to food security.

The third paper, by Astrig Tasgian, focuses on the case of Mali, by building on the results of a field survey in the region of Ségou. The paper starts from the assumption that the agricultural sector is crucial for economic growth and development and it purports to assess the socio-economic impact of large-scale land investments in this regard. To do so, it considers the experience of large-scale acquisitions in an irrigable zone of one million hectares in the inlands of the delta of the Niger River after the call issued by the Malian Government in 2005, under pressure from various international organizations, to attract big investors in the region. The results of the call are far from satisfactory, as the field survey reveals that large-scale investments have had an overall negative impact, by failing to live up to the expectations. The reasons for such a poor performance are manifold and touch upon several different aspects. For instance, the paper highlights that the principles for sustainable agricultural investment elaborated by FAO and the World Bank, and analyzed above by Stefano Montaldo, have been disregarded. At the end of her work, Astrig Tasgian puts forward a number of suggestions that may help to devise and implement more effective land acquisition projects.

The last paper, by Raffaele Bertini, offers yet another perspective on the phenomenon, by depicting land grabbing as a strategic game. This work complements the papers seen above, by providing a simplified analytical framework to assess the behavior of different actors in a complex situation. The paper takes into consideration three players – the investor, the receiving State and local communities – and it takes into account the institutional framework where the players act, by distinguishing between formal and informal institutions. The paper considers three levels of play, by presenting them in term of the reached equilibriums.

## THE ROLE OF AFRICAN GOVERNMENTS IN THE LAND GRABBING BUSINESS

Hans Holmén\*

\*Department of Thematic Studies, Linköping University, Sweden - [hans.holmen@liu.se](mailto:hans.holmen@liu.se)

### ABSTRACT

During the last few years the number of publications on the theme of “land grabbing” has virtually exploded. The phenomenon – i.e. the appropriation of (mostly) agricultural land by the powerful, with subsequent dispossession and dislocation of the poor and powerless is real. Reports about land grabbing tend to follow a rather stereotyped pattern saying that the phenomenon is immense, that Africa is the main target and that the continent is under heavy attack by greedy outsiders in a neo-colonial struggle for land. However, a careful reading of land grabbing literature reveals that while this message fits well certain prefabricated “explanatory” models, it may be misleading. Contrary to this privileged explanation, the magnitude of land grabbing may be exaggerated, drivers behind it tend to be others than those repeatedly mentioned, and the principal agents domestic elites rather than outsiders. Hence, the issue needs to be tackled in a way quite different from what is most often proposed.

### A CONTROVERSIAL ISSUE

Recent years have seen a veritable explosion of writings about “land grabbing”. From having been virtually unheard of ten years ago, a search on Google in August 2013 gave more than 36 million hits! To many, this a welcome attention, not least because land grabbing is seen to have far-reaching – even disastrous – consequences for those who lose or risk losing access to basic life-sustaining resources on which they depend. This paper is based on a thorough scrutiny of this mass of recent writings about “land grabbing”. Crisis narratives are commonplace. While there is reason to be concerned about the meaning, magnitude and consequences of land grabbing, much of what is being published is less clarifying than the issue deserves. In part this is because while “land grabbing” often fits certain ready-made agendas and apparently is “effective in activist terminology” [1] much is written before proper investigations have been made. Hence, many assertions have been based on assumptions rather than facts and much is agitating rather than analytical. This is the case whether we speak of the meaning of the concept, its drivers, magnitude, consequences, or its principal actors.

By “land grabbing” I here understand enclosure or privatization of commons. Implicit in much writing about land grabbing is that is illegal. Generally, this is a misunderstanding. Contemporary land acquisitions in Africa are in the form of lease contracts, generally between the leaser and the state. Hence, they are legal. Whether enclosure of the commons also is legitimate is, however, debatable [2]. In its simplest form, it means a “concentration of decision-making about how land is to be used [3]. Consequently, someone has to lose access to land or influence over its use. In Africa that would be the semi-subsistence oriented smallholder peasant. This has triggered massive campaigns against land grabbing. Ambiental & UNDC define it as “crafty or violent appropriation of something which is legitimately owned by someone else” [4]. Echoing the words of 19<sup>th</sup> century utopian socialist Prudhon (“property is theft”), the Via Campesina says it is “nothing short of theft” – which the popularized phrase also implies [5]. Less critical voices speak of “acquisitions” or “large-scale investments in land” [6] [7] which by many are seen as necessary for modernizing African agriculture, [e.g. 8]. Land grabbing is frequently also seen to represent a “capitalist restructuring of global agriculture” [9] and there also appears to be a near-consensus that it is mainly foreigners who acquire land in the global south, particularly in Africa. Hence, land grabbing has been labeled “foreignization of land” [10] and likened to a neo-colonial scramble for Africa [11] [12] [13]. In an environment where private land-titles are rare and the common farm-size is one hectare or less, the transfer of use-rights from the many to a few – especially if these are foreigners – is bound to arouse protests, not least because it is assumed to have severe social consequences.

Behind this apparently new-found and allegedly northern appetite for southern lands are usually mentioned the three combined elements of food, fuel and financial crises from 2008/9 and onwards. Declining investment opportunities in the global north together with internationally rising food prices and demand for bio-fuels are commonly presented as the driving forces behind land grabbing. In some cases, the intention behind land acquisitions is obviously to produce something (bio-fuels for export to Europe, for example) whereas in other cases mere speculation is believed to be a prominent driving force (cheap lease contracts now that can be sold profitably at a later stage when the investment market ‘normalizes’). This, allegedly, leads to a situation where large amounts of African farmland are taken over by ‘investors’ who have neither knowledge about nor interest in farming. Such ‘investments’ are unlikely to have any developmental effects. Also, is frequently mentioned, populous ‘emerging economies’ like China, India and Arab Gulf states with high demand for food but limited opportunities to produce it at home. They, therefore, opt for ‘off-

shore' production in order to escape the volatile world market [14] [15] [16]. Also here investments represent resource-mining and are geared to satisfy external demands, not towards African needs. Others object that foreign governments are only minor investors and that the major culprits are financial institutions, international agribusiness and transnational corporations [17] [18] [19] [20]. Foreignization it is, nevertheless.

Reading about land grabbing, one easily gets the impression that Africa is under heavy attack from a large number of external real or potential grabbers. Djurfeldt, thus, writes about "an epidemic of land deals" [2]. Some writers, however, claim that the grabbers are few [20]. They "operate out of the big financial centers of the world and often get together at farmland investors meetings" (ibid). This, it is further maintained, is done with the consent of the G8, the World Bank and the EU. While northern governments and IFIs are not directly involved, their policies "play a crucial role in supporting agribusiness-led acquisitions" [19]. Hence, land grabbing is often depicted, not only as a northern project, but more or less explicitly as a conspiracy.

This is all the more serious as the magnitude of land grabbing is widely believed to be enormous. Oxfam thus claims that, on a global scale, "in the past decade an area of land eight times the size of the UK has been sold off as land sales rapidly increase" [16]. Africa, it is claimed, receives more than half of all foreign investments in land [21]. Hence, it has lost "millions of hectares" to outside grabbers [22]. Estimations vary about the African land area affected. Oxfam claims that, in the last ten years, an area "almost the size of Germany" has been acquired by foreigners [23]. The Oakland Institute asserts that "in 2009 alone ... an area the size of France was purchased or leased in Africa" [18] (emphasis added). Implicit in such claims is also that Africa presently is flooded with FDI aimed for land purchases or leases.

Critics claim "foreign countries and companies and wealthy foreigners are rapidly taking over the productive lands in Africa and turning Africans into refugees and slave laborers in their own homeland" [24]. Not surprisingly, the numbers of adversely affected people are presented as enormous, with millions of African smallholder farmers being evicted, cheated on compensations and losing access to vital sources of livelihood [25] [26] [27]. Some ask whether this means "the end of the African farmer" [28]. Others go a few steps further and envision a future where smallholders either must migrate to city-slums or eke out a meager living "on tribal communal 'holding grounds', akin to the Bantustans of the apartheid period of South African history" [29]. We should ask ourselves whether this is a realistic assumption.

In fact, we must ask ourselves whether the above sketched message is realistic at all. For one thing, the land grabbing issue is permeated by a multitude of uncertainties. Hence, quite different stories can be told. Below, a different perspective will be briefly presented, based in part on the same sources as those used above but supplemented with information that alarmists tend to overlook.

## UNCERTAINTIES

Due in part to its recent 'discovery', the phenomenon of land grabbing suffers from a lack of empirically reliable foundations and methodological discrepancies which has allowed a wide range of interpretations, assumptions and speculations. Hence, it has been possible to squeeze tales of land grabbing into prefabricated theoretical straight-jackets and give it ideologically suitable 'explanations'. The political role of land grabbing 'research' is often apparent and sometimes explicit. The campaigning – and often referenced – organization GRAIN, for example, recently declared "Let us state this plainly: GRAIN's aim is not to do neutral research" [13]. Not surprisingly, the term 'land grabbing' often obscures more than it reveals [1]. Still, after five years of intensive publishing about land grabbing, the question "what is a 'land grab'?" remains unresolved [30]. Below, an effort is made to remedy preferential biases by offering a different – not opposite but complementary – perspective on the debated issue. But first, some words about uncertainties.

First hand information about land grabbing is hard to come by. Data are fragmentary [31] and statements are often based on assumptions and shaky foundations [32] – "different sources report different figures for the same land deal" [22]. Even if the number of field research has increased, "most reports offer very few insights into overall impacts, either positive or negative" [30]. Statements about the magnitude of land grabbing tend to be highly inflated. For example, Deininger et al found that actual farming had started on only 20 percent of the announced deals [7]. In Mali, Cotula found that only ten percent of intended deals led to actual leases [19]. This is because what is reported is often intended deals and/or expressions of interest, not completed contracts. Moreover, in reports about land grabbing, multiple interpretations of what a 'grab' is make generalizations difficult [30]. While there are (questionable) figures available about acreage transferred, "very little is known about the terms of the land deals" [19]. Their consequences may therefore differ widely.

Hence, "the actual impacts on the ground of many recent projects still remain to be seen" [14]. Nevertheless, because the term "land grabbing" sounds inherently harmful, we are warned that land deals imply a "potential competition with other important land uses" [33] and about "possible negative impacts" of land investments [34] [7]. Others are more certain about magnitude and consequences. Hence, it has been suggested that land deals are "likely to lead to massive enclosure and dispossession" [36]. The NGO Friends of the Earth asserts that "all sizes and types of land will be taken by TNCs, there will be no place for peasants" [37]. While such worries may be well-founded, alarmists may deplore findings of only "limited ... evidence of evictions" [21]. Often, such stories have, "at best been

supported by anecdotal evidence, and at worst, been speculative” [36].

## AN ALTERNATIVE STORY

The frequently presented view, that Africa is besieged by greedy foreigners eager to lay their hands on as much land as possible, bears little resemblance with reality. So far, foreign investments in land have been limited. For external investors, Africa has long been deemed a high-risk environment due *inter alia* to political instability, lack of infrastructure, undeveloped markets and low purchasing power [37]. The assumption that the “global rush for land” has changed this [38] appears to be ill-founded. Our knowledge about FDI in agriculture is limited and even less is known about FDI in Africa [39]. Some figures are available, however. In 2011, the continent’s share of total FDI was a mere 2.8 percent and of this only one-seventh was in the primary sector, primarily oil, gas and minerals whereas agriculture is hardly mentioned [40] [41] [39].

But it is not only foreigners who have been hesitant about investing in Africa. Mafeje notes: “[r]uling African elites accumulate a great deal of ill-gotten revenues but are not noted for their propensity to invest. At the other extreme, African small producers, contrary to neoclassical assumptions, save but do not mobilize their savings. Instead, they keep them as assurance against hard times” [42]. For various reasons, Africa has long suffered from an investment deficit [43].

One reason could be lack of land titles. Customary access to land is permeated by overlapping rights and a plurality of systems and institutions which leave room for contested claims and corrupt practices [44]. This makes investments in land a risky undertaking. Also, about half the population lives under the poverty line [45] and even if they would, their capacity to invest is extremely limited. Contributing factors are corruption and the inability of many governments to protect citizens’ rights [46] [47].

At the same time, agriculture is home to some 70 percent of the labor force but productivity is low, population growth is rapid, and farm sizes have been shrinking for decades [48]. Africa definitely needs investments in agriculture. But if domestic propensity to invest is low, where would investments come from? From abroad, there are few other options. But also foreigners have shown a lack of enthusiasm in this matter.

They apparently need encouragement. Thus, African governments, rather than being the hesitant target for (and victims of) powerful foreigners encroaching upon African soil, are actively inviting foreigners to bring much sought for capital to the continent. Hence, contrary to widespread beliefs, “in many cases it is not a global ‘land grab’ driven by the private sector, but a supply-driven process in which governments are playing an active role” [49]. Governments actively compete for investors [71] and offer them lease contracts on highly preferential terms [50], for example zero or next to zero lease costs.

In general, this policy has apparently not been successful. Most writings on land grabbing in Africa give the impression that this is a continent-wide phenomenon. Reality tells a different story. Two-thirds of all registered land deals are found in only seven countries [33]. As mentioned above, incoming FDI is less than expected. And estimations indicate that only some ten to twenty percent of intended deals actually materialize into on-the-ground investments – in spite of the preferential terms offered. Africa is still perceived as a high-risk environment. Some would-be investors obviously are deterred by unexpected difficulties of creating and running plantations in complex contexts [21]. The low or zero lease fees offered are motivated by the expectation that those who acquire land also invest in land clearance, soil preparation, build infrastructure (roads, electricity, irrigation), etc. – not only on the land directly farmed but also for the benefit of local communities. When potential investors realize how high such additional costs will be and how slow returns on money spent, they back off [51].

Apart from actively trying to attract foreign investors, African governments are key players in land grabbing also in other ways. Land in Africa is usually not under private ownership. Various ‘communal’ systems dominate and the state has assumed the role as custodian but direct power over land-use normally rest with traditional institutions and local chiefs. People enjoy varying and overlapping use rights but seldom own the land they farm.<sup>1</sup> In order to make large land leases possible, land usually has to be transferred from communal to state land. Hence, potential foreign investors must make contracts with the state. On the one hand, this leaves ample room for corrupt practices. On the other hand, governments must first “grab” – i.e. confiscate – communal land before lease deals with foreigners can be signed.

Not only the ‘state’ but domestic elites at all levels – governments, politicians, public servants and local chiefs – are active grabbers also in other respects. Deininger et al found that domestic investors are more prevalent than foreign ones [7]. Also Mosley found that, in Ethiopia, domestically sourced projects out-numbered foreign projects [52].<sup>2</sup> Domestic elites in a number of countries grab land and enrich themselves by registering former communal land as their own private property and by turning previously ‘free’ peasants into migrants, tenants or sharecroppers [53] [54] [55] [56]. It is no coincidence that the largest landowner in Kenya is the Kenyatta family [57].

On the one hand, this reflects the greed of the political elites. On the other it also reflects the “longstanding and ongoing struggles between chiefs and states” [48] [58]. Competition over land and land-use in Africa has many dimensions. In Africa, nation-building is still an unfinished project [59]. And nation-building is in large degree a matter

<sup>1</sup> Whereas citizens can obtain private land titles (but seldom do), foreigners cannot own land. Hence, they must lease.

<sup>2</sup> However, since foreigners acquire larger land areas, it is still to some extent motivated to talk about foreignization.

of control over land [58]. In general the state's outreach in rural areas is limited and African politics continue to be governed by the logic of patronage [60]. Hence, access to land has been – and still is – a “major instrument of patronage favoring the political elite” [48]. It is thus not only foreigners who acquire land at (seemingly) heavily discounted prices. Patronage is a sign both of the weakness and of the fragile legitimacy of African governments.

This fragility and the as yet unresolved conflict over authority have been accentuated by recent misfiring attempts to attract foreign investments in land. One such confrontation occurred in Mali in 2011. An alliance of “peasants and indigenous people” challenged the Malian government's decision to lease 800.000 hectares to foreign investors, pointing out that “communities had occupied land for generations; how could a Mali state which had ‘only existed since the 1960s’ claim sovereignty?” [61]. Similarly, in 2009, the government in Madagascar provoked mass protests and was actually toppled after having, in the previous year, attempted to lease 1.3 million hectares of farmland to the South Korean company Daewoo logistics [62].

These examples show that there are risks involved, not only for the leaser but also for the provider – at least when deals are large-scale. This, to judge from the literature, has not discouraged governments from searching external solutions. It is sometimes argued that African politicians (and donors) “hold a widespread belief that large-scale plantations are needed to ‘modernize’ agriculture” [50] [19] [2] and therefore flirt with transnational agribusiness. As suggested elsewhere [56], we do not know what African politicians believe. A more based explanation, that better reflects a stern reality, would be that they believe they have no other choice. With widespread rural poverty, hunger riots and after decades of being squeezed economically and having been rolled back under structural adjustment, and with considerably reduced development aid since the 1990s – especially for agriculture – governments apparently see no other options.

## SUMMING UP SO FAR

Our understanding of the issue of “land grabbing” remains incomplete. The issue is much more complex than most writings account for. Above, I have suggested that the drivers behind land grabbing in Africa are others than those most commonly mentioned (population prospects, rural poverty and limited domestic investment potential rather than contemporary global food- fuel and financial crises). The recent food- fuel and financial crises may have aroused an interest among northern companies to look elsewhere for resources and investment opportunities. However, the magnitude of “land grabbing” appears to be exaggerated in most writings (inflow of FDI apparently insignificant, limited geographical spread, only a small share of intended deals actually materialize as on-the-ground investments). Even though local inhabitants sometimes suffer from dispossessions and unfulfilled promises, and even though some foreign investors perform in less than desirable ways, worries about negative consequences of foreign investments in land seem to be exaggerated as well (only few cases of evictions found). In most cases, the actual impact remains to be seen. And I contend that the principal actors are not those that they were supposed to be. In my interpretation, the prime grabbers (the principal agents) are African governments – not external actors – who register communal land as state land and then use it for self-enrichment, for patronage purposes and/or to attract foreign investors (so far with limited success).

It can, of course, be argued that there is a conspiracy after all. By way of aid-conditionalities and other arm twisting measures, the World Bank, the WTO and donors have forced African governments to put in place legislation that opens borders for foreign investors, thereby preparing the ground for massive invasion of transnational agribusiness [17] [15] [18] [16] [56]. But, as indicated above, we are not there yet.

Different stories can thus be told. Notwithstanding the role played by transnational agribusiness, tales of a massive onslaught on Africa from outside are too simplistic. It is therefore sobering that “the crucial mediating role played by the host state and domestic elites” [63] are increasingly being acknowledged. The often mediated claims that contemporary land grabbing leads to new inequalities likewise needs to be nuanced. Sometimes they do but on many occasions it seems rather to be the case that “pre-existing domestic inequality conditions the outcomes of these deals” (ibid). This, however, is not to say that all is well. While debates about land grabbing may become more realistic and less ideologically biased, crucial real-life problems remain unsolved.

## AN UNSOLVED DILEMMA

Africa needs to boost agricultural productivity. Estimates claim that sub-Saharan Africa only realizes 20 percent of its potential production [35]. Boosting productivity cannot be done without investments. We are back at square one. With insufficient tax-base [64], low domestic propensity to invest, and with a “hostility of African governments to domestic capital” [43], only foreign capital remains...

But even if investments can be mobilized, the question remains: what kind of agriculture will it promote – mechanized or labor-intensive, big farming or peasant-based? Transnational corporations tend to prefer big units where they can benefit from economies of scale. This has also been suggested as a solution to Africa's persistent inability feed itself [8]. However, there is little evidence to back up the idea that large-scale plantations would be a solution in Africa [50]. Deininger and Beyerlee remark: “If property rights are well defined, technology is available, markets work well,

and nonfarm sectors lead economic growth and employment generation, investment in large-scale farming can lead to positive social outcomes” [35]. In most of rural Africa, all this is missing.

Instead, a policy based on smallholders has been suggested [51] [65] [2] [66]. This is easier said than done. Previous attempts to promote smallholder agriculture in Africa have not been successful. They led to ‘spurts of production’ [66] but were not sustainable. The same non-availabilities as those hampering large-scale farming also negatively impact on a development policy from below. Moreover, African governments often do not hold smallholders in high esteem. For example, the Malawi Ministry of Agriculture has accused peasants for “not taking farming seriously” and recommends smallholders to “look at farming as a business and not just as a hobby” [67]. Some African governments have recently become more active in promoting rural and agricultural development. However, these policies have not been smallholder based [68]. Instead, politicians have opted for external solutions.

Promoting smallholder agriculture – and basing development on domestic resources – sounds immediately appealing. I use to be in favor. But how small can smallholdings become before it is useless to support them? Whichever strategy donors, governments and investors opt for, “[a]n important policy question is how the current generation of adults in the high population density areas with one hectare of land or less are going to subdivide their land among their children when they reach their old age ... and whether farming can still provide a viable livelihood for those remaining on the land” [48].

Against this background, to define ‘land grabbing’ as “controlling a scale of land which is disproportionate in size in comparison to average holdings in the region” [3] [14], is plain nonsense. African farms obviously need to become larger – and therefore fewer – and many contemporary smallholders will, in time, have to abandon agriculture and seek other sources of livelihood. A perhaps unwelcome reminder is further that the enclosures in 18<sup>th</sup> century England were not only an important part of industrialization and modern development. Some contend they were a precondition.

## THE COMMODITIZATION OF COMMONS: THE ROLE OF CIVIL SOCIETY AND ACADEMIC ORGANIZATIONS IN GLOBAL LAND GRABBING

Davide Cirillo\*

\*Human and Physical Geography, University of Padova, Italy - [davide.cirillo@unito.it](mailto:davide.cirillo@unito.it)

### ABSTRACT

Traditional societies always treated land as a common good, a fundamental resource. Land is related to almost all the productive activities vital to human livelihood. Thus the peasant and the dynamics of agrarian change become subjects of reflections and studies. It is necessary to include the figure of peasants and the agrarian question to carry out a spatial analysis linked to land. Nowadays, in the context of neoliberalism, land represents a key asset. It is facing a commoditization process due to global dynamics of capital accumulation. By analyzing theoretical and methodological issues, the present article aims firstly to ontologically present land grab and land acquisitions. By deconstructing the dichotomist cost-opportunity approach used by mainstream institutions and scholars the paper aims to answer the question posed by them. Secondly, in line with the McMichael food regime theory I point out that the current increase of land acquisitions during the last years is neither a new nor an isolated phenomena. Rather it is an uncontrolled acceleration of the historical process of commoditization and accumulation of the commons reshaping the global geography of capitalism. Thirdly, the article presents the effectiveness of the *human right based approach* used as framework by transnational agrarian movements and civil society organizations coordinating their interdependent global – local action. They propose an alternative to market economy based on the Food Sovereignty principle. Finally, according to the Italian territorialist school, I argue some remarks highlighting the negative impact of land acquisitions as growing processes of tenure concentrations and the competitive global territoriality of transnational agrarian movements using the *human right based approach* as a mediator to challenge the neoliberal globalization hegemony.

### INTRODUCTION

Traditional societies always treated land as a common good, a fundamental resource. Land was considered a continuity symbol which linked clans to their ancestors. To preserve it has been their priority to guarantee social and environmental sustainability [1] [2].

Generally, a fundamental value has been attributed to land, related to almost all the productive activities crucial to human livelihood. Moreover, the figure of the peasant is emblematic because it not only symbolizes the bond between man and land, but it has always survived through the centuries in spite of tremendous industrial innovations. Products of agricultural work, and in particular foods, become elements of expression laden with cultural and identity-making factors. Thus, the peasant and the dynamics of agrarian change emerge as subjects of reflections and studies, protagonists of the narrative related to the rural field. Therefore it is necessary to include the figure of peasants and the agrarian question to carry out a spatial analysis linked to land (land management, land tenure system and land use changes).

Nowadays, in the context of the neoliberal model, land represents a key asset. Like other resources, it is facing an increasing commoditization process due to several players committed in capital accumulation. Indeed, in recent years a new wave of investments in land by states, companies, and investments and pension funds targeted not only the Global South – which captures the attention of the literature and the activists – but almost the whole world.

The escalation of these acquisitions was firstly reported in terms of *land grab* by Grain's Report *Seized* [3], where the appendix contained a list of one hundred cases. Events confirmed the organization's complaint since that same year the Daewoo case took place in Madagascar: an acquisition attempt that has had serious consequences not only on the internal political level of the African country but also on a global scale. This case was reported by different newspapers [4];[5], who started describing the event in terms of neocolonialism and agro-imperialism. The term *land grab* was then absorbed in a mainstream trend. It was gradually depoliticized into a dialogue about development and the valuable opportunities of land acquisitions in the appreciation of the industrial large scale agriculture [6]. Even the main international institutions have studied the subject by introducing the most neutral phrase *land acquisitions* and discussing it in terms of cost opportunity, as expressed by the question: "Are the large-scale land acquisitions a risk or an opportunity for local populations?" [7] [8]. The academic community has started investigating the phenomenon

through a variety of multi-disciplinary approaches<sup>1</sup> with the intent of clarifying the dynamics, relationships and causality related to land acquisitions, encountering a number of issues that will be the subject of the next paragraph.

## THEORETICAL AND METHODOLOGICAL ISSUES: DEFINING AND RECORDING LAND GRAB AND LAND ACQUISITION.

Some methodological and epistemological issues emerge in studying land grab, both on the practical and the theoretical level, which could make research rather difficult. During the last years, after a thriving development of specialized literature, the scientific debate is questioning some issues related to this set of problems, some of which will be analyzed in this paper. As mentioned in a previous essay, the first key issue – of ontological nature – results from the lack of *consensus* on the definition of land grab [9]. Although this issue could enrich the debate, it also makes difficult data collection and comparisons – already complicated by the lack of transparency and availability of information in the field as well as by the lack of standard criteria for classifying and reporting the acquisitions [10].

Is it really possible to define as land grab all investments in agriculture involving land acquisitions? Which determinants allow us to do this? In response to these issues, we should start from the question posed by the international institutions' reports [11] [12], that is if land investments are a risk or a development opportunity. Considering the land acquisition and its *continuum* – from "land grab" to "development opportunity" (fig.1) – what kind of parameters should we consider to place the land acquisition? Looking at the figure, on the one hand, given the substantial amount of studies about local development, it will be quite easy to understand criteria usable for the evaluation of an investment project; on the other hand, it will be necessary to establish some specific criteria about the land grabbing, before proceeding.

With reference to the analysis of both the current academic literature and the international institutions' and organizations' reports, it was decided to use the term 'external actor (outside local community)' to define the agent, since the acquisitions are often carried out not only by foreign entities but also by domestic entities – sometimes these are companies or funds made *ad hoc* in order to elude rules or inquiry. According to the parameters, it is useless to refer to quantitative data (for example, the size of the estate), while qualitative criteria are preferable<sup>2</sup>. Therefore, it is possible to refer to the transnational peasant movements' actions oriented towards the so called *human right based approach* – introduction of their claims on the basis of the international law –: the right to the land becomes essential within human rights together with fairness and transparency thanks to the *Voluntary Guidelines on the Responsible Governance of Tenure of Land, Fisheries and Forests* [13]. Along with other contributions, such as La Via Campesina's Act Proceeding in Mali [14] and the Tirana Declaration [15], they give the possibility to formulate the following definition:

*Land Grab are all the investments and acquisitions of land made by external players (outside local community) belonging to private/public sector (firms, states, investments and pension funds, state owned enterprises) focusing on the Global South during the last years. Such deals happen with a lack of transparency and in violation of the human rights of local populations excluded, marginalized by the negotiation process and sometimes even evicted with violence. Land ownership is transferred by means of various transactions forms (grant, lease or purchase) and for long period of time (from 50 up to 99 years).*

Far from being exhaustive, this definition would be a starting point in stimulating the academic debate. Hoping to see it criticized, integrated and enriched, to get to a definition with a broad consensus is desired, which could facilitate the identification and census of the records<sup>3</sup>. At this point, it is possible to argue that the term land acquisition could be

<sup>1</sup> For further information on the international debate, see Borrás et al 2012 and Cirillo 2012.

<sup>2</sup> According to land grabbing and land acquisition studies, qualitative criteria are mainly used into the advocacy organizations' reports, but they become a reference for academic researches by reflex (see Rulli et al.[16], who refers to 200 hectares as parameter to define the *land grab*, with reference to the ILC's criterion to define the large-scale acquisition). A spatial criterion only referred to the large-scale would be easily eluded and it could reduce the attention or just create some tangles which should be gradually restricted. Moreover, it seems more appropriate to pay attention to the modalities and the dynamics behind these processes.

<sup>3</sup> It is necessary to point out that during the International Academic Conference on Global Land Grabbing II, organized by the Land Deals Politics Initiative (LDPI) at the Cornell University, 17th–19th October 2012 it emerged that the problematic nature of the definition is related to its ideological characterization. The term *land rush* has been indicated as the most appropriate despite the activists keep on preferring the term land grab [17].

referred to the act, while land grab is the way these actions could be managed if certain rights or conditions are not respected.

The definition proposed allows to introduce the second methodological problem of epistemological nature, which is the inadequate data availability caused by the difficulties of data retrieval and classification. This aspect needs a careful consideration on the direction that the research should take about it. In the last years' debate on land acquisitions and land grab, the numbers have great relevance. There are huge economic and political interests at stake and the millions hectares reported are useful in media communications and in political debates at all scales [20]. How do scholars have to proceed, in this regard, in the scientific field? Who posted this data? Have they been verified? How? Do they represent the main factor toward addressing the research?

These sources are characterized by a level of unreliability that affects their use for academic and scientific studies. Recent research on land acquisitions indeed refer to enormous amounts of hectares dealt without paying particular attention to empirical evidence or consideration of the scale rather than of the area [21].

At the moment almost all the quantitative data come from reports provided by investors [22] or from the newspapers whose aim is to grab credits [23].

Without a doubt we are facing an accumulation process that often passes through the eviction and expropriation of local communities; however, the publication of quantitative data could have different strategic aims depending on who collects, uses, and divulges them. Moreover, ambiguous and unreliable data could not only reduce the activists' and researchers' legitimacy and credibility, but also divert the attention from less publicized cases, players and social dynamics put at risk by the effects of this phenomenon [24]. A methodological discussion on these evidences should go beyond the big numbers and *dataset* and set a critical reflection on what it is reported, published and on which references and methods [25]. References should be always verified and be subject to a reflection, considering that:

*Every dataset has an implicit epistemology behind it. Different kinds of datasets are created for different administrative, bureaucratic, political or other purposes and always contain systematic biases [...] Who created it and why? What were the circumstances and context of its production? What accounts for its preservation, its location in an archive or its diffusion? What does it say and what are its silences? [...] one might interrogate in these ways sources as diverse as the articles in the business press that often constitute the first reports on particular grabs, or the crowd sourcing reports that lead investigators to highlight new grabs or to 'verify' unconfirmed reports. [26]*

## **FROM FOOD TO LAND REGIME? A LAND GRAB ONTOLOGICAL ANALYSIS.**

Drivers of this new land rush have been usually related to temporary events of the last years (food and oil prices hikes, energy substitution and emission reduction policies, global economic crises, investments diversification). In many instances it has been studied from a perspective that, in addition to not allowing the full understanding of its meaning, can offer neither an interpretative paradigm nor an exhaustive explanation for a critical analysis. In the light of a deeper study, and by observing the phenomenon from a wider perspective, we can try to deconstruct the debate on land grab and land acquisition releasing it from the dichotomy risk-opportunity introduced by the international institutions, typical of a neoliberal logic. In this way it is possible to identify those elements that relate the land rush and the modality of grabbing not only to some historical events but also to the dynamics of agrarian changes both on the global and the local scale.

Thus, new causality could emerge, linked to the economic policies of the current hegemonic market model. The land rush could be considered as the acceleration of ongoing processes but with new players and manners which have contributed to the redefinition of the historical geography of capitalism.

As stated before, a reflection on the land rush, without considering the terms in which it leads to reformulate the agrarian question, is unavoidable. From an economic and social point of view, land deals could be connected to the alienation of the workers from their means of production that turn the social instruments of subsistence into capital and the workers into wage laborers; to be more precise, land deals could be connected to construct of primitive accumulation [27]. According to the eurocentered Marxist theory, focused on the land exclusion process related to the enclosures phenomenon in Great Britain [28], the primitive accumulation was linked to that historical-geographical period; consequently, it was considered as the leading process of the extended reproduction, from which it would be replaced at a later stage [29]. The geographer David Harvey [30] revisits the Marxist concept. He points out that primitive accumulation practices persist also in historical and geographical context different from the one analyzed by Marx and keep on characterizing the long historical geography of capitalism not only as a primitive process. Harvey introduces the concept of "accumulation by dispossession" for the "primitive" one, in order to shift the attention to its coercive – and sometimes violent – ways.

Considering land acquisitions as a kind of accumulation by dispossession, we can relate these, on the historical level, not only to phenomena such as the British enclosures but also to the big colonial plantations, and put them on the

---

However, land rush could define a tendency which could be barely adapted to a specific case that could happen throughout the course of this tendency but which could not be classified and distinguished in that way. For further information about this debate, see Borrás et al. [18], Li [19].

time axis that examines the commoditization process and the privatization of resources such as water and land indeed (*enclosing the commons*). In White et al. [31] and Catherine Corson's studies [32], who analyses the land acquisitions in Madagascar, they are defined as the new enclosures. Therefore, it is possible to state that land acquisitions, as commoditization and accumulation processes, are strictly related to the contemporary rural crisis. Indeed, it is interesting to note that the majority of starved people in the world are not urban consumers and buyers of food, but peasants who produce and sell agricultural products. Their number is not a legacy of the past but the result of a process that is leading to poverty hundreds of millions of farmers deprived of land [33].

The McMichael's concept of *food regime*<sup>4</sup> [34] could be useful in this analysis because it allow us to connect all this phenomena. McMichael studied food system focusing on the strategic role of agriculture and food in the capitalistic global economy development and in relation to specific configurations of geopolitical power. Thanks to its historical analytical approach, the food regime theory allows us not only to identify different phases of capital accumulation. It also allows us to figure out how transnational peasants organizations reacted and thus reshaped the agrarian question in all these periods. They established indeed a political discussion space and proposed an alternative modernity.

According to neoliberal view, one principal issue in agricultural and land tenure system policies was the central role of the state. It caused market distortions like uncertainties in formal property right and agricultural investments. On this basis the needs for more formal private property right has been justified. Another element of failure was related to land acquisitions ways. At that time it was characterized by coercive expropriation and resisted by landlords. The neoliberal model identified in the 'free market forces' the fundamental mechanism to redistribution of land resources through a process of privatization and decentralization. In order to do that, barriers posed by a state centred approach should be eradicated and landlord resistance should be avoided [35].

While the '80s, which were characterized by the introduction of the structural adjustment funds and by the disillusionment of the agriculture as driving force of the development, experienced a total carelessness about land tenure reforms [36]; at the beginning of the 90s the so-called Market Led Agrarian Reforms (MLAR) started to gain attention as an alternative to the state centred approach. Such reforms became part of the neoliberal paradigm which identified the economic growth and the global market economy as the unfailing vehicle to prosperity. The MLARs were largely promoted by the International Financial Institutions and in particular by the World Bank, aiming to globally implement policies of formal private land property rights and voluntary transactions between willing sellers and willing buyers. Nevertheless empirical evidences from countries which accepted to try to adopt such a framework showed that these policies were not able to face the political power of great landlords. They not only fostered land concentration and social disorder, but unlikely could encounter the needs of and of local population and landless peasants [37] [38].

Finally, I argue the current increasing of land acquisitions during the last years is neither a new nor an isolated phenomena. Rather it is an uncontrolled acceleration of the historical process of commoditization and accumulation of the commons reshaping the global geography of capitalism. Such a MLARs implementation in a changing global geopolitical scenario, which is facing a systemic crisis let to consider the beginning of a new phase of the global neoliberal agenda that could be defined as *the land regime*. McMichael himself [39] some years ago questioned about the effects of food prices hikes catapulting the whole world toward a *post food surplus era* [40] through a food scarcity socially constructed, and commented as follow:

*As an expression of food regime restructuring, the land grab reveals a new threshold in the conversion of farming and farm land into a source of food, feed, agrofuels and general biomass to serve the needs of a (minority) global class of consumers distributed across an increasingly multi-centric global food system. [41]*

The scholar highlighted new elements from the past accumulation processes like the energetic and carbon emissions reduction questions. Nevertheless it is necessary to complement this reference by adding the speculation to the analysis. In many cases land acquisitions do not involve any productive activity nor generate labour. Land is often acquired by taking advantage of lower prices and scarcely defined governances, counting on a future price increase. Such a strategy indeed is used as an investments portfolio diversification by financial players. This new phase and acceleration in land concentration are characterized by deep technological innovations which allow huge flows of financial capital to move all around the world without any precedent in history. Volumes of financial economy largely exceeded the real economy. The land rush may be considered as a way to convert this overaccumulated unreal capital into a real one. All these elements impact on agrarian question today:

*The land-grab is forcing us to reformulate the agrarian question once again, this time "not only as a food question, but as a food and energy question", with agriculture positioned on both ends of the energetic equation. [43]*

---

<sup>4</sup> According to the *food regime* the following phases can be identified. Firstly, a state-centric period between the XIV and the XX centuries. It carried on around the Second World War. Such a period of economic nationalism was characterized by industrial capitalism and its resulting global reorganization of land tenures and property rights and by a struggle to a colonial global land grab [42]. In the aftermath, mercantilism and cold war have been trends of the postwar developmentalist interlude. During this period both blocks did state collectivization and reforms resulting in expropriations. A huge number of people moved away from rural to urban areas increasing proletariat. Since '80s/'90s the economic nationalism was replaced by the neoliberal globalization project. Such a phase of *corporate food regime* is characterized by an increasingly reduced state presence in agriculture and a consequent privatization. The transnational corporations supremacy push toward market oriented land tenure reforms.

Nevertheless, during the '90s the effects of the neoliberal model rise and the MLARs have already been noticed by peasants. They started a grassroots movement at global scale which played - and still plays - a fundamental role by opposing, studying and denouncing land grab and land acquisitions. Such a movement will be object of the following section.

## THE ROLE OF TRANSNATIONAL AGRARIAN MOVEMENTS (TAM) AND CIVIL SOCIETY ORGANIZATIONS (CSOS)

As showed in the previous sections, the new land rush and land grab are some relevant symptoms of the neoliberal globalization process. In line with several studies, it is possible to argue that during the last twenty years nation states in developing countries have been transformed by some dynamics: globalization, partial decentralization and increasingly privatization [44] [45] [46]. Such pressures on the one hand reshaped linkages between different scales -global, national and local- making them more interconnected; on the other hand they restructured terms on which people accept or resist to global neoliberal political economies (Borras 2008). Moreover these changes did not save the agricultural sector and have been challenged by many organizations and movements been transformed as well [47]. On the one hand they have been pushed to further localize – as an answer to decentralization-, on the other hand they organized toward a higher level of internationalization -in response to globalization - [48].

For rural populations to defend their access to land is relevant. It has been crucial indeed in encouraging a strong mobilization. They organized in network and coalitions from a local to a global scale going through the breach opened by systemic crisis (food, financial, energetic and climatic). Such a resistance let them call into question the hegemonic economic paradigm at a level without any precedent. In the last twenty-five years indeed peasant movements and civil society organizations (CSOs) have been able to open and occupy a political space in the global institutional arena. They finally had a voice in the decision making process about governances in food and agriculture by proposing their alternative in terms of the so called Food Sovereignty principle [49]. Borras [50] studying Transnational Agrarian Movements (TAM) like La Via Campesina defined such a space as new – due to a previous lack of representation in institutional meetings open only to officially recognized NGO and rich agricultures representatives- and distinct - because it has been defined, occupied and used by and for poor peasants and all players related to land-. Such a space anyway needs to be continuously defended, increased and redefined.

Why and how TAM have been able to succeed in their advocacy where others failed? Harvey [51] analysing social movement resisting neoliberal globalization classified them in movements against accumulation by dispossession – opposing to primitive accumulation dividing peasants from their land- and movements against extended reproduction - resisting against exploitation of wage labour and the conditions defining social salary. The author highlighted the practical and theoretical urgency to find an organic connection between these two forms. McMichael [52] pointed out how the politics of La Via Campesina unifies these two components:

*Arguably, Via Campesina's politics unites these resistances, organically, in linking the accelerated movement of food with the accelerated dispossession of the peasantry. Neoliberal industrialization of agriculture on a world scale simultaneously generates casual labour and reduces capital's wage costs.*

*Via Campesina dereifies the euphemism of 'free trade', revealing its corporate/state origins and its unequal and devastating consequences. Further, to show that the expanded reproduction of capital depends upon the generation of an expendable global wage-labour force, also shows that corporate agriculture, as such, is not simply about producing cheap food, it is also about securing new conditions for accumulation by lowering the cost of labour worldwide. It is in this sense that agriculture is central to the solution.*

*In building an organic link between movements against dispossession and against the relations of expanded reproduction, Via Campesina importunes us to recognize that accumulation is [...] about dispossessing alternative practices and foreclosing options for alternative futures. In particular, the ontology of capitalist modernity, [...] rules out a place for peasants, physically expelling them from the land, and epistemologically removing them from history. Conversely, the ontology of the food sovereignty movement critiques the reductionism and false promises of neoliberalism, positing a practice and a future beyond the liberal development subject, and the science of profit. This emerging ontology is grounded in a process of revaluing agriculture, rurality and food as essential to general social and ecological sustainability, beginning with a recharged peasantry.*

Among the reasons which touched off the emergence of La Via Campesina in 1993 indeed it is possible to recognize the establishment of the World Trade Organization (WTO) and the acknowledgement that agricultural policies will be decided globally. It became crucial for peasants to be able to defend their interests in the institutional arena at that scale. It is useful to notice that in all debates and negotiations about agricultural policies inside international institutions the voice of peasant movements never pronounced any judgement. They have always been absent. Paul Nicholson, European represent of La Via Campesina *International Coordinating Committee* confirmed such an absence by affirming "The principal reason of the existence of La Via Campesina is to be that voice to the creation of a more just society [53]". In fact the presence of non-state actors at the first *World Conference on Agrarian*

*Reform and Rural Development*, held in Rome in 1979, has been limited only to international officially recognized NGO and specifically to the *International Federation of Agricultural Producers* (IFAP)<sup>5</sup>. Nevertheless IFAP was only representing the interests of large scale market oriented agricultures [57]. The official debut of La Via Campesina in the international political arena was in 1996 at the Forum of Civil Society held in conjunction with *World Food Summit* organized by FAO. On that occasion La Via Campesina started to lay the foundation for what internationally has been known as its most important international campaign: the declaration of the *Food Sovereignty*<sup>6</sup> principle. The Food Sovereignty indeed was not only the key concept of the *Global Campaign on Agrarian Reform* (GCAR) launched in 1999 in opposition to MLARs, but the centre of the alternative model proposed by the most part of TAM using the so called *Human Rights Based Approach*. A common significance of the concept of 'land' indeed has developed inside GCAR during the years and it has finally been deeply connected with the right to food. In fact in the Food First International and Action Network (FIAN)'s view the right to land represent the fundamental precondition to the right to food. FIAN's allied with La Via Campesina in 1999. It actively worked with the movement about GCAR development and promotion. The aggressive promotion of MLAR by the WB has thus actively contributed to strengthen such broadly shared right oriented meaning significance of land.

Although several differences in terms of ideology and classes, almost all activists of La Via Campesina agree on the idea that 'land is crucial for peasant survival'. Nevertheless, the effective control of resources has always been monopolized by landlords and this shows the need to redistribute land to landless peasants. MLAR will not be able to do that, on the contrary it risks to frustrate any effort [60]. Such a strong opposition to MLAR constituted a key element facilitating not only the acknowledgement of a common principle but even the progressive affirmation of GCAR. At the same way, identification of WB – main MLAR financier and promoter - as a common opponent helped to face such high diversities inside La Via Campesina [61].

The innovation of the approach used by the movement lies not only in the connection between food and land with human rights, but also in the introduction of an alternative model of rights: the collective dimension above the individualistic one -prerogative of the utilitarian neoliberal model-. In the movements' view indeed problems in governance related to food and agriculture should be considered at all scales as they are interdependent.

The need to develop and to implement such a strategy led to the establishment of another organization: the *International Planning Committee on Food Sovereignty* (IPC). Such a broad network grouping not only TAM as La Via Campesina but also commercial agricultural unions and other NGOs – member at the same time of other organizations as the International Land Coalition (ILC) - count around 500 rural organizations all around the world. IPC consist of a space of representation and comparison for millions of food producers. Although as other movements and organizations it has inevitably to face strong internal ideological and class differences of the several members, IPC is a platform allowing active participation to decision making processes about food and agricultural policies through facilitations between NGO and peasant movements and international institutions as FAO [62]. Since 2003 IPC assisted participation of more than 2000 small scale food producers and indigenous populations representatives in FAO conferences. IPC served as mouthpiece of the will of an alternative model to free market and agribusiness [63]. Finally it led an ideological diversification in this political space [64].

A first interaction opportunity with international institutions arrived in March 2006 during the *Conference on Agrarian Reform and Rural Development* (ICARRD). The IPC refused to participate at the official conference and preferred a parallel civil society forum with opportunity to interact with official deliberations. During that conference the right to land and its importance - not only in economical but also in cultural socio-political and historical terms- have been officially recognized [65]. The final ICARRD declaration was the base for the FAO's initiative launched in 2009. The main aim was the development of a practical code of conduct for governments to improve governance on natural resources according to the shared recognition that clear tenure systems and fair access to land, fishery and forests are crucial to reach food security and the right to food. Thanks to an inclusive process with strong participation of international organizations and peasant movements to a long series of meetings, the civil society elaborated its proposal presented and negotiated with member states. The result has been the document *Voluntary Guidelines on the Responsible Governance of Tenure of Land, Fisheries and Forests* ratified and came into force in 2012. Despite being voluntary the code clearly refers to some human right obligations and links them to natural resources. Moreover it contains a guide section about the practical implementation. Arguably the *Voluntary Guidelines* have some weaknesses.

Firstly they did not obtain inclusion of water as a resource linked to land, secondly they have been too weak in giving priority to small scale food producers and finally to protect indigenous populations – although they are already recognized by others international codes; nevertheless the *Voluntary Guidelines* doubtless represent an almost unheard-

<sup>5</sup> L'IFAP is one of the oldest transnational agrarian movements. It has been founded in 1946 by commercial oriented associations of agricultures mostly from industrialized countries which led the organization up to 2008. IFAP became the agricultural sector principal organization and obtained the status of official representative during international intergovernmental institutions meetings [54]. IFAP policy is almost related to the interests of its most economic powerful members [55]. In IFAP's view neoliberalism is an opportunity and it always approved it [56].

<sup>6</sup> The *Food Sovereignty* principle first appearance was during the '80s in Central America. It was the answer to the structural adjustment programs which cancelled public support to agriculture and included food imports from the United States. At that time food sovereignty was mainly thought as 'national food security' and linked to the right to continue produce locally [58]. *Food Sovereignty* has been internationally stated in 1996 at the NGO forum of the *World Food Summit* as: "the right of every nation to preserve and develop its own capacity to produce food in regards of cultural and productive diversity [59]. The principle evolved during the following years and lies today on 6 pillars as stated in the 2007 "Nyéléni Declaration" for more info: <http://www.foodsovereignty.org/FOOTER/Highlights.aspx>.

of step forward not only in the application of the *human rights based approach* but also in making good use of circumstances and results of the collective struggle.

## FINAL REMARKS

In the present paper we highlighted some methodological and theoretical issues emerging while studying the recent land rush and land grab. It is possible now to try to answer the upcoming questions raised by the close examination done in this text.

By deconstructing the land grab and land acquisitions discourse - which, as previously pointed out, a neoliberal trend has gradually de-politicized and brought on a dichotomist cost/opportunity level -, it has been possible to highlight the social dynamics presiding over the changes in land use pertaining to the phenomenon in point. Focusing on spatial analysis it is possible to recognize this wave of land acquisitions as the effects of a neoliberal political economy at a global scale. From a geographic perspective, such land use changes could be considered as what Turco [66] defines widespread deterritorialization and reterritorialization processes. In land acquisition processes territory is structured by a growing privatization and reified by a intensive use or speculation on land. Moreover I also pointed out that by assuming the definition of land grab proposed in the first section, it would be possible to distinguish it from land acquisitions and consider it as a way they are done. Finally I argue that land acquisitions are processes of commoditization and progressive resources accumulation. Land deals are often realized by means of predatory practices which lead us to talk about grab which in turn could degenerate in conflicts. Anyway, may they be acquisitions, or may they present features of land grabbing, the increasingly land tenure concentration toward a reduced number of owners implies a growing competition which collides with concepts like cooperation, sustainable development and common good, but will profit few people at the expense of many. *Rebus sic stantibus*, I argue that land acquisitions could neither be useful to achieve target like poverty eradication and food security nor be considered a development opportunity. According to a critical approach to neoliberalism, land acquisitions should be avoided because they are part of this unsustainable economic model. Such a model in fact considers economy as absolute: free from any tie with social and environmental spheres. On the contrary, these three aspects should never be neither divided nor differentiated. They are part of a whole and can't be separated in any kind of political economy or territorial planning analysis aiming to achieve sustainability.

In this background TAM and other kind of CSOs try to resist to what Raffestin [67] would define neoliberal exclusive territoriality<sup>7</sup> by reshaping capitalism geography through the achievement of a new territoriality using the human right based approach as main mediator to reduce relations asymmetry in the global political arena. TAMs in fact chose to propose their alternative to the 'market' basing on the food sovereignty principle which considers land and food as fundamental rights. The achievement of the *Voluntary Guidelines* represent an unprecedented turning point. It was not the conclusion but the beginning toward the establishment of a new *modus operandi* in decision making processes related to global policies. Moreover, despite maybe not being the most effective one, it demonstrated that an alternative perspective to market economy is possible. The political space once opened, should be continuously renegotiated and redefined in order to face internal and external issues due to the strong heterogeneity which characterizes TAM and CSO.

<sup>7</sup> Raffestin reflected on the concepts of space, territory, and territoriality. After having elaborated a relational problematic, the authors understood the necessity of deriving these concepts from each other, privileging, naturally, the activity of the actors (Raffestin, 1980). The territoriality is simultaneously a system of relations with material and immaterial realities and a system of the representation of these realities.

## LARGE-SCALE LAND ACQUISITIONS AND FOREIGN DIRECT INVESTMENTS: A CHALLENGE FOR INTERNATIONAL LAW

Stefano Montaldo\*

\*Department of Law, University of Turin, Italy - [stefano.montaldo@unito.it](mailto:stefano.montaldo@unito.it)

### ABSTRACT

Foreign acquisitions of land for agricultural use in developing countries caught the increasing attention of the international community in the last years. Several factors such as the generally large size of the deals, the lack of transparency and incompleteness of contracts and the risk for local communities' rights led to fears of land grabbing. Indeed, large-scale land allocations mainly affect high-value lands, due to their agricultural production capacities or to the availability of abundant waters for irrigation. After the season of nationalizations boosted by the decolonization process, this modern rush to the conquest of foreign agricultural lands is often led by private actors, namely multinational companies, which on their part benefit from the support of some governments fostering international direct investments in farmable lands. As far as the legal perspective is concerned, large-scale land acquisitions raise remarkable questions on the need for a tougher regulation of multinational companies' activity, as well as on the role that international institutions and civil society are (or should be) called to play. To this regard, the paper briefly analyses recent agricultural land acquisition trends, then focusing on the main reactions to this phenomenon and to its shortcomings. In particular, the paper aims at considering the efforts that international actors have put in place in order to set up principles and guidelines allowing for a proper balance between foreign investors' interests and local needs. To this regard, the analysis is centred on three aspects: the effectiveness of multinational companies' self-regulatory solutions; the role of international law instruments; the debate on the adoption of an international code on large-scale land acquisitions: the analysis highlights the absence of specific binding *ad hoc* international instruments, thereby claiming for the adoption of hard-law rules to properly address the phenomenon.

### INTRODUCTORY REMARKS: BACKGROUND AND INCIDENCE OF LARGE-SCALE LAND ACQUISITIONS

As a complex global phenomenon, land grabbing raises several and highly debated economic, sociological and political questions, which would require an extensive and continuous study. The analysis proposed in the present brief paper is therefore limited to some rapid glances to a selection of issues that large-scale land acquisitions pose on the international stage [1].

The last few years have been characterized by a surge of interest in foreign acquisitions of land in developing countries. This trend led to fears of land grabbing, especially because of the generally large size of the deals, the lack of transparency and completeness of contracts and the peculiar features of the lands at stake. Indeed, large-scale land allocations mainly affect high-value assets, due their high agricultural production capacities or to the availability of abundant waters for irrigation. Land acquisitions involve both private multinational companies and foreign governments and have to be defined broadly, including purchase of ownership rights as well as use rights, e.g. through leases or concessions.

Taking the sociologist Sigmund Bauman's words, land grabbing has been described as a liquid phenomenon [2], which takes different shapes depending on the geographical areas and is further modelled in various forms by the interests of the subjects involved, such as food production and supply or biofuel processing [3].

Some notes on the factual background of large-scale land acquisitions can be useful to understand the importance and the incidence of the subject under consideration. As a matter of fact, the convergence of different global crises - namely the enduring financial earthquake, the 2007-2008 food prices crisis, the increasing need for sources of energy and the environmental detrimental consequences of climate change - in recent years has contributed to the revaluation of land and to the subsequent rush to control extensive areas in developing countries.

Productive lands are therefore targets for international investments, but this trend has to be paired with the situation of local communities and balanced with their needs. In fact, according to FAO reports [4], the incidence of future population increase is expected to affect mainly developing countries, where the majority of world rural poor live. Moreover, in order to meet the world growing needs - primarily rooted in developing countries - food production would have to double by 2050. FAO also estimated that an additional 120 million hectares - an area twice the size of France or one-third that of India - will be needed to support this growth in food production, without considering the compensation required for what are certain to be losses resulting from unsustainable forms of agricultural production and the losses of

agricultural soils destined to urban sprawl [5]. Almost paradoxically, the impetuous rush to farmable lands is a process of re-territorialization, but generates de-territorialization, since host States surrender them to foreign investors [6].

In this context, the collection of precise and comprehensive data is hampered by several factors, such as the variety of the actors on the stage and of the areas at stake. The absence of an overall official record on the volume of cross-border large-scale deals has been partially obviated by journalistic inquiries [7] and by the studies developed by NGOs and international organizations in the last years. According to an estimate from the International Food Policy Research Institute (IFPRI), between 15 and 20 million hectares of farmland in developing countries were subject of transactions or negotiations involving foreign investors as from 2006 to 2011, an area which equals to a fifth of all the farmland of the European Union. More recently, Oxfam estimated that downright 227 million hectares of agricultural areas in a way or another changed hands in the last decade [8]. Still, these impressive data show huge variations and lack a clear and objective scientific basis, so that it is very hard to assess the true range of the phenomenon.

Among the main target areas, sub-Saharan African countries, Latin America, South-Eastern Asia and Caucasian States attract the most significant amount of foreign investments. Remarkable examples are the Democratic Republic of Congo, where China has acquired extensive areas in order to establish the world largest oil palm plantation, and Sudan, where huge extensions of farmable lands have been acquired or leased by South Korea, The United Arab Emirates and Egypt.

In principle, this trend presents interesting opportunities. Indeed, in the last decades, despite its economic and social potentialities, agriculture proved to be quite a neglected subject, failing to attract foreign direct investments and lacking comprehensive and far-reaching policies and reforms [9]. Injection of increasing investments by multinational corporations and foreign governments could derive in employment, transfer of technologies, increased public revenues, improved processing chains, more affordable prices, less dependence on international markets and their fluctuations to meet local and foreign communities' food supply needs.

At the same time, however, several possible shortcomings and risks can be identified, in terms of abuse of power by foreign investors or infringement of local communities' fundamental right to property and the access to adequate quantity and quality of foodstuff and freshwaters. The current wave of investments often takes place in contexts where local communities have insecure land rights and are therefore vulnerable to dispossession. Such risks are often exacerbated by the economic and political febleness of target countries [10].

## **SHAPING A NEW WORLD ORDER: LAND GRABBING, INTERNATIONAL GOVERNANCE AND THE ACTORS ON THE STAGE**

Land grabs today are influenced by past practices and historical legacies. They exhibit continuities from the past, but also diverge in significant ways and are riddled with contradictions and tensions. The emerging approach of investors to foreign farmable lands, in fact, recalls the early involvement of multinational companies in developing countries' agriculture during colonialism [11]: at that time, international investors sought the internalization of land assets, through forms of direct control over vast areas, mainly exploited for exportation purposes. This solution allowed for neutralized negotiation costs and for stable and secured food supply, which current investors on many occasions pursue as well.

After the Second World War, however, the decolonization process boosted an opposite trend, resulting in massive expropriations and nationalizations [12]. The current scenario, above briefly outlined, is now favouring the resort to the early schemes, with some peculiar features [13]. First of all, unlike in the past, land grabbing occurs in independent States, which to a different extent exercise their sovereign powers on their territories. Secondly, investors nowadays come from very different parts of the world, being Arab Gulf States, China and South Korea particularly active in this field. Thirdly, the priority of the actors on the stage is to seek for new resources to be exploited, while in the past multinational companies aimed at gaining access to new markets. Finally, the current scenario represents a large-scale and long-term process, which appears to involve higher amounts of lands than past experiences [14].

In this context, the described transboundary process goes through multiple layers of international governance mechanisms, where a constellation of public and private actors is involved.

Before considering the international scenario, it is worth briefly focusing on the traditional concept of land governance at national level. Indeed, both the international and local dimensions are opposite but complementary elements of the same phenomenon, considered from radically different perspectives.

From a general point of view, land governance traditionally refers to the rules, processes and structures through which decisions are made about the use of and control over land, the manner in which the decisions are implemented and enforced, and how competing interests in land are managed [15]. Good governance in land therefore implies the principles of universality of tenure security, equitable participation, adherence to the rule of law, sustainability, effectiveness and efficiency in the administration of land. Also, due to the extremely different local legal traditions in land tenure, it often implies the protection of land customary rights, since traditional tenure, vested in family, community or tribe, is widely accepted in many developing countries [16]. Indeed, considering that land constitutes a source of livelihoods and social security, rights concerning its use, control and transfer are not purely technical issues. Land rights are closely interlinked with the identity, history and culture of communities, a factor which makes land reforms a highly sensitive issue [17]. National land governance is deeply intertwined with the phenomenon of large-

scale crossborder farmland deals. In fact, anywhere land tenure and land administration are not effective and formalized, individuals suffer from the risk of dispossession, so that the intervention of foreign investors may negatively affect entire local communities.

On the contrary, documented rights and proper land administration offer to holders the possibility to enact legal remedies and to see their rights being upheld by a court, or even to become negotiators in the deals concerning their lands. To this regard, the World Bank estimates that, across Africa, only between 2 and 10% of the land, mainly urban, is held under formal land tenure and the extent to which national legal frameworks protect local land claims is variable but often limited. The World Bank itself concludes that countries with poorer records of formally recognized rural land tenure have attracted greater interest [18]. This is why the rising awareness on the international phenomenon of land grabbing led several developing countries to revise and reform local land planning and tenure laws, as well as their bilateral/multilateral trade, investment, and development cooperation agreements, in order to either facilitate [19] or limit land deals promoted by foreign investors and their effects on local populations [21]. Ultimately, from a national point of view, the possibility to benefit from the opportunities of economic development brought by foreign land investments highly depends on governments' capacity to guide them in the interest of their populations, for instance as far as the terms and conditions of the contracts and the supervision of their effective implementation. However, according to several scholars, both government capacity and the transparency and completeness of contracts for these recent large land deals are very problematic [22].

At global level, the notion of international governance usually refers to all the hard or - more often - soft procedures, mechanisms and institutional arrangements which the various actors involved put in place to address crossborder issues. To this respect, land grabbing is causing a major shift in the perception of natural resources, from elements under national sovereignty to meet individual and collective essential needs to commodities for the global market. Such change involves new balances at global level, which the international community, thanks to the early efforts of the FAO UN Agency, has been trying to address as from the late seventies. That early commitment was the first step of a longer path, which is worth briefly resuming and which led to an increasing awareness on land-related issues on the supranational stage.

In fact, the first attempts to establish formal international governance for land occurred on the occasion of the FAO World Conference on Agrarian Reform and Rural Development (WCARRD), which was held in Rome in 1979. The conference was intended to set up an international legal and institutional framework to foster rural development and land reforms, especially in developing countries [23]. However, the objectives underpinned during the Conference were soon abandoned, mainly due to the lack of political support and to the strong faith in industrialization as a motor for development.

During the nineties, the issue of agricultural lands management was listed among the key-issues to be dealt with by the Bretton Woods international organizations, and in particular by the World Bank, which, from then on, played a continuous and active role in this field. The market-led reform process upheld by the World Bank was soon flanked – or, better, opposed - by civil society commitment, claiming for justice-oriented redistributive land policies. The main outcome of this rising awareness was the Global Campaign for Agrarian Reform, promoted by the international peasant movement Via Campesina [24], which was intended to call for comprehensive agrarian reforms at the global level. In 2006, this initiative eventually led FAO to convene in Porto Alegre, in Brazil, another International Conference on Agrarian Reform and Rural Development (ICARRD). The representatives of the States and civil society organizations gathering in Porto Alegre stressed the importance of collective rights and acknowledged of the multi-faceted social dimension of land as leading principles for the next steps to be taken. The ICARRD paved the way for a season of reforms towards a more attentive approach to land deals of foreign investors in developing countries and an improved regime of land tenure in those areas [25]. In particular, the newly favourable environment brought to the adoption of the World Bank Principles for Responsible Agricultural Investments (PRAI), to incisive revisions of the 1998 Equator Principles on the proper management of the projects finance by the World Bank and to the early debate on FAO Voluntary Guidelines on Land Tenure. Moreover, the 2008 food crisis imposed the adoption of several initiatives by other supranational actors, such as the G8, the G20 Forums and the Doha World Economic Forum, the former launching a New Alliance for Food Security and Nutrition [26]. In the meanwhile, civil society and NGOs have been spreading awareness on the possible shortcomings of the current wave of crossborder investments in agricultural lands.

In general terms, this entangled scenario marks some significant changes in the world order, which can be summed up in the concepts of multipolarity and fragmentation. Indeed, land grabbing is a key-example of the emergence of new protagonists on the international stage, willing and able to flank and even overcome traditional sovereign States. First of all, the phenomenon under consideration marks the transition to a new political and economic balance, mainly due to the raise of the BRICs and the strengthened influence of new OECD countries, such as South Korea and Arab Gulf States. Multipolarity and fragmentation are also testified by the shift of authority from States to an increasing number of international organizations [27], often highly specialized and endowed with significant political or even deliberative powers. As far as the policies on arable lands are concerned, a key-role is played by the World Bank, whose development strategy supports large-scale investments, the FAO and the UN Committee on World Food Security (CWFS), which carried out several studies on the subject and adopted important soft-law international instruments. Another remarkable calibration of traditional balances regards the role of private actors in global land governance: NGOs, transnational business lobbies, multinational companies, media and several other subjects take active part in this mechanism, often supporting opposing interests [28]. On the one hand, on many occasions, they are involved as

stakeholders in State projects and practices; on the other hand, they often launch their own initiatives, which can be of a great significance for the evolution of large-scale land deals. The first case can be exemplified by referring to the International Standards Organization (ISO), a formerly public network of national bodies which adopts common global technical standards often able to influence and orient national and international regulatory choices or judicial decision-making [29]. The second can be represented by self-imposed codes of conduct, which sometimes multinational companies adopt in order to orient their investment campaigns and to highlight to consumers and to the public opinion their efforts to avoid any violation of local communities rights through their activity [30].

Many further examples could be listed, but it is worth considering more in-depth some of the outcomes of the described multipolar and fragmented global land governance, namely the main soft law and hard law instruments concerning investments in land and land-related rights.

### **THE WORLD BANK PRINCIPLES FOR RESPONSIBLE AGRICULTURAL INVESTMENTS (PRAI) AND THE EQUATOR PRINCIPLES (EPS)**

Many large-scale investment projects are made possible thanks to long-term loans or insurance and financial guarantees, often provided by banks and international financial institutions. In the past decades, many of these projects were put under scrutiny by the international community, due to the detrimental effects that their implementation had on the environment and to the massive human rights violations that some of them caused. This is the main reason why in 1998 the World Bank adopted the Safeguard Policies and Performance Standards. Such set of standards was aimed at selecting the projects to be financed by the World Bank and its subsidiary - the International Financial Corporation (IFC) - thus trying to avoid any adverse consequence. This initiative was welcomed by the international community, but its effects were formally confined to the projects financed by that international organization [31].

However, the Safeguard Policies paved the way for more extensive and effective instruments and worked as examples for all public and private financial actors. As a matter of fact, in 2002, nine international banks and the IFC started to negotiate the adoption of a more comprehensive document, which was launched in 2003 under the name of Equator Principles (EPs) [32]. The content of the EPs highly reflected the 1998 World Bank Performance Standards and was later on updated in 2006 and 2012.

According to the preamble of the Principles, the EPs are to be defined as a credit risk management framework for determining, assessing, and managing environmental and social risk in project finance transactions. Accordingly, the main objective of the Principles is to ensure that large-scale projects and their implementation meet specified social and environmental requirements, thereby reducing the risk of operations in developing and non-high income OECD countries where adequate state regulation is not in place [33].

The EPs apply to all projects whose capital cost exceeds 10 million US dollars and which are promoted by any of the 77 financial institutions that nowadays adhere to them. The actual number of EP-compliant debt offerings is in fact significantly higher than the formal number of participant institutions, because the EPs apply to all loans involving one of them among multiple non-member parties [34].

From a formal point of view, the EPs system is an international private association, headed by a steering committee composed by 13 elected members, which oversees the development of the Principles and issues periodical guidelines. Even if the daily implementation of the Principles is left to each member individually, every year a report on financed projects is published, in order to underline best practices and align the waves of investments to the EPs.

At present, the core Principles are ten and include the review and update of social and environmental risks; a social and environmental impact assessment for every project; the development of management plans to address assessed risks; the independent review of projects and risk assessments; grievance mechanisms that ensure the good social and environmental performance of the project; compliance with host country laws and regular reporting to local authorities.

EPs are increasingly relevant for land grabbing, since most of the investments in this field are long-term and large-scale loans, requiring project financing and multiple international investors, cases which the EPs primarily address. Moreover, on the occasion of the 2012 reform of the Principles, the members agreed to insert specific references to land uses and access. In particular, Performance Standard 5 on land acquisitions and involuntary resettlement recognizes that project-related land acquisition and restrictions on land use can have adverse impacts on communities and persons that use this land. Involuntary resettlement therefore has to be in principle avoided and in case it proves to be unavoidable it should be minimized through carefully planned and implemented economic and asocial measures, capable of mitigating its impact. Performance Standard 7 on indigenous peoples and natural resources subject to traditional ownership or under customary use imposes the principle of free, prior and informed consent of local communities involved on projects with potential significant adverse impacts on their lives; instead, Performance Standard 8 focuses on the need to protect the cultural heritage of the areas at stake.

Some authors criticize the EPs, since they never take a truly restrictive stance on potentially dangerous projects, instead applying mitigation, compensation and negotiation strategies to reduce the negative repercussions [35]. Others criticize the vagueness of the Principles and the extensive discretionary power conferred to each member in the operation of the system, which lacks a clear and strict guidance. Moreover, from a substantive perspective and despite the high-sounding goals of the Principles, the system lacks transparency and disclosure requirements, so that its external accountability is weak. At the same time, members are in most cases market operators, which are inevitably more

attentive to their clients' interests than civil society or local communities claims [36].

In conclusion, the EPs mingle the efforts put in place by international financial institutions and the search for increasing reliability by financial operators, but are to a large extent deprived of the necessary tools and instruments to effectively and individually bind each adhering member.

## **THE FAO VOLUNTARY GUIDELINES ON THE RESPONSIBLE GOVERNANCE OF TENURE OF LAND, FISHERIES AND FORESTS**

As already mentioned, in 2006 many FAO members gathering at the ICARRD agreed on the need to put in place adequate efforts to ensure secure and sustainable access to land and other natural resources, as an elective means to fight against widespread rural poverty. In particular, the final acts of the ICARRD stressed the importance of an improved land tenure, in order to formalize and clarify existing land rights.

In 2009, stemming from this shared commitment and inspired by the similar experience of the 2004 Voluntary Guidelines to Support the Progressive Realization of the Right to Adequate Food in the Context of National Food Security, the FAO launched the negotiations for the adoption of Voluntary Guidelines on land and other natural resources tenure.

The negotiation process took more than three years and was highly participatory, since it involved several public and private stakeholders at national, regional and global level. In particular, negotiations took several subsequent steps, at each stage of which the drafts of the final Guidelines were publicly submitted to any interested actor, for proposals of alternative formulations or amendments. The text was finally adopted by the CWFS during a special session, in May 2012, as a comprehensive guide to governments to improve land, forests and fisheries governance [37].

As the official title suggests, the Voluntary Guidelines are not intended to establish new legally binding obligations, nor replace existing international treaties and principles. However, they explicitly and continuously refer to existing binding international human rights obligations and provide interpretation and guidance on how to implement these obligations in the specific field of land and further scarce natural resources.

The document constitutes a framework for natural resources-related policies and is divided into seven parts: responsible governance of tenure; the legal recognition and allocation of tenure rights; transfers and other changes to tenure rights, such as restitution and redistributive reforms; administration of tenure; responses to climate change, natural disasters, conflicts and other emergencies; the promotion, implementation, monitoring, and evaluation of the Guidelines [38].

Despite the ambition to adopt a comprehensive document, given the fact that land and natural resource tenure issues vary considerably across the world, each part of the document does not apply in the same way to every State. This also derives from the principle of common but differentiated responsibilities, a cornerstone of international environmental law, according to which developed States bear major burdens in the international pursuit of sustainable development, due to the high pressure that their societies place on the global environment. An essential aspect of the implementation process proposed by the Guidelines is the setting up of national roundtables and platforms for dialogue with the stakeholders. These *fora* are intended to identify the main problems and possible solutions when implementing the Voluntary Guidelines at the national level. At the global level, the Guidelines are an accepted standard set by the CWFS in the field of food security and nutrition, so that all relevant UN agencies are asked to support their implementation [39].

As to monitoring processes on the global situation, States and other CWFS participants are currently discussing the potential design of a CWFS-based monitoring mechanism, with several proposals under consideration. One option is an independent body endowed with the duty to record progress in improving governance of tenure; according to a second option, States would present reports on their efforts to implement the Voluntary Guidelines, that would be peer-reviewed by other CFS participants.

## **THE ROUNDTABLE ON SUSTAINABLE BIOFUELS (RSB)**

The RSB was established in 2007 as a reaction to the widespread criticism on the sustainability of extensive production of biofuels. Besides environmental concerns, the economic and social impact of biofuel projects poses severe challenges, mainly due to the vast areas needed, the adverse effects on wildlife habitat and local food production and the insufficient impact on local employment rates [40]. The RSB is a platform which highly reflects the multipolar and fragmented essence of global land governance, since it involves multinational companies, organizations from civil society and public actors interested in the field at stake. Among the others, the World Wide Fund for Nature (WWF), the United Nations Environment Program (UNEP), Royal Dutch Shell, British Petroleum, Toyota and several national governments are actively involved in the Roundtable, whose main goals are to establish criteria for sustainable biofuel production and a voluntary certification scheme for produced and processed biofuels based on these criteria.

The participation in the RSB decision-making and revision process is organized in a chamber system. The core deliberative power is conferred to the steering committee, an elective body, to which applications to join the platform have to be addressed. Candidate stakeholders can apply to join one of seven chambers, depending on their legal nature:

farmers and growers of biofuel feedstock; industrial biofuel producers; retail/blenders, transportation industry, bank/investors; rights-based NGOs and trade unions; rural development or food security organizations and smallholder farmer or indigenous people organizations; environment conservation and climate change organizations; and intergovernmental organizations, specialist agencies, governments. The Roundtable adopted twelve principles and criteria for sustainable biofuel production, such as legality, respect for land and labor rights, decrease of greenhouse gas emissions, local food security, conservation of biodiversity, protection of soil and freshwaters quality and availability, minimization of air pollution. Some of these standards and principles have been specifically applied to projects of acquisition of extensive agricultural areas, to grow crops for biofuel processing.

Despite its soft-law nature, the RSB principles were adopted taking into account the existing international legislation on biofuel production and their formulation is much more stringent than other similar instruments. For instance, according to principle 12 on land rights, no involuntary resettlement shall be allowed for biofuel operations and also in cases of unresolved land tenure disputes biofuel operations shall not be approved. One of the core- aspects of the Roundtable is a system of certification, a complex process through which interested stakeholders obtain from an independent third party the issuing of a certificate to confirm the respect of every RSB principle and standard. However, the reliability of this certification system is under criticism, mainly due to the lack of transparency of the evaluation process [41].

### **NATURAL RESOURCES GRABBING AND FUNDAMENTAL RIGHTS: INTERNATIONAL SOURCES ON THE RIGHT TO FOOD AND WATER**

In June 2009, Olivier De Schutter, the UN Special Rapporteur on the right to food, issued a report on a set of principles to address ‘the human rights challenge’ of large-scale acquisitions and leases of land. The document highly reflected the ongoing scholarly and social debate on the legal status of the right to individual access to adequate quality and quantity of food and freshwater resources [42]. In the context of further initiatives at global level, such as the adoption of guidelines on land policies and governance by international and regional organizations, which the principles fostered, the report was intended to ensure that negotiations leading to land acquisitions and leases complied with a number of procedural requirements, including the informed participation of local communities. They also sought to ensure that such transactions should allow for adequate benefit-sharing, and should under no circumstance trump the human rights obligations of States. To this regard, the document is the result of the independent work of the Special Rapporteur and did not undertake an international negotiation process, but they can be seen as summarizing and aggregating the relevant and applicable existing human rights obligations of States. In this perspective, they differ from other soft-law instruments such as the CWFS guidelines, since they do not provide for new implementation mechanisms and are limited to the indication of the (in general pre-existing) international obligations of the States.

The report puts forward several proposals on four main human rights focuses: the right to food; the rights of local communities, with a particular accent on self-determination; the right of indigenous peoples; the right to social and economic development of land users and agricultural workers.

As far as the right to food is concerned, the international legal background clearly binds each State to ensure sufficient, nutritionally adequate, and safe food to anyone under its jurisdiction. According to article 11 of the International Covenant on Economic, Social and Cultural Rights, this obligation entails the access to the minimum essential food, so that everyone can be free from hunger. The State is also obliged to refrain from infringing on the ability of individuals and groups to feed themselves, where such an ability exists, and to prevent third parties from encroaching on that ability. As a third aspect, the State is called upon to actively strengthen the ability of individuals to feed themselves.

According to many authors, similar obligations refer to freshwater resources, despite no international binding provision expressly acknowledging the right to water can be detected so far. To this regard, the UN Under-Commission on Human Rights remarked in the Preamble of the Resolution 2002/6 “*the urgent and persistent need for increased attention and commitment by all decision-makers to the right of everyone to drinking water supply and sanitation*”. At the same time, the UN Committee on Economic, Social and Cultural Rights launched the General Comment No. 15, wholly devoted to the right to water, according to which States are under the duty to adopt all the measures necessary to grant the access to water resources without any kind of discrimination: “*States have a constant and continuing duty to move as expeditiously and effectively as possible towards the full realization of the right to water*”.

Grounds for a possible right to water could be found out among the several inter-state rights and duties concerning environment and shared natural resources, the largest part of which was mentioned in the UN Convention on Non-Navigational Uses of International Rivers and Lakes [43]. A notable contribution comes from several conventions on the duties of States with reference to particularly “weak categories” of people: while asserting the rights to life and health, they often mention the importance of sufficient quantity and quality of water resources. For instance, article 14, paragraph 2, of the UN Convention on Elimination of Discriminations against Women (1979) declares that every woman would have to benefit from adequate standards of living, there included the water supply for domestic and hygienic uses. A similar provision can be found in the UN Convention on the Rights of the Child as well, thanks to which States are bound to the protection of children’s health, even by the means of the higher quality of freshwaters they consume (article 24, paragraph 2). Other potentially relevant instruments are those regulating armed conflicts,

which entails the necessity to protect civilians, to discipline occupied areas and prisoners of war's treatment. Among the others, a special attention can be devoted to the Geneva Convention relative to the Protection of Civilian Persons in Time of War, which prohibits to attack or damage any kind of facility necessary to civilians' survival, such as water distribution networks and sewage treatment facilities.

As to land users and indigenous peoples' rights, the report highlights the importance of the principle of self-determination, as described in article 1, paragraph 2, of both the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights, according to which all peoples are entitled to freely dispose of their natural wealth and resources and may not be deprived of its own means of subsistence.

To this respect, the document first of all focuses on the possible adverse effects of land evictions, quite a spread and neglected problem in many developing countries. As clarified in general comment No. 7 (1997) of the Committee on Economic, Social and Cultural Rights on the right to adequate housing (article 11, paragraph 1 of the Covenant), the protection against forced unlawful evictions is a component of the right to an adequate standard of living. The document makes reference to the 2007 UN Special Rapporteur on the right to adequate housing, according to which evictions must be authorized by law only in exceptional situations, when mandatory general interests have to be pursued, and in any case they have to be regulated so as to ensure full and fair compensation and rehabilitation.

Moreover, access to land for indigenous peoples has been given specific forms of protection under international law. Articles 13 to 19 of ILO Convention No. 169 (1989) concerning Indigenous and Tribal Peoples in Independent Countries relate to land rights. Under article 8, paragraph 2 (b), of the United Nations Declaration on the Rights of Indigenous Peoples, "States shall provide effective mechanisms for prevention of, and redress for, ... any action which has the aim or effect of dispossessing [indigenous peoples] of their lands, territories or resources." Article 10 of the Declaration guarantees the right not to be forcibly removed from their lands or territories, and no relocation shall take place without their free, prior and informed consent and after agreement on just and fair compensation and, where possible, with the option of return. Articles 25 and 26 of the Declaration, in addition, recognize the distinctive spiritual relationship of indigenous peoples with their traditionally owned or otherwise occupied and used lands, and that they have the right to own, use, develop and control these lands. States must therefore give legal recognition and protection to these lands, territories and resources, with due respect to the customs, traditions and land tenure systems of the indigenous peoples concerned. Furthermore, article 32 of the Declaration embodies the principle of good faith, free, prior and informed consent, which the Special Rapporteur includes in his report as an essential requirement for any large-scale land deal.

In conclusion, in order to address such challenges, Principle 1 suggests the negotiations leading to investment agreements be conducted in a fully transparent manner, and with the participation of the local communities whose access to land and other productive resources may be affected as a result of the investment agreement. In considering whether or not to conclude an agreement with an investor, the host government should always balance the advantages of entering into such an agreement against the opportunity costs involved, in particular when other uses could be made of the land available, which could be more conducive to the long-term needs of the local population concerned and the full realization of their human rights.

## **CONCLUDING REMARKS.**

The proposed brief analysis leads some conclusive remarks, which are intended to search for some common trends in the fragmented and multipolar phenomenon of land grabbing, through the eyes of a traditionalist legal observer. Indeed, we would like to apply to the several efforts to face agricultural lands acquisitions-related challenges the views expressed by Carl Schmitt in his well-known 1942 essay *Land und Meer*. In his book, Schmitt travels through the history of humanity, searching for the core it is based on and trying to link the key-concepts of land and space to the fundamental rules of any legal order. According to Schmitt, the essence of a legal order lays on territorial borders and on the involvement of a certain portion of land. The reason for this assertion comes from the ancient Greek noun "*nomos*", which appears to be rooted on the verb "*neimen*", whose meaning is recalled by the German verb "*nehmen*", standing for "to conquer, to appropriate". As a consequence, "*nomos*" first of all should be linked to the concepts of "conquest and appropriation". More specifically, the ancient Greek verb "*neimen*" has three main meanings: to appropriate, to divide and split each portion and, finally, to graze. The third meaning, in particular, entails the use, farming and productivity of the conquered lands, eventually till their consumption. Any passage from one phase to the other of this chain of appropriation, in Schmitt's prophetic view, is caused by the change of global political balances and the subsequent rush to the conquest of new lands to be partitioned, ruled and exploited. Such traditional and land-centred vision of legal orders appears to be a good description of the current rush to new lands and helps to clarify some points on the role which law is asked to play in such a highly controversial and politically influenced context. First of all, due to the particular economic and social conditions of host States, national legal orders appear to be inadequate to provide sufficient protection to local communities and their interests and needs. The imbalances between the actors on the stage must be addressed by international human rights law and international trade and foreign investments law. To this regard, on the one hand, the mechanisms of agricultural lands global governance benefit from the active participation of each category of stakeholders, ranging from multinational corporations to civil society and international organizations. Such complex network reflects the multitude of the soft-law instruments aimed at orienting the behaviour

of foreign public and private investors. On the other hand, this paradigm is neither universally accepted nor effective, since the references to internationally recognized fundamental rights are most of times deprived of any true enforcement mechanism. Therefore, compliance with guidelines, codes of conduct and self-imposed principles is left to the sole responsibility of investors, while local land owners and users have no effective additional remedies to resort to in case of violation of their rights.

## THE SOCIO-ECONOMIC IMPACT OF LARGE-SCALE LAND INVESTMENTS: THE CASE OF MALI

Astrig Tasgian\*

\*Department of Economics and Statistics, CISA0, University of Turin, Italy - [astrig.tasgian@unito.it](mailto:astrig.tasgian@unito.it)

### ABSTRACT

Starting from the assumption that the agricultural sector, long neglected by development models and policies, is crucial for economic growth and development, the paper intends to contribute to the debate on the efficacy of large-scale land investments as a way to promote rural development. Based on the results of a field survey conducted in Mali in the area managed by the Office du Niger in the region of Ségou on 5 case studies of large-scale land investments by national and foreign investors, the paper aims at estimating the impacts of these projects on local populations. Despite the limits indicated in the methodology, the survey suggests some conclusions: weak creation of temporary and low paid jobs, deterioration of livelihoods of affected population as a result of the loss of land and land resources and the absence of adequate compensation, reduced economic independence of expropriated women farmers, environmental harm (destruction of trees, risks of water grabbing by large investors and of biodiversity loss), lack of transparency and consultation with affected communities, insufficient coordination between various levels of government and inadequate monitoring by the authorities of land investments' realization.

### INTRODUCTION

Agriculture has been long neglected by development models (starting from the Lewis model in the late 1950s where capital accumulation had to take place in the industrial sector and the agricultural sector was conceived as a pure provider of labour) and by public policies. First of all, the development strategies of most developing countries have followed the Lewis model and, secondly, after the debt crisis of the 1980s the structural adjustment programs imposed on indebted countries have forced them to implement tight fiscal policies with cuts of all subsidies to agricultural inputs (seeds and fertilizers) and liberalization policies that dismantled the state marketing boards (which supplied smallholders with inputs and guaranteed them safe markets even if at low prices) in favour of private commercialization systems. However, since 2005 there has been a growing interest in investing in agriculture in developing countries and the attractiveness of land as an economic resource has increased. Most of these land investments by national and foreign actors are large-scale and are driven by various factors, such as: a) rising food prices in 2007 and 2008, due to little investment in agriculture for decades, low public food stocks, and growing food demand by emerging countries such as China and India, because of population and economic growth (which induces a change in the diet), b) the ensuing food security concerns of food importing countries with a limited amount of arable land, such as the Gulf States, South Korea, etc., that pushed them to outsource food production in developing countries, c) increasing demand for biofuel production (due to the rise in oil prices and the developed countries' policies to reduce greenhouse gas emissions associated with fossil fuels), timber and mineral extraction, d) land speculation due to expectations of rising land values and financial speculation (after the collapse of the U.S. housing and subprime mortgages bubbles in 2007- 2008 investment funds and hedge funds shifted a vast amount of money into the land market and future contracts for food commodities), etc. According to the Land Matrix data coordinated by the International Land Coalition, Africa, erroneously perceived as a region abundant in unused land, is the main target of these investments [1].

Starting from the assumption that the agricultural sector is crucial for economic growth and development, the present paper aims at contributing to the debate on the efficacy of large-scale land investments as a way to promote rural development. The debate is very intense (see among others [2-6]) and is often biased by ideological standpoints and conflicting models for agricultural development, due to the scarcity of data and evidence. This paper analyses the results of a field research conducted in Mali in the region of Ségou on 5 case studies of large-scale land investments by national and foreign investors. Section 2 examines the state of large-scale land deals in Mali and its legal domestic environment. Section 3 describes the methodology of the survey, while section 4 discusses the main impacts of the five case study large-scale investments. Finally, section 5 presents the conclusions of the study and some policy recommendations.

## THE STATE OF LARGE-SCALE LAND DEALS AND LAND GOVERNANCE IN MALI

In Mali most of the large-scale land acquisitions have taken place in the irrigable zone managed by the Office du Niger (ON), with the headquarters in the town of Ségou. Officially established in 1932 under French colonial rule to develop export crops such as cotton, needed by French textile industry, and rice for Western Africa, the ON was restructured in 1994 as a semi-autonomous government agency with authority over more than one million hectares of irrigable land in the inland delta of the Niger River from the Markala dam, inaugurated in 1947, up to Mopti and beyond. The zone population can be estimated at about half a million people and the number of small-scale family farms at over 30,000. Traditionally, with respect to the irrigated land, the ON has given a *contrat d'exploitation* for one renewable year to smallholder farmers who do not pay a rent but only a water fee (*redevance eau*) of 65,300 fcfa/ha/season. The *contrat d'exploitation* can become a safer *permis d'exploitation agricole* if the farmer is punctual with the water fee payments. The access to the not yet irrigated (non *aménagée*) land, starting from 10 hectares, takes place through ordinary and emphyteutic leases (*bail*) for 30 and 50 years respectively, renewable as many times as the two parties agree to.

In 2005 there was a call from the Malian government to big investors to invest in the ON area which has “a gravity-fed irrigation potential unique in the world”. The main reasons behind the call are the following: 1. To increase the pace of investment and extend the irrigation system in the area (due to shortage of public funds, the ON has managed to develop (*aménager*) only 100,000 ha out of a potential of 1,4 million hectares); 2. To increase rice productivity in the area, thanks to the introduction of modern technology (demographic growth has reduced the average size of the plots to 0.5-2 ha for a family of 11 members and, as a consequence, the average yield of paddy rice is of only 3.5-4 tons per hectare and the annual rice production of the area is insufficient – about 600,000 tons, i.e. half of total domestic production); 3. The pressures from multilateral organizations, like the World Bank, to open up to the private sector and foreign direct investments, starting from the structural adjustment programs in the 1980s to the IDA's Growth Support Project for Mali of 36 million \$ in 2005 extended until 2012 “to create the conditions for increased private sector investment”: the Malian Investment Promotion Agency (API) was created in 2005 as a “one-stop-shop” for business creation; 4. The political ambitions of the Malian government to modernize agriculture: Mali aims at becoming self-sufficient, and even exporter, in rice and sugar; in 2007 President Amadou Toumani Touré, during the Presidential election campaign, was emphasizing the improvement of primary production, with a predominant role of the private sector and the promotion of foreign investments in the agro-industry sector.

As a result of the call, there was a surge in large-scale land acquisitions, especially in 2008-2010. However, their estimate is rather problematic, due to the lack of transparency and the fact that the contracts of lease are not available to the public. On the basis of the documents collected (see among others [7] and [8]) and the meetings held during the research, the total land area allocated to national and foreign investors, as of March 2012, can be estimated at around 860,000 hectares, of which 70,000 and 500,000 by the ON respectively as leases and provisional *lettre d'accord de principe* (that will become a lease after approval of the necessary environmental and social impact studies) and 290,000 directly by the Malian state through a *convention* (signed between two states and preceding the signature of a lease, under condition of the realization by the investor of the feasibility studies). The number of domestic investors is greater than that of foreign ones, but over 50% of the allocated area is controlled by foreigners, due to the much larger size of their project land. Foreign investors are from various countries (Libya, China, U.S., South Africa, Saudi Arabia, France, U.K., Canada, West African countries). With respect to the main investment purposes, it can be estimated that 50% of allocations are for rice production, sometimes combined with horticulture in the dry season and livestock, 8.5% for sugar cane, 1% for wheat and 40% for biofuel production (including 7% for jatropha).

It is important to notice that the largest land allocations to foreign investors or to foreign-Malian state partnerships have been approved so far not by the ON as a lease but in Bamako by various state authorities (President, Ministry of Agriculture, Ministry of Industry and trade, Ministry in charge of the Office du Niger, Ministry of Housing, land issues and urban planning) in the form of a *convention*. This allows the investors to obtain special advantages (fiscal incentives, exemptions from duties, privileges in the access to and costs of water, and in the land utilization), which are sometimes greater than those envisaged by the Investment Code of Mali and which are not available to domestic investors. However, due to the lack of communication and coordination among the different Ministries and between them and the ON, the allocated land area is much larger than the national objectives set out in the *Schéma Directeur de Développement pour la Zone de l'Office du Niger* in 2004 (120,000 ha of additional development by the year 2020) [9].

According to the Vice-Director of the ON, Boubacar Sow, the ON has decided to slow down future concession of leases, due to the low implementation of the projects so far approved (only 15,000 ha have been put into production) and probably also because of the protests by local communities and the mobilization of local and international civil society organizations.

### Land policy and tenure

Land tenure in Mali is very complex and pervaded by ambiguities, consisting of modern law (*Code Domaniale et Foncier* and other codes as well as the *Loi d'Orientation Agricole* of 2006), which essentially confers ownership of the land to the state, and customary rights in which traditional chiefs manage the land and its use [10]. There is no security of tenure for smallholders. Although the Constitution states that “la terre est à celui qui la met en valeur” and the *Code*

*Domanial et Foncier* recognizes customary rights, they are only use rights and the state has the right to expropriate, with compensation, for reasons of common public interest. In case of compensation, usually what is compensated is not the land but only constructions, trees, crops, etc. Women farmers have the most difficult access to land and are not entitled to inherit land. A holder of a customary right can obtain a formal land title only through a long and expensive procedure.

## METHODOLOGY

### Case studies

To analyze the socio-economic impacts of large-scale land acquisitions, the following case studies were selected:

1. COVEC, a Chinese company of the construction sector, which in 1998 obtained in M'Bewani a lease of 1,050 ha to experiment high-yielding seeds in food crops and modern methods of production. The area has been developed but the initial objective has been abandoned and COVEC sublets plots to small rice producers. They pay a rent of 75,000 fcfa/ha/season including the cost of water, as against the 65,300 fcfa for the water fee paid by the farmers who cultivate rice on the ON land. Only one family lost land as a result of the COVEC project and thus the farmers' associations do not consider it a case of land grabbing.
2. N'Sukala, a partnership between the Malian government (40%) and the Chinese. The Sukala company from the '60s has invested in the production of sugar cane (10,000 ha) with hired labour and in two sugar factories. A third factory is opening in M'Bewani zone and in 2009 N'Sukala has signed a *convention* (which will become a lease when the feasibility studies have been completed) for 50 yrs. to cultivate sugar cane on other 18,300 ha. It has negotiated a water fee of only 2,038 billion fcfa for 50 yrs, i.e. about 2,000 fcfa/ha/2 seasons, which is half of what the local producers pay. This investment will cause to many old villages the loss of the land where millet has traditionally been cultivated.
3. Sosumar (Société Sucrière de Markala), a public-private partnership: the Malian government found a strategic private partner, the South-African Illovo Holdings Ltd. (70% of the capital) and a financial partner (African Development Bank). It is a *convention*, on the way to become a lease, on 39,000 ha, of which 20,000 ha for sugar cane cultivation to produce sugar (to secure self-sufficiency) and ethanol. Because of the Malian government's pressures, only 60% of the land will be cultivated by wage labourers, while 40% will be allocated to smallholders who will produce under an outgrower scheme. The state has granted for the water fee a flat rate of only 2,050 billion fcfa for 50 years. The project has been delayed by financial difficulties and the resistance of the population of 30-40 villages in the communes of Sansanding and Sibila (whose mayors support the project) who will lose the land on which they have cultivated millet for centuries. It is not ON land, but customary land. So far there is only an experimental field of 140 ha to test sugar cane varieties.
4. Complexe Agropastoral Industrial (CAI), part of the Group Moulin Moderne du Mali of the rich Malian businessman Modibo Keita. On 31 May 2010 it obtained a 30 years renewable lease of 7,400 ha in the M'Bewani zone to produce mainly wheat. Land was granted free by the government and the water charge is 2,470 fcfa/ha/year for spraying and 67,000 fcfa/ha/year for gravity irrigation. So far, some secondary canals starting from the ON primary canal have been dug and 250 ha have been developed (3 large plots each with a center pivot for spray irrigation) and wheat, maize, potatoes and rice have been produced. Also buildings for the offices of the management and technical staff and for storage have already been constructed. A total of one billion fcfa has been invested so far. *L'aménagement* has subtracted land for centuries cultivated with millet by the villagers of Diado, Sanamadougou Bamana and Sanamadougou Marka.
5. Malibya, subsidiary of the sovereign fund Libya Africa Investment Portfolio, in 2008 obtained through a *convention* 100,000 ha for 50 renewable years for production of hybrid rice, livestock and tomato processing for the regional market and for exports to Lybia. Land is granted free by the Malian government who will also finance the compensation to the affected population, and the water is charged at the same rate as CAI and can be used "without restriction" from June to December, while from January to May, when the river is low, less water intensive crops should be cultivated. Furthermore, Malibya will benefit of generous tax breaks and exemptions from duties. There has already been the construction in 2 years of a road and an irrigation canal, 40 Km long and 100 meters wide, that has caused massive destruction (see paragraphs on loss of land, trees and houses).

### Methods of the field survey

The research conducted in Mali in January-February 2012 is based on the following methods: a) collection of documents and reports; b) meetings with key informants; c) collective (focus groups) and individual interviews to a sample of the population affected by large-scale land acquisitions; d) observation of project areas and of how people live in the villages.

In Bamako I had discussions with agricultural specialists in research institutes, with Adama Coulibaly, *conseiller*

*téchnique* in the Ministry of Agriculture, with Souleymane Sidibé, *chargé de mission* in the *Ministère Délégué auprès du Premier Ministre Chargé du Développement Intégré de la Zone Office du Niger* (who talked about the prospects of foreign and national land investments in Mali), with the national coordinator of AOPP (Association of Professional Smallholder Organizations), M. Bréhima Dembélé, and its land specialists and with Chantal Jacovetti, coordinator of CNOP/LaVia Campesina. In Ségou I discussed the main research issues with prof. Souleymane Kouyaté, agricultural economist and vice-rector of the University of Ségou and with prof. Aliou Badara Ba, agronomist. I also had several meetings at the ON with the vice-Director, Boubacar Sow, and with Bakui Koné, *chef de service de l'Amenagement et Gestion du Foncier*, and I interviewed Amadou Ouedrago, accountant of the Complexe Agropastoral (CAI) and Henri Coulibaly, coordinator of AOPP in Ségou region. In Niono I discussed with representatives of the trade-union SEXAGON (Union of Agricultural Operators in the Office du Niger) and with Yacouba Coulibaly, Director of the research institute Nyeta Conseils. In Kolongo I benefited from the talks with Charlotte Sama, militant of SEXAGON and President of the association Sigitémason whose members are women who lost land as a result of the Malibya project.

I organized 9 focus groups with village chiefs and elders and representatives of the affected households in the following villages: Sissako, Welendiatigila, Sansanding, Goma Koro, Ouela, Diado, Sanamadougou Bamana and Sanamadougou Marka.

The individual interviews were conducted in 13 villages in the region of Ségou. The total number of interviews to people affected by the large land projects is 42 (20 to women). The sample is small because of financial, logistic and time constraints, but it was carefully chosen using the stratified sampling method, where the strata are males and females, different types of cultivation and the various villages of the case studies. The lists of farmers, from which the sample was randomly selected for each stratum, was provided by village chiefs and local farmers' organizations. In a few cases, it was necessary to use snowball sampling.

It was decided to give an important representation in the sample to women, since they are a particularly poor and vulnerable group. Being discriminated in the access to land, it is very difficult for them to acquire new land if they are expropriated and they are likely to benefit less from possible new jobs created by the projects, due to gender inequalities in the local community and their exclusion from decision-making processes. The case studies Malibya, CAI and COVEC are more represented in the sample, because these projects are the most advanced in the realisation phase.

The survey has utilised a semi-structured questionnaire divided into 3 sections: a) socio-demographic characteristics of the farmer interviewed and of his/her family, b) characteristics of his/her productive activity before and after the large investor's intervention (n° of hectares and type of crops cultivated, n° of months of production and of persons involved, land tenure system, total quantity produced for each crop and % sold, inputs and tools used, unit price for each crop, total costs, revenues and profit per hectare or season, assets owned, place of marketing), c) characteristics and total impact of the investor's investment (level of information, consultation and compensation of the local population, jobs and infrastructure created, productive and environmental losses).

### **Difficulties and limitations of the field survey**

The research was made particularly difficult by the fact that land acquisitions by large investors is a very sensitive topic at the political level in Mali. I found little collaboration from the ON officials, who feel under siege by international pressure groups and tend to view any foreign researcher as a dangerous no-global activist. It is a subject characterized by ideological positions: both the authorities and the big investors, on one side, and the affected small farmers, on the other side, tend to make their points of view too extreme, the former amplifying the possible benefits of the projects and the latter exaggerating their pre-intervention situation. Therefore, it was not easy to evaluate the conflicting information received.

The evaluation of the results is partially biased by the fact that the negative impacts of large-scale investments are concentrated in the early stage of implementation while potential benefits might materialise only in the long term. The case projects analysed are still in the initial stages with little or zero production.

## **RESULTS OF THE FIELD SURVEY AND DISCUSSION**

### **Characteristics of the sample**

The average age of the people interviewed is 51 years (83% of them are more than 40 years old); 81% of them are illiterate and on average they have 6 children, of whom 2 went to school. Their main activities were millet production (33.3%), rice production (9.5%), both rice and millet production (21.4%), horticulture (28.6%) and wage labour for investors (7.1%); 46% of them had a secondary activity (such as fishing, petty trade, de-husking and milling, tailoring or, in the case of women, working free on the husband's field). The major part of millet production is for family consumption, while most of rice production is sold to cover water fees, fertilizer costs and family expenses. Fruit and vegetables are partly sold in the market and partly consumed by the family. The average number of people working on the farm is 7, all family members. Given the small size of the plots (on average 2.5 ha per household), the average yield per hectare of the rice producers interviewed is of only of 4 tons per ha (as against the 6 t/ha indicated by the vice-

Director of the ON as average yield). Their average profit is of 400,000 fcfa/ha/season. For millet the average yield of my sample is very low (0.32 t/ha), notwithstanding the large size of the plots.

### Negative impacts of large-scale land investments

#### Loss of land

Out of 42 persons interviewed, 76% have been already dispossessed of some land, while others are going to lose it in the near future. The farmers who have been traditionally cultivating millet have experienced the largest loss of land in terms of number of hectares (on average 29.9 ha), but the women producing fruit and vegetables are the most affected, if the loss is measured as a percentage of the land held before the project intervention (they have lost 93.8% of their original land) (table 1). The majority of our sample have been expropriated either by the CAI project (11 persons) or by the Malibya one (19 persons). The land lost in some cases (28.6% of the sample) belongs to the ON (like the land taken away from the women of Kolongo) but in most cases (71.4%) is customary land, that has belonged for centuries to villages 800 years old and is not irrigated by ON canals. On this land millet is cultivated in the rainy season. This second case applies to the village of Sanamadougou Bamana - where 2,000 ha have been already appropriated by the CAI project and many more will be in the future-, the villages of Diado and Sanamadougou Marka-also affected by CAI-, all the villages outside Kolongo affected by the Malibya project, and the 30-40 villages in the communes of Sansanding and Sibila that have started an association - Association des villages de Sana (ADVS) - to fight against the Sosumar project.

**Tab. 1** - Average and median number of hectares lost and in % of the hectares held before the large-scale investors intervention by type of crop and by case study.

Type of crop	Case study	Average n. ha lost	Median n. ha lost	Average n. ha lost as % of ha originally possessed
Millet	CAI	30.0	30.0	89.1
	COVEC	11.0	11.0	100.0
	MALIBYA	30.6	20.0	78.7
	SOSUMAR	42.0	42.0	100.0
	Total	29.9	30.0	86.6
Fruit and vegetables	MALIBYA	0.73	0.75	93.8
Total	CAI	30.0	30.0	89.1
	COVEC	11.0	11.0	100.0
	MALIBYA	11.7	0.75	88.2
	SOSUMAR	42.0	42.0	100.0
	Total	18.9	18.5	89.3

The village chiefs and the populations argue that customary rights are recognized by the Constitution and the *Loi d'Orientation Agricole* and that the authorities cannot justify the land expropriation on the basis of reasons of public interest, since the investment projects are private. In reality, this is true in the CAI case while the Sosumar project is a public-private partnership. Furthermore, ON officials argue that the state mission of modernizing agriculture is in the public interest.

#### Loss of trees

The *aménagement* (development) works cleared the land of all the trees, so that modern mechanized techniques of cultivation and irrigation could be applied. In the case of the CAI project this resulted in the eradication of more than 1,000 trees (baobab, neré, karité, balanzan and tamarind), in some cases sacred, with a high economic and environmental value. They had contributed to family food security and were an important economic resource for the women, since from their leaves, fruits and nuts it was possible to obtain valuable goods such as oils, condiments, medicines, fuel wood, etc. In the case of Malibya investment, the construction of the 40 km long irrigation canal and adjacent road resulted in the destruction of the gardens of women farmers, who lost all their harvest and source of livelihood. The 12 affected women of our sample have experienced a loss of fruit trees (mango, guava, papaya, tamarind, palm, lemon, banana, custard apple, baobab, karité, balanzan) ranging between 230 and 10 per woman, with an average of 64 trees. In some cases the trees had belonged to the woman's father, before his death. Their average income from the sale of fruit and vegetables had been 370,000 fcfa per year.

#### Loss of houses, obstruction of transhumance trails

The Malibya investors, who had been granted by the state land defined in the *convention* as “*libre, vacante et sans maître*”, in building the canal and road did not take into account the presence of populations along the project perimeter, so that many houses and even a cemetery were destroyed by bulldozers in Kolongo. This commune was cut in half and no bridge was built. Traditional animal trails and grazing areas were obstructed, as the *Plan d'aménagement des espaces agropastoraux* prepared by local authorities was not considered, and alternative trails for the animals were

not prepared. Also the Sosumar project will block transhumance routes.

### *Cultural loss*

The large-scale land investments analyzed in this study threaten the traditional culture and diet of millet, which has been cultivated and eaten for centuries in the villages I visited. Although the yield is low, the farmers who had been producing millet claimed that, before being expropriated of their land by the investor, the harvest had guaranteed food security to an extended family (they were eating 2-3 times a day) and could even sell part of the production to cover taxes and family expenses. Millet cultivation has the advantage of being very sustainable for the fragile local environment and its costs of production are low (no need to pay for seeds, fertilizers or water). It can grow in dry poor soil. The opinions of the rural specialists I met in Mali are divergent: some of them declared that rice, maize and potatoes cultivation should be preferred to millet due to the much higher yields, others that Mali should not make the mistake of India, that after abandoning millet for the green revolution crops (such as rice and maize) now suffers from water shortage. In any case, all the small farmers interviewed reaffirmed emphatically that they and their children wanted to continue to cultivate millet as their ancestors had done and that they would refuse to cultivate sugar cane, since it was not part of their tradition and could not be eaten. They showed a strong attachment to their traditional millet diet (even those who were cultivating rice, after losing the millet land, were selling rice to be able to buy millet and continue with their diet). As a village chief explained to me, “mil est bon pour la consommation et riz pour la vente”. According to them, the diet based on millet is cheap: millet can be pounded manually in the villages and the accompanying sauce uses freely available baobab leaves, while the rice sauce needs more expensive ingredients, like tomatoes, onions, meat or fish.

Furthermore, the possible resettlement of villages 800-900 years old, like Sanamadougou Bamana or Goma Koro, where the ancestors are buried, the sacred trees, the animist shrines with the fetishes and the chiefs' old palaces are located, produces serious wounds to traditions.

### *Threats to human rights and to village cohesion*

To weaken the resistance of the community to the project, CAI investor used threats, the police, the judiciary system, bribes and the creation of divisions. As I was told during the focus group in Sanamadougou Bamana, 120 gendarmes on 18 June 2010 attacked the villagers who were protesting for the cutting of their trees, beating also old people and two pregnant women, one of whom later miscarried. About 35 people, including 14 women, were arrested, most of whom released without charge after 2-5 months. With respect to my sample, 3 smallholders from Sanamadougou Bamana had been in prison for 2 months (one of them accused of being the revolt leader), one had been summoned 3 times by the police for cultivating expropriated land and a farmer from Sansanding protesting against the Sosumar project had been imprisoned for 1 month.

The CAI investment created divisions and tensions between nearby villages and even within the same village: the villages of Diado (17 households of up to 100 members each) and Sanamadougou Marka (31 households) and 7 households out of a total of 120 in Sanamadougou Bamana accepted an agreement with the investor, obtaining gifts such as de-husking machines, motorcycles and even soccer balls and shirts for the youth, compensations in nature (1 ha to produce rice in exchange for 10 ha where millet was cultivated), money or access to credit and temporary jobs for the sons in the construction works (about 40,000 fcfa/month for a year) and for the women in the fields (about 1,000 fcfa/day). The other families in the village declared to me that they were ready to fight until death for their land and customary rights.

### *Environmental impacts*

On the basis of my investigation, it appears that, contrary to the required procedure, large-scale investors started developing the land immediately after acquiring it and before completing the necessary environmental impact study. This can explain the tremendous destruction of valuable trees. For the future the main worries concern the impact of large land deals on water resources. Considering that in the dry season the water level of the Niger river is already low, that climate change will worsen the situation, that the large investors have been granted priority in water access by the state (without consultation with ON agents and consideration for the *Schéma Directeur de Développement Intégré de la Zone Office du Niger*) and that a large area of future investments will be dedicated to the cultivation 12 months a year of a very water intensive crop like sugar cane, there is the danger of scarcity of water for the small producers especially for the second harvest during the dry season [11]. The ON officials interviewed argued that it will be necessary to reduce the present large loss of water in secondary and tertiary canals, extend the use of more efficient methods of irrigation, such as spraying, and cultivate in the dry season less water intensive crops.

Furthermore, the increased utilization of fertilizers and pesticides might cause water pollution and the transformation process from sugar cane to ethanol will use and pollute large quantities of water [12]. Finally, there is the risk that biodiversity will be eroded by the introduction of monoculture by N'Sukala and Sosumar projects and of imported (mainly from China) hybrid rice varieties in Malybia, COVEC and CAI projects. Smallholder associations believe that the use of hybrid seeds will extend to small farmers who now often produce their own seeds, increasing their dependency on imported seeds and their debts [13]. There is also the risk that local millet biodiversity sustained through local knowledge will disappear.

### Positive impacts on employment, infrastructure and production

The impact on job creation is so far small, because large-scale land investments in Mali are still in the early stage of realization. According to the accountant, CAI project had created 290-300 jobs. I interviewed a young man with two wives and two children, working in the Sukala sugar cane factory and earning 36,000 fcfa/month for 10 months a year. He seemed quite satisfied with his job, but he could count on his father's and brother's production for his family food needs. The expropriated millet producers told me that they did not want to become wage workers, claiming that they used to earn much more than 36,000 fcfa/month and that such a wage was not enough to nourish a family of 4-5 people. Nor they wanted to produce sugar cane under an outgrower scheme that would make them dependent on the price fixed by the sugar factory and force them to buy food. I also interviewed some women working for 3 months in CAI fields in transplanting and weeding (about 1,000 fcfa /day). They were working as well on the family field.

The canals and roads built have so far benefited exclusively the investors. There was a limited positive impact on social infrastructure in the CAI project (see next par.). Four respondents had been able to increase rice production thanks to the access to the land that COVEC had irrigated.

### Compensation for communities

From our study findings either there was no compensation for the population whose land was taken, because their customary rights were not recognized or the compensation was delayed or it was inadequate to restore the previous standard of living. It was never discussed with the population. Also, it is not clear whether the compensation payments should be financed by the state or by the investor. The ON told me that it is at the investor's charge. In practice it varies case by case. In the Malibya and Sosumar projects it should be the Malian state that pays the compensation in exchange for the investments made (canal, road, sugar factory), while in the N'Sukala case the *convention* states that it is the responsibility of the Chinese investor. About 40% of the sample respondents had received a compensation. The smallholder producers expropriated by Sosumar seven years ago began receiving a compensation only after three years (50,000 fcfa/ha/year which is barely enough to feed with millet a family of 10 persons for three months). The villages outside Kolongo affected by Malibya investment were not compensated, while in Kolongo the commune, supporting the project, had distributed compensation payments for the loss of trees and houses in an arbitrary way (*"selon leur visage"*, as a woman said), often based on patronage, favouring its supporters. All the Kolongo affected women in my sample had received compensation payments, ranging between 40,000 and 641,000 fcfa (on average 253,250 fcfa per woman). These payments did not even cover the income that the women were receiving from the fruit trees in one year and were certainly insufficient for investment in a new activity (only one woman used the compensation to rent a plot for rice and another one to start rice trading); in most cases they had been used to feed the family. As a sign of their inferior status, the women farmers reported that a male family member (husband, son, brother) had gone to the commune to receive the compensation.

In the case of CAI project, only few households accepted the unfair exchange of 1 ha of irrigated land to produce rice for 10 ha where millet was cultivated (see par. on threats to human rights and village cohesion). According to the farmers opposing the project, even the ON vice-director had told them that the exchange should be 3 ha of rice land for 10 ha of millet land. With respect to cash compensation, the company accountant claimed that payments of 100,000 fcfa per hectare of expropriated land were given to affected households, for a total of 20 million fcfa. However, it appears from my survey that only the 7 households of Sanamadougou Bamana were compensated. In fact, the village chief of Diado maintained that the village had so far received only a total of 10 ha to produce rice and had renounced cash compensation, being satisfied with the jobs created by the investment for their young people. The investor had promised to develop some plots where women could grow vegetables. In Sanamadougou Marka they had not yet received cash payments. As part of the compensation package, a school, a health center and a cereal bank were being built or planned in Diado and Sanamadougou Marka. The CAI accountant also pointed out that there was a compensation in trees, since every week more than 1,000 eucalyptus trees were planted together with fruit trees. However, as the villagers argued, this could not be classified as compensation, being an investment in timber production that would benefit the investor and certainly not the local community.

### Lack of transparency and of consultation, corruption, false promises

From my focus group and individual interviews it results that communities living on the land leased were not informed of the details of the projects nor asked for their consent and had not been shown any environmental and social impact study. Although ON officials claimed that local communities had been widely consulted, according to the villagers interviewed they simply had been visited in the village by a representative of the ON or of the investor or of local authorities who had announced: "the state is taking back his belongings, his property" or "this investor will work on your land", etc. Only 19% of the sample respondents (from the two villages in favour of CAI project and from the ones affected by COVEC) admitted some consultation.

As examples of corruption, I was told that in the Sosumar case the investor gained the support of the mayors of Sansanding and Sibila by financing their electoral campaign and that part of the compensation payments for the Kolongo affected farmers were appropriated by the mayor.

Furthermore, it was reported that ON officials or the investor (especially in CAI case) made promises of compensation or of alternative plots for rice and vegetables production that were not kept.

### **Impact on livelihoods**

The survey tried to look at how producers' lives and livelihoods had changed after the investors' intervention. For 72.5% of the respondents there was a deterioration of livelihoods as a result of the loss of land and land resources and the absence of adequate compensation, for 15% no change and for only 12.5% an improvement (thanks to COVEC project or a job at the sugar factory). Out of the few respondents who could quantify the loss of income, 33% had experienced an income reduction of 80-90% (the average was 56%). Thus, in most cases, the large-scale land investments produced food insecurity: the affected people, who all claimed not to have experienced it before, were nourishing themselves much worse, due to the impossibility to exercise their traditional income-generating activities and to the large size of their household (15 members on average, with the median value at 10). They were surviving thanks to "*entraide*", help of relatives and not yet affected villagers, cultivating small plots of relatives land in far away villages or renting a small parcel to grow rice or vegetables. Some of the affected Kolongo women were trying to survive collecting wood, washing clothes or pounding millet in other people's homes. All Kolongo women, after losing the income from the fruit trees, had experienced a reduction in economic independence from their husband and were often obliged to cultivate onions on a small plot of their husband's land.

### **CONCLUSIONS AND RECOMMENDATIONS**

The findings discussed above suggest some conclusions that must be treated with caution, due to the low realization stage of the investments and the fact that it is difficult to evaluate at a single time point projects evolving over time. First of all, the increase in land deals in the ON zone has certainly been excessive (even if a lot of them are still provisional allocations) and the "principles for responsible agricultural investment" [2] [12] formulated by FAO, IFAD and World Bank have not been respected.

Customary land rights have been ignored. Land acquisitions were not negotiated with local communities. Investors could exploit the ignorance of village chiefs and populations, due to the secrecy of the land alienation process and the asymmetry of power between the two opposite sides, particularly considering that local authorities usually supported the large investors. The large-scale deals were often negotiated at central level directly by Malian and foreign ministers or heads of state. The lack of transparency and of participation of local communities increase the risk of corruption and of appropriation of part of the project's benefits by the national and local political class at the expense of poor farmers. It was alleged by sample respondents that behind CAI project there was President Amadou Toumani Touré himself.

Second, the most dangerous potential impact of large-scale land acquisitions in the ON zone is water grabbing by large investors with environmental and food security consequences, especially if a large area is devoted to a non food crop like sugar cane and if part of the food crops is going to be exported (Malibya and Sosumar cases).

Third, the positive impact on employment is likely to be limited, because they are capital intensive investments. They tend to be more labour intensive in the initial phase of construction works and become increasingly mechanized later on. There is also the risk that part of the labour will come from outside, as in the past in the ON area starting from the colonial period. In any case, a monthly wage of 36,000-40,000 fcfa can be a useful addition to family income if it is earned by a son or a wife while the rest of the family continue to cultivate their land, but cannot be the only source of income of a large family.

Fourth, the project affected people showed an attitude of refusal to change and a great will to fight "until death" against large-scale land projects. They perceived their user rights as legitimate despite the lack of formal property titles. With the help of farmer organizations and civil society groups, they filed petitions to the prefect, the governor, the Minister of Agriculture, members of the National Assembly. In November 2010 Kolongo forum was held to discuss land grabbing and in February 2012 they took their case to Markala court against Sosumar and CAI projects. ON officials, during our meetings, minimized these protests, claiming that they were instigated by old conservative village chiefs or by villagers now living in Bamako and that in the future the farmers will appreciate the benefits received by the projects. However, the protest movement has been successful against Sosumar project (with the withdrawal on June 2012 of the main shareholder, the South African sugar giant Illovo, due also to financial difficulties and the political-military situation in Mali), while the trial against Modibo Keita is slowly going on at Markala court.

Finally, the implementation of land acquisitions has been characterized by many failures: lack of coordination between authorities at the micro, local, regional and national level, inadequate monitoring of the process by the ON or collusion with investors. In many cases the investors started development works before the approval of the environmental and social impact study or on a land different from the one assigned by the deal.

Based on these considerations, the following recommendations can be suggested:

- there should be a careful selection of the investors, taking into account their technical and financial capacities, in order to reduce the amount of approved but not implemented investments.
- Authorities and public administration must be able to negotiate a contract that maximizes the investment

benefits for the country and local community. Lease contracts tend to be very short and simple (I managed to see two of them). On the contrary, the lease contract should clearly indicate the type of production, its impact on water and food sovereignty, minimum requirements for job and infrastructure creation; it should take into account the investment impact on the population living on the allocated land, indicating the investor's obligations with respect to compensation.

- Mechanism to monitor and enforce investor's compliance with the contract clauses should be developed.
- Civil society and producers' associations can educate communities on their rights and provide assistance in negotiation and monitoring of the projects.
- A potential role in regulating large investments can be played by the codes of conduct for land deals, proposed by international organizations. While their enforcement is problematic [14], they might offer useful guidelines to governments and investors and some investors might have a self interest in respecting self-imposed codes of corporate social responsibility to avoid conflicts with local populations that harm the investment.
- Land governance must be improved. Collective registration of community lands can be a tool for protecting existing local land rights. Processes for land acquisition should be transparent.
- The Malian state must invest part of the revenues from the mining sector in the modernization of household farming through appropriate public support (temporary subsidized access to good quality seeds and fertilizers, access to credit, improved equipment, storage facilities and extension services, strengthening of farmer organizations to support crop marketing, appropriate pricing policies with respect to inputs and output, consolidation of land plots to reach a minimum size of 5 ha per family farm), in order to raise smallholders' productivity.
- In the ON zone the peaceful, and possibly fruitful, coexistence of family farms and large-scale investors, which is probably inevitable due to the insufficiency of public funds for the irrigation works, must be assured by a precise agro-ecological zoning, taking into account soil, water and social constraints. A limit to the size of large farms should probably be set and the small farmers must feel secure in their investments. The farmer trade-union SEXAGON intends to reach an agreement with the ON, according to which a more secure contract (a type of lease) can be given also to a smallholder, if, alone or in association with others, he contributes to part of the *aménagement* costs, which amount to 4 million fcfa per hectare.

This set of policy recommendations aims at ensuring that large-scale land investments present an opportunity to stimulate local development and not at the expense of existing smallholders.

## LAND GRABBING AS A STRATEGIC GAME: A THREE LEVEL APPROACH

Raffaele Bertini\*

\*Department of Economics, University of Florence, Italy - [raffaele.bertini@unifi.it](mailto:raffaele.bertini@unifi.it)

### ABSTRACT

Large land acquisitions in poor and developing countries implemented by international investors can be considered as a strategic game where involved actors – three are considered in this stylized model - act in a framework where several factors are presents. This paper aims at looking at this phenomenon in a simplified way with some special focus on the most relevant and central issues. Moreover, this paper considers the possible instruments to explain the large land acquisitions in SSA countries by international investors through a strategic game model. The game strategy – even if used as a narration of the analyzed phenomenon - is a new and, in our opinion, interesting method to explain the large land acquisition in developing countries because of some of the most relevant characteristics of this complex phenomenon considered in this game. Three actors- two player acting in each level-, payoffs of the game, a framework wherein the process is implemented and many other characteristics reported in the following parts of the model are the most relevant issues studies in this three-level games. The structure of the paper starts with the theoretical points and its main implementations of this model in social and international economic issues. The second part presents the three level model. In the entire paper, some further issues are presented in order to observe the main characteristics presented in each level in particular the commons - land and water resources –, general rules in the players behavior and the institutional framework.

### INTRODUCTION

Large land acquisitions in poor and developing countries implemented by international investors can be considered as a strategic game where involved actors act in a framework where several factors are presents. This paper aims at look at this phenomenon in a simplified way with some special focus on some of the most relevant issues. The process of increasing investments in land by international investors in developing countries as reported in the large literature on this during the last years takes into account all the issues related to this rising phenomenon from the international to the local policies and conditions in terms of natural resources availability. From the theoretical point of view, this model is based on the theoretical approach reported in a recent paper [1]. The paper supposes the existence of a two step equilibrium where there are two institutional frameworks based on the levels analyzed in this scenario. A sort of two level analysis is implemented in the paper of Gambetta, Origgi while some further steps, can be done in order to implement a further step in analyzing the phenomenon studied in this paper. This step can represent a new approach in implementing the analysis of the phenomenon of large land acquisitions and to give further developments of the debate on the LL equilibrium. This paper aims to use the models reported in Gambetta Origgi to explain the phenomenon of large land acquisition and to develop some points of the considered paper.

### STRATEGIC GAME BACKGROUNDS AND MODEL HYPOTHESES

The strategic game implemented in the following sections is a 2X2 game [2] played simultaneously by the actors that are considered central in the process of large land acquisition and the frame wherein this game takes place and in particular the institutional frameworks at international and local level [3]. Moreover, some relevant concepts taken from the literature relative to the game theory in particular the contribution reported in Gambetta Origgi is considered in the model implementation.

The players in the three levels considered in the model are:

- **I** is the investor and it is an international company operating in the international market, producing, selling and buying in several countries and with the headquarter generally in a developed or emerging country, the international company aims at producing agricultural goods in the receiving country in order to invest resources in the same or in a different branch of the company;
- **R** is a receiving country in a poor continent, for instance Sub Sahara Africa, that wanted to attract international investors especially in rural areas generally underdeveloped and lacking in investments, this country is generally a poor and unstable country;

- **P** considers the receiving country people and local communities that is the direct recipient of the international investment and it is linked to the local and national economic and political authorities and they represent all the players acting in the local and regional framework.

Another important aspect to take into account is the institutional frameworks wherein the players act in a contest of rules, regulations and institutional structures in the international, national and local systems. These frames are summed below:

- **Formal institutions:** this system collects all the international and domestic rules, regulations and structures leading the behavior of actors in large parts of their actions,
- **Informal institutions:** they are a group of behaviors, rules, relationships and common laws leading the behaviors of individual and collective actors.

The three actors presented above play in three levels and the following sections present each one in details. The three levels are briefly resumed below:

- **First Level:** the two actors R and I are involved in a cooperative game within a formal institutional systems,
- **Second Level:** the two actors R and I reach a LL equilibrium within an informal institutional framework and a series of norms,
- **Third Level:** two actors I and P can be considered as a hegemonic equilibrium and within a frame of the asymmetry power between the R and the local population. This actor is forced to implement the largest efforts for the project effective realization in a classical hegemony game.

At the end of the introduction, it is important to explain the payoffs at the end of the game and of the final equilibrium reported at the end of the three levels. Each player has its own interests and outcomes derived from the implementation of the project and the payoffs reported in the table reflect this interests and expected outcomes.

**FIRST LEVEL: SECOND BEST GAME SOLUTION**

In the first level of the game each actor - player I and R - involved in the bargaining process declares to implement all its efforts to reach the best results for the receiving country people and for the resources exploitations in the receiving countries and for the maximization of its gains where the involved part in the bargaining process would gain the higher results with cooperation than adopting free riding behaviors. The players act in a formal international and national framework and rules and, moreover, the national authorities care to the domestic audience. Investor and receiving country declare to implement the maximum of their efforts to obtain the best results for both and for the receiving country, while, as second step they change their real behavior in adopting practices and actions to maximize its own gains with a free rider approach with the emergence of a LL equilibrium. This result can be considered a second best in the game structure at this stage of the process within a two players and two levels game showing that the actors in pursuing their interest reduce the potential benefits of the investment in land by international companies.

**Fig. 1 - First Level Game.**

	Player R	
Player I	C	D
C	1,4	2, 2
D	4,1	3,3

In the scheme proposed above, the final result shows how H declaration is replaced by the effective behavior of the players. The final equilibrium represents a situation where each player gains three instead of four if they would adopt a free riding behavior with which they would have gained 4 and the other 1 for player I and 2 and 2 for the receiving country. Moreover, with a HH behavior I would gain only 1 while player R would gain 4 in the bargaining process. There is a common convenience in declaring to implement the maximum of efforts in implementing the project in the interested contests and the possible explanation of these behaviors are reported in the previous sections as the L norms and the H declarations. Player I is interested in implementing less efforts is in the project implementation and this can be easily observed in several real case where the investor does not respect the contract points. They are linked to the respect of the local communities' rights, job creation, infrastructures constructions especially those related to the social services as schools, hospitals, streets and other physical infrastructures and the respect of the exploitation limits of natural resources in the project implementation and in other several issues. The international investor is supposed to be not interested in respecting the signed contract and in the respect of local communities' interests and on the well being of these people and on the environment and natural resources in the receiving country. One important point in the entire model but especially in this level is the timing of the contract that is generally not an acquisition but a deal for a short or

medium period from 33 to 99 years. This fact reduces, especially for shorter times, the efforts of the international investor that aims at looking at the largest investment gains through the exploitation of the local resources and to produce the largest gains of this project. On the other hand, the R player has several interests in declaring to implement its largest efforts to create a positive environment for the investments and all the conditions from a social, political and economical point of view for the best environment in receiving international investments. Despite this, receiving country is generally not capable to reduce the contrasts with the local population; to build the necessary material and not material structures for the best results of the investments therefore a D approach can be expected.

**SECOND LEVEL: LL GAME**

The model presented at this level is based on the L norm that has been presented in the previous section. Given the characteristics of the informal institutional systems that is central in this level of analysis, the equilibrium reported below is a “double defeat” - DD - where both actors choice their D with less efforts implemented in the process. This behavior by both the players is due to the mutual convenience in acting in the conviction of the L choice reported below. Despite the expected choices, the players adopt a LL solution instead of a classical LH strategy. This can be considered as a ‘paradox’ where each player seems to reduce its gains by choosing the defeat strategy of the other instead to look for the other cooperation strategy. The expected prevalence in terms of each player gains is not effective given the conditions analyzed at this level and the two players choice their effective first best solution that is based on the LL solution. This can be considered as a solution driving to the stall in the worst situations where both the players adopt a low profile approach in order to gain as more as possible from the bargaining process. The LL solution can be explained only from the existence of informal rules driving towards this equilibrium and furthermore to the existence of other levels in this simultaneous game making us able to explain these unexpected results [4].

**Fig. 2 - Second Level Game – LL.**

	Player R	
Player I	C	D
C	2,2	1,3
D	3,1	4,4

The land acquisitions in certain unaffordable and corruptible countries are related to the institutions that can be considered as informal in terms of classical definitions of formal- written law, common law, constitutions and the other forms of respected and formal rules- that regulates the public and private affairs in the social, political and economic spheres and of informal law that can be collect all the rules leading the behavior of domestic and international players not considered in the formal law and commonly acting in several areas. Gambetta, Origgi paper poses the so-called L norms as the groups of political, social and economic factors that aim at reduce the possible availability of choices as H for the players in the game considered. In the model proposed by the two authors, moreover, some groups of social norms acting in this way nine possible explanations and justifications of the LL equilibrium. In this Section, in order to observe the possible explanations of the reaching the reported results in the game equilibrium the focus of our analysis is in on the systems of informal institutions leading the behaviors of the involved actors. Political, economic, cultural and historical linkages are at the base of the analyzed phenomenon and this informal link gives the dimension of the phenomenon where the L norms or informal norms prevail in the game solution. An international investor interested in acquiring land to produce agricultural good to be imported in the global market can implement some investment strategy as corruption to obtain the necessary land overturning the official and formal law where naturally this “investment strategy” is punished. On the other hand, country R creates the conditions to attract international investments by reducing the law contingency in the exploitation resources creating a sort of *vulnus* in the formal system and can be considered another example of overturning of formal law. These examples of ‘tacit’ pact between the two players in order to reduce the space to H choice and make the situation to mutual convenience for them to reach the equilibrium.

**THIRD LEVEL: HEGEMONY GAME**

The third level of the analysis is the last step in the model implementation and it can be considered as the base of the model solution. In this level of the analysis, the most important factor to observe is the introduction of the asymmetry of power between the two actors. The analyzed phenomenon has to be considered in the real frames of the existence of asymmetric relationships between the involved actors - player I and P - and the different positions that these actors have in several aspects of the analyzed phenomenon and especially in the bargaining process for the large land acquisition. Moreover, different levels of asymmetry of powers exist and are briefly reported in this section. The first one is the relationship in the bargaining process between investor company and the receiving country as a whole considered with the political and economical elites – those supposed to be the counterpart in the acquisition process in

the previous steps - and the local populations living in the areas- playing in this level of the game. This kind of relationship is supposed to be a symmetric in the two first levels of the analysis while it can be observed in the effective phenomenon that the international investors and a poor and investment lacking country is an asymmetric one where the first player has the economical and economical power to impose its decisions to the receiving country considered as a whole and especially as local communities. Moreover, in the domestic relationship there is another important level of power asymmetry that can be easily represented by the behavior of a central political and economical elites that decided to invest in the acquisition of a large land area and the local population and communities and the local interested areas in terms of natural resources considered as commons that is not considered in this model.

To sum up: the first player is the international investor company that can be considered as the dominant player in the strategic asymmetric game. This player can impose its decision to the other player and the asymmetric game drive to an equilibrium that is more favorable to this player. The second player is the local population touched by the land deals but it can be considered all the parts of the social, economical and political lives of these communities and the local area environment. From the strategic point of view, this player dominates the other because they do not any power to reduce the expected decisions on its land and it has moreover to implement all the efforts to final project realization. This level of the analysis can be considered as a sort of formalization of the “Zamagni Paradox” presented in the Gambetta Origgi 2012 because the local population- player P- is compared to the black slave that have to implement all the efforts for the real effectiveness of the project.

In the next figure the hegemony game is reported and in the next Section the final equilibrium of the strategic game to explain the phenomenon of large land investments in developing countries during the last decade.

**Fig. 3 - Third Level - Hegemony Game.**

	Player P	
Player I	C	D
C	3,4	2, 3
D	<b>4, 2</b>	1, 1

All in all, the presented model is the last step of the analysis and in particular of the model and in this model there are the model solutions. This level shows how the previous levels can find their equilibrium and the model presented in this section showing that the there are several aspects in the narration of the large land acquisitions that have to be analyzed as the asymmetry of powers between the interested actors and players of this strategic game.

**MODEL LEVELS INTEGRATED IN A FINAL MODEL**

This final equilibrium of the process is a second interesting part of the model considered in terms of the general results of the model and represents moreover the final attempt to categorize the different steps of the general theoretical model reported in this section. In order to observe the integrated results, some authors implemented a series of integration techniques as the one reported in Inohara, Takashi, Nagano [5] 1997 that shows how several games and hyper games can be integrated in a single model with added gains and results. The first two levels are integrated in a single game and the third game in order to use the integration as used in the paper cited above.

The final model results can be represented with a possible example applicable in this case considering an international and powerful company acting in the international market. On the other hand, the receiving country as a whole with the ruling classes in terms of political, economical and social elites and the local populations that have to take all the bad consequences of the project implementations. The international investor adopts a three level equilibrium choosing an L strategy in the first level declaring to implement all its efforts to implement a project in agricultural areas to produce goods to import these products. Moreover, all the relative positive outcomes as buildings and physical infrastructures that can be useful for the local populations and for the receiving country that can reduce its gaps in the agricultural investment gap and in external balance for the incoming investments in dollars. In the second step the international company acquiring land effectively does not implement large investments and moving in an informal framework the same behavior is expected by the receiving countries authority that plays at the level and choice the same behavior. In the third level the international investor can utilize all its power and reducing its efforts and the largest part of the efforts to implement the investment in land. This situation is the most profitable for the international investor to obtain all the gains of the project implementation. On the other hand, the receiving country faces to different aspects of the acquisition or dealing land areas in terms of the positive and negative consequences of the this fact. In the first step, the second best equilibrium represents a good position for the receiving country that can exploit the positive consequences of the bargaining process especially in terms of the investments that the international company has to implement to reach its targets and the amount of positive effects of the investment in terms of the reduction of external balance gap, the building of some infrastructures as streets, railroads and other functional to the investment implementation. In the second level and the equilibrium at the end of the two first games, the receiving country seems to prefer to play L in both the games. The second game gives the largest gains to the receiving country and, even if the informal institutional framework make easier the free riding behaviors of both the players, the final LL equilibrium is

the first best solution where the player acts reducing its efforts to implement the investment knowing the behavior of the international investor. The third level reproduces the real situation on the ground and all the efforts of the project implementation are on the shoulders of the receiving countries and, in particular, on the local populations and communities. They are forced to leave their lands and their lives in terms of economic and social environments and moreover they have to face to shortages give by this new condition. On the other hand, these solutions give us the opportunity to analyze the phenomenon. All in all, the entire narration of the phenomenon is reported and it is interesting to observe the entire model gains measuring all the levels considered and reported in the previous sections.

This last table below represents the final results of all the game played above and the final results showing the equilibrium considered in the three presented levels. The final equilibrium is a DDC, where according to the narration presented above, player I - international investor - defeats in the three games while R and P defeat and cooperate respectively. I gains the maximum from this set of strategy and the same can be said for what concerns R while for P the final equilibrium is the worst position and results where it has to implement the main efforts in the project implementation.

## CONCLUSIONS

This paper presents a theoretical approach of the phenomenon of large land investments by international companies in developing and poor countries rich in terms of natural resources. This theoretical model implemented to study this phenomenon is based on the paper presented by Gambetta Origgi in 2012 and, more generally, on the rational choice approach and especially on the three level model that is a sort of extension of the cited paper. The model presents some interesting peculiarities relative to the phenomenon analyzed and some aspects of the phenomenon relative to the conditions presents in the receiving countries and the international scenario as the institutional systems and on the commons as land and water resources. Another important issue to be considered relative to natural resources exploitation is the timing of the investments that is linked to the choices implemented by the different players. The first player is the international investor in land that where this can be a transnational company and other public and private companies and, as the other player, acts to maximize the gains of their strategies and choices. The second player is a poor or developing country generally a Sub Saharan African country aiming at receiving investments in its agricultural sector generally lacking in the agricultural sector. The two players act in different frames both formal and informal institutional systems and in the first two levels they have the same power in relative terms. In the third level, a hegemonic power is presented by the role played by the international investor that has the economic and political power while in the side there is the receiving country in the presence of local population and communities. The models are presented especially in terms of the reached equilibriums:

- first level: the receiving country is a classical developing country especially a Sub Saharan African country with a large amount of resources in terms of natural resources and with a series of lacks in the rural areas especially in the agricultural sectors. The second player is an international company acting in the global market of agricultural and interested in acquiring large arable land areas in order to produce agricultural items to be sold in the international markets. Given their characteristics, they declare to implement all their efforts to reach the best gains from each player's point of view but they act differently. The final equilibrium in this step is the defeat-defeat game that is due to behavior of the two players acting in order to optimize their gains. The institutional framework where the two players act in a formal frame where international and local rules and codes.
- Second level: the same two actors act in an informal framework and exploit all the resources that are available for them and make the minimum efforts and expect that the other player make them and cover with the efforts implemented in the game. This step final equilibrium is a typical LL equilibrium as that presented in the Gambetta Origgi paper where both the players implement their minimum efforts to reach their results that give the optimum results for both in the second steps of this game step.

- Third level: in this last step of the model implementation, some different considerations have to be done especially in terms of the power and strategic relationship between the receiving country and international investor are presented and analyzed. In the previous steps there was a peer relationship between the players with a special regards to the decision of project implementation and on the efforts considered in that. At this respect, a sort of hegemony by the powerful actor- namely the international company acquiring land in the poor and institutional fragile SSA country- play a sort of golden share of the game through different aspects of the relationship as the financial, economical and political power utilized by this player in the attempt to take the largest as possible gains from the project implementation.

This model, with the opportune modifications and developments, can be applied in different situations where two or more actors have the same targets than those observed in this case and where some power relationships are reported. Some interesting cases can be those similar relative to the acquisitions of land or other natural resources by an actor - international or domestic - in a hegemonic conditions face to the bargaining partner as the investment receiving parts. Other cases can be find into several historical and actual situations especially in the post colonial areas in many former colonies in large part of the so-called developing world [6]. In the end, this model can be an instrument to try to observe the behavior of international investors in land and it can be useful for the explanation of the phenomenon.

Panel 3.2 on “AGRO-BIODIVERSITY AND DIVERSIFIED AGRI-LIVESTOCK SYSTEMS” moves from some considerations about the interconnections among agriculture, rural development strategies and urban and peri-urban areas expansion.

Agriculture uses a third of the planet's surface and is the main activity for most of the world's population. The different farming systems, indigenous people and local communities have been, since a long time, the guardians of a large part of the Earth's resources. We must not forget that all the natural resources from which the agriculture depends need continuous care and that its sustainability is increasingly called into question.

To analyze the rural world, it is possible to use the categorisation of agricultural system made by Vorley [1] in 2001:

- “Rural World 1”: the “commercial farmers”, or the entrepreneurs belong to this category. It is a minority group of producers with large plots of land and availability of financial resources, that produces for the market and are connected into the global agrifood economy. They have often benefited from government subsidies and other forms of credit facilitations.
- “Rural World 2”: this category includes the “traditionalists”, or small/medium landowners. In addition to the production for family consumption, they are able to devote even a small part of their production to the market. Normally they own property rights on their land and they are often organized in associative forms [2].
- “Rural World 3”: here are included small landowners who live in conditions of subsistence and whose production often fails to satisfy family consumption needs. They live in conditions of absolute precariousness and fragility, they are often prone to emigrate and have little rights and minimum income.

Dealing with the context of developing countries, Lovisolò [3] has recently suggested to add the category of the “survivors”, namely farmers with no access to land and forced to offer their workforce to others. Among them malnutrition is widespread and emigration is the only alternative.

It is not a novelty that essentially poverty is a rural phenomenon: “70% of the billion and a half people in the world live in conditions of absolute poverty - with less than \$ 1.25 a day - in fact resides in rural areas and is concentrated in some Asian countries and particularly in sub-Saharan Africa” [4]. The persistence and concentration of poverty in rural areas are therefore highly crucial issues where it is necessary to intervene with development strategies targeted to the rural sphere.

This critical situation is caused by several factors, as the lack of access to production means and resources for most of rural communities and the replacement of the pre-existing agro-ecological systems with the industrialized ones.

Agro-ecosystems simplification results in loss of biodiversity and in the consequent decreased provision of ecosystem services, which are essential inputs for agriculture and for society.

Besides, the oligopoly of production factors led by corporations, the inability of small farmers to compete in the global market and the difficulty of accessing to land results in many countries in a patchy distribution of resources, high rates of poverty, but even the loss of safety on production and availability of food/currency.

All these considerations identify a local and global framework where it is compelling to find solutions that ensure the availability of food in the present as in the future through the implementation of more sustainable, fairer and safer production systems. Dealing with these issues, we are forced also to deal with the conservation and use of biodiversity.

In developing countries rural communities have been often the engine of indigenous biodiversity conservation thanks to everyday use of local species for food and other purposes. It is so important to maintain and enhance the role of local species and breeds in the definition of sustainable agricultural systems, where biodiversity can play also a role also in the cultural identification of the communities.

To examine more in depth these topics, we started with the work by Prof. Sottile of the Department of Production Science and Agri-Environment of the University of Palermo titled CULTURAL IDENTITY AND CONSERVATION OF INDIGENOUS AND NATIVE DIVERSITY which highlights the need in Africa, to know and valorise local species. We meet the same need in the paper LOCAL FRUITS AND NUTS AS A TOOL FOR THE DEVELOPMENT OF AFGHANISTAN where Prof. Giordani of the Department of Production Science and Agri-Environment, University of Florence, presents the excellent results of the Perennial Horticulture Development Project - Afghanistan (Phdp) ([www.afghanhorticulture.org](http://www.afghanhorticulture.org)) funded by the EC EuropeAid Program (2006). Dr. Fiorito with ANALYSIS OF THE SUSTAINABILITY OF THE SLOW FOOD MUSHUNU CHICKEN PRESIDIO IN KENYA introduces a case study where the exploitation of a local breed of chicken provides short time excellent results from the point of view of social

environmental and economic sustainability in a system of small-scale farming. The paper **THE ROLE OF DIVERSITY AND DIVERSIFICATION FOR RESILIENT AGRICULTURAL SYSTEMS** of Dr. Tecco of the Department of Agricultural Sciences, Forest and Food Sciences of University of Turin, underlines the links between biodiversity and resilience and the challenging option of using resilience as an approach for managing the system especially for cooperation development projects that operate in various ways to safeguard and promote biodiversity. Finally, during the Congress, Dr. Turco of the NGO Mais reports the experience of the Coordination of farmers in Piedmont (Coordinamento Contadino Piemontese - <http://coordinamentocontadinopiemontese.noblogs.org/>) and its experience in the promotion of values and practices of small scale farming in Piedmont as a form of a differentiated agricultural systems.

### ABSTRACT

The economic development of rural areas has rarely followed that of urban centres, with greater evidence of this in developing countries where the outlying communities have remained considerably more remote from the systems of cultural and economic growth. Even if this has had negative repercussions in terms of social equilibrium within the various countries, from a strictly agronomic point of view it has often resulted in the natural conservation of indigenous and native biodiversity. This has been affected by the natural and daily use of local plant extracts both for nutritional purposes and for a variety of other reasons. The exchange of genetic material between one community and another, often a sign of respect and friendship, has helped to increase plant diversity and to enhance its role in the everyday diet of rural populations.

Any activity aimed at conserving biodiversity cannot disregard the fact that native plant species (and even more indigenous species) now play a vital role in the cultural identity of rural communities, and that making such communities aware of this precious asset can also play a strategic part in the idea of promoting biological diversity as a way of developing local economies. Such evidence clearly emerged through the various activities conducted in the context of the project, FAO GTF/RAF/426/ITA *Promoting Origin-linked Quality Products in Four Countries in West Africa*, financed by the Slow Food Foundation for Biodiversity Onlus. This project, conducted in 4 West African countries (Sierra Leone, Guinea Bissau, Senegal and Mali), aimed to carry out a study of these 4 states and draw up an inventory of the traditional plant and animal species, to examine the link between these and the diet of rural populations, and to assess the risks of genetic erosion by actions to safeguard the native biodiversity.

### INTRODUCTION

In some developing countries with a greater incidence of native and indigenous plants and animals linked to the cultural and dietary customs of the local peoples, any approach to the study of biodiversity and the use of this in diet is bound to introduce a more complex view of the situation. Such a vision is linked to questions concerning the concept of land ownership, the right to exploit native resources, and the guarantee of access to such resources, especially if they provide a substantial part of the local people's sustenance [1]. The Convention on Biological Diversity (1992 CBD) has already defined certain specific roles for the contracting nations, ensuring that conservation of biodiversity is linked to the knowledge and practices of indigenous peoples and local communities, in particular the rural populations [2]. In this sense, also, the conservation approach is geared towards interventions which respect the traditional ways of life: important for the conservation and sustainable use of biological diversity, in the broad sense, but also more vital in promoting any sort of conservation activity with the approval and involvement of the possessors of this knowledge, and in producing a fair division of the benefits that can derive from the use of such knowledge and practices.

This approach is substantially more valid in countries where development has been obstructed by a variety of factors, and where local genetic resources, whatever their geographic origin, represent not only an important aspect of subsistence but also play a not inconsiderable role in the field of medicine and medicinal treatments. This is a matter, in this instance, of forms of traditional knowledge that the indigenous populations and the local communities guard with jealousy and respect, fearing that they are more likely to disappear through use than through possession. There have been various attempts to identify methods of protection, but their management, even prior to their implementation, has always been very difficult to apply, especially in the context of that constant play between tangible and intangible components which often come together in traditional knowledge [3].

The relationships between traditional knowledge and natural resources have been the subject of extensive study over many years, and the developments connected with the implementation of the CBD have also resulted in significantly different approaches to the management of genetic resources (or more commonly biodiversity), in relation to rights to exploit them either as food or as commercial products [4]. What emerges in a meaningful way is that the

preservation of plant biodiversity is a process which is fundamentally linked to its use by the peoples most generally in contact with it. This clearly has very significant implications for all those species, varieties, accessions, and ecotypes of general nutritional interest, and which over the course of time have come to play a consistent role in the daily diet. However, the same can also be said for all those plant resources which are of medicinal interest, and which have been employed by custom and tradition as the natural solution for everyday problems, especially in rural areas cut off from the economic development which has characterised zones of greater industrialisation, and with greater access to financial resources, over the last hundred years.

The approach offered by the project, FAO GTF/RAF/426/ITA *Promoting Origin-linked Quality Products in Four Countries in West Africa*, has taken on its own unique character in this respect. Starting from the assumption that there is a very significant risk of loss of plant diversity, especially in the area of agro-biodiversity (biodiversity connected to food and agriculture), it studied the role that many plant species (indigenous or simply native) still play in the daily lives of rural populations far from urban areas, evaluating the risk of their loss and adopting forms of sustainable promotion which directly involve the local populations.

The geographical area now recognised by the name of West Africa presents a series of specific characteristics which point to a reality unique in many respects [5]. There is clear evidence of a strong divide between the urban and rural areas, but also of significant geo-political turmoil, and this affects the development and growth of cultures that are very diverse, even if physically very close together [6].

Without entering into the merits of the various geo-political events, which nevertheless have had a significant impact, it is evident that the link between this part of the African continent and plant biodiversity is incredibly strong. There are many species which originated in West Africa [7], a surprisingly high number if one considers the relatively small size of the area when compared to the other main areas of plant origin and domestication around the world. African rice, in addition to African groundnuts, certain species of banana tree, sweet potatoes and many species of leaf and root vegetables, and so on, were all first identified in this zone [8]; and such species were subsequently diversified and selected by the local peoples in order to make them suitable for direct consumption, or for use as ingredients in traditional preparations.

In this respect, there is a body of absolutely tangible scientific evidence, not just in terms of the classic categorisations of *vegetative wild relatives* or ancestral species, but also through more accepted methods of botanical archaeology which demonstrate how many varieties belonging to species of sorghum, millet and rice do indeed date back thousands of years in terms of their presence, diffusion and use [9]. Clearly, all this did not occur over the course of a few years, but is the result of an evolutionary process originating from a concentration of different climates to which such species were adaptable, and reaching us today through the excellent system of conservation of biodiversity to be found in everyday consumption.

It was the very variability of climates within this large geographical area which enabled the significant incidence of genetic diversification in these many different plant species. From the Sahel to the Atlantic Ocean, one passes through desert zones, arid zones, and fertile lands of fluvial origin, until finally reaching tropical forests. Here, there are a huge number of indigenous species which have prevailed as a result of their adaptability and their exploitation for nutritional and economic purposes. In alluding to the variations in climatic environments and agronomic and cultural factors, we are in fact referring to macro-areas which do not fall within the political borders which define the individual states [10].

### **The climatic areas and plant biodiversity**

The *forest area* represents just a portion of the vast and varied rain forest system. The presence of a large variety of species with arboreal growth habit has led to many of these being widely cultivated. In Sierra Leone and Guinea Bissau, for example, palm oil, rubber from indigenous trees, cocoa, but also timber from various types of native tree, together with many other plant species, have played an essential role in the economic, cultural and social development of these areas.

The oil palm, for example, has always been a species of great indigenous interest for its oil and for cosmetics, obtainable by means of a rudimentary tree-tapping process. Traditional alcoholic beverages can be made from the trunk, and the leaves and fronds provide useful building materials and are primarily used for roofing houses. All these applications, therefore, account for the widespread use of this species in many West African countries. However, palm oil first became successful on an international scale with its export to Britain near the end of the 18th century, for its use first in industry and then in food production. Palm oil subsequently began to be exported to very many countries, attracting a lot of industrial concerns, and these ended by subverting the production techniques developed over many years by the indigenous populations. Not much remains of this original production, although some of the traditional palm groves have still been conserved. Here, you can still find a form of sustainable management which uses traditional cultural techniques and follows indigenous rules, both for the maintenance of the plantations and for the production of the palm oil. These areas represent just one example of what was once a form of production closely linked to the traditional cultivation of a species which was naturally and widely distributed throughout the forest zones of this large corner of the African continent. A similar story in some respects relates to the production of rubber from widely diffused native species. The peak of production follows, to some extent, the growth of the palm oil trade, at least until the end of the 19th century. However, there never existed formal plantations for the production of rubber: the local people just profited from a long period of commercial demand, collecting the product from the trees found spontaneously growing

around the forest.

Many of the areas where oil palms could be found, or trees from which to extract rubber, were heavily exploited during the period of greatest trade and remained partially deforested or at least much beaten down. It was precisely in these areas that the development of cocoa palms became possible, and there was an immediate increase in the number of these plantations. It was the introduction of cocoa, reaching West Africa in the second half of the 19th century, which significantly altered the agro-environmental landscape, with plantations growing in number and encroaching ever further into the rain forests. Amongst other, more minor species, meanwhile, there was also a culture of coffee growing, which played quite a significant role although never reaching the levels of cocoa or palm oil production. Nevertheless, apart from various scattered and not very widespread fruit trees (pineapples, bananas, mangos, etc.), it is the cola tree which represents the most important species in terms of the link between indigenous cultivation and the forest. Cola nuts, traditionally collected from the trees scattered around the forests, from Ivory Coast to Sierra Leone, still act as a strong link between local traditions and the sale of plant products. They are used generically as stimulants by the people of the savannah and those living closest to the desert areas and have always been restricted to a relatively local trade, without ever finding space on more distant markets. Due to this limited diffusion, the traditions related to the gathering and processing of cola nuts have continued up to today. This is mainly thanks to the constant activity of the women, who have helped to maintain interest in this purely indigenous product, even if only at a local level.

Finally, in the typical forest areas, can be found a small number of species more directly linked to the diet of the indigenous population: mainly types of tuber (cassava, yam, etc.), and some trees such as the plantain. What is striking above all is the capacity of the women to profit from a range of spontaneous species whose tubers or leaves offer significant nutritional characteristics (in some cases, also medicinal), and which have come to form part of the daily diet of rural communities living in villages on the fringes of the forest. These forest areas become a source of edible species which prevail over those typically related to commerce and trade, emphasising the importance of the use of spontaneous, indigenous forms of biodiversity for the purposes of daily sustenance. This is really the very best form of conservation. However, it is also clear that forest zone is of lesser importance in terms of the species used in everyday nutrition, especially compared to the savannah region, to which the forest gradually gives way.

The *savannah*, as we have noted, is not an area uniformly spread throughout West Africa. It begins as very fertile territory, especially when close to river basins, and extends towards the Sahel with a succession of pedoclimatic zones which range from the humid to the very arid. The types of indigenous species to be found in these environments vary radically, as do the systems of agriculture and different methods of cultivation. There is widespread livestock farming, while rice, in the form of a native variety related to *Oryzagliaberrima*, is grown throughout the area and represents the staple food of the local populations.

The savannah of West Africa, during the time from the 18th to the mid-19th century, contained within it a vast array of very different species, some of which played a crucial role in the rural economy of the age. One of the crops with the greatest tradition and firmest links to the rural culture of this area was therefore rice, and this region was known at the time as the “*rice-growing belt*”: a zone stretching from Casamance in Senegal to as far as the Ivory Coast.

However, within the Savannah, the ever greater scarcity of water resources and the alternation between very dry and very wet seasons, has become a very important factor in the selection of species and cultures which over time have become well established and have become essential to the nutrition of the local populations, especially the rural communities. Despite the fact that the continuing industrialisation of agriculture in Sub-Saharan Africa has contributed to the ecological degradation and impoverishment of the territory, there nevertheless still exist certain characteristic species in this area from which the indigenous populations derive a large part of their income, as well as, more importantly, a large part of their nutritional needs and sustenance. Indeed, the cultivation of groundnuts has been consistently important in West Africa, with some significant specifications. Until colonial times, the cultivation of groundnuts involved native and indigenous species: the *Voandzeiasubterranea* also known as *Vignasubterranea*, and whose common name is *Bambara groundnut*, originated in West Africa, probably in northern Nigeria, where it was first established as a distinct species. It was only with the arrival of the American groundnut (with a completely different use and purpose) that the *Vigna* began to diminish in importance. However, it still remains an important, basic species, especially in rural areas with a prevalence of subsistence agriculture, and is closely linked to the preparation of traditional dishes. There is no doubt that this species, with its special nutritional and dietary characteristics, especially in terms of its content of protein and high-energy oleaginous fats, has been an essential element in the diet of indigenous people, from Senegal outwards: also because it is easy to store. There have been many ethnic groups involved in its production over the years, from the Wolof in Senegal to the Bambara in Mali, who cultivate groundnuts in their fields alongside the traditional millet or cotton. This provides these people with an important sort of agronomic and economic “flexibility”, which at certain times proves vital in helping them to overcome specific hardships.

Indeed, the West African savannah is a concentrated area of production for millet, sorghum, maize and rice, which, almost exactly in this order of importance, have represented a productive system of agriculture as well as a basic nutritional system. To a lesser extent, durum wheat is also grown, but principally many and varied types of pulses. Since their growing season intersperses with that of cereals, they can be used to enrich the diet of the local people as well as helping to maintain the fertility of the soil by fixing nitrogen through their roots. It is, in any case, fascinating to observe the differentiation of species their variety according to the specific climatic conditions of the savannah. The alternating wet and dry seasons make it necessary to cultivate varieties with short growth cycles: varieties able to use the end of the dry season for germination and harvesting, and also capable of withstanding the limiting conditions

imposed by the aridity of the period which immediately follows. Where conditions have permitted small artisan systems to be established for water management and irrigation during the dry season, the cultivation of vegetables, tobacco and rice has proved to be extremely fertile and productive.

Rice has always played a fundamental role in Sub-Saharan Africa. Until the introduction of Asian rice (*Oryzasativa*), all the varieties spread through in Africa, and in the western part in particular, were descended from *Oryzaglaberrima*, a native, indigenous rice variety which provided the essential staple for the local populations. These varieties of rice were used for a multifaceted form of cultivation, from the classic paddies to rice fields on dry hillsides, and from areas with high salinity in the middle of mangrove swamps to the “floating” varieties, with their long stems and short growth cycles: proving in a definitive way the huge genetic variability of this plant and its great adaptability to environmental conditions.

Over the course of the decades, while Asiatic rice has come to dominate in peri-urban agriculture, due to its larger yield and consistency of production, the rural areas have consistently maintained their cultivation of *Oryzaglaberrima* and its different varieties managed by local farmers. Between the 1960s and 1970s, Porterés observed a considerable number of native African rice varieties, identifying just a few morphological differences between them, which were mainly related to the size and colour of the paddy. At the same time, he described their agronomic characteristics, emphasising, in particular, their high resistance to fluctuations in water level [11] [12].

In some rural villages, therefore, the native rice still plays an important role, and the few varieties that come down to us today have been maintained primarily because they are always grown together. Indeed, one very well-established tradition is that different varieties of rice with different characteristics should always be grown together in the same fields, as a way of guaranteeing production even in the event of unexpected adverse conditions which could affect any variety: a rare and also very efficient method of protecting and conserving biodiversity. This strategy is implemented largely due to the expert knowledge of the local women, who are able to distinguish the different cultivars just from the paddy, and therefore know how to create the right mixture at the time of sowing. Their choice, therefore, is based on different types of adaptation to the soil, or resistance to adverse conditions, and acts as a useful instrument which contributes to the movement of varieties from village to village. Indeed, these women exchange seed with the women of other villages so as to ensure the maximum morphological and agronomic diversity between the seed types they intend to sow [13].

The significant genetic erosion of native African rice largely took hold after the 1960s with the start of a real and prolonged period of drought, which, combined with a pronounced population increase, led to a need for rice imports. Apart from a few brief periods, average rainfall decreased by a third - and in some years even by half. It was therefore thought necessary to rely on varieties with very short growth cycles, which would not grow excessively high and would maximise yield in the shortest possible period. For this reason, Asiatic rice became increasingly widespread, while at the same time research programmes were launched by African and European institutions to try to develop consistent improvements to varieties by combining the genetic characteristics of *Oryzaglaberrima* with the high yield of *Oryzasativa*.

### **The role of women in the conservation of biodiversity**

It is interesting to note how, in this context, the different roles of men and women are perfectly balanced: the men till the soil and sow the seeds, while the women harvest the crops, select the product, and maintain diversity by deciding what should be kept for the next sowing and in what proportions. Paradoxically, this part of the world has become one in which this sort of balance and form of relationship has assumed increasingly differentiated connotations. On the one hand, this form of equilibrium is still very much alive and rooted in the indigenous social culture of outlying rural communities: especially those remote from cities. But on the other hand, in many urban areas close to zones of expansion and colonial domination, this system of balance has profoundly changed, and women especially have lost the valuable and decision-making role which they have always traditionally played within the African family. This aspect alone helps to highlight how, and to what extent, colonialism helped to set in motion and then to consolidate a series of social and political changes, with a consequent impoverishment which has not yet been put into reverse, and with a succession of *coups d'état* and periods of political and economic volatility which have certainly not promoted social stability.

The indigenous peoples - and women in particular - have been the most significant victims. Their communities were the ones that best preserved the biodiversity: that biodiversity of which there was once an inexhaustible supply in West Africa. For all these reasons, the rural areas furthest from the cities and large centres of population have somehow managed to counteract this trend towards impoverishment. Indeed, they have assumed the role of guardians of a significant part of this native and indigenous heritage, and have become living proof of the traditional ways and knowledge: factors which have so often helped the indigenous peoples to overcome major problems in relation to sustenance, and to political and social issues.

The colonist, in fact, were never very accommodating to changes in their own customs, instead exerting heavy pressure on the local traditions by the importation of new species, new habits of consumption and new approaches to everyday nutrition and diet. Nevertheless, as in other parts of the world, and especially in developing countries, these African women remain the repositories of that essential knowledge on which the sustenance and nutrition of the whole nuclear family depends. The women know where to go in the forest, and how to collect the leaves, stems and roots of

plants. They know how to recognise them, and to cleanse them of any alkaloids or dangerous substances. They know how to mix them together to make a complete meal, or to provide the ingredients for a useful and nutritious dish. Indeed, apart from certain cultivated plants, wild herbs almost always form the basis of the most traditional African recipes.

## **THE PROJECT ACTIVITY**

The implementation of the project, *Promoting Origin-Linked Quality Products in Four Countries*, has enabled the creation of a sizable inventory of the species, varieties and types of plants associated with the traditions of the local people; selecting as case studies 4 West African countries characterised by the great richness of their biodiversity. On the basis of knowledge of the region, and by building up a dialogue with the local people, it was possible to draw up a substantial inventory, which could be exploited by applying the special methodology developed by the Slow Food Foundation for Biodiversity. It was aimed at promoting those products related to traditional history and culture: products with a high organoleptic and nutritional value, of either native or indigenous origin, which were habitually collected by women and so handed down the generations.

Starting with these types of products, a process of investigation, assessment and selection was then carried out. This was aimed at establishing various projects to evaluate at least one product per country, and envisaged the direct involvement of small producers, local farmers, and expert women involved in the preservation of such knowledge. This could form the basis for a demonstration exercise for the rural populations, leading to the creation of small scale but very viable economic systems.

An evaluation process was established, aimed at exploring markets able to enhance the value of products originating from very particular areas, and a system was developed to promote knowledge of “local eating” in two parallel ways. This involved working firstly in the villages, to emphasise the importance of local foods, their consumption and nutritional benefits, lending added value to products once considered exclusively poor; and secondly in the large cities, where contact with local production risks becoming more and more sporadic, and loss of knowledge risks opening the door to increasing genetic erosion and loss of biodiversity.

The specific aims of the project can therefore be summarised as follows:

- to promote all initiatives aimed at the conservation of biodiversity and local traditions, by identifying those products associated with indigenous history and culture in 4 West African countries (Sierra Leone, Guinea Bissau, Senegal and Mali).
- To apply the evaluation system of the Slow Food Foundation for Biodiversity, using the criteria for various products and selecting those suitable for developing a Slow Food protection project in each of the 4 countries;
- To help develop a small-scale production organisation in relation to the local social and cultural hierarchies and structures, and to contribute at the same time to improving (where possible or necessary) the production techniques related to agronomy, health and hygiene, and also to the packaging of the final product.
- To promote and improve access to these products in local markets, within the individual countries involved, and on an international scale.
- To improve the knowledge of the local population with regard to native and indigenous products; to the importance of their consumption; to the link between their consumption and improvements in nutrition, the conservation of biodiversity and an increase in environmental sustainability, and, in short, all the benefits which derive from these various interconnections.

### **The case studies – the 4 West African countries**

It is difficult to speak exclusively of one or other of these countries without referring to the larger geographical zone (i.e. West Africa), since biological evolution is certainly not defined by political borders. Indeed, it is abundantly clear that the entire region has undergone a similar process of evolution in terms of the domestication of plants, the development of agriculture and the close relationships with local traditions in the rural areas. A study of the region reveals a strong link between dietary traditions, closely connected to a huge variety of products, including species from the vegetable plot, types of fruit, cereals, and especially pulses. Sweet peppers, tomatoes, aubergines, cucumbers, beans of every type, different forms of tuber, and species of tropical fruit-tree and palm-tree are all traditional features of the West African landscape. Many of these products are also linked to the distant past, both in terms of their cultivation in the different countries, and because of their associated use in preparing dishes of varying complexity, or in a range of processes after harvesting.

The obvious geographical isolation of the rural areas has certainly impeded economic and social development, but has also substantially helped to conserve an unparalleled cultural and agricultural heritage. One can still witness the preparation of so-called “poor” dishes; the result of the harvesting and combining of ingredients derived from wild species or traditionally cultivated plants. The skill of the village women in selecting wild plants for use in cooking is still a source of amazement today, and confirms the existence of a repository of extraordinarily valuable knowledge. This is an asset to be explored, studied and disseminated in order to help maintain a culture of local consumption: a

culture of sustainable consumption which encourages biodiversity and enhances the social fabric.

It therefore seems clear that in order to implement a process of reviving and enhancing plant and animal biodiversity – that same diversity that is ever more closely linked to local consumption in marginal areas - one must inevitably undertake a process of investigation, monitoring and cataloguing, of studying and researching the different plant species and varieties [14] [15]. It was from this perspective and with these specific objectives (as noted previously) that the present study was conducted, using certain specific activities which led to the identification of products with very strong links to their areas of origin: products of great prestige, characterised by a history firmly rooted in local traditions, and with significant connotations in regard to the nutrition and sustenance of the indigenous populations.

### The methodology

The activity envisaged in the project, ‘*Promoting Origin-linked Quality Products in Four Countries*’ (GTF/RAF/426/ITA), was divided up into a number of stages, entailing detailed bibliographical work, and a series of visits to the 4 countries involving many contacts with local personalities, farmers, small producers, shopkeepers and local officials. This method allowed the project team to identify and learn about various products of significant local interest in terms of food, including those which had been subjected to processing. According to the project plan, the evaluation of the various products had to be subject to a checking process, involving a series of criteria used by the Slow Food Foundation for Biodiversity in relation to the programme leading to the establishment of Presidium.

In the context of this project, the process divided into four different phases:

- *Inventory*: The creation of a list of local products with related data sheets. This list was planned to be wide-ranging and thorough, and took account of information collected in situ; through interviews and meetings with small producers and inhabitants of rural villages, exchange of knowledge with people from various countries, and from institutions which carry out cooperative activity and sharing of expertise at a local level. The information obtained was then put together with the evidence acquired from extensive bibliographical research, involving both the science of agronomy and sociological, archaeo-botanical and geopolitical aspects.
- *Selection*: This involved the list of criteria for creating a Slow Food Presidium. Each product identified was given an in-depth description and related data sheet, and then evaluated using the criteria established by Slow Food for accessing the Slow Food Presidium programme. This process helped to highlight the strengths and weaknesses of the product in terms of its potential for development and its contribution towards the conservation of local resources.
- *Presidium Project*: Together with all the local players involved, this entailed a process of development for those products which met the criteria for Slow Food Presidiums (<http://www.slowfoodfoundation.com/presidia>). This action plan began with an assessment of the potential of each individual product in terms of the safeguarding of cultural, social and natural resources, and also in relation to the economic development and involvement of consumers and of the Slow Movement network on the spot.

## RESULTS

A data sheet was created for each of the local products identified, and this was used to evaluate possible successive action. In this way, an inventory was produced of about 50 traditional products from the 4 West African countries. These were products of either native or indigenous origin which have an important role to play in the agronomic, social and cultural life of these 4 countries. This list certainly does not exhaust the full potential of any of these countries, and it can be gradually expanded as the increase of the association’s activities within the country leads to a spread of the Slow Food philosophy and a consequent highlighting of products of interest.

The inventory forms part of a clear strategy, whose aim is to develop a virtuous circle based on the promotion of good quality, traditional products. Each data sheet contains a large quantity of information in relation to the botanical identity of the product, with detailed facts regarding the origin and distribution of the particular species or variety. It also includes data in relation to its prevalent use and main characteristics in relation to food preparation, diffusion throughout the territory, possibilities for commercialisation, and all aspects of its nutritional value. Each product is then subjected to an evaluation process based on the selection criteria for the Slow Food Presidiums, to check whether it possesses the requirements to access the promotion stage, in line with a process already tested in many countries and every continent. This results in a selected list of products with suitable characteristics for the Slow Food programme (bottom-up type micro-interventions). This list can be included in priority series of interventions, enabling the identification of possible actions to propose to financiers at the time when the Slow Food Foundation for Biodiversity is in a position to propose and set up new projects in developing countries.

The products chosen at the end of the evaluation phase are those which succeed in fulfilling all the criteria mentioned. The Somè Dogon Presidium products, which met these conditions, were not considered because they were already the subject of a Slow Food project following previous activity by the Foundation in West Africa. The **Cola of**

**Sierra Leone**, the **Palm oil of Guinea Bissau**, the **Salted millet couscous of Senegal** and the **Kattapasta of Mali** are, on the other hand, products which managed to fulfil all the necessary criteria of the rigorous selection process. These products, therefore, have now embarked on a process of development and promotion, calling for the full involvement of the small producers. They are products which have fulfilled all the conditions required for setting up a Slow Food Presidium, in relation to small-scale production, quality and good taste, sustainable systems of production and management, and risk of extinction for the product of production system. Each Presidium is equipped with production guidelines, drawn up by joint agreement during a moment of social interaction between the producers, who had the opportunity to present their various products at the Terra Madre 2012 international event.

## CONCLUSIONS

As already noted, plant species in the rural areas have been able to maintain real diversification, somehow integrating the production of rice, maize and tubers as well as fruit and vegetable products, in addition to an increase in livestock and dairy farming. All this is partly related to farming enterprises developing next to family concerns, but without the presence of proper agro-food businesses.

In general, the agro-food market in West African countries lives in a state of constant antagonism between a timid defence of local production and small producers and a growing interest in importing products from abroad, both from other African countries and from the EU. In this way, various bodies and action groups have been established with a protectionist attitude to indigenous production, and these have been opposed and often impeded by those concerns which manage to import and distribute foreign products with considerable ease [16].

There is therefore a very conflicting situation: on the one hand, the increase in imports reduces the costs of food products, increasing their ready and constant availability, but also causing fierce competition, without any of the guarantees offered by local production. On the other hand, activities to protect and promote local products certainly cannot see any chance of success in the immediate future, but require a prolonged programme of information, research, and the sharing of experiences and skills. All of this must be directed towards reviving awareness in relation to the importance of a healthy, balanced diet, based on local products which require less energy input for their production, with a consequent increase in agronomic, social and economic sustainability.

In these social contexts, the opportunity to implement activities aimed at the conservation and promotion of biodiversity, as through the Slow Food Presidiums, seems to be of great importance not just for purposes of conservation, but also because it is by the diffusion of information about the consumption of indigenous plant products that one can more practically achieve the general aims of the rural communities [17].

The great pressure to which this biodiversity is subjected every day, quite apart from any connection to the period of European colonisation, depends heavily on an ever-growing demand for food, and the need to satisfy it within certain timescales and in sufficient quantities. Indeed, local production is not characterised by very high yields, but often (or rather, almost always) responds to the needs to resist constrictive climate conditions, and the ever-present threats of biotic or abiotic stress, while also demonstrating an unequalled nutritional capacity. A demonstration of this is the increasing activity in the field of genetic enhancement, which, independently of the methods employed or the parent strains used, has had a wide-reaching effect in quantitative terms, while also leading to an impoverishment in the nutritional potential of various foods and a growing risk of genetic erosion amongst plant species [18].

The work carried out by the project, '*Promoting Origin-Linked Quality Products in Four Countries*', was aimed at highlighting the approach of the Slow Food Foundation for Biodiversity with regard to local products and traditions, and the process of selecting and creating a Slow Food Presidium in an area as complex as the one under review in West Africa. The innovative aspect of the approach adopted by the Slow Food Foundation for Biodiversity consists in creating relationships which do not involve a one-way connection between the project developer and the beneficiary but which are instead circular systems. These are systems where everyone, by contributing to the creation of the activity, becomes one of its beneficiaries, and where even small producers become main players in enabling the success of the project. In such a context, there is no contradiction between the actions of the individual and of the community, for they both benefit from each other within a network of generally positive relationships. Indeed, sustainable production does not only benefit the individual who puts it into practice, but also the entire community who live with and consume these products. In the same way, being part of a community allows the individual producer who works, for example, in marginal areas, to overcome the restrictions imposed by physical isolation which made it hard for him to access and compete on the market. In view of these considerations, it is possible to underline certain key points in the model for the Slow Food Presidium Project, which has provided a means of integration and consolidation in both West Africa and other parts of the world:

- in varied parts of the world and with very different products, it has managed to apply the same basic operational formula, even though it had to adapt the specific action to the context involved;
- the implementation of these activities, like their support and control, is ensured by a cooperative structure on the spot, and by the presence of a community which shares the key values of the SF philosophy and which does not therefore require the presence of ex-patriot personnel on the ground;
- the Slow Food movement and the Terra Madre network promote the spread of their philosophy through the

- creation of a relationship of circular exchange between the various individuals who form a part of it;
- there is continuity of the activity over time, in that the SF network allows an indefinite life and visibility for the project, with no determined end to the operation, in that it makes up an integral part of the SF system.

Using this approach, the movement has operated in West Africa, reaching the end of a process of evaluation which has allowed it to come into close contact with the rich legacy of native and indigenous plants which is still present and still used, although sometimes at grave risk of extinction due to the constant pressure of foreign products. The rural communities have managed to put up a strong defence, but now recognise the importance of projects able to give voice to their skills and knowledge, applied to the use of the biodiversity which they know how to value and recognise. Valuing and promoting this legacy through projects which put the indigenous people at centre stage and make them masters of the success of their enterprise, has also proved to be a winning formula in relation to preserving the agrobiodiversity still in existence today.

## ACKNOWLEDGEMENTS

The work carried out in the context of the project, '*Promoting Origin-Linked Quality Products in Four Countries*', was made possible thanks to the network that the Slow Food Foundation for Biodiversity has managed to set up in the countries involved in the case studies. Our special thanks go to all our local collaborators for helping us to identify the products to study and the links with local traditions over the course of our study trips and visits to local communities. Finally, the creation of the project was made possible above all thanks to the hard work of many people involved in the SF Foundation, amongst whom we would especially like to mention Cristina Battaglini, Serena Berisio, Francesco Impallomeni, Michela Lenta, Velia Lucidi, Marta Messa, and Piero Sardo.

°Perennial Horticulture Development Project, Afghanistan - [g.masiniphdp@gmail.com](mailto:g.masiniphdp@gmail.com)

### ABSTRACT

The Perennial Horticulture Development Project – Afghanistan ([www.afghanistanhorticulture.org](http://www.afghanistanhorticulture.org)) funded by the EC-EuropeAid Program since 2006, is supporting the Ministry of Agriculture, Irrigation and Livestock of Afghanistan in the sector of fruit culture, including the fruit tree nursery segment, through a process of collection and selection of local fruit varieties. The main goals are the strengthening of the perennial horticulture through the utilisation of mostly local and imported genetic resources and the development of a consistent private commercial nursery sector. About a thousand fruit varieties (of grape, almond, pomegranate, apricot, etc.), selected by local advisors across a wide area of Afghanistan were collected during the first phase of the project (2006-2010), propagated and planted in National Collections at six Perennial Horticulture Development Centres. The collected accessions are under morphological characterization and evaluation following standardized methods in order to choose the best ones and to allow their registration in a national list, hence contributing to their safeguard and protection. Many varieties are already being cultivated and are also being used for adaptive research in order to point out the best cultural practices (e.g. pruning, training). PHDP also provides capacity building at technical and institutional level, fosters the establishment of nursery sector associations and helps to provide international expertise for local staff in cooperation with local and foreign universities, and NGOs and other public and private companies working in Afghanistan are also involved. One of the most challenging tasks is to promote, tutor and bring to sustainability the Afghanistan National Nursery Growers Organization (ANNGO) and the apex Afghanistan National Horticulture Development Organization (ANHDO), mainly concerned with value chains.

### FOREWORD

This paper aims at illustrating the activities of the Perennial Horticulture Development Project (PHDP) and placing them within the framework of the economic development of Afghanistan. The description of the project and the related considerations will be performed by keeping in mind the leading question of the Section "Rural development, natural resources and environment - 3.2 Agro-biodiversity and diversified agro-husbandry systems" of this Congress, which states "the integration between scientific and technological innovation and traditional knowledge and use of local genetic resources: how to promote capacity building and technological transfer taking into account these aspects?".

### INSIGHT AFGHANISTAN

This section briefly describes the country's background and those aspects directly related to the PHDP activities, focused as they are on the development of fruit culture sector.

#### Historical, cultural and institutional background

The 5,000 year history of Afghanistan can be defined as a continuous overlapping of conquests and defeats by neighbouring countries and civilizations which have led to a variegated and multiethnic nation. The current conflicts go back to 34 years, and have deeply affected people and their relationships both within and between ethnic groups. Even if the war had tragic effects in the countryside, the rural cultural heritage and social structure could stand these events better than towns, where, most of the governmental structures (e.g. Ministry of Agriculture and Universities) practically collapsed, leaving a void in the institutions demanded to manage and promote, for instance, agriculture, the leading sector of the economy of Afghanistan. The destruction of buildings was closely accompanied by the almost total annihilation of human resources, with a whole generation of people missing out on education and social and economic development. Another effect of the conflicts was, notwithstanding the wide *diaspora* of Afghan citizens, the isolation of this country towards the international community in most of sectors of public and private activities. Hence material rehabilitation and human capacity building are still a must in Afghanistan.

## Environment and agriculture

Afghanistan has a surface of 652,230 km<sup>2</sup>, two thirds of which are represented by mountainous terrain and dry plains with little or no vegetation. Good statistics are impossible to come by, but of the total 65 million ha only 12% is ever cultivated, as most of the land is too mountainous to cultivate, and much of the rest of the land receives too little rainfall for rainfed crops. Of this approximately 8 million ha of cultivated land, only about 2 million ha is irrigable currently; although many irrigation schemes could be improved or extended. Water for irrigation is generally derived from precipitation as snow at high altitude in the winter. Where water courses are fed directly from melting snow, the irrigation capacity decreases during the summer as snow melts. More consistent aquifers are available from groundwater areas, and a limited number of dams were built going back as far as the 1950s. High mountain chains (e.g. the Hindu Kush) separate usually narrow valleys with specific microclimates, each one with diverse typical fruit varieties. In the central and northern parts of the country, the climate is harsh, with very cold winters and very hot, dry and in many areas windy summers. Nevertheless a wide range of temperate species are adapted to these conditions and are grown from 250 m up to 2-3,000 m above sea level. In southern areas, winters are milder, and in parts of eastern Afghanistan, which are on the edge of the areas influenced by the South Asian monsoon system, many citrus and similarly tender species can be grown. Over 75% of the Afghan people live in rural areas where agriculture is the primary activity and the agriculture sector contributes about half of the GDP of the country. The World Bank estimates that to enable faster economic growth and rural poverty reduction, agriculture needs to grow at least 5% per year over the next decade. This is a big challenge since technology, communication and transport, irrigation, and education are substantially deteriorated due to conflicts and lack of maintenance. Both public and private institutions lack the physical infrastructure, the necessary regulatory framework, and the skilled staff to build a modern and competitive agricultural sector.

## Fruitculture

The strategic position of Afghanistan in the crossroad between western and eastern regions, which motivated the repeated conquests and re-conquests of that country by different civilizations, explains the presence and the wide diversification of most of temperate fruits species originated in Middle East, Central and Eastern Asia. Many historical and artistic records indicate a strong traditional linkage between the Afghan people and fruits (fresh and dried fruits, and nuts) [1]. For instance, Qasem Ebne Yousof Abunasre Herawi, in his "Guide to agriculture" of the XIV Century, quoted over 100 types of grapes for the area of Herat. Fruits trees are very often recalled in present literature; some nice examples related to pomegranate and pistachio trees can be found in the popular "The Kite Runner" [2] and "A Thousand Splendid Suns" [3] novels of Khaled Hosseini, while "I fichi rossi di Mazar" (*The Red Figs of Mazar*) is the title of a recent book by Mohammad Hussain Mohammadi [4]. An interesting Italian reference, where fruit trees are cited, is "Nel mare ci sono I coccodrilli – Storia vera di Enataiatollah Akbari" (*In the Sea There Are Crocodiles*) by Fabio Geda [5], based on the candid testament of the experiences faced by a young asylum-seeker from Nava (Afghanistan). These are sound proofs of how much fruits are a part of Afghans everyday life and how deeply they are linked to their cultural heritage. The "bagh" is the typically closed home garden where a wide range of species and varieties (often obtained directly by seed) are grown and from which many local varieties, composing the fruit germplasm of Afghanistan, came out. More specialized mono-specific orchards are also called *baghs* and they supply most of fruits and nuts, nevertheless also sparse trees in community areas are a valuable source of some nuts like pistachios and seldom "wild" pomegranates. Afghan consumers prefer very sweet, extremely low acidic and tasty fruits; high sugar content is a necessary condition for drying fruits, a very popular and traditional practice in Afghanistan, which is facilitated by very hot and very dry air during windy summer times. As a matter of fact, storing dried fruits and nuts represents a suitable strategy to overcome harsh winters with a natural and healthy source of energy in the rural areas. Fruits represent for the Afghan population a valuable product both for subsistence and profit. Fruit and nut production in 2011 reached 1,355,985 t [6]; the actual amount could be more, since the statistics on production are not always very reliable. The percentage of "fruit and nut production on total crop production" in Afghanistan is over 16%, which is quite high if compared to world average (about 11%), and lower than the proportion of Italy (about 30%), considered a typical fruit producing country. The following table 1 gives a picture of the species cultivated in Afghanistan and their relevance in the sector. Global fruit production yield in Afghanistan (6,7 t/ha) is about half of the Italian value; the most unbalanced situations are presented by apple production (the Afghan yield is about 15% of the Italian one) and then by peaches and nectarines (38%) and apricots (50%). These figures are evidencing problems in terms of fertility, production systems and cultural practices. Insofar as these yield figures are reliable, they are also influenced by the average age of the orchards, after a lot of orchard planting in the last few years. One aspect of major concern for fruit industry in many developing countries is related to the nursery system, the starting segment of fruit production chain. A strong impulse to top quality fruit production in developed countries of the last decades was the adoption of high quality propagation material, characterized by true-to-type genetic identity, clean phytosanitary status and high technological properties. Traceable propagation material (such as buds, cuttings and saplings) released by a nursery sector working under a certification-filiation scheme is a guarantee of quality for fruit growers. At this regards Figure 1 clearly illustrates the potential effect of the application of a nursery system based on traceability on the orchards of Afghanistan, characterised by poor quality, mixed and often un-identified trees. The limited natural

resources and the high population growth rate (average of 3,2%, against 1,2% of world in the last ten years) of Afghanistan, impose to adopt innovative strategies in agriculture (and namely in fruit culture) in order to increase yields in general terms, and, at the same time, to improve the marketability of fresh and dried fruits, and nuts. At this regard, it is worth to notice that Afghanistan is a net exporter of grape and raisins ( $\approx 48,000$  t in total), pomegranates ( $\approx 50,000$  t), fresh and dried apricots ( $\approx 8,000$  t in total), then dried fig, pistachios, etc. (FAOSTAT, 2013; Saeedi *et al.*, 2011), while is a relatively strong importer of citrus ( $\approx 120,000$  t). Increasing and improving production will answer to country's growing demand of fruits, will promote export and reduce import.

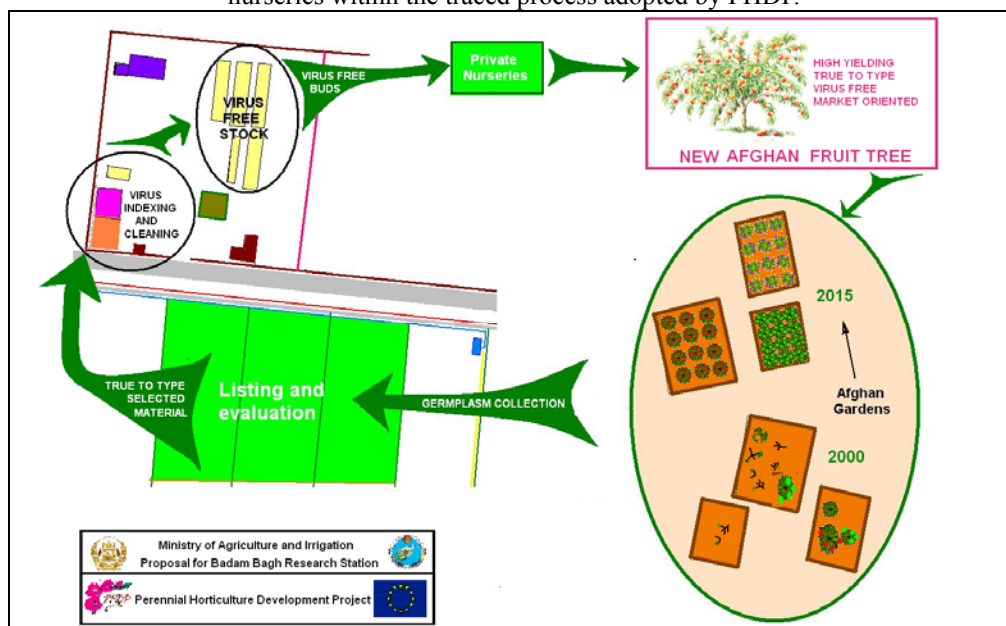

### Science, technology and institutions

Each important town of Afghanistan has a university with a Faculty of Agriculture; the authors of this paper have direct contacts with the Faculties of Agriculture of Kabul, Herat, Nangarhar Kunduz and Mazar Universities. Unfortunately the universities greatly suffered the effects of conflicts, the organisation, content and quality of the courses are still far away from the international standards. The causes of this disparity are essentially the lack of financial support (also for physical re-building and payments of salaries) and, with some outstanding exceptions, a generalized very poor human capacity. As a consequence the development of basic and applied knowledge and technology is very poor. Universities in Afghanistan are not considered to have any research function. Similarly, public institutions devoted to manage, promote and develop agriculture (and namely perennial horticulture) need to be supported in order to foster their concrete and active rehabilitation and assume the role they are expected to have in society. As a matter of fact, the few regulations existing for agriculture (namely fruit culture) are not applied following standardised procedures and "certificates" are in many cases almost merely bureaucratic documents.

**Tab. 1** - Fruit production of Afghanistan in 2011 (FAOSTAT, 2013; other sources).

Species	Amount (t)	Amount (%)	Species	Amount (t)	Amount (%)
Pomegranates	500000	36,9	Peaches and nectarines	13460	1,0
Grapes	411000	30,3	Oranges	7407	0,5
Almonds, with shell	60611	4,5	Pistachios (wild)	4203	0,3
Apples	59469	4,4	Pears	1596	0,1
Apricots	56043	4,1	Olives	1500	0,1
Plums and sloes	28406	2,1	Other fresh fruits	106946	7,9
Berries	24604	1,8	Other stone fruits	44713	3,3
Figs	19045	1,4	Other nuts	1649	0,1
Walnuts, with shell	13902	1,0	Other citrus	1431	0,1

## THE PERENNIAL HORTICULTURE DEVELOPMENT PROJECT (PHDP)

### Origin

In the 1990s, after the fall of the Soviet supported government in 1992, various projects supported the development of fruit tree nurseries and the introduction of many modern varieties of peach, plum, apple, almond, apricot, as well as rootstocks for apples. A leading figure in these efforts was Dr Abdul Wakil, one time Minister of Agriculture in the time of Zahir Shah, who led in the training of a large number of personnel in the basics of budding, grafting, orchard management and related skills. These trained people, mostly aged in their 50s by the time of the start of PHDP, were available to PHDP to staff the project and the NGO sub-projects. Other younger staff who had grown up and trained in Pakistan were also recruited.

The efforts included setting up mother stock nurseries and propagation of fruit trees at government research stations, which were managed by various NGOs for this purpose. This original concept of a limited number of key mother stock nurseries run on Ministry land informed the design of projects such as PHDP and also the World Bank (Emergency) Horticulture and Livestock Project (HLP), both starting in 2006.

Another initiative undertaken by PHDP that had never been done before, was the description of germplasm. Physical collection of Afghan fruit germplasm was first done by PHDP from 2007. Some fruit germplasm collection done by FAO and ICARDA prior to 2006 was lost due to lack of records and lack of continuity in activities. A major centre of the germplasm description was in Ghazni, which has still not been accessed by the PHDP, due to security problems. This earlier work on germplasm description provided the PHDP with the possibility of recruiting one or other of the two persons with some experience in this work.

The FAO received a grant from Italian Cooperation for the restoration of the Afghan germplasm in 2002-2003. The project imported a range of apple, plum, peach-almond, quince (for pear), cherry rootstocks. These were planted in Kabul, Ghazni and Herat. By 2006, at the start of PHDP, the Ghazni materials were inaccessible, and the Kabul materials were denied to the project by the Head of Research at MAIL ("PHDP should bring in its own materials").

Following the funding of the FAO project by Italian Cooperation, the FAO staff approached the European Commission in regard to follow-on funding. The European Commission Delegation organised a feasibility study in 2004 focused on the development of the Ministry of Agriculture, restoration of the old mother stock nursery systems, with six nuclear stock nurseries, and some germplasm collection.

A report prepared during 2004 in Kabul identified the main subjects taken up by PHDP when it commenced in 2006. These main subjects included: a) *germplasm collection and nursery development*; b) *clean germplasm systems*; c) *provision of facilities for the development and testing of new varieties of and new growing systems of horticultural crops*; d) *training programmes for implementing agencies; training for senior extensionists/MAIL staff/farmers/traders; linkages between MAIL and universities*; e) *development of an integrated horticultural research and technology transfer system*.

During 2005, taking into account the Agriculture Master Plan [7], the objectives of PHDP were clearly defined in the overall scheme of a number of horticultural development projects. Basically, the actual design of the EC horticultural project was adapted to minimise the direct involvement of the MAIL in the production of fruit trees and in the development of mother nurseries, with the MAIL emphasizing to the maintenance of reference collections, research and extension production methods and regulation of the industry, backed up by appropriate analytical laboratories and an inspection and quarantine system.

### Management and main objectives

In 2006 the European Commission-EuropeAid Program funded through a public/private consortium formed by IAK Agrar Consulting GmbH, AHT GmbH and the University of Florence-Italy the Perennial Horticulture Development Project (PHDP) ([www.afghanhorticulture.org](http://www.afghanhorticulture.org)) in support to the Ministry of Agriculture, Irrigation and Livestock of Afghanistan (MAIL). A second phase is being supported by EC for the period 2010-2015 to a wider consortium (Agriconsulting SpA, Department of Agri-food and Environmental Science - University of Florence, Department of Agricultural Sciences - University of Bologna, Centro Attività Vivaistiche, Landell Mills UK) with the contract "Technical assistance to MAIL to strengthen the planting material and horticulture industry in Afghanistan (EuropeAid/129-320/C/SER/AF/2)". PHDP involved as an average four international permanent staff, ten short terms experts, and forty local staff, for about 150 man/months international and 630 man/months local staff. As stated in the project web pages "The specific objective of the project is to develop a demand oriented and export led perennial horticulture industry". A major purpose of the project is to develop the nursery sector of this country in order to strengthen and to qualify fruit production. The main activities regard the establishment of a traced nursery system based on the propagation of true-to-type local varieties. The adopted steps can be summarized as follows: i) individuation of superior trees in productive orchards; ii) cataloguing and definition of the *in situ* National Collection; iii) propagation from the *in situ* original mother plants; iv) establishment of the *ex situ* National Collection; v) characterisation and evaluation; vi) foundation of traced mother stock nurseries (MSN). Such activity included also the establishment of six centres (the main one located at Badam Bagh - Kabul, the remainder in Herat, Jalalabad, Kandahar, Kunduz and Mazar-e-Sharif) and of a Laboratory of Biotechnology for plant indexing and micropropagation. PHDP workplan can be

distinguished into the following five components: 1. public and private sector institutional and regulatory reform; 2. national collection of fruit varieties and adaptive research; 3. nursery industry; 4. training and extension; 5. horizontal activities.

The concept underlying all the activities can be summarized with the call for a meeting with local nurseries and fruit-growers: *It is the intention of the PHDP to undertake various initiatives that create and develop a system that ensures the availability of the best possible planting material for the perennial horticulture industry in Afghanistan, and to ensure the long term sustainability of such a system owned by the private sector.*

Long term sustainability regards essentially the handover of the system built up by PHDP to the local staff of MAIL and of two organizations, the "Afghan National Horticulture Development Organization" (ANHDO) and the "Afghan National Nursery Growers Organization" (ANNGO) currently under temporary tutorship/supervision of international experts.

## PHDP: MAIN RESULTS

PHDP has a quite long history; along the last 7 years relevant achievements were mixed to organizational problems in some cases due to safety issues, which threaten the positive development of specific tasks. The authors are describing here only some of the results more directly linked to the problematic backgrounds highlighted in the previous chapters.

### The National Collection of Fruits and Nuts of Afghanistan

After the field surveys performed during 2006-2008, an *in situ* collection of over 850 accessions of different fruit species, selected by local staff with the participation of farmers holding the trees, was defined. The best and more "profitable" varieties were chosen together with fruit growers (who were recognized as "custodial" of the *in situ* selected accessions) to be propagated and planted in the 6 PHDP Centers in plots with mostly six replicates in the *ex situ* collections, which form the National Collection (NC). For each species, for security reasons, the NCs have been duplicated. The amount and location of collected accessions is reported in table 2. Most of the accessions were locally collected, with the exceptions of citrus, loquat and persimmon, donated by CRA-Centro di ricerca per l'agrumicoltura e le colture mediterranee - Acireale (Italy) and IVIA-Valencia (Spain), for which most of accessions have been imported since they were considered strategic for the development of fruit-growing especially in the area of Nangarhar valley (Jalalabad Province). Many varieties of cherry, peach, plum, apple and pear represent introductions in the last twenty years, or even more recently. Most apricots and almonds are of native varieties, and represent a valuable genetic resource not available elsewhere. Many grape and pomegranate varieties were also collected locally, but they are probably well represented in germplasm collections elsewhere, and many foreign varieties look to have more potential at first glance, due to lack of development of these species in Afghanistan. The NC represents the source of material to establish the Mother Stock Nurseries (MSNs) in different parts of the country. In 2009 the characterisation of accessions following standardized procedures (specific descriptor lists for each species) started and up to now around 70% of all collectable data have been gathered and input in a database by trained local staff. At present the description is going to completion and identification procedures started where necessary. Once this task will be finished, possibly also with the support of DNA fingerprinting, all the accessions will be registered by the MAIL of Afghanistan. The management and conservation of the NC will be in the hands of ANHDO (see next paragraph).

**Tab. 2 -** Amount of accessions in the National Collection of Fruits and Nuts of Afghanistan in the PHDP Centres.

Species	Kabul PHDP Centre	Kunduz PHDP Centre	Mazar PHDP Centre	Herat PHDP Centre	Kandahar PHDP Centre	Jalalabad PHDP Centre
Almond		98	100			
Apricot	125		118			
Cherry	26			28		
Peach				102	84	
Plum				77	75	
Apple	78	51

Loquat						12
Date Palm						6
Citrus						61
Total	271	199	218	346	363	101

## The apricots of Afghanistan

A huge amount of different types has been gathered for each species. We report here some information on apricot, chosen as a representative case. Apricot varieties in Afghanistan are generally white fleshed (occasionally orange fleshed), generally sweet, with little or no acidity, frequently without "apricot" flavour (compared to Turkish or European/American types), but often with aromatic flavours like coconut, generally with non-bitter kernels, and generally self incompatible. The apricot types include the large fruited white fleshed types called Amiri, which are grown at higher altitudes, 2000 m +, are slow to come into bearing, and are represented by a small number of closely related varieties. PHDP has identified 15 Amiri accessions, which are similar in fruit and tree characters, and may represent many fewer varieties. The Amiri fruit is sweet, without apricot "taste", and can be dried to a pale golden colour with sulphuring. The dried fruit fetches high prices in Pakistan. The Amiri types replace all other apricots in the market once they start coming to the market. There are no early ripening Amiri varieties. Afghanistan also has several Shakarpara (meaning "a lot of sugar") types which are varieties where the small fruit is left to dry on the tree. There is no typical Shakarpara type tree among the many accessions in the PHDP collection. A third clearly identifiable type is the Saqi type, generally grown from seed only in the Bamyan province, and grown as large trees in pasture land. The fruit is used particularly for "chapanemak", where the seed is removed, and the apricot flesh is turned inside out before drying. The fruit are prepared and dried at home. The fruit is bright orange. The project collected four accessions from village trees to assess a best clone for multiplying by budding and grafting. Many other apricot varieties are available, but the names of accessions often refer to place of origin and relationships between varieties remain to be sorted.

## The Laboratory of Biotechnology

A good example of capacity building is represented by the Laboratory of Biotechnology and its staff. During 2008, under the umbrella of PHDP, Aga Khan Foundation managed the project "Establishing Disease Indexing Services in Afghanistan". The aim was to train the staff in Italy by the University of Florence, Bologna and by CAV, and to establish in Kabul a laboratory enabled to check the phytosanitary status of propagation material (namely the accessions of the NC and of Mother Stock Nurseries). Once built up the laboratory, the first step was to apply the standardized procedures to detect virus like diseases by ELISA tests, following the European Plant Protection Office standards. In time, some additional tasks were endorsed to this Laboratory (PCR based detection of disease and *in vitro* micropropagation). Among the most relevant results of such activity, it was assessed that no one of the accessions belonging to *Prunus* spp. resulted infected by Plum Pox Virus and that most of the material could be considered clean. This finding was useful to alert PHDP and MAIL, and indirectly all the international and local organisations importing plant material, in order to be accepted from abroad only virus tested certified propagation material. A special situation was afforded with citrus orchards, where Citrus Tristeza Virus was detected; these results were presented to the 22<sup>nd</sup> "International Conference on Virus and Other Transmissible Diseases of Fruit Crops" (Rome, June 3-8, 2012) by the staff of the laboratory and a related note was published [8]. The Laboratory, unique of this kind in the area, is expected to perform phytosanitary and genetic analysis for public and private institutions. A similar record of internationalization is the participation of two field horticulturists to the II International Symposium on the Pomegranate (Madrid, 19-21 October 2011), presenting the status of Pomegranate industry and germplasm collection in Afghanistan [9].

## ANNGO and ANHDO

PHDP developed a widespread network of public and private, local and international actors (NGOs, associations, nurseries, etc.) working in the nursery sector and in fruit-growing. As a result, it "covered" almost all the areas of Afghanistan involved in fruit production. For instance, the Afghan National Nursery Growers Association (ANNGO), partner with MAIL, ANHDO, PHDP2 and other organizations, represents 27 Nursery Growers Associations in 22 provinces; all the nursery members (more than 1,000) have voluntarily accepted the ANNGO regulatory system for planting material, so ensuring that the saplings sold to the fruit growers are true-to-type and traceable to Mother Stock Nurseries (MSNs) originated from the National Collection. Such material is constantly checked by the Laboratory of Biotechnology of Kabul. Business improvement and marketing promotion; sanitary controls; monitoring the quality of planting material; improvement of nursery techniques, production of clonal rootstocks; certification and inspection services including labeling of certified saplings; technical training and dissemination of innovations and publication of the catalogue of true-to-type saplings produced by NGA members, are the main services provided by ANNGO. In 2012/13 about 1.8 million of certified bud were sold to nurseries and 900.000 certified saplings were commercialized in Afghanistan and in neighboring countries. Figure 2 shows the distribution of MSNs and NGAs covered by ANNGO.

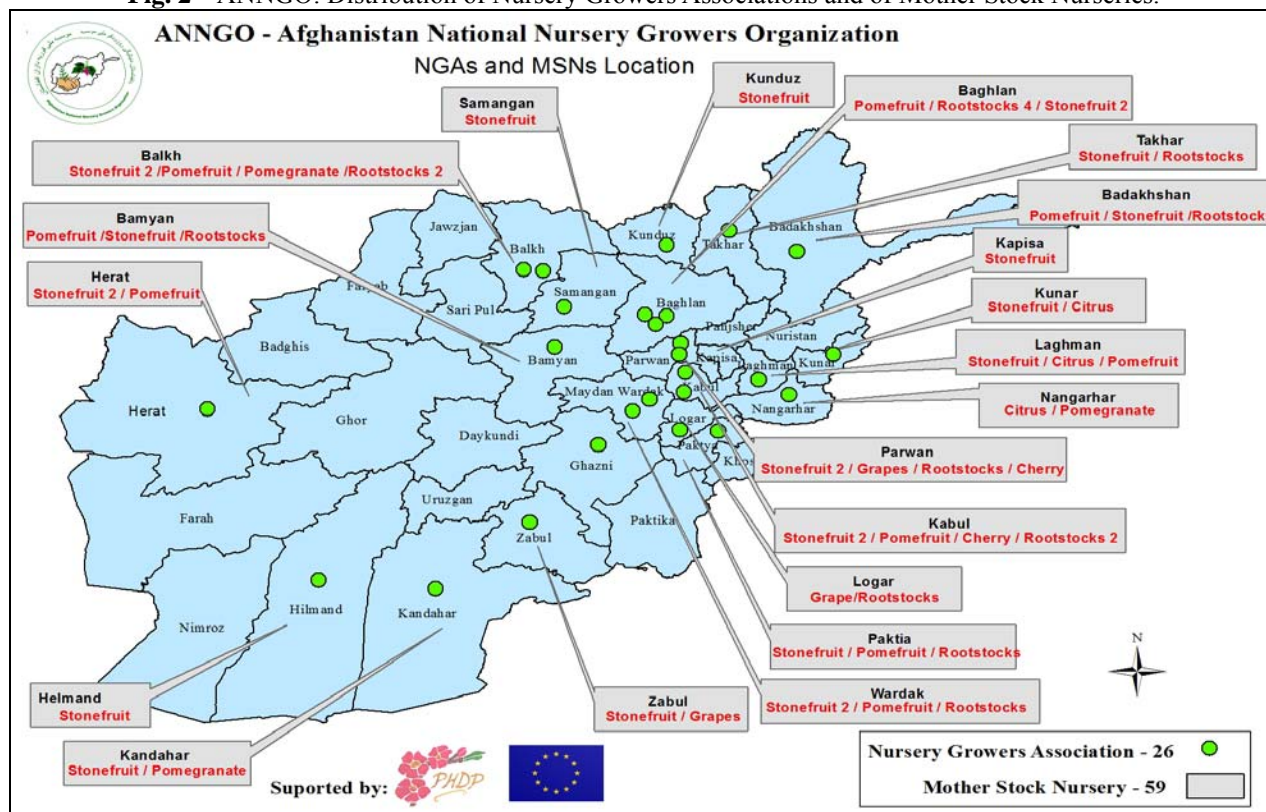

The other organization which is planned to give continuity to the activity done by PHDP I and II following the concept of sustainability, is the Afghanistan National Horticulture Development Organization (ANHDO), actually an NGO devoted to the development of a modern and sustainable horticulture in partnership with MAIL and private sector. ANHDO offer technical services for studies and surveys, training and capacity building, germplasm conservation, adaptive research, value chain studies, post-harvest technology and marketing. ANHDO is taking over the management of the National Collection and the 6 PHDP Centers in the MAIL research farms (which include also demonstration orchards, pomology laboratories and training rooms). ANHDO, with a grant from EC, is supporting the ongoing

transition of horticultural services from PHDP to MAIL.

### Adaptive research

The facilities provided by PHDPs (pomology laboratories in each PHDP Center, demonstration orchards, capacity) allowed to plan and develop various adaptive research activities, considered basilar to the improvement of productivity and quality of fruit growing. In Table 3 the list of the adaptive research lines is reported. The results of some of these investigations are already applied, for instance in the design of almond and apricot orchards for the choice of inter-compatible varieties, since many of the Afghan varieties resulted self-sterile. This information is diffused also through the Catalogue released by ANNGO.

**Fig. 2 – ANNGO: Distribution of Nursery Growers Associations and of Mother Stock Nurseries.**

**Tab. 3 - List of adaptive research lines launched by PHDPI and II and now being handed over to ANHDO.**

<ol style="list-style-type: none"> <li>1. Description and evaluation of varieties</li> <li>2. Assessment of genetic potential and selection of national almond genotypes</li> <li>3. Assessment of compatibility of national almond clones</li> <li>4. Use of Afghan and imported germplasm to develop improved varieties of almond</li> <li>5. Assessment of self-compatibility of national apricot clones</li> <li>6. Use of Afghan and foreign clones to develop improved varieties of apricots</li> <li>7. Assessment of self-compatibility of national plum clones, including crossing with Myrobalan</li> <li>8. Fruit processing – sulphur drying of apricots</li> <li>9. Monitoring of <i>Psilla pyri</i> on pear clones</li> <li>10. Plant protection against pest</li> <li>11. Soil management and quality of fruits</li> <li>12. Grafting compatibility of pears clones</li> </ol>
---

The adaptive research “Use of Afghan and imported germplasm to develop improved varieties of almond” is a clear and simple model of innovation applied to actual local resources. Most of local Afghan varieties of almond are very early flowering (a negative trait because of recurrent frost damage), paper shell (a good commercial characteristic in terms of kernel/shell ratio and de-shelling), typical in kernel shape (crescent type) and very appreciated for their taste. Indeed these are the most outstanding characteristics of the “Sattarbai” group, producing the most valued almonds in Afghanistan. The seeds resulted from the compatibility trials carried on with many local cultivars in 2008-2009 were planted and a first selection of F<sub>1</sub> seedlings was performed in 2012 by almond producers and retailers. The best F<sub>1</sub>

seedlings will be re-checked and possibly released as new cultivars in near future. An improvement of this participative "breeding" activity is related to perform crosses between local (bringing high quality fruit traits) and international varieties characterized by late flowers, a trait which allows to escape spring frosts; from this set of seedlings it is expected to obtain new high quality, Afghan type and late flowering cultivars.

## CONCLUSIVE CONSIDERATIONS

The pillars on which PHDP is founded cover a wide spectrum of activities, in accordance with the priorities acknowledged for the development of Afghan agriculture [10], related essentially the application of an innovative traceable propagation system to the local fruit germplasm, which is a relevant component of agrobiodiversity in Afghanistan. Fruit genetic resources are, furthermore, an actual and potential tool for the fair development of fruitculture, a strategic sector for this country. The selection and rational utilization of local varieties (both for direct fruit production and for breeding), their conservation and registration as national genetic resources, represents a way to protect this material from illegal appropriation and genetic erosion, but also a means to develop capacity building in both institutional and private sectors, and to promote indirect activities. Looking forward, some relevant items of the new scenarios of Afghan fruit industry to be addressed are quality standards for domestic and international markets, food safety regulations namely to export dried fruits and nuts, post-harvest management of soft fruits (being transport facilities and cold chain key factors), institutional support to these activities. Notwithstanding the goals achieved by the project, its further development will still need the support of international donors. Nevertheless a strong base for sustainability has been posed on local organizations; this represents an important step beyond total dependency.

## ACKNOWLEDGEMENTS

As understandable, it is impossible to quote all the persons who directly or indirectly contributed to reach the results here described. During these years PHDPs had a normal turnover in both local and international people, to whom goes our appreciation for the collaboration and constant enthusiasm. We hope that each one of them, perhaps reading this paper, will feel the emotion of have been or being involved in something really special.

A special acknowledgement for the "distant" and silent work of the consultant agencies and other members of the partnership which never denied their help to solve sometimes almost "unsolvable" cases.

A particular appreciation is also due to the staff of the EC Delegation in Kabul, for trusting on this project, for its support and specially for giving the necessary continuity to it.

A special mention to the MAIL of Afghanistan the acceptance and the collaboration with the PHDP.

Last but not least, an almost inexpressible acknowledgement to all the collaborators from Afghanistan for their everyday patience, constructive obstinacy and permanent availability to join us; thanks to the Afghan farmers of the villages for having kept alive all the accessions collected by PHDP, jewels of the past and treasures for the future.

## NOMENCLATURE

EC	European Commission
PHDP	Perennial Horticulture Development Project
MAIL	Ministry of Agriculture, Irrigation and Livestock - Afghanistan
NC	National Collection
ANNGO	Afghanistan National Nursery Growers Organization
ANDHO	Afghanistan National Horticulture Development Organization
NGA	Nursery Growers Associations
MSN	Mother Stock Nursery

### ABSTRACT

Rural development, the emergence of new alternative models of food production and consumption and their sustainability are today topics of great importance, which the world of Cooperation and Development reflect upon from different points of view. Within these issues, starting from the case study of the Slow Food mushunu chicken Presidium in Kenya, we present the results in terms of project's sustainability, carried out based on the SEAMETH methodology. The processing of data, coming from targeted interviews administered directly to the producers, is a useful tool for monitoring and evaluating the project, which provides a broader understanding of the Presidium, reconstructing a comprehensive framework able to measure the environmental, social and economic impact and implications.

### INTRODUCTION

When we talk about Cooperation and Development, we cannot fail to talk about sustainability both as an end and as a means. In fact, sustainability has so far influenced the debate on Millennium Development Goals (MDGs) and, following the Rio +20 conference in 2012, this will become even more explicit and obvious through the decision to establish global targets not only for development but also for sustainable development (SDGs) [1]. It's also evident that coexistence can become a global goal, achievable only through an involvement based not on competition, but on a more widespread and shared cooperation for a coordinated management of the common resources of the planet, if we really want to understand sustainable development not just as compensation but in the terms of intra-generational equity and cooperation [2] [3].

The theme of sustainability also goes back to the technical management of Cooperation and Development projects, both as an end and as a means. The durability and reproducibility of the projects are some of the essential conditions that evaluate the results: equally, monitoring activity of variables and dimensions that make up the sustainability linked to the scopes of the project may contribute to the achievement of the objectives [4] [5]. However, monitoring the sustainability of a system is a long-term exercise in which qualitative indicators are also used not to exclude some essential characteristics of sustainability<sup>1</sup>.

The SEAMETH methodology was born within this context, with the aim of providing a tool for the analysis and monitoring of projects whose aim is to achieve a multidimensional sustainability through the use of a grid of quantitative and qualitative indicators for the evaluation of the economic, agro- environmental and socio-cultural results [6]. In particular, this method has four potential uses [7]:

- assessing the sustainability of a project at time T (usually T0 is the start date of a project and T1 is the time of data collection);
- monitoring the progress, in terms of sustainability, during the development of a project;
- offering (to the beneficiaries and reference people of a project) a tool to better understand the logical framework of a project and evaluating the sustainability of single activities that contribute to achieving the final objectives;
- promoting dialogue and exchanges not only internal, but also within the institutional context external to the project.

### CONTEXT ANALYSIS AND METHODOLOGY

The SEAMETH methodology, consisting of a grid of 51 indicators grouped by components related to three scales of social, environmental and economic sustainability (*Table 1*) [6] was applied to Slow Food mushunu chicken

<sup>1</sup> Technically, qualitative indicators may be imperfect, but the success of the evaluation lies not only in the indicators themselves, but also in the process of designing them and in the discussions among the various parties involved in their verification and necessary adjustments.

Presidium in Kenya as part of Fiorito bachelor thesis dissertation [8] that took into account the three Slow Food Presidia located in Molo and Njoro districts.<sup>2</sup>

The Slow Food association was founded in Italy in 1989 to promote the culture of food and to defend traditional food production and agriculture. Among the many activities carried out by Slow Food that engage local communities, the Presidia are fundamental: these are projects aimed at supporting small local production, breeds or plant varieties in danger of disappearing, protecting territories and recovering ancient traditions and techniques [9].

**Tab. 1** - Sustainability evaluation: scales and components.

Socio-cultural scale	Agro-environmental scale	Economic scale
Use of the product	Biodiversity	Development
Internal relations	Territory	Efficiency
External relations	Animal breeding	
History, culture and tie to the territory	Energy	

The Slow Food Presidia are "chains of animal or plants derived products from virtuous agricultural systems and small - scale breeding" [6] in which sustainability, in all its three dimensions, is a fundamental objective. The research has therefore sought to reconstruct the production chain of Slow Food mushunu chicken Presidium with the aim of evaluating and monitoring the project. The data collection was carried out through administration of a questionnaire to a sample of ten producers, about one-third of the total members of the group: the interviews conducted were elaborated using the grid of sustainability indicators in order to define an overall assessment of the Presidium in terms of sustainability.

## THE MUSHUNU CHICKEN PRESIDIUIM

The Slow Food movement in Kenya is one of the most active in Africa. The activities in the country started in 2004 after the first edition of Terra Madre and over the years they have significantly developed in terms of projects implemented and number of members: currently there are five Slow Food Presidia and a network of approximately 200 family, school and community gardens. Among the five Presidia active in Kenya, the mushunu chicken Presidium, found in Molo in the South West Kenya, was established in 2009 to protect an endangered native breed, characterized by featherless neck, heavy body and a plumage that range from yellow to black and white.

The Presidium, which today counts a total of 32 producers that unite in Kihoto Self Help Group, was created to protect and promote this breed, unpopular to the local population due to threats posed by introduction of non-native breeds characterized by faster growth and greater resistance. The Presidium therefore aims at helping the group preserve, improve and enhance the breeding challenged by a number of factors, including the post-election violence that erupted in Kenya between 2007-2008 during which producers lost much of their animals.

## RESULTS

In figure 1, it is possible to observe an overview of the results of the three scales of sustainability.

**Fig. 1** - T0-T1 comparison of the three scales with weight 100. The maximum value of sustainability is 300

<sup>2</sup> The thesis aims at studying and analyzing three Slow Food Presidia of mushunu chicken, Lare pumpkin and Mau Forest dried nettles.

In general it is possible to observe a positive evolution of sustainability in all the three scales considered: a significant growth can mainly be noted on the socio-cultural scale (from 24.92 to 62.30), but also on the agro-environmental (from 29.79 to 52.4) and the economic scales (25 to 45.2.) However, it's necessary to conduct a more thorough analysis to understand how and where these results originated, giving more details of the sustainability scales taken into account.

### Socio-cultural scale

As already noted, it is precisely in the socio-cultural context that the best results and most innovative elements can be observed with a positive evolution of sustainability for all the components considered (*Fig. 1*).

A positive growth of values has been observed in respect to the following components "History, culture, ties to the territory" and the one called "External relations". Thanks to the establishment of the Presidium and to the support from Slow Food, important progress has been observed in the relationship between the group and some external public and private institutions, local NGOs, the Ministry of Agriculture and various private entities. The relationship with the Slow Food network has also clearly improved both nationally and internationally. Within the network of Terra Madre food communities, the Presidium has been able to benefit significantly from exchanges with the Italian Valdarno chicken producers, a Slow Food Ark of Taste product: it has been an interesting exchange program and an important opportunity to develop some shared knowledge within the network of Terra Madre food communities, which has allowed an interaction between these two realities through exchange visits. These social aspects demonstrate the power of Slow Food network and the social and territorial cohesion, which characterizes and unites the Terra Madre food communities that operate in many different contexts around the world.

Still, on socio-cultural field, mushunu chicken Presidium has also helped in raising the producers awareness on the existing link between the product and the area, and about the cultural and traditional value that characterizes food. Finally more modest improvements were observed under the component "Product use", in consideration of the fact that although the organoleptic quality is generally improved, it has not yet been possible to work in the direction of implementing new conservation and processing techniques.

### Agro-environmental scale

From the environmental point of view, although a general and positive evolution of values has been observed over time, these are less obvious improvements compared to the socio-cultural scale, due to the fact that the Presidium was already characterized by good performances in this field in the phase of boot design. Furthermore, the agro-environmental scale is generally the one that makes the growth record slower with changes observable over a longer span of time than the one, equal to only 3 years, taken into account in this research.

The Presidium has guaranteed an important contribution to the defense of biodiversity through the work carried out in the protection of a native breed and in order to prevent the introduction of non-local chicken hybrids: today in Kenya non-local chicken varieties are in fact getting popular because they are more resistant and characterized by a faster growth than the native breeds whose diffusion and breeding is therefore put at great risk.

Even compared to the territory, the contribution of the Presidium to the preservation of traditional cultivation practices as well as the environmental balance is really important

Under the heading of "Animal breeding" component, it was, however, observed that even before the establishment of the Presidium the producers reproduced the animals at family - home level and the chicken were free-ranged in open and wide spaces. The supplied feeds are based on foods that come almost entirely from local agricultural production. Yet in the field of "Energy", much remains to be done in order to introduce the producers to the use of renewable energy sources: it is necessary to note that the villages in which the Presidium producers live are not supplied with electricity and in general energy consumption is very low if not nonexistent.

### Economic scale

The positive evolution of sustainability in the economic context is mainly attributable to the growth that has affected the "Development" component. In fact, following the birth of the Presidium, the number of birds per family/household has increased as well as spaces dedicated to them. Today the average number of birds per producer is about 10 (which varies considerably during the year).

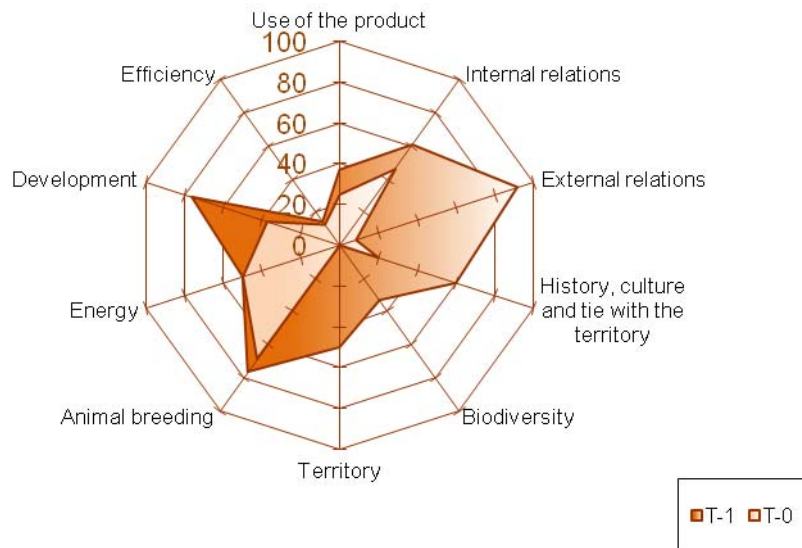

The reduced growth of the "Efficiency" is instead brought about by a very poor market development. Since the establishment of the Presidium, it had not been possible to create new commercial channels: the product marketing still remains at a loco-regional level. The production is quantitatively still too low and a number of pitfalls and difficulties have affected the producers, e.g. adverse weather conditions and diseases: these are some of the reasons behind the failure of the Presidium. The use of incubators recently purchased by Slow Food Presidium is an opportunity for the future, capable of increasing production to reach the target market.

The aim of Slow Food is to help in the development of this product in terms of commercialization, promotion of food sovereignty and economic livelihood improvement.

## CONCLUSIONS

The analysis method used in this work has made it possible to come up with a wide and varied understanding of the Presidium, reconstructing a complete picture able to measure the impact and implications of this project in terms of sustainability.

Looking at the graph on Figure 2, where a T0 - T-1 comparison of various components that belong to sustainability scales taken into account is presented, it is possible to make some general considerations in respect to the prospects that the future development of the Presidium is likely to face.

**Fig. 2** - T-0 – T-1 comparison of various components that belong to the sustainability scales taken into account.

Compared to the first component "Product use", characterized by a very low increase of values at time T-1, it is possible to understand how important is to introduce new conservation and transformation techniques in order to expand the product use. Yet in the field of the "Biodiversity" and "Territory" which, although characterized by good growth between time T-0 and T-1, still stood on low values, it is necessary to further promote the conservation of the rural landscape of which the Presidium is part of and to promote productive diversification. Still in the field of agro-environment scale, the need to introduce the use of renewable energy sources in the near future to promote the development of the Presidium and the general community involved has been highlighted. Finally, as part of the economic scale, looking at the poor growth of "Efficiency" it is possible to understand the need to support the future marketing goal of the product in order to promote the development of the project and the economic wellbeing of producers involved.

Taking into account the different dimensions of sustainability and their variation in this specific case of the mushunu chicken Presidium, the grid of indicators developed through practical application experience, now and in the future allows a feasibility study project and a study for monitoring the progress of planned actions to be implemented in the future: it may trigger a virtuous activity of data production, as well as a model for sustainability reporting.

In particular, the developed method has proven effective as a tool for:

- assessing the sustainability of the Presidium at time T (in this case T0 is 2009, the year in which the Presidium was established, and T1 is September 2012, the time of data collection);
- monitoring progress in terms of sustainability, during the development of the project;
- offering a tool that helps the producers and Presidium coordinators to better understand the concept of agriculture, especially sustainable farming, and evaluating the sustainability of their production in timely manner;
- promoting not only internal dialogue (between the Presidium producers), but also exchanges with external parties, on the concept of sustainable agriculture and the contribution that the Presidium can offer to this area.

In conclusion, in relation to the study and analysis carried out on Slow Food mushunu chicken Presidium, it was possible to observe good knowledge and territorial links that in this context characterizes the Slow Food network: in fact, an enhanced awareness was indeed found among the producers about the importance of local and traditional products like mushunu chicken as well as a renewed pride and a renewed push to their production and consumption.

### ABSTRACT

Biodiversity is a unique and precious heritage: generic but also cultural, social and economic. Its drastic curtailment, however, puts at risk the survival of local farming systems, and this is even more so in fragile socio-economic contexts where it risks translating into conditions of food insecurity and poverty. From the elementary level of the gene, rising in complexity up to the ecosystem, it is therefore a central element in defining first the resistance and then the resilience of the system, and by the first term meaning the degree of resistance to a disruption that distances it from the initial state of equilibrium and by the second the capacity of a system to return to guaranteeing minimum standards following a disturbance, the capacity to get back on ones feet after a fall.

It seems to be crucial, then, at a time when cooperation development projects that operate in various ways to safeguard and promote biodiversity are far more numerous, to intervene to preserve and restore the local biodiversity in order to avert future problems, and even curb them ahead of time, using resilience as an approach for managing the system we are dealing with (natural or heavily affected by human activity). In any event, this is a passage that is not routine, which makes it necessary to look at the ecosystem, at its various components, both natural and human. In the light of these preliminary remarks, the article will analyse the potentiality for applying, also in the field of development cooperation, the theoretical approach including empirical methods and instruments represented by the Diversified Farming Systems (DFS), where the starting point is diversity and diversification as functional elements in the construction of resilient farming systems.

### INTRODUCTION

Biodiversity is central to defining a system's state of health. An ecosystem with species depletion, characterised by few individual species belonging to the most resilient groups, is more vulnerable and more subject to risks like desertification, colonisation by exotic species, an interruption in the supply of fundamental natural services, and food uncertainty, with serious consequences and repercussions especially in fragile socio-economic contexts. The management of the stresses is controlled by complex genetic systems, which involve the interaction of large gene systems and the connection of the plant/animal and its environment.

Biodiversity (from the gene, at the elementary level, increasing in complexity to the ecosystem) is therefore a key element in defining first the resistance and then the resilience of the system; by the first term we mean the degree of resistance to a disruption that distances it from its initial state of equilibrium, and by the second term the capacity of a system to return to guaranteeing minimum standards following a disturbance, the capacity to get back on ones feet after a fall.

In the face of harvests lost because of the Brusone disease of rice, farmers in the Chinese province of Yunnah, who have adopted a farming system using different varieties of rice, registered an increase in production of up to 89 per cent. At the same time these farmers have conserved the traditional genetic diversity of the local varieties and reduced the use of fungicides [1] [2]. Also in Italy we have seen that a high level of genetic diversity provides greater protection against drought for wheat harvests [3].

It would seem crucial, then, to work to preserve or restore the local biodiversity to avoid problems in the future, and actually stem them ahead of time, using that same resilience to construct models/projects that allow us to successfully overcome future crises. In this sense, more than an objective, resilience is an approach for managing the system we are dealing with (natural or affected by human activity). Sensitivity regarding these issues is slowly growing; not surprisingly, the recent report of the High Level Panel on Global Sustainability, advocated by the Secretary General of the United Nations, Ban-Ki-Moon, in its title and contents takes up the concept of resilience: *Resilient People, Resilient Planet: A future worth choosing* [4].

This means using biodiversity and the richness of ecology to decide how to prevent hydrogeological instability, to manage the consequences of a catastrophic event like an earthquake or a pollutant spillage, how to manage a low impact disinfection campaign on parasites, how to use local resources to stem an economic crisis, without disturbing

the general dynamic state, composed of various levels of equilibrium that are interspersed with adaptive cycles, within a perennial transient state. According to this thesis developed by C.S. Holling [5], populations and, by inference, ecosystems have more than one state of equilibrium, and following a disturbance often a different equilibrium to the previous one is restored and they depend on the influences of the states and dynamics that occur at the levels above and below the system itself [6] (Fig.1).

**Fig. 1** - Relations between several phases and adaptive cycles [7].

In numerous development cooperation projects aimed at the conservation and sustainable use of the ecosystems and habitats containing a high degree of diversity, as well as the preservation of genome types and genes of social, scientific or economic importance and the fair division of the benefits deriving from the use of genetic resources, a genuine protection and valorisation of biological diversity can occur exclusively through inter-sectorial action, which looks at the ecosystem in all its diverse components, both natural and human.

For cooperation projects in the agronomic context, a particularly interesting approach in this direction is the theoretical framework of the Diversified Farming Systems (DFS), recently drawn up by a group of researchers at the University of Berkeley in California. These are models that agree upon the attention to local production, to farmers' knowledge and practices, to approaches capable of limiting the negative environmental externalities, whose goal is the improvement of the sustainability and resilience of farming systems, and thereby making a significant contribution to fundamental issues like food security and health [8].

## BIODIVERSITY AS A STARTING POINT

The DFS model is innovative in that it goes further and reconstitutes in an original way the now abused concepts of sustainable, multi-functional and biological agriculture, in an attempt to create a common denominator through meeting minimum objectives from among the various approaches that seek to achieve farming that is capable of providing sufficient food and maintaining the ecosystem services for present and future generations, in an era of climate change, increasing energy costs, social unease, financial instability and growing environmental degradation. All this also in light of the diversity of the ecological, socio-economic, historic and political contexts in which farming systems developed and are still evolving.

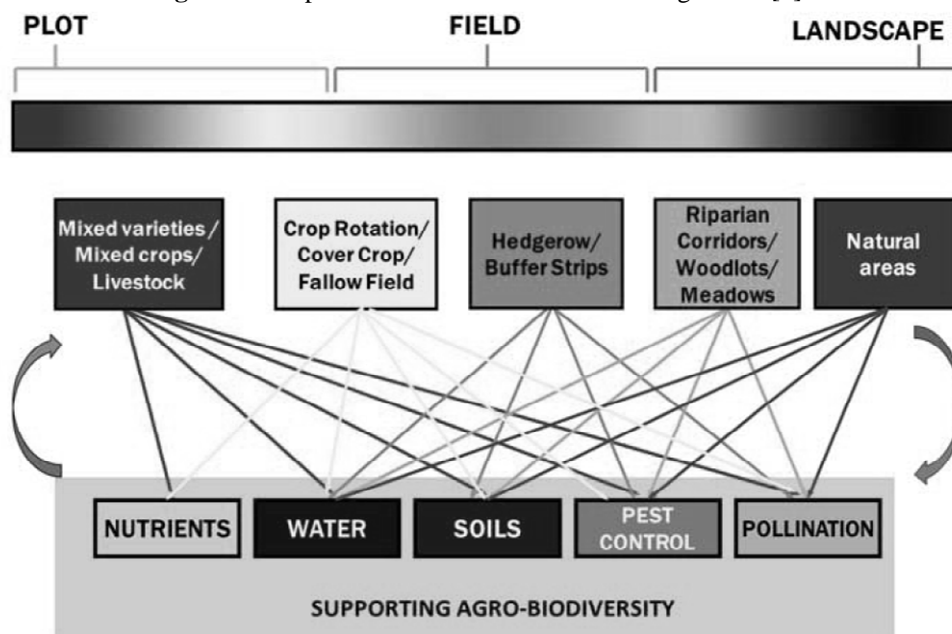

So, rather than starting with a vision from which a pre-defined model follows, the approach is that of operating on a series of attributes, which necessarily should possess a system that you want to define as sustainable for working on a strategy of farming production capable of inverting the negative externalities produced by erroneous farming technologies and about which an article published in the International Journal of Agricultural Sustainability [9] sought to draw some attention to, where the following main characteristics were identified:

- the employment of local varieties and breeds, so as to bring out the **genetic diversity** and improve adaptation to changing biotic and environmental conditions;
- avoid the unnecessary use of agrochemistry and other technologies that have a negative impact on the environment and on human health (like heavy machinery, transgenic farming, etc.);
- the efficient use of resources (nutrients, water, energy, etc.), the reduced use of non-renewable energy to limit dependence on production factors outside the company;
- the valorisation of agro-ecological principles and processes, like the cycle of nutrients, nitrogen fixation, biological control using the promotion of diversified farming production systems, and the agroecosystemic optimisation of **functional biodiversity**;

- innovation through recourse to human capital in the form of scientific knowledge and traditional and modern skills, and the promotion of appropriate innovation and technology networks thanks to the use of social capital and respect for cultural identity;
- the reduction of the ecological footprint of the production, distribution and consumption system, so as to reduce greenhouse gas emissions and keep pollution of the ground and water to a minimum;
- the promotion of practices that can increase the availability of drinking water, carbon sequestration, **the preservation of biodiversity**, soil and water;
- the capacity to adapt to change based on the possibility to respond quickly to disturbances, pursuing a balance between the capacity to adapt in the long term and short term efficiency;
- reinforcing the resilience of the farming system **by preserving the diversity of the agroecosystem**;
- the dynamic preservation of the socio-cultural legacy of the farming heritage, permitting social cohesion and a sense of pride and belonging, reducing migration.

These attributes often focus attention on biodiversity (highlighted in bold) as a crucial ingredient of the resilience of the agroecosystem. The approach of the DFS is positioned within these assumptions and identifies in diversity the starting point, including it intentionally and functionally in the various spatial (from field to landscape) and temporal scales of reference [8]. In this way, maintaining and preserving diversity assumes the function of a flywheel for maintenance and balance (intended in the dynamic sense) of the services of the input ecosystem of farming (soil fertility, control of pathogens, pollination, the efficient use of water resources).

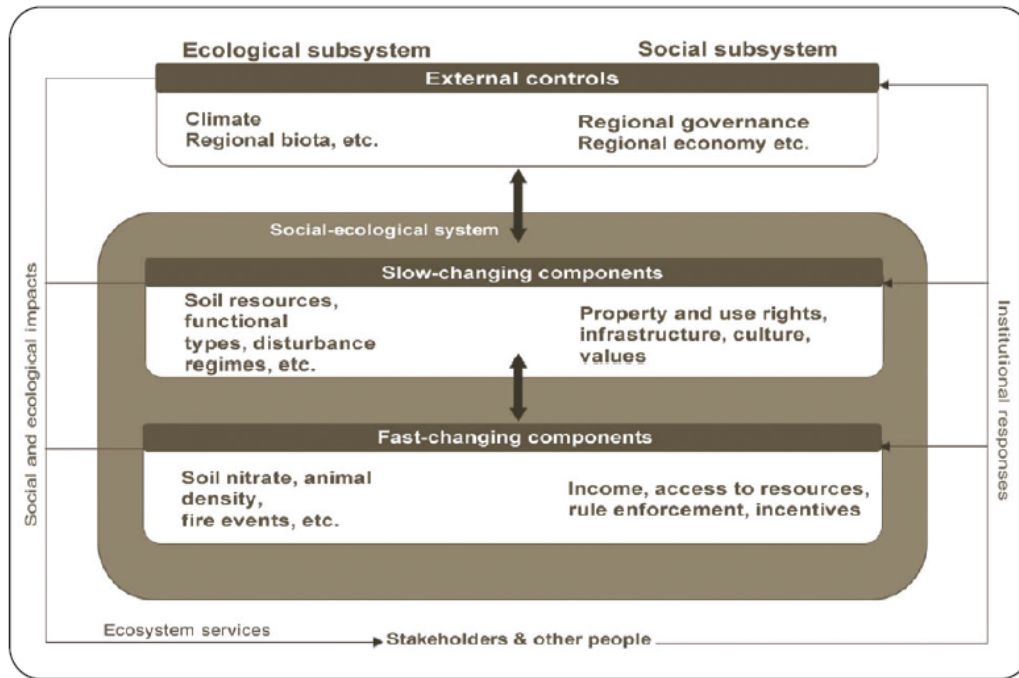

Fig. 2 - Conceptual model of a diversified farming model [8].

In this way, biodiversity is located within a strategy characterised by resilience as an approach and not as a mere end, the first functional unit of a complex system, where the role of the social component should not be undervalued. Recognising, according to one's view of human ecology [10], that ecosystems are heavily interconnected with the social fabric in which they exist, and that this is particularly so for farming as the result of the perennial connection between human societies and ecosystems, the result of a co-evolution between nature and culture (Fig. 3), particular importance is given to aspects like:

- the interdependence between social, economic and ecological systems;
- the social factors and processes that influence and maintain the processes of an economic nature;
- the social structures, values and hierarchies assigned to some identity markers like ethnic background, class and gender;
- the decision-making processes, the construction of alliances and governance.

**Fig. 3** - Conceptual model of integration between ecological / social components in the ambit of a farming system [11].

### THE POTENTIALITIES OF THE DFS APPROACH FOR DEVELOPMENT COOPERATION

Research in the field of the sustainability, the resilience, and the vulnerability of socio-ecological systems is becoming ever more important and is significant also for the political and economic sphere, and it is our hope that they can contaminate in a positive sense the world of development cooperation (research and practice). In this sense, we feel that the DFS approach has some potentialities and some points to reflect upon regarding the objectives of development cooperation. Once again, not as much as biological diversity, in that it is the object of cooperation projects and interventions, but the way in which we work on diversity, through an approach to resilience, to attain development objectives that necessarily have to take into consideration the reference socio-territorial context, in terms of institutional analysis.

In fact, knowledge of social institutions is crucial, namely the combination of regulations that human beings use to organise interactions of a repetitive and structured nature, including those within the family, the neighbourhood, in the market, in the factory, in church, of organisations and government at all levels [12] to understand how to deal with biodiversity so that it can generate a resilient system. This is the result of collective, long-term action, where the benefits and the positive externalities associated with the maintenance of the agro-biodiversity are evident to all.

It seems to be especially important how to integrate scientific knowledge and traditional and modern skills, and to promote innovation and technology networks suitable for the use of social capital and for respect for cultural identity within a process that includes diverse stakeholders including farmers, engineers, researchers, local governance, where the cooperation projects should stand as facilitators, where traditional knowledge can integrate with that deriving from scientific and technological innovation.

We can observe, then, in the DFS theoretical model a series of ideas that should be examined more closely through training and occasions for discussion in an academic context, through a necessarily interdisciplinary perspective and with operators of the cooperation sphere, especially regarding the potentiality of the DFS approach as a process for education, training and technology transfer that can better take into account the complexity and the diversity of the systems, in a context like that of cooperation projects, where cultural diversity is a fact, and which could, however, be a further value added.

## AGRICULTURE AND URBAN AND PERI-URBAN BREEDING

Mario Mattoni\*, Daniele De Meneghi\*

\* Department of Veterinary Sciences, University of Turin, Italy –  
[mario.mattoni@unito.it](mailto:mario.mattoni@unito.it), [daniele.demeneghi@unito.it](mailto:daniele.demeneghi@unito.it)

There is evidence that livestock contribute to the livelihoods of approximately 70% of the World's poor and represent a crucial component of any strategy aimed at improving food security and reduce poverty. The demographic booming of the human population in the poor areas of the Planet lifts up the problem of food production, its access and distribution. Particularly in sub-Saharan Africa (SSA), data indicate that by 2025 the population will increase by nearly 800 million of new individuals, of which 55% will live in towns. The impressive demographic growth in developing countries (in some cases even +4% year) requires an overall increase of food production to assure the livelihood of human population. Some data (UNCHS, 1996) indicate that by 2030 the global urban population will reach 4.9 billion, and most of this increase will be in cities of the so-called developing countries. This is due to migration from rural to urban areas and rural settlements being incorporated into urban areas. The quick urbanization not accompanied by a reasonable and equitable economic growth has led to urban poverty and food insecurity.

The agricultural development has been focused on rural areas to improve food production to supply the growing urban population. Recently, more focus is given to urban and peri-urban livestock production (UPUL) systems and peri-urban agriculture (PUA) directed towards the urban demand. In 1999, FAO estimated that 800 million urban residents worldwide were engaged in PUA. Generally the status of PUA and UPUL has changed from illegal to tolerated activities and to “new development strategy”, although most resources are devoted to PUA rather than UPUL. Nevertheless, despite the scarce attention, PUA and UPUL have shown a continuous development, driven by the growing demand. Virtually all species can be bred within PUA and UPUL system: from large (cattle, water buffaloes) to small ruminants (sheep and goats), monogastric (poultry, pigs, rabbits) and unconventional or mini-livestock (agouti, guinea pigs).

The problem could be tackled by enhancing food production through the integration and the intensification of small scale agriculture-livestock production systems in urban and peri-urban areas. To make the system productive and sustainable, it should stand on four main pillars: i) animal feed supply integrated with the available local agro-industries; ii) raise livestock species to meet local preferences and needs of the inhabitants; iii) assure timely, balanced and continuous production, iv) improve animal health and ensure the adoption of bio-safety measures.

PUA and UPUL system has strengths and weaknesses: the most relevant strengths are represented by the proximity of the production sites to market areas which contribute to reduce transport costs, thus generating competitive prices. Moreover, raising livestock in urban and peri-urban areas offers the opportunity to re-use household waste, agro-industrial by-products residues from local food-markets and small-scale urban farmers. PUA and UPUL can contribute to enhance social security of vulnerable social groups of poor, e.g. female headed households, children, old people. In addition, PUA and UPUL can contribute to enhance the social security by contributing to retirement plans or sustain convertible assets to cover important expenditures such as school fees, health treatments etc..

On the other hand, breeding animals close to human settlements/agglomerations may generate the problem of feed competition and availability. Particularly when high quantities of feed is required for large livestock species such as cattle, which are usually zero-grazed. Limited feed availability also generates high labor input to seek for feed resources. Breeding in urban areas forces to apply specific management practices often unknown to many farmers, who usually tend to replicate traditional management schemes, not adapted to urban and peri-urban conditions. Ultimately an insufficient networking compared to rural areas and a lack of extension and provision services not tailored to urban and peri-urban circumstances represent undoubtedly a further weak point.

## PRELIMINARY RESULTS ON THE DEVELOPMENT OF INNOVATIVE SITE-SPECIFIC INTEGRATED ANIMAL HEALTH PACKAGES FOR THE RURAL POOR

### ABSTRACT

In Sub Saharan Africa, milk production has constantly increased from early sixties till late eighties. However to fulfill the demand, production should increase by 4% per year, to reach 45 million tons/year by 2025, with a stronger growth in peri-urban areas [1]. Within a given production system, milk production is maximized when the genetic potential of a dairy cow is sustained by optimal management, including adequate feeding and absence or control of diseases affecting specifically the udder. It is estimated that the economic losses from mastitis in the peri-urban areas of Addis Ababa around 58 USD per cow/lactation[2]. The largest proportion (>60%) of mastitis is subclinical, with main causes identified as: poor housing, improper milking, elevated insect/vector burden at farm level [3]. In the East-African Highlands, local dairy market is mainly sustained by small-scale farms [4]. In Kenya, small-scale dairy often operating under highly intensified small-scale zero-grazing, furnishes 80-85% of the national milk production. Dairying contributes to increase income of poor rural households who depend on the production and trade of dairy products for their livelihood. In 2010, IFAD has funded a project “*Development of innovative site-specific integrated animal health packages for the rural poor*”, implemented by FAO in collaboration among others with an International Research Centre (ICIPE, Kenya). Main project’s goal is to develop animal health packages for managing and controlling animal diseases to improve food security and alleviate poverty. Zero-grazing dairy units are protected with net impregnated with an insecticide (synthetic pyrethroid) to reduce insect/vector burden. The results are encouraging indicating a reduction in mastitis cases by 50%, farmers knowledge and perception of mastitis risk highly increased (cows are checked for mastitis before purchase), and more clean and higher quality milk produced. There is general reduction of housefly population and also a decrease of human malaria morbidity due to reduced mosquito population, while there are no effects on helminthes and tick-borne diseases.

### JUSTIFICATIONS AND INTRODUCTION

It is widely recognized that, throughout the developing world, livestock contribute to the livelihoods of roughly 70% of the world’s poor, supporting farmers, consumers, traders and laborers. Furthermore, there is increasing demand for livestock products for the growing and more affluent populations of many developing countries, particularly in Africa, which offers new market opportunities for poor farmers in rural areas. Hence, success in raising small-farmer productivity leads to improvements in household food security, level of nutrition and income leading to poverty alleviation. However, livestock disease is a major constraint for increased, sustained animal productivity of small-farmers in vast areas of sub-Saharan Africa. A project to alleviate poverty and enhance food security at small scale farmers level is implemented in three countries Kenya, Ghana and Burkina Faso. Specifically the project aims to: i) develop prototype animal health packages in different livestock production systems; ii) tests their socio-economic through optimization adoption and dissemination; iii) enhance farmers, farmers’ associations, NARES and PATTEC capacity building. In Kenya the project is implemented within the IFAD funded program SDGP, focused on peri-urban smallholder dairy farms. In Kenya many farmers have set up smallholder zero grazing dairy farms for the improvement of their livelihoods, this also support the revival of the milk and dairy subsector in the country. The husbandry structure is essentially based on stall feeding, where dairy cattle are confined and fed with a cut-and-carry fodder system. The zero grazing model for dairy production accrues farmers benefits, by pass the shortage of grazing land helps to enhance productivity of dairy cows and reduces the prevalence of diseases. The zero grazing systems among other advantages

allow to collect manure produced by cows to be used to improve soil fertility and also as a source of material for biogas production and are therefore an essential part of zero-grazing enterprises. On the other hand cattle handled in Zero Grazing Units and the waste pits associated with them attract flies and other nuisance insects which are highly debilitating to livestock, they bite animals, cause agitation, spread diseases and contribute to unsanitary conditions. Which also involve mechanical transfer of disease agents from flies to the animal host causing eye infections and mastitis amongst other diseases. To tackle the problem, LPNF deltamethrin treated nets of 1m height are deployed around the Zero Grazing Units. This paper describes the preliminary results obtained in Kenya by using LPNF which are evaluated in full zero-grazing units and in semi-zero grazing units.

## MATERIAL AND METHODS

Two project sites were identified in Kisii and Bungoma Districts, Kenya (see Figure 1) where baseline data were collected, between the months of December 2010 to February 2011, with the scope to identify prevailing diseases and disease vectors/flyes in the zero grazing units. After the baseline data collection, a total of 63 units and 176 animals were protected with LPNF nets (manufactured by Vestergaard Frandsen) of 1m height encircling the zero grazing unit. These LPNF are installed as follows: measure perimeter of zero-grazing unit or waste pit then cut the required length of LPNF from roll. The net is then nailed to bottom boards of the shed, stretch and nail to highest board of the shed. The bottom of the net is kept 10cm above the ground (see Figure 2). For this reporting period, the following activities were conducted: the protected units were monitored during the period between April 2011 to January 2012, in both sites. Kisii project site had 36 units, and the treatment was allocated as follows: 15 zero grazing units were PU with LPNF, 10 units have the LPNF around the waste/dung pits (WPP). In Kisii, additional 11 zero grazing units, where no PU, or WPP were in place and used as control CU. In Bungoma project site, 16 zero grazing units were PU and 11 used as controls, bringing to a total of 27 units. In Bungoma no WPP units have been protected with LPNF, as there are no large waste deposits. Monthly data sheets and farmer recording data sheets were used to collect data on milk production and malaria's morbidity in local villagers, and mosquitoes presence was determined in the households. Socio economic baseline data were also collected using a questionnaire.

Fig. 1 - FAO Project study sites.

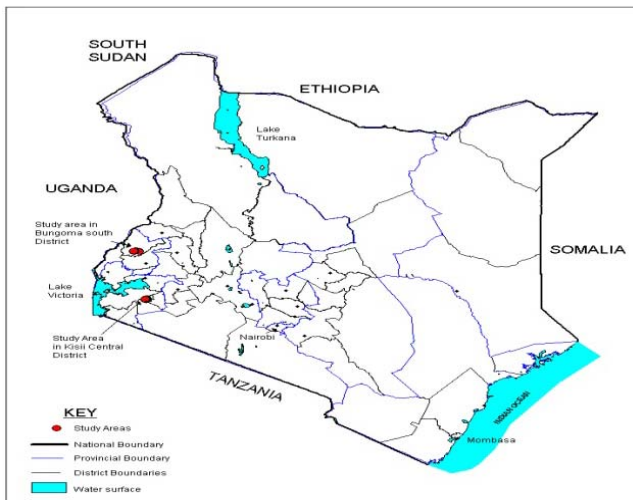

Fig. 2 - Livestock Protective Net fence.

After baseline data collection in both sites of Kisii and Bungoma, data were collected to determine the health status of the animals through: i) entomological and epidemiological data collection carried out on monthly basis assessing PCV, blood smear for haemoparasites, helminthes, coccidia and protozoa; ii) tick-borne diseases, like East Coast Fever (ECF) by *Theileria parva*, transmitted by *Rhipicephalus appendiculatus*; Anaplasmosis (*Anaplasma centrale* and *Anaplasma marginale*) and Babesiosis (*Babesia bigemina*) were investigated through blood smear examination. Mastitis were detected using CMT and milk was also collected and analyzed for brucellosis infection with RBT and bacterial identification. For entomological monitoring, thirteen units drawn using random computer numbers, were monitored on monthly basis, for three days using the NGU, CDC and the sticky traps. The selected units, monitored on monthly basis were as follows: 5 PU, 4 WPP, and 4 CU in Kisii. In Bungoma, 8 units were PU and 5 CU. The NGU and CDC trap were placed on each side of the zero grazing unit, outside the unit, and one sticky trap inside the unit for 3 days. The flies were identified, counted and stored in labelled vials after every 12 and 24 hrs for the CDC. The same data were collected after ten months of intervention with LPNF. Data were later analyzed in Stata SE, Stata Corp LP version 419.11.2.711. The T-test was used to compare the means for statistically difference. For fly catches, data was entered in Excel, FTDs were calculated and plotted. ANOVA tests were used in each set of data to determine if there was a significant difference between the treatments. The results from the questionnaire survey were coded, cleaned and

entered in SPSS for analysis.

## RESULTS

Baseline data collection carried out before the LPNF deployment indicated 68% prevalence of mastitis, 30% *helminthiasis* and 25% TBDs. The large majority of mastitis detected was sub-clinical, though clinical mastitis has been reported by farmers. The overall average prevalence of mastitis after a period of ten months following intervention was as follows for Kisii: CU 49% (95% CI=37.481–61.179), PU 28% (95% CI=21.148–35.296) while WPP presented a rate of infection of 35% (95% CI=22.187–48.479). Significant differences in mastitis prevalence were observed between the CU and the PU ( $t=3.772$ ,  $p=0.007$ ) and also between the CU and the WPP ( $t=2.662$ ,  $p=0.032$ ). However, there was no difference between the PU and WPP. In Bungoma the overall mean prevalence was as follows: CU 36.4% (95% CI=20.198–52.658), and PU 40.1% (95% CI=21.519–58.765). There was no significant difference between the CU and the PU ( $t=-0.369$ ,  $p=0.7242$ ) in Bungoma. Monthly analysis for statistical differences across the treatments are shown in Table 1 for Kisii and Bungoma.

**Tab. 1** - Monthly percentage (%) of animals with mastitis in zero grazed cattle in Kisii and Bungoma.

Treatment Kisii	Percentage (%) of prevalence of mastitis								
	Apr	Jun	Jul	Aug	Sept	Oct	Nov	Dec	Jan
CU	61a	29a	55a	47a	37a	63a	73a	50a	29a
PU	27ab	25a	38a	38ab	16a	20ab	42a	20a	29a
WPP	70b	33a	34a	10a	15a	40a	35a	40a	41a
Treatment Bungoma	Percentage (%) Prevalence of mastitis								
		Jun	Jul	Aug	Sept	Oct	Nov	Dec	
CU		42a	27a	44a	27a	11a	67a	37a	
PU		47a	45a	22a	35a	23a	29a	80b	

Note: Numbers in the columns with same letters are not significantly different ( $p>0.05$ ).

In Kisii, although the difference was not significant, PU were slightly better than WPP in terms of mastitis prevalence. This could be explained by the fact that the net around the units kill flies directly on contact and thus preventing diseases. The WPP would have an effect on flies that are breeding in the dung pits and which would eventually move to the units nearby. Since, a comparison between the two treatments of PU and WPP showed no difference this could mean that one can either use LPNF to protect the zero grazing units or protect the waste pits themselves. It is important to note that the management styles in the two sites of Kisii and Bungoma are very different. In Bungoma, it was practised some form of semi-zero grazing with animals released daily to graze outside the unit for up to six hours. Animals would enter the units with flies and ticks already on their bodies. There was a notable rise in mastitis prevalence in both sites across the treatments in the months of October to January and this coincided with the season after the short rains when fly numbers were also high. The prevalence of mastitis also increased coinciding with the rise in fly population.

### Analysis of milk

Forty (40) milk samples were taken to the regional Veterinary Investigation Laboratories and the most frequent mastitis causative species identified were *Staphylococcus aureus* (44%), *S. epidermis* (12%) and *E. coli* (12%) while (32%) samples were negative. *S. aureus* was the most detected pathological agent, it causes one of the most common types of chronic mastitis. Though some cows may flare up with clinical mastitis (especially after calving) this is what was reported by farmers when there was a flare up of clinical mastitis. The infection is usually subclinical, causing elevated somatic cell counts (SCC) but no detectable changes in milk or the udder. The infection is spread at milking time when *S. aureus* contaminated milk from an infected gland comes in contact with an uninfected gland, and the bacteria penetrate the teat canal. Once established, *S. aureus* infections do not respond well to antibiotic therapy and infected cows must be segregated or culled from the herd. This explains the chronic nature of the disease in the herds, with some cases not resolving after therapy. Milk from the udder looks normal but tests positive with CMT. Farm inspection revealed that udder hygiene, cleanliness of the unit, milking rope, single udder-towel and dairy labourers as the most substantial risk factors of mastitis.

When data were pooled for Kisii and Bungoma, the numbers of cows in lactation monitored per month vary from 3 to 20 for the CU (Control) and from 7 to 35 for the PU (Netting). The analyses were performed month by month because of the repeated nature of the data in order to see from which month after intervention difference start to occur. Results of the analyses show that although the lactation cows in the PU and WPP treatments performed slightly better than CU there is no statistically significant difference in the overall milk off take.

**Fig. 3** - Average daily milk off take per cow (litre) in Kisii and Bungoma polled data (Control=CU; Netting=PU).

**Testing for Brucellosis**

None of the 58 samples from Kisii and 38 from Bungoma tested for Brucellosis using the RBT and the CFT at the National Department of Veterinary Services, Kabete were positive, for both tests, though human brucellosis has been reported in the districts.

**Tick-borne Diseases**

In Kisii the average incidence of TBDs over the monitoring period in the studied animals was as follows: PU 19%, WPP 10%, whereas CU had a 11% prevalence. There was no significant difference in tick-borne disease incidence between the treatments. In Bungoma the mean incidence was 15% for PU and 20% for the CU with also no significant difference between the two treatments ( $t=1.2034, p=0.2679$ ). The most commonly diagnosed parasite through blood smear was *Anaplasma marginale*. Farmers, however, indicate that ticks were of great significance, and they used acaricides for tick control. The acaricides were applied at one-week intervals and the most common method of application was hand spraying, but still some farmers still experienced problems with ticks. On probing it was found out that most of the tick infestation was due to cross species infection mainly from the dogs. Dogs were used as night guards for the much valued animals, most of the time they slept inside the unit as the case for Kisii. The cut and carry method of feeding the animals with Napier grass sourced from other homesteads and grass cut along the road reserves also served as a source of infestation.

**Tab. 2** - Monthly percentage (%) incidence of animals with Tick Borne Disease in zero grazed cattle in Kisii.

Treatment Kisii	Percentage (%) Incidence of TBDs									
	Apr	Jun	Jul	Aug	Sept	Oct	Nov	Dec	Jan	
CU	16a	19a	19a	16a	6a	0a	20a	0a	0a	
PU	25a	29a	45a	11a	12a	18a	15a	18a	3a	
WPP	8a	3a	25a	6a	6a	6a	9a	6a	9a	

Note: Numbers in the columns with same letters are not significantly different ( $p>0.05$ ).

**Helminths**

Overall the infection was 15% (95% CI=-11.388–41.888) in the WPP, 13% (95% CI=1.092–24.907), for PU and 9% (95% CI=-7.957–25.457), for CU in Kisii. In Bungoma the prevalence for CU was 21.75 (95% CI=7.794-35.705), the prevalence in the PU was 16% (95% CI=4.306-27.693). There was no significant difference between the treatment and the CU ( $P>0.05$ ) in all the sites. The netting has thus no effect on worm control in the zero grazing units, though it’s important to point out that the farmers carried out routine deworming after every three months. Overall FEC were highest in cattle less than 1 year of age (mean FEC 670) and lowest in adult cattle over two years old (mean FEC 150). This is lower compared to studies done elsewhere with a mean FEC of over 1000 for cattle less than 1 year. Farmers had moderate to high levels of knowledge on worm infestation and diagnosis. Seventy-five percent of the respondents indicated that they de-wormed their cattle, mostly after every three months. Farmers mainly diagnosed worm infection by observing unthriftiness (60%), and distended abdomen (30%), coughing (10%) and poor appetite (10%). Expert veterinary advice on drugs was moderate to minimal and farmers relied mainly on over the counter salesmen (70%) for advice on drug usage. Other considerations included previous experience of the drug effectiveness (34%), the low price of the drug (12%), ease of administration (18%), advice from animal health personnel (26%), advice from other farmer (9%) and seminars (5%).

**Entomological Results**

The most commonly identified flies in both sites were *Stomoxys* (69%), which are associated with confined livestock keeping, mosquitoes (23%), and houseflies (11%) and a few tabanids (0.5%) on an irregular basis. The

number of flies captured from inside the units using the sticky panels ranged from an average of 3 flies in PU, 2 in WPP and 8 in CU. The trend of the flies captured from June 2011 to January 2012 is shown in graphs below as FTD. In general the fly population was high at the beginning of the monitoring phase with the population dwindling from the second month of monitoring onwards. The control units recorded higher relatively FTDs compared to the waste protected pits and the netting. During the month of December immediately after the short rains, there was an increase in mosquito population and higher FTDs were recorded in the control units in Kisii. For Kisii there was no significant difference between the CU and the PU ( $\chi^2=1.817$ ,  $P=0.927$ ) in *Stomoxys* FTDs. However, there was a significant difference between the CU and the WPP ( $p=0.014$ ) indicating that protecting the pits is effective in killing the flies especially *in situ*. (Table 3).

**Tab. 3** - Catches of house flies: significant difference between the control units and the netted and waste protected units.

Treatment	Houseflies								
	Apr*	Jun*	Jul	Aug	Sept	Oct	Nov	Dec*	Jan
CU	14a	10a	1a	0a	0a	2a	1a	4a	0a
PU	7ab	1ab	0a	0a	0a	0a	0a	1ab	0a
WPP	5b	5b	0a	0a	0a	0a	0a	1b	0a

Treatment	Houseflies								
		Jun	Jul	Aug	Sept	Oct	Nov	Dec	Jan
Bungoma									
CU		4a	5a	3a	0a	0a	1a	1a	2a
PU		3a	1b	1b	0a	0a	0b	1a	0b

*Note:* Numbers in the columns with same letters are not significantly different ( $p>0.05$ ).

Though some flies were captured inside the units by use of sticky panel, the numbers were less in the protected units compared to the non protected units. Statistically, there was a significant difference ( $P=0.02$ ) in Kisii in *stomoxys* catches between the WPP and the CU. There was no significant difference between the PU the CU in Kisii ( $p>0.5$ ) for *Stomoxys* but there was statistical difference for Bungoma. Flies inside the units could be explained by the fact that some farmers left the doors of the protected units open despite the instructions given and also due to constant accumulation of animal dung, rotting straws and hay inside the unit especially if not cleaned frequently permitting the introduction of new suitable breeding places for flies.

*Stomoxys* flies are serious pests of confined livestock. The adult flies suck blood from the cow and the bites are very painful. There was considerably decrease in the number of flies physically observed on the PU. On further observation the animals were more calm and feeding well, as compared to the controls where fly repelling behaviours were noted such as tail flicking, feet stamping, throwing the head back towards the torso, rippling the skin etc. During these repellent behaviours, the feeding of the animal was disturbed and food was strewn all over the place.

There was no significant difference in the mean weight gains and PCVs across the treatments both for Kisii and Bungoma. Reduction of stable flies attacking cattle is likely to result in relief of the animal from nuisance flies and giving the animal time to concentrate on feeding thus improvement of the animal condition and production. Also incidence of mechanically transmitted diseases such as pink eye and dermatophilosis is reduced. Eye problems are common in the study sites with a case of long standing case of dermatophilosis in Kisii.

### Human health

Although there is no difference between treatments from June onward Figure 4 shows a declining trend of the percentage of total household members falling sick of malaria in Kisii. In Bungoma no significant difference could not be observed between the CU and the PU in terms of the percentage of total household members falling sick of malaria per month.

**Fig. 4** - Monthly percentage (%) of total household members falling sick of malaria in Kisii (Control=CU; Netting=PU; Waste pit protection=WPP)

## Farmer's perceptions

Farmers mentioned that:

- There was a general decrease in fly populations inside the units and generally in the homesteads.
- Cooking and eating is more comfortable.
- Social life and friendly chats outside the houses are now carried out with no disturbances.
- Milk production is improved, animals were calmer in feeding and during milking times.
- Farmers in households with WPP expressed higher satisfaction with reference to reduction of fly populations.

## CONCLUSIONS AND DISCUSSION

### Mastitis

- Mastitis prevalence in PU and WPP is significantly lower than in CU units, but there is no difference between PU and WPP, meaning that either barns or waste can be protected.
- As in Bungoma, there was no significant difference in mastitis prevalence between CU and PU it can be concluded that netting is not suitable for semi-zero grazing units.
- LPNF have no effect on tick-borne diseases in both sites nor on helminthes.

### Entomology: Catches of *Stomoxys* and Houseflies using the NGU, and Mosquitoes using the CDC Traps

- In Kisii, there was no significant difference in *Stomoxys* catches between the CU and the PU, it appears that *Stomoxys* populations drastically collapsed after the introduction of the nets.
- In Kisii, *Stomoxys* catches in WPP were significantly less than in the controls indicating that protecting the pits may be effective in killing the flies in situ.
- In Bungoma, there was no significant difference in *Stomoxys* catches between the control and the protected units indicating there is no need to protect semi-zero grazing units.
- In Kisii, overall there was no significant difference in mosquito catches between the treatments (both the net and waste protected units) compared with the control, but immediately after the rains mosquito catches were significantly more in the controls than in the other 2 treatments.
- In Bungoma, there was a significant difference in mosquito catches between the PU and CU thus LPNF affect mosquito catches.
- Housefly catches were significantly less in PU and WPP compared to the CU in Kisii and also in Bungoma.

### Sticky traps

- *Stomoxys* catches were significantly lower in zero grazing units where the waste pits were protected with nets compared to the un-protected units (control) interestingly, there was no significant difference in *Stomoxys* catches between the netting and the controls in both Kisii and Bungoma. This observation is similar to the results with NGU trap.
- In Bungoma, in mosquito catches, there was a highly significant difference between the control and net protected units ( $p=0.0001$ ). Similar results were observed with CDC catches
- Fly populations reduced drastically immediately after the intervention across all the treatments. The population seemed not to recover and this could explain why there was little or no statistical difference in the monthly FTD trends.

### Impact

The LPNF and dung pits protection with impregnated nets are likely to have economic impact due to the potential in decreasing insects burden in the zero grazing units. The non significant difference may be attributed to the sample size and other confounding factors such as nutrition and cattle breed that should be taken care of in a long term assessment of the PU and WPP. In conclusion LPNF decreases agitation and disturbance of animals easing their feeding and limiting strewing of fodder. Provide consistent protection to livestock by reducing flies burden in zero-grazing units and biting flies in waste pits allowing to keep improved dairy cattle breeds and thus offering the opportunity to increase milk production. LPNF is easy to install and use, it is long-lasting, doesn't need repeated interventions and is not harmful to the environment. Is safe for livestock and humans population which also benefits from a reduction of mosquitoes presence resulting in a reduction of malaria morbidity if waste pits are protected.

## NOMENCLATURE

CFT	Complement Fixation Test
CU	Control Units
PU	Protected Units
FEC	Fecal Eggs Count

## LA FILIERE LAITIERE EN AFRIQUE SAHELIENNE: VALORISATION DU PRODUIT LOCAL

Massimo Zecchini\*, Anna Cantafora\*

\*Département de Médecine Vétérinaire et Santé Publique, Université de Milan, Italie - [massimo.zecchini@unimi.it](mailto:massimo.zecchini@unimi.it)

### RESUME

Une étude bibliographique et de synthèse sur la filière laitière en Afrique sahélienne a été réalisée. Après une description générale sur le Sahel et le rôle des produits laitiers au sein des économies locales, ce travail fait le point sur la dépendance des importations du lait en poudre par plusieurs de ces pays. Bien que le lait représente un élément important dans les civilisations pastorales au Sahel, les filières laitières locales tardent à s'affranchir des marchés internationaux. L'étude analyse la filière locale dans ses différents aspects et en particulier son récent développement dans un contexte urbain et celui plus traditionnel au niveau pastoral. Les étapes de production, transformation, commercialisation et consommation sont passées en revue selon les deux contextes analysés, en faisant ressortir les possibilités d'amélioration et les freins qui empêchent la croissance de la filière locale. Une description des produits laitiers locaux est suivie par l'analyse des potentialités qu'ils pourraient jouer dans le processus de lutte à l'insécurité alimentaire. Cette zone d'Afrique souffre encore de ce problème et le lait produit localement pourrait intervenir comme un important maillon de la chaîne alimentaire. Pour émanciper les pays sahéliennes de la dépendance des importations et promouvoir la production locale, il est important que la recherche et l'aide au développement s'orientent davantage vers la filière laitière, au profit d'un échange économique plus équilibré et de la valorisation des produits locaux. Une connaissance plus approfondie de cette filière au Sahel vise à faire connaître et à mieux développer les programmes orientés à la promotion et valorisation du lait local et de ses produits dérivés.

### INTRODUCTION

La région sahélienne en Afrique correspond à une ceinture de territoire qui va de l'extrémité Est du Soudan aux îles de Cap Vert, en couvrant une superficie d'environ 5,4 millions de Km<sup>2</sup> et en hébergeant une population de 50 millions d'habitants. Elle se situe au sud du Sahara en sorte de bordure de la mer de sable. Les pays sahéliens sont ceux dont le territoire se prolonge à différent degré dans le désert : le Sénégal, la Mauritanie, le Mali, le Burkina Faso, le Niger, le Tchad, le Soudan. Le Sahel est donc une zone de transition entre le désert et la savane dont la distribution pluviométrique au cours de l'année conditionne et règle la vie des hommes et les productions animales et végétales.

A l'intérieur de cette région, les variations climatiques affectent profondément le milieu en donnant lieu à plusieurs écosystèmes : du désert à l'extrême nord en passant par le Sahel proprement dit, pour continuer avec les zones sahélo-soudanaise et soudanaise, où les précipitations annuelles permettent les cultures de sorgho, maïs et coton. Même si les fleuves Niger et Sénégal assurent une partie importante de l'eau pour la vie des hommes et pour les activités agricoles, les cultures restent encore très subordonnées au régime des pluies (cultures pluviales). Dans ce contexte, même l'élevage est obligé de suivre le rythme saisonnier par une forme de transhumance pendulaire du nord au sud et vice-versa [4].

Dans la zone sahélienne, la plus part de la population est à vocation agro-pastorale. Mais le Sahel est aussi une zone à forte croissance démographique (>3% par an) avec une importante concentration au niveau urbain. Il a été estimé qu'environ 30% de la population sahélienne vit en ville, avec des pics de 50% dans certains pays. Ceci implique un changement profond au niveau des produits de consommation, qui seront de plus en plus d'origine commerciale plutôt qu'issus d'une production locale.

Les épisodes de crise environnementale vécus par le Sahel dans les années '72-'73, qui ont vu une intense dégradation des pâturages, décimation des troupeaux et l'exode des populations vers le sud, ont eu l'effet d'une prise de conscience internationale vis-à-vis de la vulnérabilité de cette zone. Il a été donc jugé nécessaire et urgent de prendre des mesures appropriées pour répondre à cette crise. Parmi ces mesures, il est important de rappeler la création d'un comité supranational de lutte à la sécheresse, le CILLS (Comité inter-États de Lutte contre la Sécheresse au Sahel) [8]. Mais les crises alimentaires dans la zone sahélienne se répètent de manière régulière et ainsi plusieurs pays se sont organisés sur la base du système d'alerte précoce (SAP), qui est censés de prévenir ces épisodes dramatiques.

Notre point de vu est que la filière laitière locale peut jouer un rôle non négligeable dans le système d'autosuffisance alimentaire.

## NOMADISME ET TRANSHUMANCE AU SAHEL

Dans la zone sahélienne la gestion des troupeaux se fait selon deux grands systèmes : le nomadisme et la transhumance. Dans le premier cas, les communautés nomades déplacent leurs animaux en fonction de la présence des pâturages et des points d'eau le long de tracés plus ou moins codés et connus par les ethnies et les tribus. Pendant la saison des pluies, les déplacements se font à l'intérieur de la zone de transition entre le Sahara et le Sahel, tandis qu'en saison sèche, ils se déplacent en zone soudanaise et même sud-soudanaise soit en zone à vocation agricole, ce qui cause parfois des sérieux problèmes de cohabitation entre agriculteurs et éleveurs [2] [10].

La transhumance par contre est une manière d'exploiter les ressources naturelles sur la base d'itinéraires pendulaires et planifiés chaque année. La méthode de la transhumance est utilisée par les ethnies classiquement pastorales mais aussi par les éleveurs qui pratiquent l'agriculture et l'élevage intégrés. A différence du nomadisme, qui se caractérise par le déplacement de tout le noyau familial et/ou communautaire, la transhumance prévoit de confier le bétail à un berger, qui peut gérer les animaux de plusieurs familles ou propriétaires. Ce berger il est le plus souvent rétribué en nature sous forme de têtes de bétail, lait ou viande. Selon cette pratique, le troupeau en transhumance est composé par toutes les catégories de bétail sauf les bovines en lactation et leurs veaux, qui restent au campement d'origine pour fournir le lait à la famille. Ceci est particulièrement évident chez les éleveurs urbains et périurbains, puisque le lait constitue une importante source de revenus [2] [10].

## L'EXPLOSION DEMOGRAPHIQUE

Depuis plus d'un demi siècle, les pays sahéliens connaissent une progression démographique importante, avec des taux de croissance très élevés. Les prévisions d'évolution démographique sont de 3,3% en 2015, 3,0% entre 2025-2030, et 2,1 pour cent vers 2045-2050 [12].

De même, la population n'est pas uniformément distribuée sur le territoire, mais l'explosion démographique est particulièrement accentuée au niveau urbain. Plusieurs raisons ont été évoquées pour expliquer ce phénomène, entre autre:

- la sécheresse des années '70,
- l'instabilité économique dans le milieu rural,
- l'insécurité liée aux épisodes de guerre ou des conflits internes (ex. la guerre au Mali en 2013).

Ce processus est à l'origine d'importants changements des systèmes de production animale que nous avons ci de suite énumérés:

- réduction des pâturages à cause d'une demande croissante de terre pour l'agriculture,
- dégradation des pâturages sous l'effet du déboisement à cause de la demande croissante en énergie par les populations urbaines,
- augmentation de la demande en produits d'origine animale et intensification de l'élevage à but commercial,
- transfert de la force travail (les jeunes en particulier) du monde rural aux grandes villes et affaiblissement du secteur de l'élevage dans les zones à plus forte vocation pastorale.

L'explosion démographique, l'urbanisation et le processus de sédentarisation des communautés nomades et transhumantes représentent aujourd'hui une menace au «système sahélien» déjà précaire en soi. La distribution et la gestion du patrimoine animal est en train de changer : de plus en plus les propriétaires de bétail sont des commerçants, des fonctionnaires, des entrepreneurs qui confient leurs animaux à des bergers salariés [8]. Le résultat est l'abandon des anciennes zones pastorales au profit de la zone subhumide, avec une série de nouvelles problématiques qui se posent, comme la cohabitation entre agriculteurs et éleveurs et le passage d'un système pastoral extensif à l'intensification de l'élevage autour des grandes villes pour en satisfaire les besoins alimentaires.

## LA FILIERE LAITIERE AU SAHEL

Le lait est reconnu comme un important élément dans les civilisations pastorales au Sahel. Il représente un facteur déterminant dans l'organisation sociale et familiale, dans les habitudes alimentaires, les échanges commerciaux, les représentations rituelles et symboliques dans plusieurs communautés. En particulier, l'élément « lait » occupe une place prépondérante chez les ethnies Peuhl et Touareg.

Même si le lait et ses dérivés occupent une place non négligeable dans les traditions alimentaires des pays sahéliens, la filière laitière est peu développée dans son ensemble. La consommation de produits laitiers en Afrique est minime par rapport au pays occidentaux. Il a été estimé qu'un africain consomme 25 fois moins la quantité d'un européen en terme de produits laitiers. Mais cette différence doit être relativisée en rapport notamment aux capacités d'achat et de disponibilité du produit sur le marché [6].

Actuellement la production et la transformation laitière au Sahel sont en expansion grâce à une multitude de petites et moyennes entreprises à gestion familiale ou coopérative, qui côtoient les unités industrielles ou semi-modernes. Tracer un profil commun de la filière laitière est pratiquement impossible en raison des différentes réalités qui se croisent dans le même milieu, mais une classification est ici proposée sur la base d'une différenciation entre filière urbaine et rurale.

La filière laitière en milieu rural du Sahel est une chaîne très courte, composée par les producteurs (éleveurs ou agriculteurs qui exercent l'élevage) qui auto consomment une bonne partie de leurs produits et/ou revendent la partie excédentaire dans les marchés hebdomadaires. Les acheteurs ne sont que ceux qui s'en approvisionnent étant sans bétail.

En milieu urbain, le commerce et les technologies assurent l'injection sur le marché de produits diversifiés, ce qui rend plus complexe la filière. Dans ce cas, les producteurs se localisent au niveau de la périphérie de la ville et ils constituent des villages d'éleveurs semi-sédentaires. Leur activité principale est la vente du lait frais (ou caillé) en détail, aux grossistes ou directement aux unités de transformation. En général, les grossistes ne sont que des éleveurs mieux organisés et qui rachètent le lait des leurs voisins pour le transporter et le revendre aux transformateurs. Le plus souvent ces grossistes sont équipés de vélos ou motos pour le transport et ils sont aussi appelés « *collecteurs* ».

Toujours en milieu urbain, les unités de transformation peuvent être de différente constitution et capacité productive. Par ordre de niveau structurel, nous pouvons trouver les ateliers familiaux, qui transforment la poudre de lait ou le lait frais local ou les deux à la fois. Ils vendent leurs produits (lait frais, lait caillé, deghé, beurre ou fromage) en détail selon le système «porte à porte» ou dans les marchés de quartier. En général, le conditionnement est en sachet en plastique de différente taille.

A une échelle supérieure, nous trouvons les coopératives et/ou les GIE (Groupement d'Intérêt Economique), qui disposent de plus grandes capacités économiques et technologiques. Ils peuvent produire du lait pasteurisé, du yaourt, de la crème, du beurre et du *deghé*, conditionnés en bouteilles en plastique, pots en verre ou en sachets thermo soudés. Souvent ils disposent aussi de leurs étiquettes avec logo personnalisé.

Le niveau plus élevé est celui des unités industrielles avec une capacité de milliers de litres par jour. Certaines de ces unités utilisent également le lait frais local comme matière première, mais le gros de la production est fait à partir du lait en poudre d'importation. Leur production est très diversifiée et en manière générale très semblable à celle des pays industrialisés. Il s'agit de lait pasteurisé, lait UHT, lait aromatisé, lait caillé, yaourt, crème et plus rarement de beurre et fromage. Ces unités de transformation vendent leurs produits aux commerçants de la ville (supermarchés, boutiques, revendeurs ambulants) et dans certains cas aux marchés de la distribution internationale.

Vu l'augmentation des prix de la matière première d'importation (poudre de lait) dans ces dernières années et de la dévaluation du franc CFA des pays de l'Afrique de l'Ouest, quelques unités industrielles ont commencé à s'organiser pour la collecte du lait frais produit localement. Ce nouveau mécanisme, si d'une part a contribué à inverser la tendance de l'augmentation progressive des importations du lait en poudre en Afrique sahélienne, d'autre part il est en train d'augmenter et intensifier le processus de sédentarisation des populations pastorales autour des grandes villes. Malgré ce timide effort des promoteurs de la filière à appuyer la production locale de lait, les quantités produites et transformées à partir de la matière première locale n'arrivent pas à couvrir la demande.

Les productions animales au niveau urbain et périurbain sont classées dans la catégorie des productions «sans terre» puisque l'élevage se fait sans une véritable exploitation des pâturages dans le sens extensif du terme. Dans d'autres mots, il s'agit d'un système dont la terre n'a aucune importance et il représente le début d'un processus d'intensification en termes d'alimentation animale, soins et stabulation des animaux.

## EVOLUTION DE L'APPUI A LA FILIERE LAITIERE EN AFRIQUE SAHELIENNE

A partir des années '40, les pays du nord ont soutenu l'industrialisation de la filière laitière en Afrique par des interventions à économie mixte (publique et privé) avec l'importation de races bovines à haute production, systèmes de stabulation intensive, cultures fourragères, etc. En ce moment les premiers systèmes de traite mécanique ont été appliqués, avec des équipements pour la chaîne du froid et de transformation industrielle du lait. Après l'indépendance (dans les années '60), les difficultés pour garder ces équipements viables ont été énormes et dans la plus part des cas, les unités de production et transformation ont cessé de fonctionner [6].

Après cette phase de transition postindépendance, vers les années '80 certains gouvernements ont pris soins d'adapter le vieux model colonial aux nouvelles exigences politiques par un processus de «nationalisation» des grandes fermes de production laitière et des unités de transformation. C'est dans ce contexte que des grandes usines de transformation ont vu le jour, comme l'ULB (Union Laitière de Bamako) [11] au Mali et la Solani (Société du lait du Niger) au Niger. Ces unités industrielles ont commencé à se positionner sur le marché international comme de grands acheteurs de poudre de lait, produit excédentaire des économies européennes et nord-américaines.

Mais la diffusion en Afrique du lait en poudre n'est pas liée uniquement à ce phénomène, mais aussi à la diffusion des aides et des coopérations (bilatérales ou multilatérales) qui commencent à s'instaurer entre les pays du nord et ceux du sud. La poudre de lait est un produit facilement transportable, relativement économique, facile à stocker et à transformer [6].

Tous ces modèles industriels ont connu de très grandes difficultés à cause notamment des capacités du personnel

local, des interférences avec les institutions, de la taille excessive des unités de transformation par rapport à la demande. Néanmoins, des retombées positives ont été constatées, telles que l'introduction de races exotiques, les techniques d'insémination artificielle, les cultures fourragères et le début de la collecte de lait produit localement.

Vers la fin des années '80, le Programme d'Ajustement Structurel (PAS) a encouragé les investissements privés et la naissance des coopératives. Même l'aide au développement vise davantage les réalités de moindre taille et mieux adaptées au contexte. Petites et moyennes unités se développent souvent sur la base de capacités de particuliers expatriés ou de communautés religieuses [6].

A partir des années '90 à aujourd'hui, une multiplicité de mini-laiteries artisanales voit le jour, quelques fois issues par la volonté de quelques entrepreneurs, d'autre fois par l'appui des projets de coopération. En général, leur production est orientée au lait frais, au lait caillé et au yaourt à partir le plus souvent du lait en poudre. Certains unités toutefois choisissent la transformation du lait frais local, comme la laiterie Danaya Nono au Mali, la mini-laiterie Kolda au Sénégal e la Coopérative Laitière de Niamey au Niger [1] [9] [3]. Des moyennes laiteries modernes ont été créées par des particuliers comme le cas de la laiterie Tiviski en Mauritanie ou Laban au Niger [13].

## **LE LAIT DANS LES DIFFERENTS SYSTEMES DE PRODUCTION ANIMALE AU SAHEL**

Dans les systèmes pastoraux traditionnels (nomade ou transhumant), le lait est trait exclusivement pour les besoins en autoconsommation du berger et de sa famille. Dans les troupeaux en transhumance, où les animaux appartiennent à différents propriétaires, le lait n'a pas une valeur commerciale et il est aperçu plutôt comme un sous produit de l'élevage. Les bergers qui conduisent ces troupeaux peuvent s'en approvisionner juste pour leur consommation durant les déplacements. Dans ce contexte, rarement le lait est commercialisé et les vaches en lactation ne sont gardées auprès du campement que pour l'alimentation des veaux. La traite n'est pas donc une pratique régulière et quotidienne, mais ça se fait selon certaines exigences, telles que l'autoconsommation et/ou la vente aux marchés hebdomadaires. Dans ces systèmes pastoraux en milieu rural, dominés par les ethnies Peuhl et Touareg, les animaux sont gérés par les hommes tandis que la traite est un travail typiquement féminin. Le lait collecté est donc consommé comme tel ou transformé et vendu selon les exigences familiales par les femmes. La commercialisation des produits laitiers représente une importante opportunité pour les femmes, qui dans cette manière arrivent à rééquilibrer la prédominance masculine sur la gestion du foyer. Avec ces revenus, les femmes achètent ce dont elles ont besoin pour elles mêmes, la famille, les enfants et l'alimentation quotidienne.

Dans les systèmes pastoraux à caractère plus intensif, comme dans les élevages urbains et périurbains, le lait devient une importante ressource économique, dont la valeur augmente au fur et à mesure que les processus de sédentarisation et d'urbanisation rendent le produit encore plus demandé. Dans cette situation, on assiste à l'appropriation par les hommes des produits laitiers. En d'autres mots, là où le lait devient une importante ressource économique, l'homme s'en approprie le long de toute la chaîne: de la traite à la commercialisation. Les femmes n'ont qu'à se contenter d'exploiter le lait des chèvres et des moutons.

## **LAIT ET PRODUITS TRANSFORMES**

La transformation laitière représente partout dans le monde une méthode pour en prolonger sa vie sous forme d'un produit moins périssable, plus facilement transportable et qui peut être commercialisé. L'intérêt de la transformation est encore plus grand dans une zone où la quasi absence d'énergie rends impossible la chaîne du froid. Ceci a poussé les communautés pastorales à mettre au point des techniques de transformation plus ou moins élaborées afin d'obtenir des produits pour l'autoconsommation et la commercialisation dans plusieurs pays du Sahel.

Dans ce contexte, les ethnies pastorales qui ont plus développé et diffusé les techniques de transformation laitière sont les Peuhl et les Touareg. Ci de suite, nous avons proposé une description succincte des produits laitiers plus communs qu'on retrouve en milieu rural et urbain.

### **Le lait frais et caillé**

Le lait (frais ou caillé) mélangé avec le mil constituent la base de l'alimentation des Peuhl. Le lait caillé est un produit traditionnel qui valorise les surplus de la production laitière et il est produit par acidification spontanée du lait cru ou bouilli qui est laissé à repos pour une nuit dans une calebasse. Pour accélérer la transformation, certaines femmes ajoutent dans la calebasse une petite quantité de lait déjà caillé; après 12 heures environ (en fonction de la température) le lactose se transforme en acide lactique et la composante lipidique surnage. Cette graisse peut être retirée avec une cuillère pour la transformer en beurre ou l'amalgamée encore au lait caillé pour l'enrichir.

Une autre technique pour cailler le lait consiste en ajouter de l'eau en pourcentage différent selon la saison: 30% environ en saison sèche, 40-50% en saison pluvieuse. Cette pratique toutefois déprécie la valeur du produit et elle s'applique normalement en cas d'autoconsommation.

Le lait caillé est consommé comme tel mais in rentre aussi dans la préparation de certains plats de la cuisine traditionnelle, en particulier la bouille de mil, un aliment composé par le lait caillé, farine de mil et eau. Cette

préparation peut être consommée sur plusieurs jours en ajoutant à chaque fois du nouveau lait caillé et éventuellement du sucre, pour la rendre encore plus attractive.

### **Le beurre et l'huile de beurre**

Le beurre est le produit final issu de l'agitation mécanique de la crème qui surnage sur le lait après quelques heures de repos. Selon la technique traditionnelle, la crème de lait est récoltée à l'aide d'une cuillère et introduite dans un ustensile particulier en guise de batteuse (le nom diffère de zone à zone). Avec 1 litre de lait, les femmes arrivent à extraire 80 grammes environ de matière grasse. L'agitation mécanique se fait selon un mouvement rythmique et régulier pour environ 10 minutes, ce qui sépare la phase liquide de la matière grasse avec la formation des boules de beurre dans leur petit lait. Ces boules, d'un poids d'environ 30 grammes chacune, sont prélevées et sont passées dans l'eau propre pour en augmenter la consistance. La conservation du produit se fait dans desalebasses de grandes dimensions sur une période variable entre 10 et 20 jours, si bien gardé dans son petit lait. Le beurre est ainsi commercialisé sous cette forme dans les marchés ruraux et urbains.

Un autre produit issu du lait et très diffusé chez les communautés pastorales est l'huile de beurre (ou beurre cuit). Il s'agit d'un produit très peu périssable et qui se peut conserver pour longtemps. Sa préparation prévoit de faire bouillir le beurre dans une casserole pour environ 15 minutes jusqu'à voir un dépôt marron sur le fond par altération de la caséine. Le produit final est un liquide de couleur jaune qui peut se conserver en bouteille de verre pour 1 ou 2 mois. Pour produire 1 litre d'huile, 1.300-1.500 grammes de beurres sont nécessaires.

### **Le déghé**

Il s'agit d'une préparation à base de couscous, de mil et de yaourt typique du Mali. Le *déghé* a colonisé plusieurs pays limitrophes et il est rentré dans les habitudes alimentaires des populations locales, autant au milieu rural qu'urbain. Il produit à l'échelle traditionnelle mais aussi industrielle. Dans les autres pays sahéliens hors le Mali, les vendeuses de *déghé* sont presque toutes maliennes ou originaires de ce pays.

### **Le fromage**

Chez les communautés pastorales, le fromage a été conçu comme méthode pour valoriser les quantités excédentaires de lait pendant la saison des pluies, qui représente le pic de production laitière au Sahel. Bien que la technique soit utile et avantageuse, en Afrique subsaharienne sa diffusion en milieu rural est très limitée. Néanmoins, quelques exemples de tradition fromagère existent surtout chez les Peuhl et les Touareg.

Dans les zones plus au nord du Togo, Bénin et Nigeria, les Peuhl ont l'habitude de produire un fromage particulier appelé *waragashi* qui est en train de coloniser aussi les habitudes des autres pays voisins. La production de *waragashi* a attiré aussi l'attention de quelques projets de coopération qui a essayé de standardiser la technique et de la diffuser ailleurs [5].

Au Niger chez les Touareg, une autre technique fromagère s'est développée, à savoir celle du fromage appelé *tchoukou* en langue haoussa et *tikomart* en langue touareg. Il s'agit d'un fromage traditionnel fabriqué par les femmes à partir du lait de dromadaire et en ajoutant de la caille naturel et en exposant au soleil le produit. Il se présente sous forme de feuilles sèches et croquantes qu'on peut consommer comme telles ou incorporées dans la bouilli de mil. En générale, pour produire une feuille de fromage (grand comme un papier A4 environ) il faut 1,5 litre de lait frais avec en temps de dessiccation d'environ 24-48 heures. Même pour cette technique, l'intérêt des bailleurs est grandissant, en particulier la FAO a appuyé depuis 1989 cette filière dans le nord du Niger par des formations et des supports techniques en visant un produit moins périssable et en améliorant le circuit commercial.

### **Le yaourt**

La transformation du lait en yaourt ne fait pas partie des traditions pastorales au Sahel, où le produit laitier principal est le lait caillé. Le yaourt au contraire fait son apparition en périodes plus récentes et notamment en milieu urbain. Sa production est en général de type industriel ou semi industriel, même si une bonne partie du marché est occupée par des produits artisanaux dérivés du lait en poudre et plus rarement du lait frais local. Dans les grandes villes du Sahel, une multitude de petits transformateurs produisent du yaourt à la maison pour le revendre selon le système « porte à porte » ou dans les marchés de quartier.

## **CONTRAINTES AU DEVELOPPEMENT DE LA FILIERE LAITIERE AU SAHEL**

Pour terminer cette contribution à l'étude de la filière laitière dans les pays sahéliens, nous avons tenté une réflexion sur les points critiques qui, à différent niveau mais à forte compénétration, en freinent le développement et son affirmation au niveau économique, social et politique. Selon notre expérience, les facteurs qui doivent être pris en considération en manière prioritaire sont les suivants:

- faible niveau d'alphabétisation des populations impliquées dans la filière soit au niveau rural comme au niveau urbain,
- faible niveau des connaissances hygiénique et sanitaires avec des retombées sur la santé humaine et animale,
- absence d'un système de contrôle de la qualité du lait,
- très forte fluctuation dans la production et disponibilité de la matière première entre les saisons (pics de production en saison des pluies, déficit en saison sèche),
- très faible organisation et structuration des producteurs locaux et des autres acteurs de la filière,
- absence de dialogue entre les acteurs de la filière,
- difficultés d'accès au crédit, en particulier pour les petits producteurs, et absence d'une politique d'appui au secteur,
- très faible compétitivité des produits locaux par rapport aux produits d'importation soit en terme de prix soit en terme de qualité hygiénique,
- quasi absence de réseau de collecte structuré et rapide dans le transfert du lait frais aux unités de transformation,
- faible disponibilité d'aliments pour le bétail et de produits vétérinaires.

Conscients que ces points critiques ne sont que partiels et qui ne répondent pas dans une manière exhaustive à toutes les problématiques du secteur, nous estimons toutefois que ce que nous venons de lister constitue au moins un premier élément de réflexion pour un approfondissement du sujet.

Beaucoup reste à faire pour affranchir ces pays de la dépendance des importations en poudre de lait. Le potentiel productif local est certainement mal exploité, surtout dans les zones à vocation pastorales, qui malgré la richesse en matière première sont déficitaires en énergie et pour le moment restent à l'écart dans le processus de contribution à la lutte contre l'insécurité alimentaire.

### **RESUME**

Au Niger, le secteur de l'élevage joue un rôle important dans l'économie et occupe 80% de la population. Malgré ceci, la production laitière nationale est faible, à cause d'un système d'élevage traditionnel extensif. Une façon d'augmenter la production est de parvenir à l'amélioration génétique des races locales grâce à l'utilisation de l'insémination artificielle (IA), qui est l'objectif de nombreux projets financés par la Région du Piémont (Italie). L'IA est une nouvelle technique pour les éleveurs nigériens, bien que, depuis le début du projet, un grand nombre d'eux a accepté de l'utiliser. Étant donné qu'au Niger l'élevage est principalement nomade ou transhumant, l'IA a été menée en fermes sédentaires urbaines ou périurbaines de Niamey. L'IA a été réalisée en utilisant la semence du zébu Azawak, qui a une bonne aptitude laitière et bouchère, et des races exotiques, comme la Piémontaise, l'Holstein et la Brune des Alpes. Les conditions d'élevage et les effectifs sont assez différents d'une ferme à l'autre. Seulement les vaches en bon état sanitaire et avec une note d'état corporel supérieur à 2,5/5 ont été soumises à l'IA. Le taux de fécondité moyen était d'environ 30%. L'utilisation de l'IA a permis de parvenir à des avantages économiques et sanitaires et de donner aux éleveurs une plus grande prise de conscience de la gestion appropriée du troupeau. Cependant, l'utilisation des races exotiques doit être surveillée pour prévenir la perte du potentiel génétique. Des enquêtes ont été menées pour examiner la perception des bénéficiaires de l'IA et la perspective de sa diffusion.

En général, les avantages et les objectifs de l'IA sont bien connus par les éleveurs, même si une plus grande sensibilisation est encore nécessaire pour une meilleure vulgarisation de l'IA au Niger.

La diffusion de cette technique devrait être améliorée en vue de l'augmentation de la production laitière, de l'atténuation de l'insécurité alimentaire et de la préservation de la biodiversité.

### **INTRODUCTION**

Au Niger l'élevage constitue un élément important du secteur agricole et il a aussi une grande importance socio-économique. En effet l'élevage concerne 95% de la population dont 20% en tirent l'essentiel de leur subsistance [1]. C'est pourquoi, la stratégie de lutte contre la pauvreté élaborée par les autorités politiques attribue au sous-secteur de l'élevage un rôle moteur pour répondre à ce défi dans les ménages [2] [3]. Le cheptel est estimé à 33 millions de têtes toutes espèces confondues [4]. Le cheptel bovin, qui compte 7.336.088 de tête, se vante de la qualité de ses races tant en reproduction, rusticité, aptitude au travail qu'en production de viande, lait, cuirs et peaux [5].

Malgré ceci, le cheptel bovin nigérien n'arrive pas à couvrir les besoins alimentaires d'une population humaine en croissance continue. La production laitière nationale ne satisfait pas la demande, ce qui oblige le Niger à importer annuellement des produits laitiers pour une valeur de 6,6 milliards de FCFA.

La consommation de produits animaux (lait, viande, œufs) est une tradition séculaire dans les sociétés nigériennes. Le lait et les produits laitiers constituent l'aliment essentiel d'au moins 20% de la population et un important aliment d'appoint pour les 80% restant [6]. Cependant, les quantités de produits consommés par personne et par an sont très en dessous des valeurs minimales recommandées par la FAO (62 litres de lait et 22 kg de viande contre respectivement 30 litres et 9 kg).

Les faibles performances en productions animales s'expliquent par un système dominé par l'élevage traditionnel extensif sur lequel pèsent de nombreuses contraintes dont les mauvaises conditions d'alimentation et d'abreuvement du bétail; l'état sanitaire du troupeau; l'utilisation de races ou des sujets peu performants; le faible niveau de ressources des éleveurs; la désorganisation de la maîtrise du troupeau et de la reproduction des animaux; la faible capacité d'appropriation et d'utilisation des nouvelles technologies.

Il s'avère donc nécessaire d'intensifier les productions par une amélioration génétique des races locales, par des croisements avec des races exotiques réputées productives et par l'introduction des biotechnologies de la reproduction,

qui permettent d'accroître rapidement les productions bovines.

De nombreux programmes d'amélioration génétique, basés sur des croisements entre les races locales et exotiques grâce aux biotechnologies de première génération (comme l'IA, outil performant de diffusion du matériel génétique largement utilisé dans le monde) et de deuxième génération (transfert d'embryon), se développent en vue de l'augmentation des performances de reproduction et de production (lait et viande) des races bovines locales [7] [8] [9].

L'IA est une technique de reproduction consistant à recueillir le sperme chez le mâle et à l'introduire dans les voies génitales de la femelle, sans qu'il ait accouplement. Le sperme recueilli peut être utilisé immédiatement ou après une ou plus moins longue période de conservation sous forme réfrigérée ou congelée.

La pratique de l'IA nécessite la prise en compte des principaux facteurs susceptibles d'influencer la fertilité des femelles. En outre, l'IA est réalisée sur des femelles en chaleur naturel ou plus fréquemment en chaleur induit avec des protocoles de synchronisation en vue d'une meilleure maîtrise de la technique, une plus rapide diffusion de la génétique amélioratrice, le groupement des vêlages dans la meilleure saison et la lutte contre des maladies infectieuses.

La réussite de cette technique nécessite aussi la prise en compte de plusieurs facteurs liés à l'animal lui-même, sa gestion, la technique etc..

L'insémination artificielle présente des avantages multiples.

- Avantages techniques:
  - o diffusion rapide dans le temps et dans l'espace du progrès génétique;
  - o découverte rapide de géniteurs ayant de très hautes performances génétiques grâce au testage sur descendance qu'exige l'utilisation de l'IA;
  - o grande possibilité pour l'éleveur du choix des caractéristiques du taureau qu'il désire utiliser en fonction du type de son élevage et l'option de production animale à développer.
- Avantages économiques:
  - o renonciation aux taureaux géniteurs dans l'exploitation, ce qui permet d'économiser les frais d'alimentation et d'entretien;
  - o diminution du nombre de mâles à utiliser en reproduction et leur valorisation en production de viande;
  - o amélioration de la productivité du troupeau (lait, viande) qui se traduit par l'amélioration du revenu de l'éleveur. Cet aspect est particulièrement perceptible chez les animaux croisés (obtenus par insémination artificielle des vaches locales) dont la production s'améliore significativement par rapport au type local.
- Avantages sanitaires:
  - o l'IA est un outil de prévention de propagation des maladies contagieuses et/ou vénériennes grâce au non contact physique direct entre la femelle et le géniteur;
  - o le contrôle de maladies grâce aux normes strictes exigées au niveau des centres producteurs de semence, ce qui réduit considérablement le risque de transmission de maladies par voie «mâle»;
  - o contrôle et diagnostic précoce des problèmes d'infertilité grâce au système de suivi individuel et permanent des vaches inséminées (fiches d'insémination).

Malgré ces avantages, la généralisation de l'IA peut présenter des **inconconvénients** de plusieurs ordres:

- **d'ordre génétique:** L'utilisation et la diffusion massive d'un nombre réduit de géniteurs d'élite contribuent à l'augmentation de la consanguinité, à la disparition de nombreuses races et à la diminution de la diversité génétique.
- **d'ordre économique:** Un animal amélioré (métis issu du croisement entre une race locale et une race exotique) est beaucoup plus exigeant du point de vue de son entretien, notamment l'alimentation et le suivi sanitaire.
- **d'ordre sanitaire:** La diffusion massive des gènes d'un petit nombre de reproducteurs très performants peut entraîner la dissémination de certaines maladies et tares.

C'est dans ce cadre que la Faculté de Médecine Vétérinaire et le CISAO (Centre Interdépartemental de Recherche et Coopération Technico-Scientifique avec les Pays du Sahel et de l'Afrique de l'Ouest) de l'Université de Turin (Italie) en collaboration avec la Faculté d'Agronomie de l'Université Abdou Moumouni de Niamey (Niger) en accord avec le Ministère des Ressources Animales et avec le financement de la Région du Piémont et de la Coopération Italienne, ont initié et mis en place un projet de production et de diffusion de matériel séminal par insémination du zébu Azawak. Les activités ont démarré en 2001. Cette race est la meilleure laitière de l'Afrique de l'Ouest.

Ceci fait suite à une convention de collaboration inter universitaire signée en 1997 entre l'Université Abdou Moumouni de Niamey et l'Université de Turin.

Bien qu'elle soit la première génération des biotechnologies de la reproduction, l'insémination artificielle est une technique nouvelle pour les éleveurs nigériens. Mais depuis le démarrage des activités du projet, une quarantaine d'éleveurs privés ont bénéficié des prestations du laboratoire. Des essais d'insémination ont été conduits à la fois dans des exploitations étatiques et privées en zone périurbaine de la ville de Niamey.

## LE PROJET DE DIFFUSION DE L'IA AU NIGER

Le projet de diffusion de l'IA au Niger a démarré sur les bases du programme de sélection de la race zébu Azawak mis en place à la Station Sahélienne Expérimentale de Toukounous depuis 1954. Cette sélection a abouti à une caractérisation phénotypique de la race (uniformisation de la robe des animaux, qui est de couleur fauve avec des muqueuses noires), avec une amélioration de la production de lait (qui varie entre 800-3000 kg de lait par vache et par lactation de 270 à 300 jours) (Fig.1).

**Fig. 1** – Vache et taureau de race Azawak à la Station Sahélienne Expérimentale (SSE) de Toukounous (Niger).

L'objectif global du projet est de participer à l'effort national de sécurité alimentaire par l'amélioration des productions animales.

Les objectifs spécifiques sont:

- créer les bases scientifiques et techniques pour une modernisation future des méthodes de production de lait et viande chez les races bovines du Niger;
- la constitution d'une banque de semence de la race Azawak;
- la diffusion des semences des reproducteurs sélectionnés;
- la vulgarisation de la pratique de l'insémination artificielle;
- la gestion de l'information sur les inséminations artificielles;
- la diffusion des résultats du projet et la répétition de l'expérience dans d'autres contextes et sur d'autres races (ex. projet de sauvegarde de la race taurine Kouri).

Les résultats attendus sont :

- la constitution d'une banque de semence de taureaux améliorateurs de la race Azawak;
- la vulgarisation de la pratique de l'insémination artificielle;
- le perfectionnement de la maîtrise de la reproduction et de la gestion du troupeau;
- l'amélioration génétique du cheptel bovin local à travers des croisement avec des races locales ou exotiques performantes;
- l'amélioration de la production de lait et de viande;
- l'amélioration des conditions de vie des éleveurs;
- la réduction de la pression sur l'environnement occasionnée par les taureaux.

Après une première phase qui s'est déroulée au niveau de la SSE de Toukounous, pour la maîtrise de la collecte des taureaux, de la manipulation de leur semence, du cycle sexuel des vaches des races locales et de la technique de l'IA, la deuxième phase du projet consistait à la diffusion de l'IA dans des élevages en zone périurbaine de la ville de Niamey, en utilisant la génétique locale améliorée (semence Azawak) ou des races exotiques telles que la Piémontaise (viande), l'Holstein et la Brune des Alpes (lait).

La présente étude rapporte donc les résultats obtenus au niveau de ces élevages et les perceptions de l'IA chez les bénéficiaires de la technique, telles que leur niveau de connaissance sur la technique, leur niveau de satisfaction, leur préférence dans les options d'amélioration des productions animales, les contraintes liées à l'utilisation de la technique et les propositions et perspectives pour le future.

## LIEU D'INTERVENTION

Les activités qui ont fait l'objet de cette étude se sont déroulées dans la zone périurbaine de la Communauté Urbaine de Niamey (CUN). Le concept périurbain recouvre non seulement la notion de limite géographique mais aussi la notion d'échanges socio économiques. Ainsi du point de vue géographique, la zone périurbaine correspond à la délimitation géographique de la CUN à laquelle il faut adjoindre l'espace périurbain avec lequel il entretient des échanges soit un rayon de 50 km [10]. Du point de vue échanges socio économiques, elle correspond d'une part aux zones d'approvisionnement de la CUN en lait et en bétail et d'autre part, aux zones de mouvement des troupeaux dans le cadre de la stratégie de gestion traditionnelle du troupeau. Elle s'étend dans ce cas sur plus de 100 km.

La CUN forme une enclave dans la partie Sud-ouest du Pays. Elle est divisée en cinq communes administrées chacune par un maire assisté de deux adjoints élus.

Son **climat** est de type sahélo-soudanien avec des températures élevées entre Avril et Juin et basses entre Décembre et Janvier. Ce climat est caractérisé par trois saisons : froide, sèche et pluvieuse. Il est aussi caractérisé par une pluviométrie variant de 400 à 600 mm.

Le **relief** est constitué d'un plateau entaillé par la vallée du fleuve Niger avec des sols hydromorphes, ferrugineux, latéritiques mais aussi des dunes de sable. Au pied de ce plateau s'étend une plaine alluviale dont le niveau plus bas la rend sujette aux inondations où l'accumulation des particules fines drainées des plateaux par les eaux de ruissellement favorise la formation d'un sol argilo-sableux, très propice aux cultures, généralement irriguées (cultures maraîchères, jardinage, riziculture...). La CUN est traversée par le fleuve Niger sur une distance de 15 km du Nord-ouest au Sud-est.

La **végétation** est formée par une bande sahélienne caractérisée par une alternance de savane arbustive claire et de brousse tigrée. S'agissant des ressources fourragères, il y a les pâturages herbacés et aériens sur des espaces assez réduits et des jachères occupant près de 3.500 ha ; les bourgoutières naturelles ou cultivées et les résidus de récolte (pailles de mil et de sorgho, fanes de niébé, paille de riz) occupent une place importante dans l'alimentation du cheptel.

La **population** est estimée à 1.302.910 habitants en 2011 [11]. Le taux d'accroissement annuel est estimé à plus de 4,54%. La population se caractérise par son extrême jeunesse, avec une proportion de plus de 67% de moins de 25 ans.

Les **ressources forestières** de la CUN sont constituées d'une flore naturelle à l'état disséminé et d'une végétation créée, appréciable, qui classe Niamey parmi les villes les plus boisées en Afrique de l'Ouest. La végétation en ville est essentiellement constituée par la «ceinture verte» qui s'étend sur 2500 hectares, de petits cordons arborés et des plantations d'arbres fruitiers le long du fleuve.

L'**agriculture** est pratiquée par près de 15% de la population de la Communauté urbaine de Niamey dont plus de 5000 personnes dans le maraîchage. Ces cultures sont conduites de façon traditionnelle et sans apport d'engrais. Quant aux cultures céréalières, on note la prédominance de la culture de riz dont les emblavures atteignent 2962 ha, suivi du niébé sur 462 ha. La culture du mil et du sorgho se font en association avec plusieurs combinaisons.

L'**élevage** est une activité complémentaire à l'agriculture pratiquée en zone intra-urbaine et périurbaine aussi bien par les femmes que par les hommes. Dans la CUN sont élevées pratiquement toutes les espèces animales dont les effectifs se présentent comme suit: 36.576 bovins, 138.763 ovins, 75.300 caprins, 42 camelins, 2470 asins et 274 équins [12]. Le système d'élevage dominant pratiqué est l'élevage bovin laitier périurbain à plusieurs variantes (système traditionnel extensif et intensif, système intensif, système des ranchs d'Etat et les coopératives) [13]. Les systèmes d'élevage laitiers périurbains traditionnels sont l'œuvre d'ethnies (peul ou touareg) qui possèdent une pratique ancestrale de l'élevage laitier. À côté de ce groupe, on note la présence d'une autre catégorie d'éleveurs laitiers, notamment les fonctionnaires, les retraités et les commerçants. Ces exploitations ont tendance à pratiquer les techniques modernes de gestion des élevages laitiers et peuvent jouer un rôle important dans la diffusion des innovations technologiques. Le mode de gestion du troupeau laitier périurbain est l'élevage extensif. Les parcours périurbains pauvres constituent l'essentiel du pâturage des animaux, une complémentation à base de son est assurée au retour du pâturage. Dans ces élevages laitiers, la traite se fait manuellement, deux fois par jour : le matin avant le départ au pâturage et le soir de retour du pâturage [3].

Les **pâturages** naturels constituent la base de l'alimentation des animaux chez les bénéficiaires de l'IA: ils donnent en plus du pâturage un complément sous forme de paille, foin et sous produits agricoles. Les 31,7% les utilisent sans aucune complémentation. Seulement 1,7% alimentent leurs animaux à l'auge. Presque la totalité des éleveurs font appel aux services vétérinaires dans diverses circonstances.

## MATERIELS ET METHODES

Les femelles sélectionnées pour les inséminations appartiennent aux races suivantes: Azawak, Djelli, Goudali, Bororo, Kouri. La situation nutritionnelle et sanitaire varie d'un élevage à l'autre. Seules les femelles ayant une condition physique acceptable sont utilisées pour les inséminations.

Les chaleurs ont été induites avec cinq méthodes de contrôle de l'œstrus par l'utilisation rigoureuse des progestagènes ou les prostaglandines avec un suivi correct des animaux. Dans les exploitations privées, les IA ont été faites à l'aveugle, c'est-à-dire de façon systématique sur toutes les femelles synchronisées et à temps fixe. Le contrôle des chaleurs n'est pas réalisable dans toutes les exploitations compte tenu de la conduite du troupeau et du niveau de connaissance des bergers. Le protocole prévoit deux IA sur chaque femelle.

Quatre méthodes de diagnostic de gestation ont été utilisées par les techniciens engagés dans le projet: l'observation simple des retours de chaleur des femelles inséminées; la palpation trans-rectale après deux à trois mois de l'insémination; l'échographie après 45 jours à deux mois de l'insémination; l'analyse des taux de la progestérone à l'insémination et à J23 de l'insémination.

Pour évaluer le niveau de connaissance, l'idée et l'impression des éleveurs sur l'IA, un sondage a été conduit auprès de 50 éleveurs privés exerçant dans la zone périurbaine de Niamey.

Un questionnaire a été élaboré à cet effet autour des trois parties:

- la première partie, pour obtenir des informations brèves sur le statut des éleveurs (activité principale, niveau d'instruction, affiliation à une structure);
- la deuxième partie sur la conduite de l'élevage (mode d'alimentation, complémentation, ressources fourragères et recours aux services vétérinaires);
- la troisième partie consacrée à l'insémination artificielle avec plusieurs aspects (connaissance de l'IA, de ses avantages et inconvénients, de son coût, de la pratique ou le souhait de faire l'IA, des motivations et des options des matière d'amélioration, du niveau de satisfaction des bénéficiaires, de la synchronisation des chaleurs et du circuit d'acquisitions du matériel d'induction et des semences exotiques, les contraintes de l'application de la technique, les solutions à envisager pour améliorer les résultats en vue de promouvoir la technique).

## RESULTATS

Par rapport à la pratique de l'IA, plus de 500 vaches ont été inséminées en zone périurbaine; l'effectif moyen des vaches inséminées par éleveur a été de  $10,5 \pm 5,15$ . Des réponses diverses ont été enregistrées dans les différentes fermes par rapport à la réussite aux traitements d'induction des chaleurs. Ces différences sont liées à la méthode utilisée, à l'état nutritionnel des animaux, à la saison pendant laquelle le traitement a été effectué. Par contre, la race, la parité, le délai post-partum n'ont pas influencé les résultats d'induction des chaleurs.

Le taux de fertilité global après induction de l'œstrus sur l'ensemble des femelles inséminées et diagnostiquées est de 30,10%. Une moyenne de 1,58 service par vache a été observée. Le taux de fertilité varie ainsi d'une exploitation à l'autre. Les résultats obtenus ont montré que la méthode d'induction de l'œstrus n'influence pas significativement la fertilité. Aucune différence significative n'est enregistrée entre les taux de fertilité utilisant des semences congelées du zébu Azawak et celles des races exotiques [14].

La fertilité après des inséminations en chaleurs naturelles est significativement plus élevée que celle des chaleurs induites: 43,39% contre 25,60%. Le taux de fertilité est influencé significativement par la parité de la femelle: il est meilleur avec les vaches qu'avec les génisses. La fertilité n'est pas significativement liée ni au délai post-partum ni aux saisons, même si par ailleurs les chaleurs sont moins exprimées pendant l'hivernage.

Par rapport aux résultats obtenus dans le cadre de l'amélioration génétique et des productions dans les fermes, quelques donnés ont été enregistrées telles que le poids à la naissance des veaux issus de l'IA, leur taux de croissance et les productions laitières et bouchères. A la naissance le veau zébu Azawak (issu de l'IA ou de la monte naturelle) pèse en moyenne 22kg. Les croisés, Azawak x Piémontais, naissent avec un poids variant entre 34 et 39 kg. Malgré cela, aucune mise-bas dystocique n'a été observée du fait de la facilité de naissance qui a été retenue comme critère de choix des géniteurs. La croissance des veaux n'a pas été suivie par des pesées régulières; cependant il a été observé une nette différence physique entre les veaux locaux et les croisés (Fig. 2) malgré l'alimentation qui n'est pas suffisante en quantité et en qualité.

**Fig. 2** – Veau croisé Piémontais x Azawak 19 mois (à gauche) et un veau de race Azawak (à droite) qui est son frère aîné (37 mois) dans une ferme périurbaine de Niamey.

Par rapport à la précocité des animaux croisés, les femelles avec de bonnes conditions alimentaires étaient gestantes la première fois à l'âge moyenne de 12 mois. Les croisés mâles ont été castrés pour éviter les croisements anarchiques; mais pour ceux qui n'ont pas été castrés et qui sont dans de bonnes conditions on constate une activité sexuelle précoce.

Sur le plan adaptation aux conditions du milieu, les veaux n'ont eu aucun problème particulier de santé. Mais il a été rapporté des signes de stress, d'halètement et de recherche d'endroits frais pendant la canicule par les veaux croisés Holstein. Le problème majeur auquel ils sont confrontés, qui est lié au Sahel de façon générale, est le problème alimentaire. Ils souffrent de l'insuffisance des besoins alimentaires, si bien que la croissance générale est affectée. Ils n'arrivent pas donc à exprimer toute leur potentialité notamment le caractère culard qui caractérise le piémontais. Mais malgré cette situation alimentaire il y a une nette amélioration de la production de viande.

Pour apprécier l'amélioration de la production de lait par l'insémination, des contrôles laitiers ont été effectués pour comparer les productions de même lactation des vaches issues de l'IA à celles de leurs mères. Des résultats différents ont été obtenus, selon l'exploitation et les conditions d'élevage. Généralement on observe une amélioration des productions, compte tenu aussi de la saison. Pour les femelles issues des croisements, races locales x race exotique, leurs productions de lait ont été estimées et rapportées par les éleveurs: 10 à 11 litres par jour dans les bonnes conditions, même les croisés piémontais produisent 7 à 8 litres par jours.

Par rapport aux résultats des enquêtes soumises aux bénéficiaires du projet, l'étude révèle qu'une grande proportion des éleveurs ont utilisé la semence des taureaux Azawak (86,7%). Les candidats montrent plus leurs préférences pour les races locales comme gènes améliorateurs, par ailleurs, 36% d'entre eux essaient les exotiques.

Les bénéficiaires de l'insémination artificielle mettent particulièrement l'accent sur les aspects économiques, techniques et culturels comme étant les possibles contraintes et insuffisances de gestion qui entravent la réussite et le développement de la technique. Cependant, d'autres obstacles ont été identifiés notamment le manque de sensibilisation, le mode d'élevage, les problèmes de communication, la méfiance des éleveurs à toute innovation.

Le mode dominant de conduite des animaux, ressorti des investigations, est l'exploitation des pâturages naturels avec la distribution d'une complémentation en paille, foin et sous produits agricoles. Ceci est conforme à l'élevage pratiqué en pays subsahariens: un système extensif (avec quelques aliments de complémentation aux vaches en lactations), la transhumance saisonnière, le sevrage tardif des veaux, la monte naturelle, les soins vétérinaires limités et l'autoconsommation des produits d'élevage [15]. L'alimentation à l'auge est timidement adoptée. L'existence de cette forme de conduite traduit l'amorce d'un développement d'un élevage de type intensif en zone périurbaine. Cette tentative d'intensification favorise d'une part le développement des infrastructures nécessaires pour une mise en œuvre efficace de l'insémination. L'alimentation à l'auge permet d'autre part une meilleure maîtrise ainsi qu'une meilleure gestion de l'exploitation (identification des animaux, alimentation, hygiène et santé animale, détection des chaleurs), gages d'un taux de réussite élevé à l'IA.

L'étude a montré que les éleveurs sont informés de l'existence d'une nouvelle biotechnologie de la reproduction pour les animaux domestiques notamment les bovins.

Les motifs de satisfaction des bénéficiaires sont: l'obtention d'un bon taux de réussite pour certains, l'amélioration du taux de reproduction des femelles et l'amélioration des productions animales. Les insatisfaits avancent les raisons ci après : le faible taux de réussite et l'échec total de l'opération.

Les contraintes technico-économiques et culturelles, le mode d'élevage, les problèmes de communication ont été identifiés comme obstacles à la bonne réussite et au développement de l'IA en zone périurbaine au Niger. Les éleveurs sont prêts à supporter les coûts de l'IA une fois que le projet n'est plus financé mais à condition d'améliorer significativement le taux de réussite à l'IA.

En perspective, pour réussir la généralisation de l'IA, les études proposent qu'il faille continuer encore la vulgarisation, la sensibilisation, la formation et solliciter l'intervention de l'Etat pour mettre en place des structures spécialisées pour l'approvisionnement en matériel de synchronisation, en semence et en prestation de service.

## DISCUSSION

En milieu tropical les chaleurs des bovins sont assez souvent fugaces ou silencieuses, ce qui peut rendre difficile la pratique des inséminations. Il faut donc avoir recours aux inductions des œstrus et des inséminations à l'aveugle.

Nombreux sont les facteurs qui influencent la réussite des protocoles d'induction des chaleurs, mais en général, pour améliorer le taux de réponse, il est indispensable d'évaluer le statut physiologique des animaux à traiter pour mieux adapter le protocole.

Le taux de fertilité global obtenu en zone périurbaine de Niamey est faible par rapport à ce qui est obtenu sur d'autres races dans d'autres contextes africains [16] [17].

En Afrique les races locales sont adaptées à produire dans les conditions difficiles sur le plan sanitaire et alimentaire. Les productions qui sont d'ailleurs largement affectées à la baisse par ces conditions défavorables.

Dans le cadre de cette étude, les croisés de tous les génotypes ne se sont pas fait remarquer par une détérioration particulière de leur état de santé face aux maladies tropicales et ceci quelque soit la saison. Les croisés Holstein comme tous les autres animaux, sont un peu plus stressés par la canicule. Les éleveurs peuvent pallier à ce problème en leur procurant des abris bien ombragés car le stress thermique peut limiter leurs performances reproductives et

productives. C'est surtout sur le plan alimentaire que l'adaptation est très difficile, les croisés ne sont pas très rustiques. Sans apport complémentaire, ils ne valorisent pas les maigres ressources alimentaires du pâturage comme les races locales, si bien que leur croissance physique est affectée. Ils sont donc un peu plus exigeants en alimentation que les locaux en quantité et en qualité.

En milieu traditionnel, l'enregistrement des performances de croissance des produits de l'insémination n'a pas été effectué du fait du manque d'une bascule mobile. Le faible effectif des croisés en lactation est un facteur limitant pour l'instant pour caractériser statistiquement leurs performances.

D'après les observations sur le terrain de l'état général des croisés, il ressort une variabilité de leurs performances en fonction des conditions d'élevage. Ceux ayant bénéficié d'une croissance régulière et continue sont précoces pour la reproduction par rapport aux congénères locaux. Pour les quelques indications rapportées par les éleveurs concernant la production laitière, les quantités sont sous estimées, puisqu'une partie est laissée à l'alimentation du veau. Les quelques données rapportées sont encourageantes pour les individus croisés piémontais qui ne sont pas spécialisés en production de lait, puisque dans d'autres contextes les métis de la filière lait produisent des quantités comparables. Ainsi au Sénégal les croisées Holstein races locales produisent en moyenne 7,3l/j ; en Gambie ils produisent 4,5l/j ; en Côte d'Ivoire, les métis races locales x Jersiaise produisent 3 à 6 l/j en fonction du rang de lactation [18].

L'étude a révélé que les éleveurs en zone périurbaine sont informés de l'utilisation de l'insémination artificielle comme étant un puissant outil de reproduction. Ils sont conscients de son efficacité dans l'amélioration du potentiel génétique et de son rôle dans l'accroissement des productions animales.

Les avantages liés à cette technologie sont bien connus des éleveurs. Mais par contre tous les inconvénients ne sont pas bien appréhendés.

La majorité des bénéficiaires étaient des cadres supérieurs, et ont témoigné de leur satisfaction après avoir essayé la technique. Les attentes exprimées par les éleveurs en utilisant ou en voulant utiliser l'IA sont l'augmentation de la production du lait, l'augmentation de la production de la viande et l'accroissement du troupeau.

Le faible pouvoir économique, la non maîtrise optimale de la technique de l'IA et des techniques de gestion des animaux, la conception traditionnelle sur la conduite de l'élevage ont été identifiés comme étant des contraintes pouvant entraver la réussite et la généralisation de l'IA au Niger.

## CONCLUSIONS ET PERSPECTIVES

Les résultats indicatifs obtenus en zone périurbaine sont encourageants en matière de diffusion de l'IA et de production de lait et de viande. Ils permettent d'espérer, malgré le climat et les modes d'élevages, une production améliorée au niveau des produits issus des inséminations. Les exploitants privés doivent comprendre que la production laitière de la vache et la production de viande ne reflètent pas seulement le potentiel génétique de l'animal, mais sont influencées par l'environnement qui inclut tous les facteurs externes à l'animal. Parmi ces facteurs les fondamentaux sont: la nutrition et la saison de vêlage. Les résultats de lactation et de production de viande ont de manière générale, tendance à être meilleurs lorsque l'animal bénéficie d'une alimentation suffisante en quantité et en qualité pendant les mois les plus frais de l'année par rapport aux mois les plus chauds qui sont stressants. Le mérite génétique d'un animal est évalué donc après avoir corrigé les performances de l'animal en fonction de l'environnement.

Au Niger si l'alimentation et la santé animale sont bien suivies, les éleveurs peuvent bénéficier de l'effet hétérosis des croisés pour améliorer leur production en lait et viande et améliorer leurs revenus dans le cadre d'un programme national d'amélioration génétique.

En terme de perspectives, la plus part des éleveurs enquêtés sont prêts à supporter les frais liés à l'IA. Cet engagement est conditionné par l'amélioration du taux de réussite à l'IA, la poursuite de la vulgarisation, la formation des éleveurs afin qu'ils cernent tous les contours de la technologie.

Les structures identifiées pour promouvoir et accompagner le développement de l'IA en milieu périurbain sont les pharmacies vétérinaires, les organisations des éleveurs et les services spécialisés pour l'approvisionnement en produits et matériel de synchronisation, en semences exotiques et en prestation de service.

Ces résultats constituent des préliminaires pour cerner la problématique et l'avenir de l'insémination artificielle au Niger. Pour cela, des actions devraient être envisagées, telles que la mise en place d'un programme de sensibilisation et de formation des éleveurs afin qu'ils maîtrisent tous les contours de l'IA (conditions à réunir pour bien réussir l'IA, les avantages et les inconvénients); la formation des inséminateurs de façon qualitative et quantitative; la mise en place d'une cellule opérationnelle avec des cadres chargés du suivi et de la gestion des élevages avant et après l'IA.

Pour une appropriation effective de la technique au Niger, nous pensons qu'il faille mettre en place des structures organisées pour faciliter l'acquisition du matériel d'insémination (matériel de synchronisation et semence). L'implication de l'Etat à travers le programme national d'amélioration génétique permettra sans doute la création de ces structures.

## REMERCIEMENT

Le projet de diffusion de l'IA au Niger s'est déroulé grâce aux financements de la Région du Piémont et de la

Coopération Italienne du 1999 à 2009. Nous remercions le Ministère des Industries Animales du Niger qui a permis l'exécution des activités et la réalisation des résultats.

## NOMENCLATURE

CISAO	Centre Interdépartemental de Recherche et Coopération Technico-Scientifique avec les Pays du Sahel et de l'Afrique de l'Ouest de l'Université de Turin (Italie)

## KEEPING DAIRY CATTLE IN THE GAZA STRIP: A CASE OF STUDY.

Cristiano Rossignoli\*, Francesco Di Iacovo\*, Roberta Moruzzo\*

\*Department of Veterinary Science, University of Pisa, Italy –  
[crossignoli@vet.unipi.it](mailto:crossignoli@vet.unipi.it), [francovo@vet.unipi.it](mailto:francovo@vet.unipi.it), [robemoru@vet.unipi.it](mailto:robemoru@vet.unipi.it)

### ABSTRACT

Due to a protracted situation of conflict, the economy in the Gaza Strip has developed largely dependent on International humanitarian assistance. The isolation of markets, widespread unemployment, and the economic crisis have caused a serious decline in population living standards, with a high level of food insecurity. Recently the population in Gaza Strip has reached a 1.65 million in an area of only 360 km<sup>2</sup> (PCBS, 2013). The rapid increase of the population (3,2% yearly growth rate), land scarcity and the challenge of food security have accelerated the phenomenon of urban agriculture. Currently, the majority of agricultural production of vegetables, fruits and livestock in Gaza is recognised as being from urban or peri-urban agriculture. In Gaza Strip, despite many constraints, agriculture and related activities are still offering the opportunity of food, income and employment for the local population. By presenting a study case related to an International project promoting the dairy cattle sector, we have investigated the humanitarian intervention in the Gaza Strip exploring key actions and related effects (technical, social and economic). We have also identified and investigated ways of breeding cattle and proposed a reflection on how developing the sector, focusing on main strengths, weaknesses, opportunities and constraints. In addition, we have explored the social and economic reasons for keeping dairy cattle, and analysed the related sustainability. Finally, we would like to propose what we have learned from this experience in order to help making future choice and contribute to the process of rural development supported by International cooperation.

## GENDER AND RURAL DEVELOPMENT IN COOPERATION PROGRAMS

Angela Calvo\*

\*CIRSDE, CISAO, DISAFA, University of Turin, Italy - [angela.calvo@unito.it](mailto:angela.calvo@unito.it)

Gender is not a specific topic among other cooperation themes, but it must be transversal to all of them. This is the correct theoretical approach, but in the real situation, in rural areas especially, gender projects are still confused with women projects and nowadays in the rural cooperation projects we witness a lot of women oriented activities, which share little with gender. It seems to be brought back to the seventies WID ages and the consequence is the feeble sustainability of these projects during the time, especially when they come to an end. The problem is more manifest whereas these projects should implicate men and women in rural villages, often recluses and with poor communication lines and means.

The proposal of this panel was to explore this situation through the analysis of different contributions coming from ONGs, universities, local municipalities, research centres.

The presented papers showed the well known critical points that limit women's participation to improve concrete gender actions in the field, from lack of policies to land grabbing, from weak mainstreaming to unreliable gender data to highlight the real context where improve projects actions, from the gap between research studies and the daily life of rural people (especially women) to poor assets management and resources control. Last, but not less important, the multiple factors of discrimination (clan, religious, social) at the base of internal conflicts and wars, which mainly strike women.

The first speech concerned the presentation of the IAO gender project, a multidisciplinary one funded by the IDC (Italian Development Cooperation - Direzione Generale alla Cooperazione allo Sviluppo del Ministero) under the Italian Ministry for Foreign Affairs and managed by the IAO and based in Florence.

The IAO/Gender working group developed a multi-disciplinary research system which was carried out at three levels:

- analysis of the available literature to highlight the development project priorities: land and resources tenure, relationship between farm production and market, rural associations, food security, rural information availability, all of them seen from a gender point of view;
- study of a methodology to conduct field analysis, through experts involvements and focus groups;
- field surveys, to analyze gender project effects, in priority countries for the Italian Development Cooperation: Senegal, Burkina Faso and Mozambique.

Among many lessons learned through this project [1], only some notices are here reported. Concerning the research, the aim that it creates a dialogue and it is a creation of alliances for field purposes: studies on land representations, geographic surveys, socio-anthropological analysis, economic and statistic considerations, are all important if field actions follow. Afterward, the need to develop a system of monitoring, shared with all stakeholders participating in the life and governance of the land, in order to guarantee voice to both women and men and to support gender empowerment and mainstreaming. But the most important issue is to create a different development model with different lifestyles from those prevailing now, where it is impossible to include women's capacities and chances without changing power relationships [2].

The Lanzano et al. paper highlighted the problem of the implementation of the gender approach in some rural development projects in Senegal, specifically in the Louga Region (Northern Senegal), one of the eleven areas at high environmental and social risk (ZARESE, Zone à Risque Environnemental et Social Elevé) of the ITALIA-CILSS program. As observed by the Authors, many of these projects, focused on income generating activities through food processing, aimed to make home-based informal activities more structured and, therefore, more profitable. They nevertheless observed that these formalized interventions, based on a modernism approach, have paradoxical consequences: women involved in these projects have expectations of modernity and efficiency, not in line with the poor local market and the low final products demand. Another critical point is the technology, always requested also when training lacks or it is not well suited. More 'women only' projects than gender ones have been observed by the Authors, who did not found in them the relational dimension of gender, but the crystallization of women's roles in value chains.

Mariam Yassin Hagi Yussuf and Davide Rigallo presented the ONG IIDA (a non-profit organization that was founded in 1991 in Mogadishu by a group of Somalia women to promote women's political, economic and social rights). Since 1991 this ONG has been promoting food security, education, health, conflicts management, demobilization and disarmament, local Government building, as well as gender projects. Concerning the difference between 'rural' and 'urban' areas, it is interesting to notice that, because of the long term conflicts during the Civil War,

it was increasingly blurred, to the point that it no longer constitutes a cut-off criteria on the social plan for the definition of specific methods of intervention. Two are the focal points of IIDA: the fact that traditional channels of influence (men and women shared) should be explored as a priority and a gender audit of the Somali Constitution.

The 'Ne Yi Beego Burkina', a project of the COCOPA network of the decentralized cooperation of the Piemonte Region was then presented. Among many other things, this project promoted some actions of education and health especially among young women: empowerment women measures were realized too.

Costanza Tognini explained a work concerning the gender mainstreaming strategies implemented by International Organizations in health and education programs. A case study of the UNICEF Indonesia's Gender Policy in three provinces was presented, through the realization of a gender mainstreaming index. Because the gender mainstreaming measurement is obtained by real data, as all other indexes, the main problem encountered in this work was the data reliability (as underlined by the Author: '... the data available lacked scientific value and was collected using arbitrarily assigned sampling methods ...'). This fact is quite worrying, because the index is a number, resulting from previous numbers and if these last are not reliable, the result is not trustworthy. Nevertheless, the conclusions revealed that among some stakeholders there was a minimal understanding of the terms gender equality and gender mainstreaming, while, especially in the local government departments, other people were unaware of the existence of a gender mainstreaming strategy, although the desire to know more was frequently expressed. The result was a lack of gender awareness training and implementation of the government gender mainstreaming policy in the education and health departments.

In a different area, but in a similar way, the same lack of gender questions in a governmental department was observed by Alice Centrone, who presented a work concerning the difficulty to implement gender indicators to support rural projects in three Regions of Senegal. This study intended to suggest gender indicators to implement a development project aimed to improve the subsistence level and the quality of life of the population across a rural area of sub-Saharan Africa. Another goal of the paper was to reflect on the effectiveness of these indicators as well as on their contribution (or not) to a more equitable implementation of such development projects. On the basis of the available data, three indicators for each region were elaborated: a Nutritional Index, an adjusted Gender Inequality Index and an Index of Economically Qualified Presence of Women and Men in Agriculture. Hereafter the numerical results (which encourage to continue to realize specific regional index to picture local situations instead of using national indicators), it was noted how in Senegal accurate data disaggregated by gender in agricultural contexts or do not exist, or are not available, or are available primarily through direct qualitative surveys (which is difficult to access, especially if conducted by other institutions or international organizations). Another focal point was the necessity to implement a deep sharing of the research outputs with all the stakeholders implicated by the development projects, whether direct and indirect beneficiaries, active subjects of the preliminary field investigations as well as the internal staff of public bodies. This is very important, especially in view to 'bridge' the research with the field actions.

In this panel many suggestions to enhance the gender perspective in the rural cooperation programs were proposed: an action list was not delivered, because lack of time, but the most important point, as Bianca Pomeranzi states, is that: '... women's participation in rural development interventions is absolutely necessary in order to meet the goals of food security and environmental sustainably ... development interventions at all levels (from macroeconomic policies to country programs...) must be able to offer a correct analysis of the results reached by the processes which have been implemented' [2].

### ABSTRACT

Overcoming the gender gap in agriculture is nowadays one of the focal points of major international institutions, governments and development agencies. In this paper, we discuss some effects of international aid in rural contexts on gender dynamics and women's empowerment. Through the analysis of some small-scale projects in Northern Senegal – implemented within a wide rural development aid program in West Africa - we develop some reflections on the observed women-oriented projects: we stress the risk that women end up being “locked” into pre-defined roles, namely in small-scale food processing activities, by a standardized logic of aid projects. We develop an analysis of the practices that may lead to this outcome and of the characteristics of such “women roles” in value chains. We discuss this observation in the light of the gendered division of tasks in primary products value chains and of the literature on the integration of “gender” in development thinking. By means of this analysis, we draw some reflections on the discrepancy between explicit empowerment goals and unintended outcomes of aid.

### INTRODUCTION

This paper originates from an interdisciplinary qualitative fieldwork – at the crossroad of social anthropology, human geography and economics - on an aid program in rural development in Senegal and in some of the small-scale projects that have been funded within its framework. Without being an evaluation and neither a monitoring of the development program, it tries to observe some of its practices and outcomes and to discuss them in a gender perspective.

We focus on the donor's intervention practices on what concerns the way gender is integrated into the project, with a greater attention to the smallest level of the project, that is the small-scale realizations. We identify a standardized procedure of design and implementation of those projects directed to women, that we try to situate in the wider debate on the integration of gender dynamics into development aid programs. This observation leads us to identify in food-processing the major field of women's projects; we thus analyze some characteristics of this recurrent practice (and some relevant exceptions), such as market power and control over resources of women that enter into the promoted food-processing activities, or the effect of putting a huge emphasis on formalization of home-based activities and on technological modernization. Our claim is that the risk of creating a “ghetto” for rural women has to be taken into account.

We don't aim here to give an exhaustive picture of the specific development program we observe: we “use” it as a tool to extract reflections that may provide insights for a wider range of projects, where a gender component has been integrated by means of income-generating activities specifically oriented to women.

### RURAL DEVELOPMENT INTERVENTIONS IN THE LOUGA REGION, SENEGAL.

In 1999, the Italian Government decided to reconvert a substantial part of his credit revolving fund into multi-sectorial grant interventions for poverty reduction. These grants were destined to some of the poorest geographical areas in the world by using framework programs to guarantee coordination and coherence between the different types of intervention promoted by Italian Cooperation system (multilateral and bilateral aid, decentralized cooperation and NGOs).

Owing to his conditions of extreme poverty and environmental degradation, the Sahel region was selected for this kind of program through a pilot scheme – the Italia-CILSS Fund to Combat Desertification for Poverty Reduction in the Sahel - mainly focusing on four countries: Burkina Faso, Mali, Niger and Senegal.

The general objective of Italia-CILSS was to tackle the poverty and desertification spiral through improving rural people's socio-economic conditions and natural resources management, in the framework of the ongoing decentralization process, by acting at three different levels at the same time, sub-regional, national and local. At a local

level, eleven areas at high environmental and social risk – labelled “ZARESE<sup>1</sup>” – were selected and many micro-projects were cofounded at a village level. These small investments were promoted by local Governments and Farmers’, Community and grass-root organizations, within which both women only groups and mixed ones. Italia-CILSS Fund strategy was therefore clearly based on a local development approach in order to encourage local communities’ initiative and control over project design and implementation process.

It seems useful to identify two distinct phases of the program. A first one, from 2005 to 2008, in which interventions were made at the village scale, where micro-projects were designed following the priorities of Participatory Poverty Assessment and Local Development Plans. An extension phase, from 2009 to July 2011, marked by a “territorial” approach for defining a Natural Resources Management Program for each ZARESE with interventions at inter-village level. During this reframing period, the necessity of integrating a gender approach in the strategic framework raised up. It has been observed that implicit concern could not be enough to guarantee full participation of women in designing micro-projects and in enjoining their effects. Moreover, it is claimed that women livelihoods and economic activities are particularly exposed to depletion of natural resources. There has been therefore the attempt to introduce the gender dimension in the second phase of Italia-CILSS. We don’t aim here to evaluate the introduction of a “gender approach” at the macro-level of the program. At the small-scale level (that is our focus in this work), we observe that both the projects proposed by women associations and the Advisory Support Team’s approach didn’t modify substantially their practices during the second phase of the Program.

Our study area – the ZARESE of Louga – is situated in the Louga Region in northern Senegal. It formally matches the administrative limits of the Louga Department (5.649 km<sup>2</sup> and 299.075 habitants<sup>2</sup>), but actually operates in just three of his fifteen *Communautés Rurales* (CR) – Léona, Mbédiennne and Gandé – for a total area of 2.603 km<sup>2</sup> and for a total population of 40.829 units. These three CR are not contiguous and they overlap three distinct agro-ecological areas: the Pastoral Rangeland area covering about 90% of the Gandé CR; the *Niayes* area whose extension is about 40% of the Léona CR; and the Groundnut basin that includes the remaining 60% of Léona and the whole CR of Mbédiennne.

## PROJECTS FOR WOMEN: PROCESSING FISH, VEGETABLES, MILK AND GRAIN.

In the Louga ZARESE, the associations involved in promoting micro-projects have been: grassroots’ organization (*Comité de Santé, Associations Parentes d’Elèves*); village level associations, including *Groupements de Promotion Feminin* (GPF-women organizations); peasants’ organizations (*Groupement d’Interêt Economique* or local unions of regional or national organizations).

On what concerns the Mbédiennne CR, in the two phases 23 micro-projects (first phase) have been funded and 19 villages (second phase) have been involved. Of these, only 8 have been promoted by women’s *groupements*: 5 grain processing units, a collective plot devoted to horticulture and a warehouse for grain storage. In the CR of Léona, 27 micro-projects have been financed and 23 villages involved: 11 of these projects explicitly concerned women’s groups. Again we find 5 grain processing units, a warehouse, a collective plot, a unit for vegetable processing and one for fish processing activities, and a unit of compost production from fish scraps. On what concerns the Gandé CR, out of 15 projects of the first phase, only one (a grain processing unit) is promoted by a women’s group, while in the second phase they are two out of 8 projects (that involved several villages): a training for the introduction of improved ovens for cooking and a processing unit for dairy products.

As we can see from this survey, the majority of micro-projects proposed by GPF promote small-scale food processing activities for women’s group (namely grain, milk, fish and vegetables). Only four out of these are primary production projects (collective horticultural plot...), among which two were currently not operational at the time of our fieldwork.

On the other hand there are several primary production projects promoted by peasants’ groups that include man and woman, but from our observation they show a remarkably lower participation of women with respect to men<sup>3</sup>. In what follows we present four cases of women food processing activities that constitute our case studies.

### Dry fish in Niayam Plage

In the coastal area of the rural community of Léona, funds from the Italy-CILSS program have supported the role of women in purchasing and processing part of the fish caught in the local lively chain of *pêche artisanale* (small-scale fishing through motorized *pirogues*). The development of fisheries in the area is – according to some sources [1] – relatively recent, and it is mainly due to seasonal migration of fishermen and their households from Guet Ndar, an area in the Northern city of Saint-Louis whose population is specialized in fishing activities [2]. On a beach located 7 km

<sup>1</sup> The term ZARESE (Zone à Risque Environnemental et Social Elevé) was originally coined by the Italian General Directorate for Development Cooperation working groups and after more largely employed to individuate target-areas for interventions against poverty and desertification. In Italia-CILSS Fund the ZARESE matched the administrative level called *Département, Province* or *Circle* (according to the Country), embracing several local Governments (*Communes* or *Communautés Rurales*) with a variable amount of villages and nomadic hamlets.

<sup>2</sup> According to the Senegalese Statistical Department assessment in 2005.

<sup>3</sup> For example, within a project of phosphate fertilizers and compost ditches experimentation only one woman out of ten producers has been involved.

away from the commercial center of Potou, the *Guet-Ndarien* fishermen have established a semi-permanent settlement nowadays known as Niayam Plage. Women from the neighboring village of Niayam, whose population is predominantly Wolof and Fula and was not traditionally active in fishing, have become increasingly involved in fish processing and especially in the treatment and commercialization of *gejj* or dried fish: they have received training, or taken example, from women of Niayam Plage, who dominate the local market.

In this context, women groups in Niayam, who gather a total amount of approximately 200 women active in fish processing, have received support for funding a storage building for the tools used in their work; they have also been supported for the purchase of a *pirogue* in order to guarantee a sufficient supply of fish for their processing activities. In fact, women from the fishermen settlement of Niayam Plage take advantage of their kinship relations to obtain satisfying quantities of fish from their husbands or male relatives who own a *pirogue*, while still paying for it; conversely, women from Niayam can experience obstacles in obtaining fish of acceptable quality, especially in periods of scarcity when fishermen give priority to the most profitable fresh fish markets. The purchase of a *pirogue* was meant to help overcome some of these obstacles: while entrusting it to trained *Guet-Ndarien* fishermen, the women group would retain the property of the canoe, thus securing the majority of the product resulting from fishing expeditions.

The operation resembles another intervention by the Millennium Villages Project, which funded the purchase of three canoes in the same area; our example, though, is the only one where the control of the *pirogue* was specifically attributed to a women group – and, as a consequence, used mainly to improve the processing phase of the chain. We don't have enough data to prove whether the intervention of the Italy-CILSS fund has managed to reinforce the position of the women from Niayam. Overall, the dried fish market seems to be still dominated by *Guet-Ndarien* women sellers, and the proportion of means – one *pirogue* for the women group of Niayam out of a few hundreds circulating in the area – will probably achieve only limited though symbolic results.

### Juices and vegetables in Potou

Potou is a growing commercial pole of the rural community of Léona, at the heart of the Niayes, where horticulture plays a crucial role in local economy<sup>4</sup>. A processing unit for horticultural products has been built in the compound of the local Maison Familiale<sup>5</sup>, under the supervision of an extension worker, responsible for the organization in the area. The Italy-CILSS program has funded the construction of a small building, the purchase of tools and machines necessary for processing and conserving the products (such as pots, buckets, kitchenware, refrigerators) and the organization of training sessions on food processing and hygiene (co-organized with the ITA – *Institut de Technologie Alimentaire*). Since the unit was meant as a reference workplace for the area, representatives from 26 villages in the whole rural community were encouraged to participate to the training sessions: 9 of these villages were even located far from the Niayes, in the inner territory of the *Djeri*, where in fact the culture of cereals largely prevails over horticulture. In each village, 2 women were selected to take part to the training, and a final selection was subsequently operated to constitute the work team, composed of three 5-women small groups who would alternate in working at the processing unit.

Completed by early 2011, the unit started in March a test production, which was suspended a few months later for the rainy season. At the time of our last fieldwork, activities were expected to start again soon, but some problems that emerged during the test phase had not yet found a solution. From March to June, the unit had produced fruit juices, mainly the so-called *jus locaux* such as ginger, *bissap* (hibiscus) and *ditax*; fruit jams made with papaya or *buy* (baobab fruit); and some vegetable jams made with sweet potatoes and eggplants. Though initially inspired by the idea of valorizing the rich production of the Niayes area, of offering new forms of product conservation and of diversifying the market, apparently the unit had oriented its activities in favor of the most successful products, based for example on the processing of *bissap* and baobab fruit; as a consequence, a significant part of fresh fruits – later to be processed – was in fact purchased outside the Niayes. Even so, problems in the commercialization of final products were repeatedly reported.

### Dairy products in Gandé

The rural community of Gandé, is located at the Western margins of the Ferlo, a large dry area in Northern-Central Senegal mainly inhabited by Fulani herders. While several studies have exposed the transformations undergone by livelihoods in the area as in all African pastoral societies, especially concerning sedentarization and changes in mobility patterns [5] [6], or commercialization of exchanges and preferences [7], bovine herding remains central for the articulation of social and kinship relations. The gendered division of labor, though subject to change especially under the pressure of markets<sup>6</sup>, attributes women the essential of dairying activities and the informal trade of dairy products.

In Gandé, following the example of many micro-dairies (*microlaiteries*) promoted by development projects in West Africa since the 1990s [9], the Italy-CILSS fund has supported the creation of a processing unit for the production of *lait caillé* (also referred to as *soow* in Wolof) or curdled milk, that most Fulani women usually process at home and sell to neighbors and in the street. The project has included the construction of the unit main building (currently one of the

<sup>4</sup> For a detailed description of the production patterns of horticulture in the Niayes, see [3] or [4].

<sup>5</sup> The local unit of a National-level association network.

<sup>6</sup> For an early analysis on modernization of dairying and its consequences on Fulani women in Nigeria, see [8].

very few buildings in bricks that can be found in the town of Gandé), the funding of materials and machines for the processing work, and the organization of training sessions on milk processing and hygiene. A team of 16 women has been constituted for the work at the processing unit, while a few men have been selected for collecting milk quotas in the different villages and selling it during the weekly markets of the area. Nevertheless, several problems have delayed the conclusion of the project: the building process was ended by early 2011, but at the time of our last fieldwork the unit had not yet started working, mainly because of lack of power supply.

### Grain processing units in Bari Diam Cissé and Thiar Ndiaye

Groundnut and millet processing activities are widely practiced by women and children in the region (and in most West African rural areas), that is the reason why several projects providing mills and oil presses have been implemented. Here we focus on two out these to exemplify different management strategies and effects, that are partly linked to the socio-economic environment and the degree of autonomy of the promoting GPF.

In Bari Diam Cissé (Mbédiène CR), the GPF *Book Diom* is composed by 60 women that were used to process groundnut and millet manually or moving to another village 5 km far. Flour and oil are both produced for family consumption and for commercialization and micro-project had a significant impact on the amount of production that can be sold. A managing Committee keeps the accounts of the processing unit and calculates sale proceeds every month. Their amount varies depending on season: during *hiver* (dry season) from December to May, when there are considerable groundnut and millet assets, profits can reach 150.000 FCfa par month; while during *hivernage* (rainy season), when raw materials are scarce and agricultural field work is the main people's occupation, profits are around 50.000 Fcfa. Up to now, profits have been divided in three equal parts: one to the unit working capital, one to the GPF as amortization fund, and one to the miller (a man). At the moment of our fieldwork, it was the local *marabout*<sup>7</sup> to take care of the GPF funds. This money is not only used for unit amortization costs, but also for other village needs (such as funerals, medicines, diseases...) and for co-funding other community development projects. Women however did not show a great degree of involvement in money management: profit allocation and decisions about projects financing are kept by the village association Secretary (a man).

In Thiar Ndiaye (*Djeri* zone of Léona CR), the introduction of a grain processing unit had a lower direct impacts on the 116 women's individual revenues and displacement, since private processing machineries were already present in the village. Moreover, interviewed women have declared that only groundnut oil is devoted to commercialization on weekly markets of Potou and Léona. As in Bari Diam Cissé, sale proceeds are calculated every month and divided in three parts, but, here, millers are two women and GPF funds belong to GPF members only. Profits have also been invested in an awning and utensils for ceremonies (rush matting, stockpot, chairs...) that are rented to people outside the *groupement*, also in the surrounding villages. Women have obtained a loan from a microfinance institution to buy a more powerful engine for the processing unit, while the old one can be used in their collective horticultural plot. Grain processing unit therefore had direct effects on GPF collective savings and had consequently upgraded their access to credit and investment capacity for both individual activities (small ruminants breeding) and collective ones (utensils for ceremonies, horticultural plot).

## THE STANDARDIZATION OF "GENDER APPROACHES"

In the previous section we have shown that most aid interventions targeted to women aim to develop income-generating activities based on processing of primary products. This is a regularity identified, beside our case study, in many other programs and in other contexts of West Africa. In this and following sections, we try to disentangle different components and possible consequences of this observed regularity. On the reasons why primary products processing is considered a "female" activity, we can put forward some factors: as suggested by Dolan [10], these may be more compatible with the other tasks women perform. These are care activities, that are carried by women, even if at different extent depending on the social context and the position women occupy within the household (whether unmarried, monogamous, or first or last wife in a polygamous family,...). Most of interviewed women who work in the food processing units told us that they started to carry out the processing activity at home, devoting to it a variable portion of time, depending on other occupations. The logic of the project has been to intervene in the organization of "female" home-based artisanal activities. This raises the question on how to deal with the need to adjust interventions to the context-specific gendered division of labor, and the risk of crystallizing a certain image of "female" and "male" activities. This crystallization is identified as dangerous for women empowerment in global value chains, since it is exploited by powerful actors in the chain in order to reduce costs and have more informal and "docile" workforce (see [11] on the role of women in agricultural contracts). As Dolan [10] argues, the gendered roles in value chains may be driven also by stereotypes on women qualities in work and women preferences; this is also highlighted by Dedeoğlu [12] with specific attention to informal market, that, as she claims, more than formal ones, embed such stereotypes. We will not be able to fully answer to this question, but we are going deeper into the analysis of the implications of such a choice and the methodology through which it is implemented.

<sup>7</sup> Religious authority.

Most of these projects tend to replicate, although in different sectors and contexts, similar patterns and intervention methods: they provide tools and working materials, such as buckets, cutlery, tables or shelves; they organize trainings, that are usually oriented to promote the creation of women's associations (*groupements*) or a greater formalization of the existing ones, and/or improve the productive process, namely on what concerns the hygienic conditions of the processing activity; sometimes they build up a permanent structure as technologically-improved processing unit (they may include refrigerators, electric mills, etc.).

This replication of the same methodology of intervention may consolidate some approaches both among "developers" and among "developed". The formers are likely to include food processing projects directed to women as "packages" within an overall strategy that pays little attention to gender relations as a broader and cross-cutting concern, thus operating in a manner still closer to the WID approach, with little integration of its criticisms. On the other hand, from the point of view of the beneficiaries, the integration of a "gender approach" usually translates into the implementation of *ad hoc* projects for women that replicate pre-defined models.

A sign of this replication of practices regardless the context is that, in any of the visited processing units, a business plan has not been prepared before the start-up of the activity, nor a market analysis has been carried out. Aims of food processing activities are to diversify production in order to reach a greater demand or to provide conservation systems for perishable products. From the observation of the described cases, nevertheless, we can see that often these interventions aren't grounded on local market characteristics, on existing trading networks, on market prices and their variations, on seasonality of products, or on the actual mobility opportunities of traders or of women employed in the activities. Of the problems we have observed in the activities that are the core of the projects, some depend on project implementation delays or inconveniences. More relevant to us are production and market related problems, such as difficulties in commercialization of final products, due to demand lower than expected, or to high production costs that implied non-competitive prices of final products. In other cases, problems were related to difficulties in finding raw primary products to be processed or to high prices of these commodities. In the fish processing case, the difficulty in buying fresh fish is related both to product seasonality and to the lack of "relational capital" of Wolof and Fulani women who are the beneficiaries of the project. In other cases, there are not enough means to expand the trading network. Juice and processed vegetables producers suffered high costs when decided to produce *bissap*, since this has higher local demand: in order to meet this demand, they have to buy raw material far away at higher costs, thus moreover reducing the positive impact of processing towards local production.

This lack of consideration for actual market condition and economic effectiveness in projects that nonetheless aim to develop market-oriented activities, goes together with the need, specific of aid agencies, that the project (the processing unit) is operational, even if the women working within the units have to buy raw material far away from local producers, thus "distorting" the economic aim of processing process, that is to sell out excess of local production and to favor local producers. The outcome risk to be surprisingly similar to the one produced within global value chains: autonomous revenues are generated for women, but they are small and volatile. The risk is that women end up being locked in "small income" occupations or poorly profitable activities, whose promotion is justified by the fact that they are "for women".

We find a similar observation in the work by Fatou Sow [13], who analyzed the promotion of income-generating activities for women in the petty trading sector and concluded that "there is a contradiction between these generous ideas and their actual practice, that does not support women's effort and continues to consider their jobs as ancillary activities"<sup>8</sup> [13: 53].

## GHETTOIZING RURAL WOMEN THROUGH INCOME -GENERATING ACTIVITIES?

So far, we have identified this standardization of women-oriented aid projects and the risks that these contribute in "locking" women into specific tasks in local primary products value chain. The following question is whether these are disadvantaged or marginal positions. A first element to be considered is market power. In the cases that we have seen, women working in processing activities are in quite large number, both on the demand side, when buying raw products, and on the supply side, when selling final product. This implies a tight competition that makes them face short-side power from the other part of the transaction. The fact that most of women perform the same activity on a home-based artisanal basis - and that they are very likely to continue to do so even when they take part in standardized work at the modern processing units- has the consequence to increase demand of raw commodities and supply of final products. A partial response to this problem is the organization of workers in *groupements*, but what we have seen is that rarely women's group priority is collective trading.

In the case of food and vegetables processing in Potou, trading is organized on a group-basis, but the *groupement* faces low market power, since the demand for processed products is limited by the size of the local market and incurs in the high costs illustrated in the previous section.

Two other elements that have to be taken in consideration in analyzing the power of the position women have in the considered value chains are skill specialization of tasks and skill "fungibility", that is to say the scope for applying those skills outside that specific position. On what concerns the first issue, it is often noticed that women occupy low-

<sup>8</sup> Authors' translation from French.

skilled position in agricultural and handcraft value chains, as it is argued by the literature on gendered roles in global value chains, that are sometimes defined as the lowest levels of “global assembly lines” [12: 2]. Dolan [10] finds this segregation into low-skilled jobs in packhouses of Kenyan export-oriented horticulture, both from the point of view of tasks that are routinized, and of the position within the chain, that is into flexible or “casual” jobs: “their opportunities of skill development are circumscribed by their concentration in flexible work, in which companies are less likely to invest” [10: 117]. Even if both the contractual framework and the market characteristics of the cases we observe are very different from the one presented by Dolan, we can identify some common features. On one hand, the flexibility and seasonality of the task performed, and, on the other hand, the fact that it demands skills that are quite widespread among local women (or at least within an ethnic or regional group, such as Guet-Ndariens women in the case of fish processing and Fulani women in the case of dairy products). These projects aim to reduce the flexibility of women manpower, but they manage just partially to reach this aim, as a consequence of the limited scope of the economic performance of the activities.

On what concerns skill use outside the sector, our observation suggests that such small scale processing activities do not provide women with “fungible” knowledge to be potentially employed in alternative ways on the labor market. This is probably more a limitation of the rural Senegalese labor market, rather than a limitation of the implemented projects: as claimed by Oussouby Touré and Sidy Mohamed Seck [4], weaknesses of the rural non-agricultural labor market is a major bottleneck in employment creation, also on what concerns processing activities.

If compared with the projects directed to men associations, these small-scale transformation activities allow for less access to key productive resources (namely land, physical capital and credit). This aspect is noteworthy, since access to these resources is widely considered a crucial aspect of women’s empowerment both by scholars involved in gender-related approaches to development and by activists.

As stated by Cathy Rozel Farnworth [14] in her report to a recent international organizations’ meeting, a gender analysis of a value chain shall imply, among other elements, an analysis of differentials in access and control over key productive assets between women and men. We don’t have sufficient data to proceed to such an analysis systematically, but, from our case studies, we get some hints that suggest that projects directed to women don’t provide new access to productive inputs.

A partial exception is represented by the project on fish processing: as we have illustrated in section 3, the purchase of a pirogue for the women’s *groupement* represents an innovation in projects’ procedure, since it allows for physical capital ownership, thus favoring women’s access to factors of production and to raw products. The main difficulty faced by Wolof and Fulani women is, as many of our respondents said, the purchase of fresh fish, since they face a disadvantage with respect to Guet-Ndarien women: the latter buy fresh fish from men within their household and, at time of shortages, the former may face major difficulties in purchasing the raw product to be processed. The ownership of a pirogue by the *groupement* seems to be a key factor to get a stable level of fresh fish. This is an important example of access to raw products, that, as we have seen, in other cases turned out to be a major problem for the women-led transformation units.

The claim that “female” roles in value chains, whose pattern is followed by the analyzed project, are weak from the point of view of market power, of skill development and access to resources does not mean that these are not important elements for the sustainability of the whole value chain. This has been indeed the role of women-led fish processing in sustaining the Senegalese artisanal fishing sector: following Jean-Pierre Chauveau [1], since the 1950s small-scale fishing in Senegal was organized such that it relied on few selling channels, among which the processing activity made by fishermen’s wives.

## “MODERNIZATION” OF INFORMAL ACTIVITIES: A TOOL FOR EMPOWERMENT?

The analyzed projects aim at making home-based informal activities more structured and, at least in principle, more profitable. This development practice goes interestingly together with a strategy often adopted by Senegalese household of “commercialisation du travail domestique” [15: 207], that is the marketing of home-based activities that were previously non traded: the authors identify this strategy as being adopted as a consequence of the decline of household incomes since the 1990s. Although the projects intervene on already existing activities, they produce important changes in the organization of labor, namely in those cases where permanent structures are built, such as in the vegetable processing and in the dairy cases.

A first visible change is the formalization of the existing activity. Projects are directed to women’s *groupements*, thus trigger the creation of structured groups or the formalization of the existing ones. This happens also in that majority of cases where production keeps being individual. The organization of work seems partly to transform an informal activity into wage work, since teams are created who follow work shifts (at least during the processing season). Work teams are composed by women who passed a selection or have been chosen in the village assemblies, “because they are more motivated”, we are told. In other cases, projects require an *équipe* of women to work on a voluntary basis to guarantee the sustainability of the managing committee of the processing unit, to decide of the allocation of profits, etc.

From our observation we argue that this increase in formalization does not lead, nevertheless, to stabilize employment: production keeps being seasonal and is not smoothed in time, hours worked are limited, the economic performance and the profit margin are small, such that the processing option does not become actually a non-farm labor

market opportunity for women. Lower access to formal labor market income for women in rural areas -and access to more precarious and lower paid jobs- are well documented [16] [17] [18] [19]: Whitehead and Kabeer [16] argue for a “lower reservation wage” for women than for men, that is the lower wage they are ready to accept, because of the lower income potential of their own production or the urgent need they may face. Whether this is due to women’s preferences for flexible-but-underpaid work in order to meet also the reproductive tasks, or it is due to the constraints given by the commodification of their labor is a debated issue (see Razavi [18: 216] who argues that women’s labor market engagement has a “distress character”). What we claim here is that these international aid interventions aimed at building up income-generating activities for women don’t manage to trigger the development of a labor market that is substantially more remunerative for women than the existing one.

It doesn’t seem that the “formalized” production fully replace the home-based one: this may be due to the limited extent of these interventions in terms of employment and of income generated. On the market usually we find both the products from the processing unit and the home-made products: the extent of their substitutability may vary, as underlined for the case of *lait caillé* in Corniaux at al. [9].

These formalization-oriented interventions sometimes produces, together with the organizational and “modernization” effort of processing activities, some paradoxical situations: it happens that, although facing thin markets or low demand for the produced commodities, expectations are created that recall myths of “modernity” and “efficiency”, not in line with the actual realizations. These are created by the inherent logic of the project and, most of all, by the training women attend within the project itself (and within other policy-interventions that follow the same practices). It is often the case that the building itself of a permanent structure is source of prestige, regardless the function that it serves. This is namely true in village contexts, where these may be quite visible since they are surrounded by constructions built using precarious and perishable materials: in these cases they are likely to become – in the imaginary – referential places, where “modern” processing can be learnt and performed. Indeed, the need for new technological endowments is often mentioned in interviews as being one of the major needs of workers, irrespective to the effective use that is done of the existing machineries.

Trainings, moreover, seem to be arenas of top-down transmission of practices and values formulated in a “developmentalist” and “hygienist” approach. They are often organized by the ITA (National Institute for Food Technology), following recurrent models that transmit a standardized approach to production processes and to organizational structures of collective action. Moreover, they seem to convey a “promise of modernity” that is difficult to keep in terms of material effects, but that it’s rich in consequences on the discourses and practices concerning women’s work.

## CONCLUSION

In this work we have tried to draw some reflections from the observation of a number of realizations of the Italy-CILSS program in Northern Senegal. We are not carrying on an overall evaluation of the program, but we discussed some of the practices and outcomes at the micro-project scale from a gender perspective, considering it as an example of a widespread set of tools to introduce gender into development programs. Our first remark is the standardization of projects directed to women: even if the approach is bottom-up and the projects are proposed by local level committees, the typology and tools of women-oriented micro-projects are almost always the same. If we look at the international debate on gender and development, it seems that this aid program situates itself within the WID approach, without integrating much its critiques. Cornwall at al. [20] criticize the idea of reducing gender to a “set of tools”, that de-politicize it; in our claim, this doesn’t necessarily happen only when top-down approaches are adopted, but may occur in bottom-up settings too, as far as standardization of aid practices shapes (e.g. through trainings) the approach both in the “developers” and in the “developed”. Moreover, we find out a framework of “women-only” projects, where the relational dimension of gender is rarely taken into account. This is, still today, a debated issue on gender integration into aid interventions: moving “beyond a focus on women as a bounded group” is the need expressed by Christine Okali [21: 9].

A second observation is that these aid projects tend to crystallize women’s role in value chains. With the words of Cheryl Doss [22: 81]: “in an effort to be responsive to the needs of women, these organizations have tried to prioritize ‘women’s crops’ and ‘women’s tasks’. Both of these approaches compartmentalize women’s contributions in agriculture and thus limit the understanding of women’s work and women’s needs”. If we think that women have been “locked” into pre-defined roles by the standardization of food-processing projects, can we say also that these are marginalized roles? We have tried to discuss some possible weaknesses of the position of women within the value chain, even though we have limited tools and cannot carry out a rigorous value chain analysis. We can nevertheless argue that revenues produced by these activities are limited and volatile: as it seems the case in most analyzed situations of global value chains, the integration of women in these (even though so different) production processes doesn’t seem to provide tools to stabilize and substantially increase incomes.

Even though the observed projects aim to reduce the flexibility of women manpower, they manage just partially to reach this aim, since the scope of the economic performance of the activities seems to be (up to now) limited; they partly allow for the shift of unpaid activity to the sphere of paid jobs, but produced revenues are small and unstable and they seem to provide women with low market power. Besides the exception of the fishing sector, our claim is moreover

that such food-processing interventions don't provide women with greater access to productive resources. Moreover, even when a greater access to resources is gained, there is a risk that low profit margin makes the access to inputs unstable [23]; it may be that control over assets depends on how productive is the use that it is done of it, but in our observation, when women are targeted, little emphasis is put on economic performance.

A last point has to be made on the strong emphasis put by the project logic on production formalization. Looking at the literature, we don't have unambiguous evidence that tells us whether this is a tool for women's empowerment. Literature on global value chains stresses the negative consequences of "keeping women informal", on the one hand; on the other hand, literature on agrarian economies under liberalization stresses the negative effect on women of increased access to formal markets. It is difficult to us to have a conclusive evidence in our case, but we have highlighted some limitations of this "formalizing" approach (impossibility to fully replace home-based activity, limitations in providing new access to productive resources and limited market power).

If we compare local aid-driven value chains (the ones that we have observed) to global value chains driven by big retailers, we have the feeling that women labor is "squeezed" between under-formalization of women's work (in global value chains), that hides exploitation on the global labor market, and a form of "over-formalization" (our case), where little attention is paid to economic performance, to local demand, and therefore to workers' revenues.

## ACKNOWLEDGEMENTS

The fieldwork on which this paper is based was made possible by the research project "IAO-Gender", funded by the DGCS (General Directorate for Development Cooperation at the Italian Ministry of Foreign Affairs) and supported by the IAO (Overseas Agronomy Institute, Florence). Although we assume full responsibility for the shortcomings of our work, we are grateful to all those who participated to this project, and particularly those who gave precious commentaries to earlier versions of this paper, such as Angela Calvo, Egidio Dansero, Roberta Pellizzoli, Bianca Pomeranzi and Gabriella Rossetti.

### ABSTRACT

This paper aims to present the role played by Somali rights activists in the projects carried out by IIDA Women's Development from 1991 until today a particular attention was given to the impact of their actions on the process of social reconstruction and the management of cooperation projects in Somalia . These are initiatives that are part of a wider range of action that includes different policy areas (food security, education, health, the fight against FGM, conflict management, demobilization and disarmament, local Government building, etc.), in which IIDA, in its twenty-two years of activity, has been operating with the support of several UN agencies and international organizations.

For an adequate understanding of the planning put in place, in this paper we attempted to give a brief description of the Somali social context and its historical transformations, which highlights the multiple factors of discrimination (clan, religious, social) at the base of the internal conflict broke out in 1991, and lasted for more than twenty years. In this context, the distinction between "urban" and "rural contexts" was increasingly blurred, to the point that it no longer constitutes a cut-off criteria on the social plan for the definition of specific methods of intervention.

The introduction is followed by a selection of the projects implemented by IIDA Women's Development under the Gender Equality and Women Empowerment: these are some of the most significant actions that led IIDA women to acquire a high degree of social role recognition. This was achieved by multiplying the individual contexts of local communities the practices of conflict management and effective application of rights. The last two paragraphs present the most recent results and prospects of development in the struggle for the recognition of women's rights, in the light of the constitutional making process of Somalia and the growing importance of the civil society in the peace process.

In its twenty-two years of activity, IIDA's work has been possible to achieve thanks to the strong support of many international organizations that have allowed them to carry out humanitarian interventions and cooperation and, above all, to have a profound impact in the peace processes in Somalia.

The Coordination of municipalities for Peace of the province of Turin (Co.Co.Pa.) aims to support the work of IIDA in spreading the mission and results achieved so far by IIDA by making available their know how and support of projects in institution building, essential for the reorganization of the fabric of the Somali state.

### ABOUT IIDA WOMEN'S DEVELOPMENT ORGANISATION

IIDA is a non-profit organization that was founded in 1991 in Mogadishu by a group of Somalia women leaders to promote women's political, economic and social rights [1]. IIDA believes that people are the drivers of change and the custodians of their own destinies and therefore works to mobilize the community and encourage the beneficiaries of their development programs to take ownership of the projects. It is these beliefs that inspire IIDA to formulate women led programs that are geared towards making a lasting impression on the lives of Somali women both at home and in the diaspora. Today IIDA is, operationally, the largest grassroots movement in Somalia, and is represented in different regions of the country such as Lower and Middle Shabelle, Banadir, Galgaduud, Bay, Bakool and the Jubbas; and continues to work towards fostering sustainable development. IIDA has earned the respect of the Somali community and is able to resourcefully and successfully penetrate the grassroots, even in times when international organizations are unable to do so due to security concerns.

IIDA's mission is to promote peace and work towards non-violent means of conflict resolution, to foster and ensure the integration of Somali women in sectors of their society, to promote education for women and the youth in order to increase their awareness on critical issues that affects their lives and to increase their potential as individuals and groups and to enhance women's economic self-sustenance and improve on women's health [2].

IIDA is committed to:

- mobilizing the community in an effort to advance the goals of human rights; equality; development, peace and reconciliation for all women in Somalia;
- supporting poor and most vulnerable people and communities, especially women and children;
- working in partnership with men towards the common goal of gender equality in Somalia;
- respecting and valuing the full diversity of women's situations and conditions and recognizing that some women face barriers to their empowerment;
- protecting the rights of women and girl child as inalienable, integral and indivisible of human rights.

IIDA partnered with various organisations and donors to achieve networking and women's rights goals. The partners included: United Nations Children Fund (UNICEF), BBC Media Action, International Organization on Migration (IOM); Cooperazione per lo Sviluppo dei Paesi Emergent (COSPE), EU, The French Government, United Nations Development Programme (UNDP), Save the Children, The Norwegian Government, The Danish Government, UNPOS, ILO amongst others. Over the years, IIDA has set up networks that have lobbied for children and women's civil, political, social, economic and cultural rights in Somalia. These include Lower Shabelle Women's Association, Somali farmers Association, SHAYDO, Somali women health Association, Puntland Women's Health Association, Somaliland Women's Health Association, Somali Women Teachers Association, Puntland Women Teachers Association, Free Education for All (FEFA), Somali Women Entrepreneurs Association (SWEA), Shabelle Obstetricians Association, Lower Shabelle Youth Association, Galgaduud Youth Association and the Association of Poets and Writers (HORYAAL Band). Over time IIDA realised it needed a bigger organisation to front for women's rights and thus created Somali Women's Agenda (SWA). SWA worked very well and had many achievements in areas of women's rights. IIDA originated the idea of a 30% legislative or constitutional quota for women's representation in Governance.

## **BEHIND IIDA'S SUCCESS**

IIDA strategy is to involve the community from the beginning of their projects. This encourages both trust in the process and community buy-in and support for whatever actions are taken by IIDA. It is IIDA's believe that the Community participation and involvement also promotes leadership from within the community, giving voice to the voiceless.

In the last 22 years, IIDA has always envisioned the execution every few years of a number of assessments, mapping and research. This was done with the purpose of understanding the changes and to identify the resources that are already available to help meet the needs of the people. Further, the needs assessment:

- helps IIDA gain a deeper understanding of the target community in Somalia. Each community group has its own needs, culture and social structure - a unique web of relationships, history, strengths that defines it;
- helps uncover not only needs, but resources and the underlying culture and social structure that will assist IIDA understand how to address the community's needs and utilize its resources;
- encourages community members to consider the community's assets and how to use them, as well as the community's needs and how to address them. That consideration is (and should) be the first step in their learning how to use their own resources to solve problems and improve community life.

## **THE SOMALI CONTEXT: TRADITIONAL STRUCTURE AND DISCRIMINATING FACTORS**

To understand the importance of the results achieved by the women of IIDA, it is important to describe briefly the social context of Somalia with its multiple discrimination factors. The entire social organization of the Somali population is based on traditional criteria of identity, according to which the sense of belonging to groups of people is distinguished by strong clan affiliation (*clan* or *Qabil*).

The clan subdivision forms the backbone of anthropological and historical rule that regulate all human relationships within communities hierarchies of "purity", "nobility" and "antiquity of descent" [3]. In addition to the four major clans (Dir, Darood, Hawiye and Dighil-Mirifle), usually connoted by the term *Nasab* (nobles), the Somali population includes a myriad of minority groups, the origins of which are often difficult to identify, but whose condition is of absolute subordination compared to the former.

These are minority groups whose presence is probably due to the migration of units from the south (Bantu) and the Arabian Peninsula, settled over the centuries in the territory of today's Somalia. The term used to indicate them is *nasab dhiman*, i.e. "non-noble", and expresses their economic and social condition of inferiority compared to *nasab*, as well as their being subject to persistent discrimination [4].

The traditional organization of the Somali population has had to constantly contend/compete its self with two elements of instability: the nomadic lifestyle of the individual groups and the internal fragmentation of clans. If the first element binds tightly to the predominantly "pastoral" structure the Somali economy, which forces the groups to move from region to region to provide water to the flocks, the second factor is explained in family dynamics and relationships that, over the course of history, have seen clan units multiply into pyramids of sub-clans and smaller groups (*reer*),

which often took power, changing and complicating every time the general equilibrium [5].

The clan fragmentation has always been a factor of potential conflict, contrasting with the attempts to construct a national Somali identity since the independence of the 1961. It is a tangible example of the tragic parable of the regime of Mohamed Siad Barre (1969 - 1991), in which the instances of nationalist unity paraded in the name of the ideology (scientific socialism) that aimed to "anticlanic", "anti-colonial" and "anti-religious" have ended up spilling into the opposite, constituting the premises of the civil war that erupted in 1991.

During the civil war, another element of instability added to the overall picture: that of religion. If it is true that, historically, the Somali society, entirely Sunni Muslim, has always been characterized by a substantial balance between the religious dimension and civil life, in the last twenty years have gone affirming groups that appeal to schools more openly radical Islamism (*Wahhabism*), with extremist and terrorist continuation (e.g. the militia of *Al-Shabaab*). After the 2000 (but started in the nineties), particularly in Somalia, there has been a genuine attempt of "re-elaboration of identity" based on religion, the aim of which (partly realized) was the cultural hegemony, educational and political of radical Islamism over the traditional social structure.

The multiplication of Koranic schools, the adoption of *shar'ia* laws in areas of civil life previously outside its jurisdiction, the imposition of customs alien to the Somali tradition (e.g. the use of the *hijab* for women), the concept of subordination of women in economic and civil life, the character forced with which it was implemented everything: they are elements that express the increase of criticality of the framework and, above all, of the factors discriminatory inside.

## URBAN AND RURAL AREAS DURING THE CIVIL WAR

From the territorial point of view, the "rural areas" of Somalia see a higher incidence of certain phenomena compared to the urban areas. Among them, we highlight the dramatic drought conditions in many inland areas, heightened by food insecurity and the consequences of deforestation.

From an anthropological and sociological perspective, however, in Somalia is difficult to make a clear distinction between "urban" and "rural areas" contexts. Although it is undeniable that the existence of urban centers that during the twentieth century (especially after the Somali independence), have seen the development of a manufacturing economy and organization of type already metropolitan (approximately 36% of the area of the country), the nomadic nature of the population and the essential role of pastoralism have always being characterized in areas predominantly "rural".

In fact, the development of some cities (Mogadishu, Brava, Merka and Kismayo in the south, north Hargeysa and Berbera in Somaliland; Bossaso in Puntland) has had the effect of shaping over the years in many ways otherwise different populations, with medium-high level of education, skills and relations with foreign countries. However, the outbreak of the civil war and the interruption of the process of development have caused a real dispersion of these populations, often victims of the fighting and forced to "evacuate" to the inner regions.

At the same time, the transformation of cities during the war have seen the traumatic irruption of masses of people from the hinterland and armed groups involved in the looting of neighbourhoods and the guerrillas. This dual aspect of the phenomenon has further weakened the distinction between urban and rural areas, to the point that the characters of many groups currently residing in cities are relatable to those of populations traditionally "rural": illiteracy, lack of skills, tendency to life nomadic.

From a methodological point of view, this condition makes it difficult to talk about different approaches to rural and urban areas for cooperation interventions/projects. The social contexts in which it operates (city, IDPs camps, inner regions) are often a mixture of these realities, with combinations also dramatically conflicting.

Therefore, the "rural development" in its broadest sense, represents the objective to engage and relate easily even to groups of people emerged from the city, forced to displacements and also repeated ones that settled in locations distant from their origins. The collapse of the state structure that followed by the civil war, with the disappearance of schools, hospitals and public services, has further accentuated the rate of illiteracy and human dispersion, decreasing the results of earlier processes of urbanization.

## WISE WOMEN CONCEPT

The formation itinerary undertaken by IIDA Women's Development is based on awareness of the central role that women have always had within the Somali community. In village life, such as the organization of the clan system, the Somali woman has in fact traditionally played an active function/role around which they built their economies of the various groups, as well as their internal relationships. During the civil war, women were the only people to keep up some form of "civil economy" alternative to the "military", supporting production and trade otherwise lost with the dissolution of the Somali state.

In there exploration of an alternative quest for peace and human security in SC Somalia IIDA came up with the concept of the Wise Women. IIDA believe that traditional channels of influence should be explored as a priority. For this reason, IIDA when needs arise is since years mobilizing and has been engaging the wise women of Somalia (i.e. daughters, sisters and wives of the Ugas, Bogor, Garadhs, Suldans; the respected women in Somalia who we believe

maintain a very high level of influence among the Somali society and who can transcend the clan barriers as peace brokers. The women today can bring change in Somalia if given the opportunity and if to explore together some of the domestic solutions that women have.

With this in mind, they realised that at a time when women are the remaining custodians of peace it has been necessary to understand the International Resolutions, which purport to provide for women representation and participation at all levels of society especially in the context of conflict resolution now in Somali's history. For this reason that IIDA together with SWA have in the last decade translated and Disseminated CEDAW [6] and all the UNSCR on women from 1325 through to 1960.

## **GENDER EMPOWERMENT PROJECTS CARRIED OUT BY IIDA**

The gender empowerment initiatives fall into IIDA projects spanning into multiple sectors (health, food security, the fight against FGM, demobilization and disarmament, local Government building, etc.) and above all, in a broader process of building a strong and responsible civil society in Somalia, able to make lasting and sustainable peace. Here, we report a selection of the most significant planning stages of this journey.

*Women Trade and Small Enterprises Network and Capacity Building along the Shabelle Valley.* Donor: UE. Partner: COSPE. Period: August 1999 - January 2000. The goal of the project was to promote women's access to democratic participation. The result was the establishment of organizations of women entrepreneurs with projects that have involved about 1,500 women over the years.

*Shabelle Women Enterprises Support System (SWESS).* Donors: EC-SU e Cooperazione italiana. Partner: COSPE. Period: March 2003 - November 2005. The program supported 5 groups of entrepreneurs from 4 regions for the creation of an association of the second level (SWEA). It included a prior training at all levels: management/accountability, data collection, understanding the differences between facts and perceptions. The next step was to guide the association to translate the results obtained in the context of daily life, aiming to respond to the immediate needs of women entrepreneurs. With this aim, the project has fostered collaboration between entrepreneurs, providing support services to enterprise development, such as education, technical training, empowerment services, support for women's access to the market and financial opportunities [7].

*Strengthening Somali Civil Society - Capacity building.* Donors: UE. Partner: COSPE e NOVIB. Period: 2005 - 2008. Series of focus workshops for representatives of the Somali civil society, associations and traditional leaders on access to basic rights. The action of IIDA was geared to focus on gender (7000 entrepreneurs, 1000 business people, health care professionals and 2,000 teachers in 2000).

*Somali Women Platform for Action (SWOPA).* Donors: UNIFEM e DFID. Partner: COSPE. Period: April 2007 - 2009. The program has promoted the participation of women in local and national democratization. The target of the beneficiaries included Somali women of every social level, women leaders, policy makers, parliamentarians, professionals, women's organizations, union groups and opinion leaders of the community. The aim of IIDA was to ensure that women and women's groups were able to commit to the goals of the MDGs and access to fundamental rights, through:

- protection initiatives aimed at supporting the participation and representation of women in government structures;
- strengthening and increasing the participation of women in national and local processes of democratization;
- the promotion of dialogue between stakeholders and government officials in the establishment of a platform for women's actions in Somalia.

*PACE SETTERS - Somali Women taking up their Destiny!* Donor: UE. Partner: COSPE. Period: November 2006 - 2009. The project has conferred capacity for action of women's organizations in Mogadishu (Benadir), Merka and Afgooye (Low Shebelli), Jowhar (Middle Shebelli), Beletweyn (Hiraan), Dhusamareb (Galgaduud), Gaalkacyo (Mudug), Bosaso (Puntland), Hargeysa (Somaliland), Kismayo (Lower Juba), Garbaharey (Gedo), Baydhaba (Bay), by strengthening their active involvement in the local and national political processes. Through a kind of intergenerational dialogue based on the reality of the community, the project has promoted women rights through education and understanding of issues related to peace and security from the perspective of human rights.

*The promotion of gender equality and women's economic empowerment in Somalia.* Donor: ILO. Period: September 2012 - ongoing. The project will improve the (self) employability of women through training on entrepreneurship and enterprise skills. The project will also facilitate an enabling environment through the development of private business support services.

*Gender Equality and Women Empowerment Programme.* Donor: UNDP. Period: May 2013 – ongoing. Women MPs and CSOs need each other to win over men and women to support women's human rights. Women have to start redefining their roles and allegiances. The proposed project will work to create a link between the elected women in parliament and their constituents. The project will serve as a catalyst, a hub and an incubator for possible future interventions in relation to working with the legislature in lawmaking, conducting oversight over the executive, representing Somali citizens and their interests and facilitating and promoting public knowledge and participation of

citizens in parliamentary processes.

**Fig. 1 - Women of SWEA at the first interregional congress – December 2003.**

**DISARMAMENT, DEMOBILISATION AND REINTEGRATION.**

Despite the customary limitations, Somali women struggled to contribute to the peacebuilding process in war-torn Somalia. IIDA was the first organization who played an important role in the demobilization and disarmament of the local warring militias. IIDA (Women’s Development Organization) in the 1997 in collaboration with COSV, an Italian NGO, and with EU funding, carried out the first DDR (Disarmament, Demobilisation and Reintegration ) Project offering education, housing, and income opportunities for about 150 disarmed militias in return for submitting their weapons in the city of in Merka (Southern Somalia) [8].

**Fig. 2 - Monument DDR project of IIDA were 156 young army were disarmed.**

**GENDER AUDIT OF THE SOMALI CONSTITUTION**

In Somalia women constituter over 52% of the population based on the projections between 8 and 10 million people and the Constitution cannot ignore the concerns of over half of its population, if sustainable peace were to be achieved. It is acknowledged that peace in Somalia is attainable and it is linked with the advancement of women, who are a fundamental force for leadership, conflict resolution and the promotion of sustainable and a lasting peace in the country. This gender audit of the draft constitution will ensure that women’s concerns are well articulated and presented to the Commission for incorporation in the final draft. The audit will inform women to take position on their concerns, and to be at the forefront in championing their representation and involvement at all level of decision making. The gender audit will also be used for civic education, in public and political consultation to create a critical mass – a strong and unified women’s voice in articulating the concerns of women, generally and in the Constitution. In gender audit provides opportunity to incorporate the human rights commitments made by the world governments in advancing the

participation of women in decision-making positions at all levels of governance, especially as outlined in Resolution 1325; CEDAW; and the AU, Rights of Women in Africa and Solemn Declaration on Gender Equality. It is recognized that progress of Somali women has been uneven, and inequalities between women and men have persisted and major obstacles remain, with serious consequences for the well being of the state. The constitutional-making is an opportunity to create visibility for Somali women concerns to be heard within the country. In summary, the gender audit will be used to ensure women's concerns are well articulated in the Constitution; mobilize women at all levels to address women's rights issues through civic education; and create a critical mass, a strong and unified women's voices and visibility of women's concerns in the whole country.

This audit also included a component of Women's Right in Islam, component, added to counter the misinterpretations of Islam, especially those concerning women's rights. To give women the chance to know their rights in Islam also giving tools to use if the latter are misinterpreted. Women's rights have been prescribed in the Sharia Law; it was critical rights that the audit report bases its analysis on the rights of both men and women as provided in Quran and Sunnah. It was also critical that Islamic teachings are endorsed and used as a means to secure women's rights in the Constitution while highlighting how the Quran supports gender equality.

### **IIDA POLICY BRIEF. SOMALIA: LA LOTTA CONTINUA! A WOMEN'S RIGHTS PERSPECTIVE ASSESSMENT OF THE SOMALI FEDERAL CONSTITUTION**

On the 30th of October 2012 IIDA have launched of a Policy Brief On Women's Rights Within the Somali Provisional Constitution. The launch was attended by a large number of people and officiated by amongst others the former Minister for Constitution and Reconciliation, Hon. Abdirahman Hosh Jibril. The purpose of this policy brief was to ensure that the past two decades of work in development of a framework for women's rights is not lost. Since, the rights of women are now written in law, the next battleground for women's rights will be at interpretation and implementation of the constitution. Therefore the fight for women's rights has to continue and IIDA policy brief starts that discussion and provides some ways forward.

The Policy Brief is part of IIDA's celebration and contribution to its 22 years of frontline engagement in women empowerment in Somalia. The road to get to where we are today after 22 years and was characterized by its sad moments and difficult moments and other glorious and full of satisfaction. In all this, our organization has always believed that we need to pursue their dreams at all costs to arrive at a just society. The leadership of IIDA always look ahead and anticipate the times being the pioneers of new ideas and this because we are the setters of peace.

### **CONCLUSIONS**

For over 20 years Somali women have fought for their rights. Currently they have much of their rights provided for within the provisional constitution. The interpretation and implementation will define the future of women's rights in Somalia. This document has come at a time when forward thinking is required in order that rights of women are realised. This policy brief outlines the challenges that women face in order to actualize their constitutional rights. The hurdles include the capacity of the state to deliver services, the capacity of women to demand services due to the lack of a functional state for the last 20 years, the lack of a culture of constitutionalism, the limited capacity of the constitutional court to make progressive interpretation of the constitution, problems of corruption within the government and the busy legislative calendar that will priorities issues of peace and stability as the expense of dealing with women's rights.

IIDA will continue to build alliances with other like-minded national institutions. Concerted effort must, however, be made by all state and non-state actors responsible for the future of Somali to achieve these provisions. IIDA will take this unveiling opportunity and work towards achieving that goal of human rights in Somalia.

Having this prospective in mind, the Coordination of municipalities for Peace of the province of Turin (Co.Co.Pa.) aims to support the work of IIDA in spreading the mission and results achieved so far by IIDA by making available their know how and support of projects in institution building, essential for the reorganization of the fabric of the Somali state.

## GENDER MAINSTREAMING IN INTERNATIONAL DEVELOPMENT: AN EVALUATION OF STRATEGIES IN HEALTH AND EDUCATION

Costanza Tognini\*

\*Università Cattolica del Sacro Cuore, Italy - [costanzatognini@gmail.com](mailto:costanzatognini@gmail.com)

### ABSTRACT

Investing in women has brought about positive effects for societies and for the economies of developing and developed countries. In the areas of education and health, women have innumerable opportunities to contribute to the economic and human development of their countries. In 1995, the international development community convened in Beijing to address the situation of women and how best to improve it. At this conference, the concept of Gender Mainstreaming was first given official recognition, and began to be used as a framework for development policy in many organizations. The aim of this strategy is to ensure gender equality in all development efforts, through the integration of women's concerns in all phases of the development process.

The aim of this paper is to analyse and evaluate the gender mainstreaming strategies implemented by International Organisations, by now ubiquitous in the international development discourse. This was achieved through an accurate analysis and comparison of international guidelines for Gender Mainstreaming in health and education programs. Secondly, through a case study of UNICEF Indonesia's Gender Policy. The case study is based on field research carried out in Jakarta, Papua, Aceh and Nusa Tenggara Timur, and focuses on the implementation of the organisation's Gender Mainstreaming policy in health and education programs. The results of the field research were then elaborated into a Gender Mainstreaming Index for health and education programs in each province.

Results showed that Gender Mainstreaming has made much progress since Beijing. However, barriers to its implementation stemmed from a certain ambiguity regarding key terms and definitions in the elaboration of specific policies, as well as a general lack of understanding and awareness further down the line, i.e., at country office and field office levels. This was particularly reflected in the Gender Mainstreaming Index developed specifically for this research.

### THE RATIONALE BEHIND THE STRATEGY: INVESTING IN WOMEN

The World Bank's 2012 World Development Report [1] was entirely dedicated to Gender and Development. This is an indicator of the central role played by gender issues in development, which has not always been recognized. Indeed, it is the result of long-standing pressure on governments and the international community to include gender issues in development policy, which dates from the 1960s and 1970s. Leaving the ideological motivations for this sort of pressure aside, it is interesting and worthwhile to consider the economic motivations for the elimination of gender inequalities as a strategy for development.

Investing in women improves economic growth – this fact has been proven by many studies, and will be explained in the paragraphs to come. This can be seen in a variety of issues, from health and education, to labour force participation and employment, to political empowerment, finance and trade. Healthier and better-educated women raise healthier and better-educated children, generating more human capital for their countries. Women in the labour force can be more productive, and represent an untapped resource in many parts of the world (both developed and developing). Finally, 'empowered' women participating in politics can strengthen democracies and, subsequently, economic growth.

In particular, investing in women's education can bring about strong economic returns, both at household and countrywide levels. Stephan Klasen [2] shows that gender inequality in education can have severe repercussions economic growth, affirming that if gender inequality in education had been lower in past decades, several countries would have witnessed faster economic growth. Furthermore, Anne Hill and Elizabeth King [3] assert that '*the nonmarket benefits of women's education experienced by the family are considerable. These benefits extend beyond the family to society at large.*'

Investing in women's health is also of crucial importance, particularly for a country's social and economic development. When it comes to women in particular, investing in health is important for the improved wellbeing of their children and families, and in turn for the economic growth of their countries. This contribution is crucial to economic growth, as Jere Behrman [4] affirms that '*Each year over 22 million infants are born with low birth weight (LBW) in developing countries, with an inverse association between the proportion of infants with LBW and economic development.*'

## THE EVOLUTION OF GENDER MAINSTREAMING

Investing in women has by now become a priority for most stakeholders in international development, although this has not always been the case. Getting women's empowerment and gender mainstreaming at the top of the development agenda has been a long process, which started from criticisms moved towards development theories and strategies in the late 1960s and 1970s. A pioneer in gender and development, Ester Boserup [5] was among the first to draw attention to the fact that *that in many African nations, improvements of agricultural techniques and practices actually lowered the status of women by reducing their access to productive work roles.* Boserup's observations gave a strong impulse to what has been called the 'Women In Development' or 'WID' approach, a first stride towards the inclusion of women's issues and problems in development strategies. According to C. Moser [6], at around the same time female professionals based in Washington joined forces with other groups of feminist critics of development policies to advocate the WID approach and reach greater women's empowerment in international development.

Overall, the effect of the WID movement was to achieve a greater integration of women in development. In fact, the World Conference of the International Women's Year was called in 1975 in Mexico City, and the UN called the years 1976-1985 the United Nations Decade for Women. It was in this period that 'women in development' bureaus began to be created in international development agencies and governmental aid offices. Women-specific programs were put into place, and a greater impulse was given to research on women and development. The first 'gender policies' and statements also began to emerge in international development organizations. However, Razavi and Miller [7] note that *'for historical reasons (the legacy of the 'welfare' era), WID advocates distanced themselves from welfare issues. This placed them at odds with the general thrust of development discourse in the 1970s.'* Furthermore, the creation of 'WID bureaus' and gender-specific programs had contributed towards the creation of a 'women's ghetto' in development, which separated gender issues from the main stream. Hilary Charlesworth [8] further notes that WID *'... began to be criticized as inadequate because it identified women as a special interest group within the development sphere requiring special accommodation.'*

Stemming from criticism to the WID approach, a second strategy began to emerge some years later. The Gender and Development approach focuses on the relationship between the socio-economic status of women and gender inequality, and has also been used as a basis for criticism of the structural adjustment policies put into place in the 1980s by international financial institutions. The GAD approach also delineates different policy interventions for the elimination of gender inequalities. One contribution of GAD was to bridge *'the gap between left by the modernization theorists, linking the relations of production to the relations of reproduction and taking into account all aspects of women's lives.'* [9] Furthermore, it focuses on the work done by women within the household and attributes a central role to governmental institutions for the promotion of women's empowerment through specific policies. Emphasis is placed on policies that strengthen women's legal rights, such as the reform of inheritance and land ownership laws, and the promotion of affirmative action and intervention policies. However, though theoretically distinct, these two approaches are overlapping in practice and it is at times difficult to separate between the two.

It was, finally, GAD's primary objective of institutional change that gave rise to the concept of Gender Mainstreaming within a group of international development organizations. The impulse given by GAD was also accompanied by a series of steps from the international community, which led to the official recognition of gender mainstreaming at the 1995 United Nations Fourth World Conference on Women in Beijing.

## WHAT IS GENDER MAINSTREAMING?

According to Hilary Charlesworth, [10], the term 'mainstreaming' was first applied in the realm of education in the 1970s, indicating the inclusion of children with different learning abilities in the same classroom. Children with disabilities joined children without disabilities in the same learning environment, therefore being included in the educational 'mainstream'. Through the emphasis on institutional change, GAD provided the framework for the emergence of gender mainstreaming. Although the GAD framework did much to integrate women's issues in development, Caroline Hannan [11] affirms that *'the attention to women often came after major decisions on policies, strategies, and resource allocations had already been made. Awareness of these fundamental constraints led to the development of the gender mainstreaming strategy in the early 1990s.'*

Gender Mainstreaming, essentially, requires the inclusion of a 'gender perspective' in all stages of the development process, so as to make further progress towards gender equality in all development efforts. An official definition of gender mainstreaming was provided by the United Nations Economic and Social Council (ECOSOC) two years after the Beijing conference, according to which *"Mainstreaming a gender perspective is the process of assessing the implications for women and men of any planned action, including legislation, policies or programs, in all areas and at all levels. It is a strategy for making women's as well as men's concerns and experiences an integral dimension of the design, implementation, monitoring and evaluation of policies and programs in all political, economic and societal spheres so that women and men benefit equally and inequality is not perpetuated. The ultimate goal is to achieve gender equality.'* [12]

Lorraine Corner [13] identifies three major elements that most gender mainstreaming strategies have in common:

- a) **Conceptual clarity and understanding.** According to the author, all organizations should start with a general conceptual clarity regarding the goal, objectives, approaches and rationale regarding gender mainstreaming. Generally, and in line with the goal set out within the Beijing Platform for Action, the goal of most gender mainstreaming strategies is to achieve gender equality in the organization's areas of activity. Regarding approaches to gender mainstreaming, many organizations favour the "two-pronged approach": while on the one hand the organization in question integrates gender issues in all activity areas and in all stages of the program life cycle, it also maintains specific programs and projects that focus on women's issues. Finally, different organizations provide different rationales for their gender mainstreaming strategies. Some focus on the efficiency of achieving gender equality in their activity areas, while others favour the human rights-based approach, according to which gender equality is a basic human right, the achievement of which need not be justified at all.
- b) **Organizational arrangements and processes.** In addition to establishing specific departments and divisions within their structures, most international development agencies and organizations have also put specific gender staff into place. Known as "gender focal points", "gender specialists" or "gender experts", these individuals have the responsibility of coordinating the organization's gender strategy and providing aid to the organization's staff on matters relating to gender equality and gender mainstreaming. The rationale behind the creation of gender focal points is that in most development organizations, the staff is made up of specialists with knowledge in specific fields, such as sanitation and hygiene, macroeconomics, education, maternal health, and so on. Gender specialists tend to have more technical knowledge regarding gender equality and gender mainstreaming, and are hired to provide technical assistance to the organization's staff. On the other hand, gender focal points are usually regular employees of the organization with their own mandate and role, who also take on the responsibility of coordinating and implementing the organization's gender mainstreaming strategy.
- c) **Tools and training.** Many organizations and agencies have also developed several tools to aid staff in the implementation of their gender mainstreaming strategies.
- *Gender Awareness:* the concepts and terms relative to gender mainstreaming are difficult to translate into other languages other than English, and to other contexts than those of developed North American and European countries. For this reasons, many organizations have developed tools (such as training material, manuals, and guidelines) to improve the level of gender awareness both within the organizations and throughout the organization's partners and fellow stakeholders.
  - *Gender Analysis:* most gender mainstreaming strategies call for an analysis of the impact of the organization's development policies with regard to women, primarily, but also to men. Gender analysis also refers to the analysis of the situation within the country and region in which the organization operates. Analysis of men and women's situations within the national and regional context should precede the creation of development programs, while the analysis of their impact logically comes second.
  - *Gender Statistics:* instrumental to the above tools and to the following is the segregation of national and regional statistics by sex. Sex-disaggregated statistics shed light upon the different situations of men and women in different contexts, and help to steer attention towards specific needs. For example, the disaggregation of nutritional statistics by sex can reveal that in a certain area boys suffer more from stunting than girls do, and can therefore provide an impulse toward the tailoring of nutritional programs in the area to address this specific issue.
  - *Indexes and Indicators:* in order to monitor progress towards gender equality, organizations such as the United Nations Development Program have created a series of indicators to aid development organizations in their battle for gender mainstreaming. Two of the most used indexes are the Gender and Development Index (GDI) and the Gender Empowerment Measure (GEM), both introduced by the Human Development Report 1995. The GDI is based on the same methodology used for the HDI, and therefore combines indicators relative to life expectancy, educational attainment, and income into a composite index which takes into account different social and economical dimensions of development. The GEM, on the other hand, measures the extent to which women participate in the economic and political life of a country, and takes the following indicators into consideration: political participation, decision making power, economic participation and command over resources. Used together, these indexes are useful to international organizations for monitoring the achievements made by the country in question with regard to women's empowerment and gender equality.
  - *Budgets and Auditing:* the importance given to gender issues in any government or organization can, obviously, be judged by the (monetary) value given to such aspects, and gender-focused budgets and audits show the entity of resources that an organization or government allocates to gender-related work.

## WOMEN IN INDONESIA: AN EXAMPLE OF GENDER ANALYSIS

The second part of this paper focuses on a case study of gender mainstreaming in UNICEF Indonesia. Specifically, field research was carried out in three provinces (Papua, Aceh and Nusa Tenggara Timur) to give an accurate and detailed picture of how the organizations was implementing its gender mainstreaming strategy in health and education programs, and at country office level. The first step in the process was to conduct a gender analysis of Indonesia at

regional and national level.

- *Socio-legal status of women in Indonesia*: The constitution of Indonesia, written in 1945 and since amended several times, treats men and women equally at the formal level, with its focus on the term ‘citizens’. [14] However, the national legal system coexists with *sharia* law in some areas (specifically, in Aceh *sharia* law has been in place since 2002) and with customary, or *adat* law in others. Even in urban centres, men are seen as the ‘breadwinners’ and often women stay at home to care for the family. Most ethnic groups in the country (there are over 300 ethnic groups in Indonesia, each with their own distinct culture and language) are based on patriarchal societal structures (some however present matrilineal or matriarchal cultures such as, for example, Central Flores, where the dowry system does not exist). In the general culture, women are seen as ‘*orang kecil*’, or ‘small people’.
- *Legal framework for gender mainstreaming*: One of the most important instruments for the promotion of gender equality at the international level (which also produces concrete consequences at the national level) is the Convention on the Elimination of All Forms of Discrimination Against Women. Adopted in 1979 by the General Assembly, the convention aims to eliminate all forms of discrimination against women contained in national legal frameworks and promoted by all enterprises and bodies within each State party. With some exceptions, such as in the case of protection for maternity or in the case of legal instruments for the suppression of forced prostitution, States are required to repeal all discriminatory provisions in their laws. The Committee on the Elimination of Discrimination Against Women monitors the implementation of the convention, and reviews State parties’ progresses in the elimination of discriminatory laws, practices and provisions in the national legal framework.

In order to complement (and contribute towards the implementation of) the legal activity that has taken place in the past decade, the Indonesian government has also put into place a series of mechanisms that should ensure the implementation of gender mainstreaming at all levels of government, both national and local. The primary institutional instrument is the Ministry of Women’s Empowerment, which has the task of realizing and monitoring the implementation of Presidential Instruction no. 9/2000.<sup>18</sup> The ministry is composed of members from other government ministries, such as Child Protection, Growth, Religion, Foreign Affairs, and so on. Furthermore, the ministry appoints Gender Focal Points in each government ministry, which have the task of monitoring and aiding the implementation of gender mainstreaming in all government actions. Finally, the Ministry was expanded in 2001 to include Child Protection and Welfare in its mandate. The ministry is also concerned with the coordination of official reporting on the compliance of Indonesia to CEDAW provisions, and works to further implement the convention through the achievement of gender mainstreaming in all government policies and programs.

Alongside the Ministry of Women’s Empowerment, the government of Indonesia has also placed other instruments, such as the Gender Working Groups, which can be found in virtually all government departments. Working together with Gender Focal Points and with the Ministry of Women’s Empowerment, these groups are made up of government officials working in different departments, and provide support for the implementation of the national gender mainstreaming directive. These working groups are present at *all* levels of government (local, district, provincial and national) and in all departments (from health and education to infrastructure and foreign relations). Furthermore, at the provincial level Women’s Empowerment Bureaus (Biro Perempuan) have been created for the coordination of the gender policy. All in all, the institutional framework for gender mainstreaming includes 29 Gender Working Groups, more than 30 Women’s Empowerment Bureaus, and more than 304 Gender Focal Points distributed in municipalities all over the country.

## MEASURING GENDER MAINSTREAMING IN UNICEF INDONESIA

The present case study is based upon a report elaborated under the United Nations Children’s Fund (UNICEF) in December 2010. In order to produce this report, a research on the effectiveness of UNICEF Indonesia’s gender mainstreaming strategy was conducted in three Indonesian provinces. The research team was made up of a Gender Specialist, assisted by one volunteer and two interns, all working within the Social Policy and Child Protection Cluster of the Jakarta Country Office. In September the team focused on general data collection and desk review, while in the following month the structure and methodology of the research began to take shape, and feedback from different clusters was received. Consultations with management figures and field offices followed. In November the team travelled to the field offices of Papua, Nusa Tenggara Timur and Aceh to conduct interviews and collect data. The following month, the collected material was elaborated and the final report was produced.

The main purpose of the research was to gain a better understanding of how UNICEF was mainstreaming gender in two specific areas, health and nutrition. Due to the fact that the research was carried out during the elaboration of UNICEF Indonesia’s new Country Program Action Plan (CPAP), the final report was of great use to the country office.

The two main objectives of the research were the following:

- to collect data and document ‘best practices’ in gender mainstreaming, within UNICEF’s education and nutrition programs in Papua, Aceh and Nusa Tenggara Timur;
- to develop observations and recommendations regarding UNICEF Indonesia’s gender mainstreaming strategy for the creation of a future action plan.

Focus of the research was the integration of gender mainstreaming within the project lifecycle, as well as the extent to which gender issues were being addressed by local (district and/or provincial) or national government bodies.

**Methodology**

Following the initial period of desk review, two specific UNICEF programs were chosen within the health and nutrition sectors. Within the education sector, Creating Learning Communities for Children (CLCC) was chosen, while the target program in the health sector was the Infant and Young Child Feeding program (IYCF). The rationale behind these choices was purely practical: the two programs were present in all three provinces, and UNICEF staff working on these programs was available for collaboration with the research team. In consultation with field office staff working in the two programs, a list of relevant stakeholders to interview was finalized. These came from schools included in the CLCC program, as well a *sposyandus*<sup>1</sup>, health centres (*puskesmas*), local government health, education and women’s empowerment offices, local religious communities, universities and NGOs. In total, the following 150 stakeholders were interviewed.

The sampling of these stakeholders, schools, NGOs, local communities, and health facilities was elaborated in consultation with local field office staff and did not follow any scientific methodology. Stakeholders and venues were chosen purely on the basis of availability and the extent to which they reflected the socio-economic diversity of the region (a division between urban and rural areas was necessary in all provinces). Given the limited time and resources of the research team, location and budget considerations were also influential in the sampling process. Through interviews and focus group discussions (FGDs) with the stakeholders listed above, the main body of qualitative data was collected, which allowed the research team to evaluate the extent to which gender issues were being mainstreamed in the two specific programs.

Quantitative data was also collected, mainly through national statistical surveys, as well as through UNICEF staff and Internal documents and research. The interviews with stakeholders were structured in order to respond to the following indicators (Table 1) The results that emerged from the interviews and focus group discussions were then integrated with the results of interviews with staff in the Country Office for a wider view of the gender mainstreaming strategy. The results, as well as observations and recommendations from the research team, were included in the final report.

**Tab. 1 - Indicators of Gender Mainstreaming.**

<b>Indicator</b>	<b>What does it measure?</b>
Girls’ participation in the classroom and in extra-curricular activities	The extent to which girls feel free to participate, as well as the extent to which teachers treat girls and boys equally
Girls’ and boys performance	Extent to which teachers treat boys and girls equally
Patterns of socialization between girls and boys	Gender roles
Seating plans	Extent to which teachers are gender-sensitive, as well as gender roles between boys and girls
Distribution of classroom duties among boys and girls	Extent to which teachers are gender-sensitive, as well as gender roles between boys and girls
Inclusion of gender issues in school curricula	Gender-sensitivity of national or provincial education policies
Gender sensitivity of teachers when interviewed	Gender sensitivity of teachers (as well as the effectiveness of any gender training they may have received within the program)
Inclusion of gender awareness in teacher training activities	Extent to which gender issues have been mainstreamed in the program project cycle, as well as the extent to which gender issues have been mainstreamed at the national and provincial government level in education policies
Equal training opportunities formal and female teachers/health workers/midwives/government officials	Extent to which gender issues have been mainstreamed at the national or provincial government level

<sup>1</sup> The term *posyandu* refers to particular health outposts dispersed throughout provinces in Indonesia, where basic nutrition and ante- and post-natal care services are dispensed to mothers and their children. While *posyandus* fall under the purview of local health departments, the *posyandus* included in the sample worked in partnership with UNICEF to deliver basic health services to mothers and children.

Number of women in key decision-making positions	Extent to which gender issues have been mainstreamed at the national or provincial government level
Participation of mothers in school and committee activities	Gender roles between mothers and fathers
Participation of fathers in school and committee activities	Gender roles between mothers and fathers
Attendance of mothers at the <i>posyandus</i>	Gender roles between mothers and fathers
Attendance of fathers at the <i>posyandus</i>	Gender roles between mothers and fathers
Inclusion of gender issues in the training activities of midwives and health workers	Extent to which gender issues have been mainstreamed at the national or provincial government level, as well as the extent to which gender issues have been mainstreamed in the program project cycle

### Building the Gender Mainstreaming Index.

The data collected during the research on the field was then elaborated in order to build a 'gender mainstreaming index'. It should be noted, first of all, that the data available lacked scientific value and was collected using arbitrarily assigned sampling methods. This was due to budget, time and capacity constraints of the research team. Furthermore, the construction of the index necessarily entailed arbitrary decisions based on practical and theoretical knowledge of gender mainstreaming in health and education. This can also be witnessed in the indicator table above, where the indicators and the dimensions that they measure have been constructed based on knowledge picked up after extensive research on the subject and after a (relatively) substantial amount of time spent in the field interviewing all stakeholders involved.

The first step in the construction of the index was the identification of the different dimensions relative to the implementation of gender mainstreaming, both in health and education. For education, Table 2 illustrates the dimensions of gender mainstreaming and the relative indicators.

**Tab. 2** - Dimensions and indicators of gender mainstreaming in Education.

Dimension	What does it measure?	Indicators
UNICEF Field Office	Extent to which UNICEF's gender mainstreaming strategy is being implemented at the field office level	<ul style="list-style-type: none"> <li>- Understanding of the term 'gender mainstreaming'</li> <li>- Awareness of UNICEF's gender mainstreaming strategy</li> <li>- Implementation of UNICEF's gender mainstreaming strategy</li> <li>- Gender-responsive budgeting</li> <li>- Collection of gender-disaggregated data</li> <li>- Gender awareness training</li> </ul>
Government Education department (district and provincial level)	Extent to which UNICEF has collaborated with local authorities involved in the selected programs for the implementation of gender mainstreaming	<ul style="list-style-type: none"> <li>- Understanding of the term 'gender mainstreaming'</li> <li>- Gender awareness training for officials</li> <li>- Women in key decision-making positions</li> <li>- Equal training opportunities for men and women</li> <li>- Gender policy at district/provincial level</li> <li>- Collection of gender-disaggregated data</li> <li>- Gender-responsive budgeting</li> </ul>
Parents of children attending CLCC schools	Extent to which the gender mainstreaming strategy is being implemented in the CLCC program	<ul style="list-style-type: none"> <li>- Understanding of the term 'gender equality'</li> <li>- Participation of both parents in decision making</li> <li>- Participation of both parents in school committee activities</li> </ul>

Teachers who work in the CLCC schools	Extent to which the gender mainstreaming strategy is being implemented in the CLCC program	<ul style="list-style-type: none"> <li>- Understanding of the term 'gender mainstreaming'</li> <li>- Gender awareness training for teachers</li> <li>- Participation of boys and girls in classroom activities</li> <li>- Participation of boys and girls in classroom tasks and chores</li> </ul>
Head teachers who work in the CLCC schools	Extent to which the gender mainstreaming strategy is being implemented in the CLCC program	<ul style="list-style-type: none"> <li>- Understanding of gender mainstreaming</li> <li>- Gender awareness training for head teachers</li> </ul>

The indicators selected reflect a relatively comprehensive picture of gender mainstreaming: understanding of the term, gender awareness training, disaggregated data and gender-responsive budgeting. These elements have been listed in the previous chapter as necessary tools for almost every gender mainstreaming policy. The indicator 'awareness of UNICEF's gender mainstreaming policy' was necessarily added during the interviews, when it became clear that hardly any UNICEF officers had even heard of the organization-wide strategy. This also shows that all manner of policies and directives can be set at the organization's headquarters, but it takes a great deal of effort to make them trickle down to the field office level, and directly into the programs that the organization puts into place.

Another dimension identified relative to gender mainstreaming was that of the provincial and district education department. It has already been mentioned that the purpose of gender mainstreaming is to actively promote gender equality, and a necessary level of action was that of local government. Seeing as curricula are established by the provincial and district education departments, and it is these departments that also nominate teachers, head teachers and administrative staff, as well as organizing training courses for school staff, it was necessary to measure the extent to which gender issues had been mainstreamed within the local Indonesian government, as well. This was done in relation solely to those officials involved with UNICEF in the CLCC program, seeing as the focus of the research was UNICEF's gender mainstreaming strategy and how, through the CLCC program, local government was also affected. The same rationale stood behind the dimensions relative to teachers, parents and head teachers of the CLCC schools, all of which gave an indication of how gender issues were being mainstreamed by the program.

The interviews carried out followed different sets of questions, due to the fact that the question sets were changed several times during the field research. When looking back on the transcripts, it was possible to identify 'yes/no' answers to each indicator listed above, by re-formulating the answers given to interview questions as 'yes/no' answers. Once the indicators were re-formulated, the interview transcripts were re-read and answers to the questions were found, even though the original questions did not follow the same structure. For each indicator, therefore, a dummy variable was created by assigning a value of one to 'yes' answers and a value of zero to 'no' answers, indicating the fulfilment or not of each particular indicator. This was repeated for each subject (school, teacher, head teacher, officer, government official, etc.) in each district, and the mean was calculated by finding the sum of each variable and dividing by the total number of indicators. The mean for each district was found by summing up the results for each subject and dividing by the number of subjects. For example, if one school in Aceh obtained a score of 0.50 for the teacher dimension, and another school obtained a score of 0.75, the total score for Aceh with regard to the teacher dimension would be the mean between these two scores, leading to a total score of 0.63. The total 'gender mainstreaming' score for each province was found by calculating the mean of the dimensions for each province. For the health programs, the same methodology was used. Due to a much smaller sample size for IYCF programs (33 stakeholders) than that of the CLCC programs (117 stakeholders), the results obtained for health and nutrition programs are less reliable than those for education. Finally, an overall gender mainstreaming score in education and in health and nutrition was found for each province.

## RESULTS

The results showed better overall results for all three provinces in education, with lower scores in health. Aceh obtained the best gender mainstreaming score in education, while Nusa Tenggara Timur scored highest in health and nutrition.

The average score between all three provinces was 0,48 for education and 0,33 for health and nutrition.

The following scores were obtained for each province:

**Tab. 3** - Gender Mainstreaming Index score for health and nutrition.

Dimension	Province		
	Aceh	Papua	NTT
UNICEF Field Office	0.17	0.17	0.00
Government health department (district and provincial level)	0.29	0.29	0.43
Midwives and health workers	0.40	0.40	0.80
<b>Total Provincial Score</b>	<b>0.29</b>	<b>0.29</b>	<b>0.41</b>

**Tab. 4** - Gender Mainstreaming Index Score for education.

Dimension	Province		
	Aceh	Papua	NTT
UNICEF Field Office	0.17	0.33	0.17
Government education department (district and provincial level)	0.64	0.52	0.43
Teachers	0.50	0.25	0.25
Headteachers	0.63	0.63	0.67
Parents	0.67	0.52	0.67
<b>Total Provincial Score</b>	<b>0.52</b>	<b>0.48</b>	<b>0.44</b>
<b>Average</b>	<b>0.48</b>		

## CONCLUSIONS

Despite the challenges presented by the strategy, many benefits have stemmed from its implementation in the work of international development organizations. The object of the author's experimental research was precisely the effectiveness and impact of UNICEF Indonesia's gender mainstreaming strategy. While the situation of women in Indonesia has improved considerably over the past decades, many challenges remain. Universal primary education has been reached in almost all Indonesian provinces, but due to poverty and workloads at home many girls are still forced to drop out in some of the poorer areas of the country. Many less girls than boys attend university, and most marry between the ages of 18 and 25. Malnutrition, both among mothers and, most of all, among children, is a worrying issue in many provinces (in particular in Nusa Tenggara Timur). The rate of violence against women has decreased across the country, although it remains shockingly high in some provinces. Even today, after having had a female president for three years, women are under-represented in parliament and excluded from the elitist and heavily corrupt political life of Indonesia. Women participate in the workforce, mainly in agriculture and retail or manufacturing activities. The Indonesian government has been active in the past decades with legislative efforts to eliminate discrimination against women in these areas, particularly inside the government structure.

The picture that emerged from the interviews was mixed. Among many stakeholders there was at least a minimal understanding of the terms gender equality and gender mainstreaming. This, however, was offset by a complete lack of understanding among other stakeholders, mostly in local government departments. Within the UNICEF Field Offices, many staff members were unaware of the existence of a gender mainstreaming strategy, although the desire to learn more about it and to put it into practice was expressed frequently. This result was coupled with a complete lack of gender awareness training and implementation of the government gender mainstreaming policy in the education and health departments. The reasons for which staff members were not aware of the gender mainstreaming strategy were mainly two: firstly, although the strategy *had* been communicated throughout the country office, lack of accountability on gender mainstreaming, as well as time and workload constraints on staff members, ensured that the strategy was not put into place.

Secondly, the lack of an effective Gender Focal Point and Gender Specialist network undermined efforts to implement the strategy at the field office level. However, thanks to the arrival of a Gender Specialist during the field research period and to the increased visibility given to the strategy for the purposes of the field research, gender focal points had been named in each country office even when they had not previously existed. This is an encouraging result that, with appropriate follow up and capacity building, could bring to the effective implementation of the gender mainstreaming strategy throughout the field offices in Indonesia.

Both the qualitative and the quantitative results show that there *has* been progress in implementing the gender mainstreaming strategy in the three provinces, although much work still needs to be done. The regional gender strategy, with its focus on the four areas listed above, should be much more widely publicized and staff should be held accountable for its implementation, particularly at the Field Office level.

Overall, gender mainstreaming as a strategy has made much progress since the Beijing conference. By now, it is almost a must within international development organizations. UNICEF Indonesia's gender strategy could contribute widely to the elimination of gender inequality in the country, if it is properly implemented. There *are* barriers to its implementation, as discussed above, which can easily be overcome. Although the organization is already on the right track, some changes and improvements could do much to improve the situation of women in Indonesia through gender mainstreaming.

## ACKNOWLEDGMENTS

Acknowledgment and profound thanks go to Professor Simona Beretta, who oversaw the research and provided guidance and advice throughout. A second word of thanks must go to Angela Kearney, UNICEF Indonesia Representative, and Marcoluigi Corsi, Deputy Representative (now Country Representative for Bolivia), who provided the unique opportunity of working for UNICEF Indonesia, as well as continuing support and advice. All staff members of the UNICEF Indonesia Country Office, as well as of the Aceh, Papua and Nusa Tenggara Timur Field Offices, must be acknowledged for their patience and support.

### ABSTRACT

The use of indicators as tools to summarise large amounts of data, providing information as comprehensive as possible about a particular phenomenon, it is largely shared by the academic world. Nevertheless, it may be noted how the supply and the availability of gender indicators, applied to the specific framework of natural resources and agriculture, are very limited, especially in developing countries. This research would therefore analyse this lack, focusing on the importance of identifying gender indicators in rural settings of these Regions, comparable over time and space. Gender indicators in agricultural developing contexts can have multiple purposes: they can be a methodological resource for the comparative analysis of gender in the stages of feasibility, monitoring and evaluation of cooperation projects, focused in rural-agricultural issues, as well as having an impact on national agricultural policies, lobbying and advocacy. For this reason, in a general turmoil context like the present, characterised by the debate on the new Sustainable Development Goals, included in the Post 2015 Development Agenda, gender indicators in agricultural contexts may play an important role as support instrument for the new global instances. Moreover at micro level, the development and the provision of gender indicators, as much as possible qualitative and all-encompassing, would appropriately supplement the deficiencies in statistical terms frequently observed by technicians and researchers, both at national databases level, both within national or regional specific field surveys, particularly in the Southern countries. In conclusion, the need to measure the actual incidence of women in natural and agricultural resource management, could be translated in the development of indicators gender-sensitive oriented, to be used as a tool to analyse, and possibly promote the active participation of women in political and economic life in the North as in the South of the world.

### THE RESEARCH BACKGROUND

Indicators are commonly defined as tools able to summarize large amounts of data with the purpose of representing a dynamic situation (i.e. time trends of the level of education, average number of children, etc.) and, therefore, with the unique task to “state” [1]. Accordingly the problem of qualitative and quantitative indicators, such as gender and social indicators [2] immediately arises, in which numerical information is almost never sufficient and it needs to be complemented with qualitative analyses (often more complex than quantitative, especially if one-dimensional, i.e. based on only one type of data).

In order to make information comparable with each other, it must be added the difficulty to standardize them, since who works with these data is obliged to scaling operations. The situation becomes even more complicated when gender indicators in rural areas are considered, where there is a less accessible location for the information, such as the Sahelian villages are. If on one hand is complex obtaining national data disaggregated by sex, on the other hand is even more difficult to gather local data, often completely excluded by the national statistical supply.

Another critical aspect is related to the definition of indicators to measure the level of gender “empowerment/un-empowerment”. Naila Kabeer [3] gives a definition of empowerment as a possibility to make strategic life choices in a context in which these choices were first denied. The empowerment of women thus involves both the importance of increasing their strength decision-making, both the right to determine free choices in their life and to influence the direction of change, through the ability to increase their control over resources and materials [4].

The UNDP (United Nations Development Programme) has tried to quantify this dynamic change from a gender point of view, introducing in the Human Development Reports [5] the GEM (Gender Empowerment Measure), aimed to highlight the level of participation of women in political, professional and economic sectors. This indicator was however, soon questioned by several authors [6] for different reasons. For instance, the GEM does not measure gender inequalities since it only concerns women with higher levels of education and economically advantaged and political situation at national level as well; in fact it does not take into account the contexts economically less visible and comprehensive by statistics such as the rural areas. For these reasons subsequent amendments were proposed [7].

The gender empowerment is not just a set of quantifiable information, but is also a mixture of motivations and objectives that accompanies the actions of men and women towards change and new opportunities (“the agency”) and it

is certainly not efficiently represented by only one indicator [8].

Moreover, according to other authors, no indicator, although articulated, is able to capture the subtle implications of power relations which are established among different stakeholders in the processes of change and empowerment. Accordingly this “numerical” approach has to be combined to targeted qualitative analyses [9].

The measure of change and the decision of which aspects to measure and how to measure them as well, is thus something complex and cannot be attributable to a mere technical exercise, especially if the progress is measured in terms of gender equality, which also entails a strong political component [10].

With respect of the overall problem complexity, this study intends to suggest gender indicators to implement a development project aimed to improve the subsistence level and the quality of life of the population across a rural area of sub-Saharan Africa. Another goal of the paper is to reflect on the effectiveness of these indicators as well as on their contribution (or not) to a more equitable implementation of such development projects.

Whit this regards a sample case represented by the Senegalese Statistics Information System was individuated. In particular the analysis was focused on the national statistics supply and the general tendency related to the gender dimension at regional and national level, as well as applied to the specific sector of agriculture.

This research was developed in the framework of a field survey carried out by the authors in Italy and in Senegal in 2013. The latter was an enquiry conducted under the umbrella of an international project held in Senegal and aimed to improve food security and agricultural production in some specific regions of the country. This project is expected to involve a target of about 3000 women. In particular, the project aims to provide small irrigated plots of land, designed for activities of horticulture and fruit production (in which traditionally women play a key role) and that will be managed in according to communitarian principles.

Therefore, since the mentioned project presents a strong technological component, the need to analyse in a critical way some specific issues as fair access and management of technology as well as technical trainings to women involved in the project, appears fundamental.

Considering the access to technology, many studies conducted in Senegal [11], have shown evident differences between men and women, in terms of access to resources and management of technological applications, especially in the agricultural field. But these disparities do not forcibly entail negative effects for women. Indeed it seems that in some cases, provided that they can count on a fair and available access to technology, women have proved more entrepreneurial and innovative than men.

## **THE RESEARCH METHODOLOGY AND THE INDICATORS ELABORATION**

The methodological choices of the field survey were organised as following.

After having individuated the main subjects to assess in relation with gender and agricultural sector, a statistical matrix aimed to collect data was set-up and divided into five different sections namely:

- demographic indicators;
- social indicators;
- economic indicators (with a special focus on rural context);
- occupation in the agricultural sector and grass-roots organisations;
- agricultural production for exportation.

On the basis of the available data three indicators for each region interested by the project were elaborated: a Nutritional Index, an adjusted Gender Inequality Index and an Index of Economically Qualified Presence of Women and Men in Agriculture.

In this framework it should be specified how the analysis carried out at regional level, although if more specific than that of the whole, will never be able to identify what is really happening in rural communities, in villages and individual *ménage*, which can be investigated only through direct interviews.

The context of analysis consists in three bordering regions, two of which geographically and economically more advantaged (with access to sea and commercial activities), while the third is more inland, drought-prone and not provided with an efficient road network.

Regarding the specific characteristics of the sample, Region 1 consists in 50 rural communities and municipalities, compared with 36 in the Region 2 and 39 of the Region 3. In particular, Region 2, larger than the others, is the region with the greatest rural extent, while in Region 3 a more pronounced population residing in urban areas exists. In contrast, a more uniform distribution of the population between rural and urban areas is observed in Region 1 (Table 1).

**Tab. 1** - Distribution of the population in the three analysed regions.

	NATIONAL		Region_1		Region_2		Region_3	
	Women	Men	Women	Men	Women	Men	Women	Men
Total population	6,348,578	6,506,575	849,12	849,3	382,9	387,29	668,17	731,05
Urban	6,101,448		872.814		104,67		891,44	
<b>Rural</b>	<b>6,753,705</b>		<b>825,6</b>		<b>665,52</b>		<b>507,78</b>	
Area (km <sup>2</sup> )	196,72		6,6		7,05		4,86	
Ratio urban/total	0.47		0.51		0.14		0.64	
Ratio rural/total	0.53		0.49		0.86		0.36	
Total population / km <sup>2</sup>	65.35		257.45		109.26		287.79	
<b>Rural population/km<sup>2</sup></b>	<b>34.33</b>		<b>125.15</b>		<b>94.41</b>		<b>104.44</b>	

On the gender dimension, although women in the three regions are numerically slightly higher than men, it is not possible to know whether they are more prevalent in rural areas (as it might be supposed).

In the Table 1 it can be seen significant findings of the lack of specific gender oriented statistics in rural areas, while an interesting question emerges from Table 2, in which is evident that in Region 3 the percentage of emigrants men is significantly higher than in the other two Regions.

**Tab. 2** - Number and percentage of emigrants (per sex and per region).

	NATIONAL		Region_1		Region_2		Region_3	
	Men	Women	Men	Women	Men	Women	Men	Women
Total population	6,348,578	6,506,575	849,12	849,3	382,9	387,29	668,17	731,05
Emigrants	144,527	32,164	10,479	2,255	4,107	1,502	16,506	929
%	<b>2.3</b>	<b>0.5</b>	<b>1.2</b>	<b>0.3</b>	<b>1.1</b>	<b>0.4</b>	<b>2.5</b>	<b>0.1</b>

Instead, in respect to the elaboration of the three indicators and the sources of data as well, firstly a discriminating indicator on the under nutrition of the population was identified, using the percentage of malnourished children (under 5 years) and their mortality rate, together with the BMI (Body Mass Index) of the adult population.

The Body Mass Index (expressed in kg/m<sup>2</sup>), is a factor that helps to identify segments of the population underweight: if  $18.4 < \text{BMI} < 17$  we are in presence of a chronic energetic deficiency, while if  $\text{BMI} < 17$  the thinness is considered severe. The nutritional indicator is a percentage (ranging between two extremes never reached in practice, 0 and 100 and very similar to the Global Hunger Index, GHI) which indicates that the population in some way may suffer from nutritional and environmental problems (information provided by data on children, Table 3).

**Tab. 3** - Undernourished population, with BMI<18,4.

	NATIONAL		Region_1		Region_2		Region_3		Source
	Men	Women	Men	Women	Men	Women	Men	Women	
% undernourished children (age<5)	0.19	0.17	0.15		0.11		0.19		EDS V
children mortality rate (age<5)	0.0091	0.0083	0.0053		0.0088		0.0104		EDS V
BMI<18.4 (significant thinness)	0.282	0.220	0.242	0.208	0.253	0.161	0.409	0.295	EDS MICS
<b>Nutritional indicator</b>	<b>15.9</b>	<b>13.2</b>	<b>13.4</b>	<b>6.9</b>	<b>12.5</b>	<b>5.4</b>	<b>20.3</b>	<b>9.8</b>	calculated

In Table 3 the indicator of under-nutrition is always higher for men than for women, both at National and Regional level, with a dramatic 20.3 registered in Region 3, while Region 2 seems to be less in emergency.

The second indicator that was calculated, the GII (Gender Inequality Index), entailed some problems. The GII is a measure that captures the loss in achievements due to gender disparities in the dimensions of reproductive health, empowerment and labour force participation. Values range from 0 (perfect equality) to 1 (total inequality). GII is a composite indicator, which involves two indicators to measure women's reproductive health (the maternal mortality ratio and the adolescent fertility rate), two indicators to evaluate women's empowerment (educational attainment, secondary and above, and parliamentary representation) and the labour force participation indicator.

Specifically data on regional maternal mortality were taken from the National Demographic and Sanitary Survey of 2012 [12] as well as those relating the teenager fertility. Whereas the information on the level of education (divided by gender) as well as the number of economically active women and men, were obtained during the mission carried out in Senegal in March 2013.

Instead, obtaining data on the presence of women and men in local institutional charges (regional, provincial and municipal) was much more complex: in fact, this specific data provided during the field mission, were related to the period 2002-2007 and not divided by region. Nonetheless, through information made available by the Gender Laboratory of the University of Dakar and thanks to other researches [13] it was possible to estimate fairly accurately the political presence of women and men within the three Regions.

Therefore all these data were used to calculate the adapted Gender Inequality Index (aGII). In particular the aGII at National level (0.56) is equal to the GII reported in the Human Development Report of 2013 [14], while the adapted index of gender inequality is slightly higher in Region 1 (0.577) and even more in Regions 2 (0.611) and 3 (0.624).

However what neither the indicator on food security conditions, nor the aGII show, is what happens in the countryside to compare with the urban space. Indeed regional data are important and more detailed than the national: but what about, for example, on the level of schooling at least to the second level (as required by the aGII) in the cities than in the countryside? In addition to the (not secondary) aspect relating to the economic resources of families living in rural areas, i.e. are there roads and schools easily reached by boys and girls in the countryside? And again, what about the presence of accessible health centres, which considerably influence the maternal and child health levels of population? Are they really accessible to the villages of rural communities? Obviously these considerations are valid also for all other sub-indices and indicate that a gap, if already exists at the level of the different regions of Senegal, is amplified within the single Region and, even more, in the rural districts.

Moreover, from the information provided during the field mission of March 2013 (and divided by sex) we attempted to establish an index of the significant presence of women and men in agriculture, to be compared with that corresponding in rural and in urban areas as well. In synthesis, the following sub-indices (all divided by gender) were used, in order to calculate the presence of economically qualified women and men in agriculture:

- adults literacy rate;
- percentage of economically active population in agriculture;
- percentage of people responsible for resources in agriculture (obtained from the sub-index of the economically active population);
- percentage of economically active population in rural areas (not necessarily corresponding to the agricultural sector, since includes services, trade and other activities performed in rural areas but not strictly related to agriculture);
- percentage of economically active population in urban areas.

Finally the indices shown in the graph of Figure 1 have then been obtained: some numbers between 0 and 1 (as deducted by percentage).

**Fig. 1 - Economically Gender Qualified Index in Senegal and in the three sample Regions.**

We can note how in all sample regions, the index of the economically qualified presence in agriculture penalizes women, especially in rural areas. At the same time in the urban context the indexes of economically qualified presence are more similar for men and women, as well as even still much lower.

## THE STATISTICAL SUPPLY ON GENDER ISSUES IN THE AGRICULTURAL SECTOR: AN OVERVIEW

With regards to the outputs of the field research, first on the basis of the preliminary results, it can be noted how in Senegal accurate data disaggregated by gender in agricultural contexts or do not exist, or are not available, or are available primarily through direct qualitative surveys (which is difficult to access, especially if conducted by other institutions or international organisations, as already highlighted by the first analyses on gender and statistics [15].

However the consideration of the need of having gender-specific data, related in particular to the agricultural sector, is not new to researchers who have already worked on it in Senegal. Indeed this aspect was already pointed out within the planning document for the National Strategy for Gender Equality and Equity (“SNEEG 2015”), in which is deplored the lack of gender disaggregated data, in particular relating to the sub-sectors of agriculture [16] (as those related to processing, marketing, horticulture and so on, or rather the activities in which rural women hold traditionally an important position).

In regard to this element, among the factors attributable to such deficit of data, the role played by the insufficient political will and support on the development of national policies would be evident. Furthermore a weak involvement in the negotiations of that civil society more active and interested in these subjects is often observed. Therefore, to deal with this limit, the necessity to create and promote favourable conditions to the collection of gender-specific data in the agricultural context (and not only), released at national and decision-making level and with regard to the real weight of women in agriculture, is increasingly necessary [17].

Nevertheless, it must be stressed that, even if on the one hand, within some specific national policies (as the same new National Strategy on Economic and Social Development) [18], the will and the need to address the lack of statistical data seem to be largely widespread; on the other hand, analysing more closely the types of indicators selected, gender issues still appear marginal.

In addition, in order to obtain a complete picture of the situation of gender in agriculture (as well as to supplement the lack of official data) the elaboration of gender sensitive indicators is not exhaustive. For this reason, as sustained by several authors [19], the use of qualitative research in the field, to be conducted at a representative sample of the target audience by the means of participatory methods, should also be addressed. However, in this context another set of problems arises: that often related to the failure to recognize and officially validate data collected through sample surveys on the ground, which consequently cannot be fully exploited and used at central level. Accordingly, a method of harmonisation of data in order to compare them at regional and national level, should also be identified.

Whit regards to this, it is even necessary to implement a deep sharing of the research outputs (present and future) with all the stakeholders implicated by the development projects, whether direct and indirect beneficiaries, active subjects of the preliminary field investigations as well as the internal staff of public bodies.

Other aspects that have been repeatedly cited are the will and the need to set up a joint database, accessible and available to all relevant stakeholder active in the field of the gender issues in agriculture. However many obstacles still exist, such as the extreme fragmentation of initiatives relating to this issue, the lack of coordination between them, the weak relations between technical staff and local authorities as well as the financial problems (especially at regional level). To deal with these weaknesses a proper management of such a hypothetical database shall be ensured. At the same time a better coordination of the information sharing as well as of the networking among the different levels involved, has to be pursued.

In order to provide an overview as complete as possible of the statistician resources (available at national and regional level) and related to the issue of gender in agriculture in Senegal, the second part of our study was consisted in a detailed analysis of all the available documentation (the most updated) concerning the gender aspects within the country.

One of the first element issued by the preliminary analysis is how the overall documentation sources can be considered particularly "virtuous" in the world of Senegalese statistics, since they generally offer the double advantage of having gender-disaggregated data and/or by region.

At this point a question arises: how to examine the level of detail of gender issues (related to both the agricultural sector and the regional dimension), developed within some of the major works and in relation to the specific statistical requirements of the study (a point that will be significantly explained in the second part of the analysis).

Nonetheless, in the matter of the statistical sources specifically dedicated to the agricultural sector, within the national reports there is no reference nor to the gender nor to the division by age of farmers. This could be explained with the apparently attention focused only on the strictly gross production of the Senegalese horticultural sector, ignoring the more qualitative dimensions, which instead would contribute to obtain a more complete picture of who actually works in the overall sector.

Actually, the evidence that all the statistical efforts are focused solely on produced quantities (i.e. t/ha, income/ha, main agricultural production,...) and exploited areas, is easily traceable to such data for production and export crops are the most popular. This latter could be explained in the light of the economic weight and the consequent strong influence in the decision-making processes, represented by the horticultural export sector in a country as Senegal [20]. In regard to this, it is not surprising to observe how these types of data (that symbolise directly the interests of agribusiness, mostly foreign), are more easily traceable and mastered by the two major professional organisations of the country: the ONAPES - “Organisation Nationale Des Producteurs Et Exportateurs De Fruits Et Légumes” (which manages the 80% of exports) and the SEPAS - “Sénégalaise de Produits d’Exportation et de Services” (which holds the remaining 20%)

[21]. This context reveals some criticism: the first concerns the fact of concentrating the management, dissemination and acceptance of such a data base, in the hands of the major professional organisations of the country. It is natural to wonder what happens to small producers not incorporated within a formal body or even more to women producers, largely excluded from these organisations, and therefore not calculated within the statistical estimates, as could be proven by the absence of specific indicators related to their particular status [22, 23].

A second critical aspect, partially connected to the first, is referred to the solely focus of the management system and data collection on export crops, ignoring the crops for self-production [24], which play a key role in the food security of Senegal. This element would lead to think that where there are interests and economic resources, data can be formalised, computerised and well managed. It would imply that, to achieve similar results (in terms of availability and efficiency of statistics) but applied to other agricultural sub-sectors and more focused on the welfare of small farmers and their families, large international investments should be envisaged.

In relation with the more specific aspects of gender, the first element is that is not possible to identify, among all the available statistical sources, any document explicitly and exclusively dedicated to gender issues (except for the SNEEG 2015, but which does not constitute a statistical source in the strict sense). Therefore, we proceeded to analyse how the gender component (relating to the socio-demographic and more purely agricultural-economic variables) was present/available (and at what level of detail) within the supply of statistical information.

In synthesis, on the basis of the examination of the main Senegalese statistical sources and policies documents [25] as well as in according to the outcomes of the mission of March 2013, the statistics failures related to gender (in agriculture or not) in a country as Senegal, may be summarized in the following open questions:

- the weak mastery of the concept of gender as well as its utility, noted by the same human resources within the National Statistical System;
- the lack of coordination at the level of gender statistics production, as well as between producers and farmers, and producers and users; the insufficient consideration of gender in planning and implementation of the activities of data collecting, processing and analysing;
- the weak consideration of gender issues in sectorial programs (for instance in the new Agricultural Programme 2011-2012 [26] the word gender is never mentioned) and within the national budget; as well as the most frequently cited, limited application of the gender dimension to the field of socio-demographic statistics (population, education, health...);
- the difficulties of data centralisation due to the cross-cutting nature of gender, an issue involving in a different ways many sectors of the economy and society; the insufficient level of information and/or knowledge on gender issues registered at all levels (i.e. both in relation to the whole population, both to technicians and professionals, as well as to the political and managerial class);
- the absence of a clear methodology and tools designed to the integration of the gender dimension in the statistical production.

As occurred in the wider issues strictly related to gender, also with regards to the regional dimension of the Senegalese statistics, it is possible to identify different levels of complexity, such as:

- the multiplicity of actors involved (users/producers) without an unified framework of consultation/coordination;
- the vulnerability of the institutional framework and the methodology to collect, archive, and spread harmonized data, aimed to manage and make as effective as possible the dissemination of the regional statistics information;
- the inadequacy of human and material resources available to the various regional services of the National Statistical Agency (“ANSD”);
- regarding the specific agricultural sector, the more often criticized, lack of opportunities for consultation with producers, which can help both the technicians to obtain more specific and complete investigations, both the producers themselves to be more involved and aware of the importance of the whole statistical process as observed by several field researches [27];
- the limited decentralisation of the regional statistics services (both in terms of decision-making power, as well as financial availability and independent resources management).

In brief it is possible to extrapolate a series of cross-cutting issues to the different above mentioned aspects (i.e. data supply on: gender, regional dimension and agricultural sector) such as the weakness of the institutional framework and the lack of coordination among the different statistical areas, combined with a multitude of sources and the absence of a permanent system of consultation and harmonisation of data.

In addition, the already cited problems related to the financing of the statistics field. In relation to this, we can note often, sample surveys conducted on the ground, but only thanks to the intervention of an international donor directly affected by that specific issue (a factor that limits the impact of these surveys, as well as a widespread sharing of its outputs among multiple actors, especially considering time and costs occurred for this type of activities).

At methodological level, there are other obstacles related to data processing, such the archive and dissemination of

statistical information, the latter linked to the excessive length of processing data phase, which results in the fact that often the data processed are already old at the time of their publication.

## CONCLUSIONS

In conclusion, the integration of gender issues within the Senegalese statistics (especially at regional and local levels) should go hand in hand with public policies more attentive to gender and its concrete implementation, in the overall areas of Senegalese economy and society. The two sectors should proceed jointly, in particular by virtue of their close connection, which is necessary on the one hand, to gender policies to find more support and feedback in the reality (as facilitate awareness of multiple stakeholders on the importance of gender); and useful at the same time, to the statistics to achieve a greater recognition of its usefulness. A recognition that could help the sector to attract more (national and international) investments as well as an improvement of the management of the whole system.

This research was focused on the identification of gender indicators to use in the specific context of rural development projects. The case study was limited to Senegal, in the framework of an international development project. However, the authors purpose is extend the impact of these indicators in different geographic and cultural contexts, but even related to gender issues in rural environments. In particular, the nature and the incrementing complexity of these indicators could be suitable to evaluate the effective participation degree of women in development and rural projects, starting to evaluate their general level of empowerment and the main obstacles to access to the same rights, inputs, resources (as the property of land) and decision power than men. Furthermore, the elaboration of multiplex gender indicators could constitute an efficient tool for national and sub-regional gender policies as well as lobby activities.

## ACKNOWLEDGEMENTS

This work was carried out in the framework of the IAO Gender, a project funded by the General Direction of Development Cooperation (DGCS) of the Italian Ministry of Foreign Affairs and managed by the “Istituto Agronomico d'Oltremare” (IAO) of Florence. The research was realised under the supervision of Prof. Gabriella Rossetti while in Turin was organised by the CISAO (“Centro Interdipartimentale di Ricerca e di Cooperazione Scientifica con i Paesi del Sahel e dell’Africa Occidentale”).

The authors thanks the director and all the staff of DGCS and IAO as well as the director and the members of the Local Technical Unit (UTL) of Dakar and the ANSD representatives for their support and cooperation.

# ACCESS TO WATER AND THE NEXUS WITH FOOD, ENERGY AND LAND: THEMES AND INDICATORS FOR THE POST2015 GLOBAL DEVELOPMENT AGENDA

Emanuele Fantini\*

\*Department of Cultures, Politics and Society, University of Turin, Italy – [emanuele.fantini@unito.it](mailto:emanuele.fantini@unito.it)

Scholars and practitioners are currently discussing new sets of water goals, targets and indicators in order to contribute to the definition of the post 2015 global development agenda and the UN Sustainable Development Goals. The panel aimed at contributing to this debate, addressing future scenarios on access to water and on water resources management, and advancing proposals on themes, goals, and processes to be included within the post 2015 global development agenda. The panel adopted a multidisciplinary approach (involving lawyers, political scientists, geographers, engineers, geologists, agronomists and planners), highlighting the interaction between the technical aspects and the socio-political dimensions of access to water and water resources management.

Water policies negotiation, both at global and at local level, should be understood and assessed in the context of two main – and sometimes competing – trends. On one side the growing consensus registered in international fora around the framework of “the water, food and energy nexus” – sometimes explicitly including within this nexus also “land” or “climate change”. This approach highlights the interdependence of water, energy and food security and the natural resources that underpin that security, such as land. While this trend might offer a coherent framework to address in a comprehensive way sustainability issues, some have pointed at the risk of securitizing water issues. Moreover the approach underpinning the nexus remains firmly anchored in the modernist perspective representing water apart from its socio-cultural context and reducing it to the mere H<sub>2</sub>O resource.

On the other side, social movements, local authorities representatives and scholars are increasingly framing water issues in terms of human rights and the commons. The trend emerged firstly as a reaction to processes of privatisation of water supply services, particularly in urban contexts, both in high-income and low-income countries. From reclaiming public water, these positions have been further articulated in order to highlight the plurality of water’s meanings, its cultural, social and political dimensions. This trend has been described in terms of “water re-socialisation” or “hydrosocial renewal”. It contributes to highlight the moral economies of water, i.e. the sets of moral norms and obligations expressing popular perceptions of legitimacy and justice in relation to collective wellbeing, economic transactions and the role of institutions in water resource management. These claims cannot be overlooked in the definition of future global and local water policies that aspire to be morally and politically legitimate in the eyes of citizens and public opinions.

Bearing in mind this background, the papers presented in the panel addressed the broader issues of power relations in water management, the role of scientific knowledge in shaping these relations and the institutional frameworks that might mitigate conflicts or inequalities in access to water and water resources management.

Massimo Zortea (University of Trento – UNESCO Chair in Engineering for Human and Sustainable Development) presented a paper on “Environmental mainstreaming and integrated policies in development cooperation after Rio+20: the emblematic case of water and food”. He highlighted how environmental mainstreaming represents an effective tool of science-policy interface about water-ground-climate-biodiversity-food sovereignty serving the post 2015 development agenda. Zortea delineated and advocated for concrete actions in order to promote environmental mainstreaming in water and food policies, focusing in particular on the driving role that universities should play in these processes.

Michela Miletto (UNESCO World Water Assessment Programme- WWAP) introduced the mission and the work of UNESCO-WWAP Office, presenting the theme of next World Water Development Report, focusing on “Water and Energy” and calling to CUCS scholars and universities to contribute to the future Reports and more in general to UNESCO-WWAP activities. Following, Francesca Greco (UNESCO-WWAP) presented a contribution on “Water and the post 2015 indicators: a research proposal for gender disaggregated indicators in water monitoring assessment and reporting”. Greco reviewed the main efforts undertaken within the UN system in order to mainstream gender issues and indicators in development policies. She further presented the efforts of UNESCO WWAP in order to promote the use of gender-disaggregated indicators in the framing of monitoring mechanisms on water related UN Sustainable Development Goals.

Guido Minucci (Polytechnic of Milan, Department of Architecture and Urban Planning) focused on water challenges in the context of increasing trends of urbanisations, presenting a paper on “Fostering adaptive capacity of water institutions to face future environmental changes in an urbanised world”. By presenting the case of quinoa cropping in the Southern Bolivian Altiplano, Minucci illustrated, on one side, the growing interdependencies between urban and rural areas and the cross scale trade-offs related to the rapid globalization process. On the other side, he pointed at the need to reform water institutions in order to foster adaptive capacity and face unexpected, current, and future water problems. He also emphasized the opportunity to examine how local water institutions facilitate or constrain adaptive capacity to face future issues and to critically assess the vulnerabilities resulting from consumption

chains and urban demands.

Giorgio Cancelliere (Director of the Master on water resources management in International Cooperation - Università di Milano Bicocca) and Italo Rizzi (Director of the Ngo LVIA – Lay Volunteers International Association) acted as discussants of the three papers presented. They contributed to the debate from the perspective of practitioners involved in applied research to international development cooperation as well as in the implementation of water and sanitation projects in Africa, Latin America and the Middle East. Cancelliere and Rizzi agreed on the need to foster coordination at the national level between different actors (the Ministry of Foreign Affairs, NGOs, universities) in order to elaborate an Italian strategy on water for development, rather than merely delegating water policies definition and implementation to multilateral institutions, as it has been in the past. The aspiration to continue the debate beyond the panel and to carry on joint researches and initiatives was confirmed by the warm reception by the participants of the proposal to create a thematic group working on water issues within the CUCS in close partnership with UNESCO-WWAP. This confirmed the catalyst role that water, as inherently “relational resource”, could play in facilitating the bridging of disciplines and institutional boundaries.

## ENVIRONMENTAL MAINSTREAMING AND INTEGRATED POLICIES IN DEVELOPMENT COOPERATION AFTER RIO+20: THE EMBLEMATIC CASE OF WATER AND FOOD

Massimo Zorzea\*

\*University of Trento, UNESCO Chair in Engineering for Human and Sustainable Development, Italy -

[massimo.zorzea@zorteeasandri.it](mailto:massimo.zorzea@zorteeasandri.it)

### ABSTRACT

The goal of this paper is reflecting, shortly but with the comfort of links to more comprehensive literature, on how the environmental integration represents an effective tool of science-policy interface about water-ground-climate-biodiversity-food sovereignty serving the post 2015 development agenda, also examining in brief the trends of main International Cooperation actors and drawing a possible role of universities.

Environmental Mainstreaming – i.e. a transversal and inter-sectoral inclusion of environmental conservation and of the opportunities offered by environment in all development policies and in project approach to development – has become a theme with pressing actuality: the challenges set by the more and more evident crisis of development sustainability, particularly environmental, are by now urgent. The dramatic theme of denied access to water and food perhaps is the most symbolic expression of such crisis. U.N. System (Rio Conventions), OECD-DAC, European Commission, Development Cooperation national agencies: by now all promote an ample integration of environment in all their sectoral policies and initiatives, as main path to the goal of sustainable development.

A strategic reaction to demand for sustainable development – especially in the more mature vision emerging in post Rio+20 International Cooperation and post 2015 development agenda scenarios – requires a systematic integration of environmental sustainability into development processes as promoted at the international level. Universities are called to a decisive driving role.

### INTRODUCTION

Global environmental crisis has become a reality evident even for the most sceptic consciences. The water crisis is just one of its most remarkable expressions, perhaps the most symbolic, although it rarely conquers front pages of newspapers neither it still mobilizes a suitable international action, unlike wars and natural catastrophes. After all, like hunger, deprivation in access to water is a silent crisis lived by the poor and tolerated from holders of resources, technology and political power to stop it.

Global environmental crisis is a threat to human and sustainable development but fortunately the awareness on this concept is growing. Thus it's opportune to explore its bases with a positive approach, in order to understand whether to embank it and rather to reverse the route, by protecting and valorizing environment in an innovative way in comparison to past experiences. Alfredo Guillet argues, with his usual acumen: *“if Stockholm Conference in 1972 for the first time raises the awareness that protection of Earth natural resources is a matter of paramount importance for peace and socio-economic development, twenty years later, Rio Conference brings to a same table both development cooperation world and environmental conservation world. And it does this, by making explicit the idea that, although daily priorities must converge on starving child and not on forest conservation, it is also true that tomorrow it won't be possible anymore to save that child if we don't allow that forest to keep on furnishing the food to feed him or the firewood to heat him. That concept thrills all participants to the Conference. Then, besides, instead of producing a structured tool, able to combine the different souls of environment-development binomial, that process gives birth to a series of Conventions and sectoral fora, losing its sight on unitary integrative original concept. In such context, against integration of environment with development, different plots emerge, behind every convention and forum, tailored by several political, industrial and commercial lobbies”* [13: 11].

So that some driving themes of the present reflection are: the deep need to integrate and to make synergic development and environmental protection/exploitation policies; the great institutional and operational fragmentation; the contradictory and conflicting polarities, tied up with particular stakes. The conclusion we intend to reach can be summed up in two leading theses: first, the health of the environment is linked in double way with poverty and human development, because degradation and environmental over-exploitation produce poverty but also viceversa the latter produces or contributes to the first; second, in order to reverse this vicious circle, a specific attention to environmental profiles, in transversal and capillary way, is required to be entered into all policies and interventions for fighting poverty and promoting development, not only into those with specific environmental content.

By now the biunique causal chain among environmental degradation and poverty is blatant and universally

recognized. Almost a billion people, in particular the poor of rural zones, directly rely on natural resources for their livelihoods. But global environmental threats are wearing out that base of resources: biodiversity loss proceeds with a rapid rate in many countries, like the increase of toxic chemical substances; desertification and drought are problems with global dimensions, that strike all the regions; greenhouse gas emissions expose world climate to risks and Developing Countries are the most vulnerable to the impacts (see OECD [9]). Although all the countries are struck, the poor are the most threatened, because they have less resources to face the radical causes of environmental threats and to adapt its impacts; besides because they are highly depending on the natural resources for their livelihoods. Similar environmental threats have impacts on rural livelihoods, food security and health, while they are multiplying the effect of natural disasters as floods and droughts. Such vulnerability risks to intensify the conflicts for land and water resources and to jeopardize all the efforts to reduce poverty: poverty reduction is therefore tightly correlated to a suitable environmental management, conducted at all levels: local, national, continental and global. All environmental upsettings in progress can affect the ability of ecosystems to support livelihoods and, overall, at a scale that crosses national borders of States and ignores all the differences between juridical regimes, cultures, languages etc.

The driving factors underpinning global environmental threats are manifold and variegated over time and space. The greatest pressures are made, separately and more often with inter-action variedly combined, by these components: over-exploitation for excessive fishing, pasture and intensive cultivation etc.; conversion of forests, grasslands and wetlands still intact to artificial uses, for agriculture, industry or urban setups; fragmentation of natural areas once upon a time interconnected, with increase of their vulnerability; uncontrolled introduction of alien invasive species, that conducts to extinction the autochthonous ones. On the other hand, these direct components are referable in their turn to a number of deep causes, such as rapid growth of population, increasing consumptions, absence of market systems or defects of markets, defeating public policies, weak institutional abilities, use of inappropriate or obsolete technologies etc. In conclusion, climate change, biodiversity loss and desertification are deeply connected to human well-being and poverty, in all of its components and expressions, making much more difficult the already arduous challenge of international cooperation to satisfy the priority demands for development.

On this theme let's forward to the numerous works of E. W. Barbier, particularly: Capitalizing on Nature. Ecosystems as Natural Assets [1] and the very recent A Blueprint for a Green Economy [2]. Barbier, generous as usual with data and comparisons, underlines among other that big part of poor population keep on living in disadvantaged areas of Developing Countries, i.e. fragile: it has been estimated that from 1950 to today population living in such areas doubled. Moreover he notes a persistent poverty, even though reduced in percentage, in the countries that have seen ample part of their population going out of the threshold of poverty but that show a constant environmental degradation: typical it is the case of China; despite the strong economic growth and the general reduction of poverty, it sees withstanding a consistent pocket of rural poverty, concentrated in relatively poor agricultural western and south-western zones and in the hilly and mountainous zones: the poor Chinese living in mountains have grown from less than 1/3 in 1988 to the majority in 1995, like approximately Mexican poor.

Therefore, to take seriously and to face this mutual and biunique causal chain between environmental degradation and poverty is necessary. In order to reverse that vicious circle it will be enough, according to L.R. Brown [3], a financial investment absolutely within governments' reach, that he calculated in 185 millions annual dollars, of which 75 for poverty eradication and 110 for environmental restorations; it corresponds to invest in such new frontier of global security 12% of world military expenses and 28% of American ones in 2009.

Several studies speak openly of scarcity civilisation, characterized by the raise of environmental conflicts more and more deep, in a typically post-industrial context, for control and distribution of natural resources: starting from water resources, the so-called blue gold in XXI Century. The increasing insufficiency of resources, tied up with the growth of consumptions and with their progressive exhaustion, produces shortage and iniquitous distribution, projected both in the space and in the time: in some zones for privilege of others and in damage of future generations for excess of greed by the present one. The World Economic Forum ranks the risk from water crisis as the greatest global risk in 2013. In fact, according to a recent paper of CBD [4], 884 million people (the 12.5% of global population) live without access to drinkable water, while 2,5 million people (40% of population) lack suitable sanitation; while, paradoxically, the risks correlated to floods count for the 90% of the risks from natural disasters, keeping in mind that from 1970 over 7.000 natural disasters have caused damages for 2.000 billion dollars and just in 2010 natural disasters have killed more than 296.800 people and affected almost 208 million people, causing some 110 billion dollars damages.

Removing and displacing the effects of exhaustion and environmental degradation – sometimes for mere indifference or ignorance, sometimes for deliberate and meticulous hiding – represent the constant of this beginning of millennium. First of all, those effects are hidden by exporting pollution, wastes *in primis*, toward States less careful to environmental matrixes quality. But such hiding is dangerous even when is due to missed perception of indirect environmental costs, contained in all products and services, often very high in comparison to market prices. In International Cooperation context, these aspects are still more evident and they put a pressing question of equity, both geographical and generational. The dilemma has a nature moral and economic at the same time: in other words, even if the theme doesn't concern for ethical tolerability, it must do it for economic sustainability though.

An useful answer is the political and technical approach of Environmental Mainstreaming, that can be defined as “complex of ideas, principles and actions directed to make to know, to keep in mind, to pursue and/or to guarantee, in transversal and penetrating way, as goal but also as tool, the environmental protection in all human activities, of any type and in any field, at every institutional and operational level as well as at whatever scale, local, national and

global, with multi-disciplinary and inter-disciplinary approach” [13: 59].

## **VISION: INTERNATIONAL COMMUNITY ON ENVIRONMENTAL MAINSTREAMING, WATER, FOOD**

Both wide part of the most recent International Environmental Law (water subject is significant, not by chance, particularly the Helsinki Convention 1992 and London 1999 and Kiev 2003 Protocols), and the institutional framework in which methodology and culture of Environmental Mainstreaming have grown are certainly permeated by the Environmental Mainstreaming approach.

In ONU area, 1972 Stockholm Declaration deserve to be mentioned, especially these excerpts:

4. *Man has a special responsibility to safeguard and wisely manage the heritage of wildlife and its habitat, which are now gravely imperilled by a combination of adverse factors. Nature conservation, including wildlife, must therefore receive importance in planning for economic development.*
9. *Environmental deficiencies generated by the conditions of under-development and natural disasters pose grave problems and can best be remedied by accelerated development through the transfer of substantial quantities of financial and technological assistance as a supplement to the domestic effort of the developing countries and such timely assistance as may be required.*
19. *Education in environmental matters, for the younger generation as well as adults, giving due consideration to the underprivileged, is essential [...].*

From 1992 Rio de Janeiro Declaration:

*Principle 4. In order to achieve sustainable development, environmental protection shall constitute an integral part of the development process and cannot be considered in isolation from it.*

*Principle 7. States shall cooperate in a spirit of global partnership to conserve, protect and restore the health and integrity of the Earth's ecosystem. In view of the different contributions to global environmental degradation, States have common but differentiated responsibilities. The developed countries acknowledge the responsibility that they bear in the international pursuit of sustainable development in view of the pressures their societies place on the global environment and of the technologies and financial resources they command.*

From 2000 Millennium Declaration, these excerpts are worthy of note for this paper's purposes:

21. *We must spare no effort to free all of humanity, and above all our children and grandchildren, from the threat of living on a planet irredeemably spoilt by human activities, and whose resources would no longer be sufficient for their needs.*
23. *We resolve therefore to adopt in all our environmental actions a new ethic of conservation and stewardship and, as first steps, we resolve: [...] to stop the unsustainable exploitation of water resources by developing water management strategies at the regional, national and local levels, which promote both equitable access and adequate supplies.*

2012 Rio+20 Declaration, taking back themes and visions already emerged shortly in Johannesburg Declaration 2002, with its 283 paragraphs is a mine of cues; let's limits to extrapolate the followings:

2. *Eradicating poverty is the greatest global challenge facing the world today and an indispensable requirement for sustainable development. In this regard we are committed to free humanity from poverty and hunger as a matter of urgency.*
3. *We therefore acknowledge the need to further mainstream sustainable development at all levels integrating economic, social and environmental aspects and recognizing their inter-linkages, so as to achieve sustainable development in all its dimensions.*
30. *We recognize that many people, especially the poor, depend directly on ecosystems for their livelihoods, their economic, social and physical well-being, and their cultural heritage. For this reason, it is essential to generate decent jobs and incomes that decrease disparities in standards of living to better meet people's needs and promote sustainable livelihoods and practices and the sustainable use of natural resources and ecosystems.*
75. *[...] The institutional framework for sustainable development should integrate the three dimensions of sustainable development in a balanced manner and enhance implementation by, inter alia, strengthening coherence, coordination, avoiding duplication of efforts and reviewing progress in implementing sustainable development. [...]*
87. *We reaffirm the need to strengthen international environmental governance within the context of the institutional framework for sustainable development, in order to promote a balanced integration of the economic, social and environmental dimensions of sustainable development as well as coordination within the UN system.*

Expressively in matter of water and sanitation:

*119. We recognize that water is at the core of sustainable development as it is closely linked to a number of key global challenges. We therefore reiterate the importance of integrating water in sustainable development and underline the critical importance of water and sanitation within the three dimensions of sustainable development (then the theme is being developed in paragraphs 120 to 124; likewise significant: par. 158 to 177, on oceans and seas, particularly 174 for explicit references to *mainstreaming*; worthy of mention even par. 188, on disasters risk reduction, and 190, climate change impacts on development).*

Links between Environmental Mainstreaming and MDGs (Millennium Development Goals) are even more interesting, especially in their evolution in SDGs (Sustainable Development Goals) in post 2015 scenario, at length treated by the Declaration: see paragraphs 245 to 251.

Environmental Mainstreaming, after all, is a clear concern also for OECD-DAC, given that it has devoted several studies and publications to that theme and it declares: “Integrating environmental concerns in poverty reduction strategies and other national planning processes is a priority” [9: 10].

It is also well-known the general position of European Union in that theme and the decisive contribution engraved by the so-called Process of Cardiff: European Council in Cardiff on June 1998, favorably welcoming the communication by Commission on the strategy of integrating environmental considerations into European Union policies, approved the principle that prominent political proposals must be accompanied by an evaluation of their environmental impact. In that wake, also the following acts deserve a mention: the decision of European Parliament and Council n. 2179/98/CE (it called for a reinforcement of the role of Community in International Cooperation in matter of environment and sustainable development; the ground strategy was identified in realizing the complete integration of environmental policies with the other policies, including development policy); the Regulation CE of European Parliament and Council n. 2493/2000 (containing measures directed to promote the total integration of environmental dimension in development process of Developing Countries); the Conclusions of European Council on integration of environment in Development Cooperation 25.06.2009.

At last, the position of Italian Development Cooperation demands brief references. The Italian case offers an interesting example: the Environmental Guidelines - *Linee Guida Ambiente* of MAE-DGCS were definitively adopted on 2011, December and were elaborated through a participatory process, with an effective involvement also of civil society and scientific-academic community representatives, lasted around three years. Italian Cooperation, Guidelines state, “*respecting transversal nature of environmental theme, promotes the integration of environment in all of its sectoral initiatives as principal means for the attainment of the goal of Sustainable Development*” ([8: 5]; for ample references to everything above and to further experiences of other cooperation agencies, see Zortea [13], *passim*).

## **MISSION: ENVIRONMENTAL MAINSTREAMING AND INTERNATIONAL COOPERATION**

Beginning from this vision, it is opportune trying to understand what’s International Cooperation’s mission with reference to the challenges of sustainable development and of environmental threats and how can be implemented.

If present challenges and future scenarios, as it’s been mentioned, are global and transversal, according to their own nature, then a capacity of analysis, synthesis and action as much global and transversal. In other words, what technically is denominated Mainstreaming Approach it’s required, especially in environmental field: i.e. a cross-sectoral attitude, that doesn't confine environmental themes, problems and potentialities into the enclosure of sectoral policies and of knowledge, languages and methodologies exclusively for technicians, but rather it spreads them capillarly at all levels of decisional trials, of all sectors, public and private, and with a diffused perception in public opinion. According to European Commission, for example, mainstreaming is “the process of systematic integration of a selected value / idea / theme inside all the circles of EU Development Cooperation in order to promote specific (to translate ideas, to influence policies) as well as general development outcomes” [5: 16].

The external effects of human activities on environment are diffused and pervasive and such pervasive attitude has got two axes of development, spatial and temporal: human actions engrave on environment in space and in time. This pervasive attitude tends to be increased by the human tendency to maximize the positive externalities and to reduce to a minimum the negative externalities, besides to maximize the direct advantages and to reduce to a minimum the direct disadvantages. From that, also, the more and more ample phenomenon of the transfer (hidden and sometimes even apparent) of risk, of costs and of negative externalities from consumers of resources to third subjects, more weak and often unaware. A tangle of problems at a wide scale, therefore, that typically impinges even on International Development Cooperation. In truth, global environmental threats, with their causes and effects, cross national borders and press for international, regional, national and local responsibilities. Addressing the causes and the impacts of biodiversity loss, climate change and desertification requires measures in key sectors such as agriculture, forests, but also energy, transports, industry etc.

Too often on the contrary environmental issues have been faced as separated policy agenda issues and with a concern limited to national or even merely local political priorities. So that in many countries only environmental ministers are put in charge of implementing environmental political agendas linked to international convention, first of

all the three Rio Conventions (CBD, UNFCCC, UNCCD), without any coordination at a wide governmental level, suitable for guaranteeing measures in all key sectors, even not directly under the competence of environmental ministers.

Environmental institutions need to work in closer contact with the other, whereas the latter treat environment like an *extra-moenia* affair. On the contrary, as GEF often remarks, Environmental Mainstreaming is important, because socio-economic development and environment are fundamentally interdependent: the way we manage economy and political and social institutions have relevant impacts on environment, whereas environmental quality and sustainability are vital for economy and social well-being trends.

From the reflections above developed a component of Environmental Mainstreaming is rising, that often we tend to underestimate: the cultural component. Environmental Mainstreaming can really take root and work as method only if, even before, it stand as mentality (*forma mentis*), as cultural behaviour and movement at all levels of any organization or community. In that sense, Environmental Mainstreaming culture is a real driver for a system implementation of that methodology. We must also observe that main deficiencies at the level of theoretical elaboration and of practical experimentation are just on cultural side, in mentality spread. As a matter of fact, integration requires and implies a method and a culture of prevention, as well as viceversa: the latter represents the true and deepest meaning of mainstreaming.

Eventually, culture and methodology of Environmental Mainstreaming are complementary, in a kind of virtuous circle. A glance to practical approaches of mainstreaming, applied in public policies and in citizens' life, is useful. A first significant experience deserving a mention is the so-called Agenda 21, we can define a general and multi-level system for managing sustainability, in all its profiles, even environmental. It's an action programme for implementing a sustainable development at world, national and local level, set up during 1992 Rio Conference, summarized in 40 chapters, settled in 4 parts, respectively devoted to: economic and social dimension; resources conservation and management; strengthening of most significant groups' role; tools for performing the programme. Even the voluntary environmental management systems (EMS, actually two types are known: ISO 14001:2004 ed EMAS by European Union), i.e. the systems for analysing, planning and managing all environmental aspect in any organisation, that get an environmental certification attesting the compliance of determined standards. In an even wider circle, we can mention approaches inspired and oriented to the idea of Environmental Mainstreaming – although not exactly direct tool – also for the following initiatives, linked to the concept of Integrated Product Policy IPP: Green Public Procurement GPP; Environmental Product Declaration and Environmental Labelling (such as Ecolabel introduced by European Union for years); Life Cycle Assessment (LCA).

International Cooperation fosters logics and methodological approaches of mainstreaming, for years and in a more and more wide-spread way. The most relevant types of mainstreaming actually are: environmental (to be considered the most important among all, both because it's tied up to the survival of mankind and because the number of aspects and implications involved is huge and higher than all other themes); human rights (Human Rights Based Approach, adopted for example by United Nations System ten years ago) gender (Gender Mainstreaming); participation (Participatory Approach, aiming to apply systematically a wide-spread participation to all type of action for development).

Coming back to environment, it must be said that International Cooperation has a lot of aspects the make it a privileged sector for applying Environmental Mainstreaming; and that for at least two reasons. The first: facing environmental challenges is a key option for human and sustainable development e for poverty reduction; as a matter of fact, global environmental threats affect poor in an over-proportionated way, particularly around a billion people directly relying on natural resources for their subsistence. The second: answers to environmental threats require measures in a remarkable variety of sectors: they must be coherent with the priority national development goals and viceversa; that requires to integrate transversally these strategies into national policy agendas for development. It's necessary to work at three levels, at least: strategies and actions in headquarters of agencies and governments; relationships with Developing Countries partners; collaboration among development cooperation agencies.

A further methodological criterion, very important in order to act with efficacy in this multi-level approach, it's to intervene on priorities set up and agreed at the international level, so as to guarantee a coherent alignment and to avoid energies and resources dissipation in isolated initiatives. In particular, climate change, biodiversity loss and desertification are global scale threats putting at risk sustainable development and they can be faced only at likewise global scale: the three Rio Conventions offer an institutional and strategic framework useful to manage these global concern and reverse the current trends of natural resources base degradation.

All that requires also a work on some key factors, positive and negative, influencing a good Environmental Mainstreaming, such as: applying the principles of subsidiarity and suitability in the distribution of roles between international and local actors; inter-action between subjects with different nature, i.e. public and private, profit and non-profit; selection of precise directrices of mainstreaming, that is to foster them like as many goals of it: sustainability of human development (in the threefold component economic, social and environmental); fight against poverty and social exclusion; security, in its multiple connotations (personal safety, peace and geopolitical stability, health, food security/sovereignty...); promotion and protection of human rights and good governance.

Environmental integration, set up according to the directrices above listed, is applicable to all types of intervention in the context of Development Cooperation (among them Policy Support, Budget Support; Project Approach). Even with regard to thematic sectors is technically possible or better still desirable a wide-ranging environmental integration; let's think to the nine classical key sectors of International Cooperation according to European Union, i.e.: governance,

democracy, human rights and support to economic and institutional reforms; trade and regional integration; infrastructures, communications and transports; water and energy; social cohesion and employment; human development; rural development, land planning, agriculture and food security; environment and sustainable natural resources management; conflicts prevention and States fragility.

One of the most critical points for a successful environmental mainstreaming is the choice between short-period (3-5 years) and long-period (10 years) strategic priorities. It's an arduous often choice, because in short period social and economic urgencies, particularly poverty reduction, can come into conflict with middle- and long-term goals and strategies. The most typical example in that sense are the policies aimed to a fast growth of agricultural production in order to guarantee food security corresponding to population growth: non rarely, they coincide with the conversion at a large scale of land destination to food mono-cultures, with intensive exploitation of water resources, massive utilization of fertilizers and pesticides, substitution of local varieties with standardized varieties, or even genetically modified; but after first successes, in long period all that ends in biodiversity loss, soil impoverishment and erosion, water and soil pollution, in one word, in destruction of ecosystems and their fundamental services.

This spirit of careful integration between environmental conservation and fight against poverty is being took in serious account by all main actors of International Cooperation. On one hand, many international and national agencies have adopted Environmental Mainstreaming, setting up internal procedures and using several incentives; on the other hand, a number of initiatives has been begun aimed to promote and spread it through multilateral aggregations (Poverty-Environment Partnership, Poverty-Environment Initiative etc.). A problematic basic fact remains however: the great fragmentation among all those bodies. A coordination in Environmental Mainstreaming is missing, as besides even a general codification of law and procedures for environmental conservation. Not by chance environment is still orphan of a worldwide unitary jurisdiction able to guarantee uniform application of principles and rules put for its conservation.

A wide perspective synthesis of the work waiting for International Cooperation in future scenarios – with a perspective of proactive application of results risen from Rio+20 Conference and also, more widely, of setting up the post-2015 development agenda – is contained in the conclusions of European Council on October 25<sup>th</sup> 2012 (Rio+20: Outcome and follow-up to the UNCSD 2012 Summit).

Finally, about the specific theme of water an effective point of reference for this reflection is represented by UNDP Human Development Report 2006 ([10], especially for the reach synthesis on pages 23 to 50): in 6 chapters it draws up as many great directrices of work for International Cooperation on the theme of water and access to water resources, also in correlation with food security and human right to feeding.

## **GOALS: POLICY DEVELOPMENT AGENDA, BEFORE AND AFTER 2015**

This approach, global and cross-sectoral, helps to better translate in strategic and operational goals the great target of poverty eradication and of sustainable well-being equitably shared. In that sense, however, all the process for implementation of Millennium Development Goals and of post-2015 development agenda is traditionally oriented, by now, with the drawing up of Sustainable Development Goals (SDGs), but also with the thematic sectoral agendas, such as the CBD's one, as we'll see below.

For Millennium Development Goals (MDGs) – after 13 years since when the eight great international development goals were officially launched in the institutional frame of United Nations Millennium Summit on September 2000 with the consequent Millennium Declaration subscribed by 189 governments – it's time for balances.

The narrow space in this paper doesn't allow a wide overview of that topic, but it's useful to notice and recall two important tools, one traditional and one exceptional: the annual Millennium Development Goals Reports and the report released by United Nations Secretary-General A life of dignity for all [11].

The first, as it's known, assess both global and regional progresses and use the most updated data series provided by partner agencies and members of an ad hoc working group (IAEG). The latter contains updates on goals and strategic vision for the future route. It delivers an important assessment of the progress achieved up to now by MDGs but overall it identifies the policies and programmes that have been successfully carried out to achieve the goals. It remarks some key factors, such as: inclusive growth; policies for a decent job guaranteed for all and a suitable social protection, especially for the most weak layers of population, regardless of their geographic location; creation of innovative mechanisms for mobilizing resources even financial necessary to that scope and accessible to all; building up local and global enabling environments, juridically and institutionally; finally, valorization of multi-stakeholder e multi-disciplinary partnerships.

No doubt an un-precedented progress has been done in fight against poverty, both at global and country level. The 2013 Report shows that really some key goals have been yet reached before the deadline or will be reached within 2015 however. With special reference to goals and targets relevant for the themes treated in this paper (water and food), it's noted 700 million people live in extreme poverty conditions less then 1990. More than 2.1 billion people got access to improved water resources in the last 21 years. Over 200 million slum dwellers benefitted from improved water sources, sanitation facilities, durable housing or sufficient living space between 2000 and 2010.

On the other hand, we must be aware that environmental sustainability is under severe threats and requires a new level of global cooperation. The global growth of green-house gases is speeding up and actual carbon dioxide emissions

are 46% higher than in 1990. Forests keep being eroded at an alarming rate. The over-exploitation of marine fish stocks results in production and gains diminishing. Marine land areas under protection are increased but birds, mammals and other species are approaching extinction faster than ever, with a decline both in population and in distribution.

A further aspect that must be considered, especially in matter of water and food, but more in general for all ecosystem services available for populations, is distribution disparity. Progress towards MDGs has been uneven not only between regions and countries but also between rural and urban zones, men and women, different population groups even inside the countries.

In theme of access to water (target 10 goals 7), the UNDP Report 2006 [10] offers interesting data and comparisons at p. 55 and following; let's forward to them, because of lack of place here, but with some underlining.

Target 10 like it's known aims to half percentage of people living without access to potable water and sanitation within 2015. Beside international community not for the first time has set out ambitious targets in that matter: they come back to early 80s. Therefore the difference between that time and today is not the political willing, that evidently is not sufficient in itself, but a suitable strategy in order to translate political goals into action, monitoring and overall results for populations. And this, even due to the fact that even a full achievement of the target doesn't be said sufficient, remaining the challenge for the rest of population open.

As we said above – but particularly for water and food – the focal point is to overcome the enormous disparities between regions and countries. In fact global aggregation of data masks large differences, even inside the same countries. While South Asia marks important targets, Sub-Saharan Africa remains constantly behind. This increasing gap between Sub-Saharan Africa and the rest of the world unfortunately will feed further inequalities also in matter of health, education and poverty reduction.

In addition the gap between achievements in matter of water and sanitation is increasing, with the risk the potential benefits linked to the first are being eroded by a failure in the latter. Furthermore an increase in water delivery, where drainage and organic waste dumping are unsuitable, could worsen problems in terms of public health, especially in overcrowded areas. Once again an ineludible fact rises: the real challenge for international cooperation are overcrowded suburban areas and in theme a serious regression of human development is looming if at worldwide level in early XXI century mistakes done in second half of XIX century will be repeated, especially in Europe and North America.

The challenge stands on two floors, regardless of achieving MDGs or not: level or type of technology applicable and costs of delivery. Report 2006 in this regard remarks unusually converging estimations by researchers: they estimate the actual expense for water and sanitation around 14-16 billion dollars a year (not including waste water treatment) and around 10 a year of expense for achieving MDGs linked to that issues on a base of sustainable low cost technologies.

Maintaining furniture at the actual quantitative levels but increasing quality would imply, according to some estimations, a further expense of 15-20 billion dollars a year. Further amounts should be employed if the goal was to treat all domestic waste waters. It's a threshold of investment appearing within international community's reach, both because of the corresponding enormous benefits guaranteed (child mortality reduction, spear of time, increase of productivity, reduction of health care expense, reduction of infective diseases, reduction of school withdrawal, strengthening of women's role etc.) and in comparison with other actual public expense items (military expenses and more in general expenses for national and international security).

An interesting review on how all eight MDGs can be linked to water issue in a perspective of mutual integration (working on improvement of access to water resources to attain the respective Goal and working on each of eight Goals in order to better guarantee a qualified but sustainable access to water) is contained in the table on pages 22-24 of UNDP HD Report 2006.

As stirring as that, even for its strategic suggestions, is the SIWI Report 2013, Cooperation for a Water Wise World – Partnerships for Sustainable Development (see Jägerskog et alii [7], especially on pages 45-50, devoted to water-energy-food nexus: it argues that in order to achieve sustainable development goals it's necessary to develop and to implement systematic approaches increasing the comprehension of water-energy-food nexus, both at different scales and through multiple sectors, with typical cross-sectoral approach, just characterising environmental mainstreaming).

What about the future of global development agenda? Ban Ki-moon in above cited Report 2013 [11] affirms: *“A new post-2015 era demands a new vision and a responsive framework. Sustainable development — enabled by the integration of economic growth, social justice and environmental stewardship — must become our global guiding principle and operational standard. This is a universal agenda that requires profound economic transformations and a new global partnership. It also requires that the international community, including the United Nations, embrace a more coherent and effective response to support the agenda”*.

Doubling efforts is required to achieve the goals, although economic-financial crisis has made more complex the course. Lessons learnt for 15 years of MDGs implementation will contribute to define next global agenda. United Nations Department for Economic and Social Affairs is coordinating the UNTT (UN Task Team) working precisely on post-2015 agenda promoted by Secretary-General on November 2011. The Team has launched already three reports: Realizing the future we want for all (July 2012), Towards a renewed partnership for development (March 2013), Statistics and indicators for post-2015 development agenda (July 2013).

Under the profile of resources necessary for agenda, Rio+20 Declaration ha recognized the need of a significant resources mobilization, as known, to promote sustainable development; at this aim it has been established to create an Intergovernmental Committee of Experts that will submit the results of its work to General Assembly on September 2014. The involvement of Major Groups of civil society is guaranteed by specific participatory mechanisms.

Finally, in theme of global political agenda and of transversal cross-cutting with environmental issues, another paradigmatic example deserves to be remembered: the so-called Aichi Target, i.e. the Strategic Plan for Biodiversity 2011-2020 to implement CBD. In particular, target 14 prescribes that By 2020, ecosystems that provide essential services, including services related to water, and contribute to health, livelihoods and well-being, are restored and safeguarded, taking into account the needs of women, indigenous and local communities, and the poor and vulnerable. The Strategic Plan notes that the paramount importance of water should be highlighted in the technical rationale of Target 14. Water is also cross-cutting and therefore underpins all of the other targets.

## **ACTION: BUILDING UP AN ENVIRONMENTAL MAINSTREAMING FOR WATER AND FOOD**

The considerable extent of Environmental Mainstreaming idea has been already noted. It must be said that in reality about the concept different feelings and attributions of meaning and relevance exist. For instance, *Poverty-Environment Initiative* of UNDP-UNEP interpret it as “*integrating linkages between poverty and environment inside national development planning processes and what they produce like Poverty Reduction Strategic Papers (PRSPs) and the strategies of MDGs*” (2007).

The effectiveness of environmental mainstreaming appears under several profiles: at the scope of finding out integrated solutions to cope with intricate problems, such as the contrasts between development and environment needs or between top and bottom visions, institutional tensions, social costs; at the scope of setting up a more efficient planning of environmental assets and of environmental risks management; of supporting a technological innovation inspired to nature; of sustaining an informed debate, propaedeutic to political choices on grate issues and of helping their concrete formulation; of setting up environmental mandates to be accomplished in effective ways.

The following outer edges – with progressively ampler extent, in time and space – can be identified, in which an environmental integration can be started up: single initiatives; development projects or programmes; local or national plans (for example socio-economic, urban, environmental strictu sensu, military etc.); national or international strategies (for instance let’s think of usefulness of mainstreaming in National Strategy for Biodiversity adopted by Italy in 2010, and in general in NBSAPs, National Biodiversity Strategy and Action Plans, provided by CBD).

Under a different profile, integration can be used both in action sphere of public sector (governments, public administrations) and in that of private sector. Within the latter, really very variegated, environmental mainstreaming can be employed both in for-profit sector (in particular, companies and enterprises, including SME and cooperative companies) and in non-for-profit sector: let’s think of NGOs, but more in general of voluntary service organisations or to ONLUS entities (non-lucrative organisations with social usefulness), both in shape of association and foundation. In truth, just due to the fact that its effectiveness depends overall on its extent, mainstreaming can involve even whole groups, communities and territories, as well as can be activated (at least in hypothesis) by single individuals or families inside themselves, in daily life.

Even the theme of tools for implementing environmental integration strategies deserve brief mentions, at least. It must be underlined first of all that several typologies of tool exist (informative; formative and educational; operational; evaluative) [13: 73 ss.], but each one has its own role, irreplaceable, and is an integral part of the strategy. The dimensional limits of this paper oblige to opt for a dimension more focused on single project interventions, on a development programme or on plan and strategies, all characterized by being delimited in space and time. In this regard, some tools deserve to be remembered, that have become traditional in international cooperation, despite not all are known and widespread in the same way: Country Environmental Profile CEP; Green Logical Framework; Environmental Screening; Strategic Environmental Assessment; Ecosystem Approach; Community-Based Natural Resource Management CBNRM; Integrated Capacity Development; Technology Transfer environmentally compatible; Ecosystem and Human Well-being Framework (see more at length Zortea, *ibidem*).

Exemplary and paradigmatic is the Ecosystem Approach. Introduced by CBD in 1992, it has been promoted as main action tool of the Convention, facilitating the integration of global environmental goals into policies and socio-economic development plans at international, national, sectoral and project level; an official definition has been set out by Subsidiary Body on Scientific, Technical and Technological Advice - SBSTTA of CBD in 2000: “*a strategy for integrated management of soil, water and living resources, promoting their conservation and sustainable use in an equitable way; it’s based on application of scientific methodologies focused on biological organisation levels comprising essential processes, functions and interactions among organisms and their environment; it recognizes that human beings, with their cultural diversity, are an integral component of ecosystems*”. In other words, methodology consists in adopting all contrivances in order to make a certain project intervention on a territorial and environmental context to respect vital cycles and functionality of ecosystems existing over there, integrating itself in them; therefore it takes care of guaranteeing an use of natural resources and of ecosystem services in general compatible both with characteristics of that specific natural environment and with its “receptive” capacity, of generating or regenerating the resources utilized and of waste o recovering of rejected items produced during the intervention. Thus Ecosystem Approach must be applied both in project formulation and in its implementation; with regard to that, SBSTTA also set out 12 guide principles. OECD underline that “*capturing both environmental and socio-economic aspects of sectoral development policies, a framework of policies based on Ecosystem Approach can provide to decision makers a way to identify the best options of development and allow them to take decisions based on a solid understanding of their long-term consequences*” [9: 17].

Much would remain to tell but there's place by now only for some applicative considerations, focused on the theme of water and food. A necessary premise is that scarcity and excess of water are paradoxically both serious and actual threats to mankind. Moreover: both of them are consequence of human action!

The long necklace of natural catastrophes, for which origins or anyway disastrous consequences are directly referable to human foolishness just recently has been enriched by a further flood devastating episode, concerning also because it's far from usual locations imprinted in collective imagination, such as typical floods in Gange basin: the Amur river's flood (2.824 km) at the borders between Russia and China, with economic damages amounting to 226 million euros and 40.000 people displaced in Russia and 194 million euros and over than 200 people deceased or missing in China, regardless to risks linked to leaks in dozen dams built alongside the course of the river. It's really paradoxical that consequences of that disaster have been much amplified by a thirty-year drought that has made populations and local administrators forget those areas are under the risk of flood and river has just retook the riverbed it had created in thousand years: on that, though, entire villages had been built with regular building licences.

A very detailed analysis of this inter-dependency between poverty and wrong water resources management – and overall about how we can work backwards on this vicious circle in order to defeat poverty – is included in UNDP HD Report 2006 above cited [10]. It observes that, during the course of history, water exposed mankind to some of its most demanding challenges. Water is a source of life and a natural resource contributing to sustainability of our environment and to family livelihood, but it's also a risk source of vulnerability. At the beginning of XXI century, human development perspectives are threatened by a global water crisis more and more deep. It derives both from water scarcity and pollution and worst quality of water used by poor populations.

Dispelling myth of crisis as mere consequence of a water scarcity, the Report demonstrate how the real core of problem must be found in poverty, in power and in inequality. The poor pay more than other water and food and more than they can afford. Beyond familiar needs, competition for water as production resource is increasing. Among the symptoms of this competition is the collapse of ecological systems based on water, the decrease of rivers flow and the depletion of aquifers on a large scale. Conflicts on water inside countries are intensifying, damaging the poor. Even the risk of tensions between countries is increasing, despite it would be absolutely convenient, in terms of human development, increasing cooperation.

In this frame, the need of a well done Environmental Mainstreaming rises with all its dramatic face, but also with its effectiveness. A crucial role have infrastructures and their integrated management (see UNDP [10: 155]), but the usefulness of environmental mainstreaming in international cooperation initiatives excels particularly is the combination between initiatives of contrast to water crisis and climate change.

In parallel, the dualism water competition – food security stands. Even the problematic of access to food depends heavily on vicious circle among political choices, project implementations and consequences on population. Water competition in agriculture is perhaps one of the fields in which most blatantly the deep linkages between water, livelihoods and human development are unveiled. UNDP [10] spares illuminating pages to that theme, remarking also some strategic directrices in which international cooperation is called to a strong commitment, in fruitful synergy with universities and research centres: better governance in irrigation systems; greater water productivity for the poor (even suggesting two pilot ideas such as water harvesting with micro-irrigation and low-technology solutions with high human development returns).

A further example of how the lack of an integrated vision, both geographic and sectoral, causes disasters, spoils the work of good cooperation, multiplies the effects of other impoverishment factors and obstacles for human and sustainable development, is trans-boundary waters management. Given that water interdependency is commonly recognized, the heavy costs paid for lack of cooperation are blatant, particularly in twofold shape of transmitting tensions down rivers and of shrinking lakes or drying rivers (exemplary are the cases of Chad Lake and Aral Lake)

Case studies in that matter are innumerable. For better bibliographic convenience, we can quote those ones proposed by Water Resources Institute [12], such as the example of inter-linkage between water and health in a project for regenerating watersheds in Darewadi Village, Maharashtra (India), with a typical Community-based Natural Resource Management approach, cross-sectoral, participatory, multi-stakeholder. Other variegated examples, even on cross-cutting water/food, can be found in annual reports of realities such as ICARDA. Also the enormous range of case studies in theme of correlation between marine pollution, fish stocks, fishing, jobs and food security is significant.

Finally, at least a mention must be dedicated to reflections, even methodological, in Human Development Report 2013 about common goods conservation (among them water, with a prominent role) and shared responsibility in their management.

## CONCLUSIONS

At the end of this brief excursus, there's only to sum up some conclusions. For more comfort, let's summarize them in 5 theses:

- 1) environment and ecosystem services are crucial themes and strength points of International Cooperation, being at the same time goal, tool and indicator of a sound Cooperation;
- 2) conservation and sustainable use of environment, fair and equitable sharing of benefits deriving from them are

three key goals of the whole Environmental International Cooperation, even beyond of the context of CBD, that expressively adopts them;

- 3) it's impossible to achieve them without a generalized and transversal application of them in all policies, thus Environmental Mainstreaming is the most suitable tool, even for combating the actual great fragmentation;
- 4) in matter of water and livelihood (food, clothes, drugs etc.) Environmental Mainstreaming is mostly useful and therefore represents the emblem of how integration should permeate all Cooperation;
- 5) Universities, both of Developed and Developing Countries, can play a decisive driving role: in order to spread mentality and culture of mainstreaming as well as to develop its methodologies; but in its turn that requires to adopt an inter-disciplinary, cross-sectoral, open approach, getting over the typical stiffness of academic environments and of higher education curricula, especially in Italy.
- 6) The experience of UNESCO Chair UNITN stands indeed in this direction. For further details on all the themes above treated, let's forward to the volume *Integrazione ambientale nei progetti di sviluppo* [13] that represents precisely a first digest of this experience.

## Water and sanitation access in the South-western Region of Burkina Faso

I. Angeluccetti<sup>1,2</sup>, V. Coviello<sup>2,3</sup>, S. Grimaldi<sup>4</sup>, P. Vezza<sup>4</sup>, A. Koussoubé<sup>5</sup>

### Context and issues

In the last few years the achievement of the Millennium Development Goals concerning access to water and sanitation has been announced. However, entire nations are still facing significant water issues. Burkina Faso is one of the country that still counts an important number of water-related disease cases, although acknowledged efforts have been done for incrementing safe drinking water and sanitation access so far. The South-western regions of the country have experienced an augmenting immigration flux from neighboring countries (e.g. Ivory Coast) and a growing gold mining activity, both formal and informal. These conditions cause an increasing pressure on the scarce drinking water infrastructures.

### The cooperation project

The European Union funded project FED/2011/264-206 address the above mentioned issues through the water supply system restoration, the application of the national laws concerning water governance and the construction of improved sanitation facilities.

On the left a water well to be restored, on the right a case of drinking water pumped for informal mining activities; Burkina Faso (photos V.Coviello)

### Expected results

More than 55.000 persons will have access to an improved water source.

More than 20.000 pupils of 62 schools and the patients of 29 health centers will have access to sanitation infrastructures.

Organisational and management skills of municipalities and environmental regional offices will be improved and will permit the functioning and maintenance of the water and sanitation network.

Beneficiaries behaviour with respect to the water and hygiene practices will be improved.

Women at a deep water well; Burkina Faso (photo V.Coviello)

Women at a deep water well; Burkina Faso (photo V.Coviello)

The project is led by the Italian NGO CISV, in partnership with 8 municipalities of the South-western region of Burkina Faso and the regional environmental authorities, with the technical support of ISF-Torino.

# SUSTAINABLE BIOMASS IN DEVELOPING COUNTRIES

Federico Barigazzi, Stefano Bechis - UNIVERSITA' DI TORINO-DISAFI

Paolo Giglio – TERRE SOLIDALI Onlus

Thomas A. Lawand - SOLARGETICS LTD. Montréal, Canada

In developing countries, an unsustainable level of consumption of firewood for domestic use has been reached, resulting in severe deforestation in some areas.

Considering that the only sustainable solution to this problem is switching to fuels other than wood, a gasification stove (AARON) has been developed by our research unit, starting from a scheme originally developed by the Brace Research Institute of Montréal (Canada).

This stove uses pelletized agricultural residues instead of wood, and does not produce smoke (apart from some periods during start-up and shutdown) during regular operation. Its adoption, on a large scale, is likely to greatly reduce wood consumption and incumbent smoke-related pathologies.

The activity was carried out in the framework of the project *Energies durables dans les régions d'Agadez et de Tillabéry (NIGER)* promoted by the European Commission - Energy Facility ACP – EU.

AARON has been appreciated for its ease of use and the absence of smoke. Aaron has been certified by the Centre National d'Energie Solaire of Niamey. Currently 1000 units are under production in Niger with the side result of a certain boost to the local economy. Pellets are produced locally, principally from millet residues.

French fries cooking with Aaron.

Aaron scheme and airflow.

	Efficiency %	Power (kW)	Specific Consumption (kg/l)*
Traditional fire on 3 Stones	14,70	2,80	0,34
<b>AARON</b>	<b>30,07</b>	<b>4,55</b>	<b>0,08</b>

\*The specific consumption is calculated in kg of fuel used per liter of water brought to 100 °C.

APPLICATION OF SOLUTIONS DEVELOPED FOR DCS IN ITALY  
Stefano Bechis, Federico Barigazzi – UNIVERSITY OF TORINO – DISAFA  
Giulio Re – SCUOLA LA MALVA  
Thomas Anthony Lawand, SOLARGETICS LTD.

**Abstract** - A solar drier type named Icaro, originally developed for Sahelian climate, has been adapted to European conditions. A drier built following this new design has been installed at La Malva school in Bibiana, Italy. The unit did undergo several tests during 2013 summer, in the framework of a regional project named Sundryfruit.

**Achieved Results** - The Icaro solar drier has been adapted to European conditions. Tests indicate that temperatures and airflow obtained by the unit are suitable for drying.

**Objectives** - To adapt to European conditions an existing successful technology developed for Sahelian climate. To demonstrate that smart, eco-friendly appropriate solutions are suitable also for developed countries.

**Methodological approach** - The drier design has been modified in order to technically and economically adapt it to European conditions. With regard to technical conditions the tilt angle of the solar collector was increased and a transparent cover has been added on the cover to enhance air heating. The overall size of the drier has been increased to raise the volume/surface ratio, thus assuring higher internal temperatures. Besides the effect on temperatures, size enlargement allows a scale economy.

**Conclusion** – The new drier proved to be well adapted to temperate climate conditions. However drying time is generally longer than in African conditions, mainly because of fresher and humid nights. This aspect is a technical and economic disadvantage, and further study is going on, at present, in order to speed up the process.

Icaro solar dryer under final preparations for testing

raspberry being dried on trays

## MILK AND DAIRY PRODUCTS SUPPLY TO URBAN AND PERIURBAN MARKET IN NIGER BY THE CREATION OF A COOPERATIVE DAIRY UNIT

Anna F.A. Cantàfora\*, Filippo De Monte<sup>§</sup>, Simone Stella<sup>°</sup>, Massimo Zecchini\*, Miro C. Crimella\*  
 \*Università degli Studi di Milano, Dipartimento di Scienze Veterinarie e Sanità Pubblica (DIVET)

[anna.cantafora@unimi.it](mailto:anna.cantafora@unimi.it)

<sup>§</sup>ONG Africa '70

<sup>°</sup> Università degli Studi di Milano, Dipartimento di Scienze Veterinarie per la Salute, la Produzione Animale e la Sicurezza Alimentare (VESPA)

### Abstract

Milk and dairy products are considered more and more as an essential element for the human nutrition in developing countries, above all in urban and periurban contexts. A development project to improve the quality of the milk chain in Niger was carried out by the Dipartimento di Scienze Veterinarie e Sanità Pubblica in collaboration with the Dipartimento di Scienze Veterinarie per la Salute, la Produzione Animale e la Sicurezza Alimentare and NGO Africa'70. The farmers involved in the project, grouped into a cooperative (Association des Producteurs Laitiers de Say - Hawrinde Biradam, APL) and trained on milking and milk management, became suppliers and operators of the dairy unit realized by the project. The unit, located in the Department of Say, was equipped with a laboratory, used for physico-chemical (temperature, pH, density) and microbiological (TBC, *Enterobacteriaceae*, *E. coli* and *Staphylococcus aureus*) analyses of milk and products. If milk quality was adequate, it was pasteurized or used for the production of yogurt and mozzarella; all milk and dairy products were sold in the market of Niamey.

The presence of a dairy unit in a periurban area allows a constant provision to the milk growing demand of urban and periurban consumers, assuring the availability of hygienic products. The farmers' involvement in supplying and managing the dairy unit can be considered a point of strength of the project, following a structure already validated in previous experiences (CLN – Cooperative Laitiere de Niamey, Redou Gniwa at Maroua, Cameroon); this social model made the beneficiaries aware of their role in a collective project and responsible for the milk quality available on the local market.

### Objectives

#### Development and cooperation

To create of a dairy unit allowing a constant provision to consumers.  
 To organize farmers for an improvement of local cow's milk hygiene.

#### Research

To evaluate the hygienic status of cow's milk delivered to the dairy unit.  
 To evaluate the influence of transport on the quality and microbial load of milk delivered.

### Achieved Results

A total of 129 local farmers from 19 villages in Say Department were grouped in the cooperative Association des Producteurs Laitiers de Say (Say cow's milk producers association) - Hawrinde Biradam (APL/Say), and a small dairy processing unit, with a laboratory for basic microbiological analyses, was built in 2009. All farmers involved were trained on milking and milk management, and became suppliers and operators of the dairy unit realized by the project.

Traditional milking	Collection at ICPs	Preparation for the transport	Transport by bicycle	Arrive at the dairy unit	Control (T, pH, density)								
					 pH ≥ 6.45 density ≥ 1.028 g/L								
Storage in a cooler tank	Transport to Niamey	Transformation in mozzarella	Microbiological analyses	<table border="1"> <tr> <td>T (°C) at ICP</td> <td>32,7±2,8</td> </tr> <tr> <td>T (°C) at dairy</td> <td>31,1±3,8</td> </tr> <tr> <td>pH at ICP</td> <td>6,47±0,1</td> </tr> <tr> <td>pH at dairy</td> <td>6,54±0,07</td> </tr> </table>		T (°C) at ICP	32,7±2,8	T (°C) at dairy	31,1±3,8	pH at ICP	6,47±0,1	pH at dairy	6,54±0,07
T (°C) at ICP	32,7±2,8												
T (°C) at dairy	31,1±3,8												
pH at ICP	6,47±0,1												
pH at dairy	6,54±0,07												
				During transport, milk temperature decreased gradually, thanks to the application of wet cloths to the plastic churns									

**The results obtained by microbiological analyses showed**

- high bacterial numbers, considering international dairy quality standards (IDF, 1990), but in line with data obtained by the studies conducted in similar production contexts (Millogo *et al.*, 2010; Bonfoh *et al.*, 2003)
- high contamination values linked to traditional milking procedures, such as manual milking in non-dedicated, uncovered areas
- increase in mean values due to milk transport,  $\Delta TBC = 0.99 \text{ Log}$ ,  $\Delta \text{Enterobacteriaceae} = 0.61 \text{ Log}$

### Conclusion

The diffusion of the awareness on the importance of microbiological contamination of milk can be an incentive for farmers to improve the quality of their production. Training programs represent the most efficient mean to promote the diffusion of technical knowledge and responsibility among all the stakeholders along the whole production chain. To be effective, hygiene promotion programs should be performed repeatedly and last for extended periods.

### Methodological approach

The farmers' involvement in supplying and managing the dairy unit can be considered a point of strength of the project, following a structure already validated in previous experiences; this social model made the beneficiaries aware of their role in a collective project and responsible for the milk quality available on the local market.

'Italy in Senegal': large-scale investments and support for family farming

**Giorgio Roberto**

Università Degli Studi di Torino – Scuola Universitaria in Scienze Strategiche

## Abstract

The mobility project – which lasted five months (from April to September 2012) – came from the definition of Land Grabbing of the Tirana Declaration and was aimed to find out if the phenomenon was happening in Senegal, and eventually discover which of the Italian companies were involved.

To do this, I compared the two methods of aid to agriculture in Senegal. The first was the one led by the largest companies, whereas the second one was the support for families farming carried out by the Italian NGOs on Senegalese territory.

I also compared the presence of Italy in the private and public sector.

## Achieved Results

- Recognition of the laws that allow foreign private investors to access to the land in the territory of Senegal.
- Localization on a map of the agricultural investments made by companies with Italian participation
- Analysis of two international cooperation projects that deal with the support for farm families and food security.
- Study of two Italian companies operating in Senegal in the cultivation and processing of jatropha: *Tea cooperative society* and *SBE Senegal*. A further analysis has been done to the *Tampieri* company operating in the field of sunflowers in Fanaye and the *African National Oil Corporation* operating in the field of jatropha.
- Creation of a matrix for the collection of data for each studied agricultural investments and development of a database for the classification and data management.

## Objectives

The result of the research was a qualitative and quantitative information on which land had been taken away from local farmers by Italian investors in order to produce biofuels and / or food for exportation. Here follows a list of the main objectives:

- A database on the use and ownership of land as far as the Italian factories installed in Senegal
- An analysis of the relationship between the use of local populations and the evolution of land grabbing
- A detailed analysis that leads to the understanding of the processes and dynamics of the formal acquisition of land by foreign and domestic investors and the role of local authorities.

## Methodological approach

The research methodology has been developed as follows:

- Interviews with university professors and companies managers of the area
- Field visits
- Compiling the database of the companies
- Photographic documentation

## Conclusions

This research can be seen as a basic work for the creation of a database of Italian companies operating abroad. Future researches could expand the research I carried out and implement the database already in place and, at the same time, integrate whatever is still missing.

My suggestion is to investigate on all those organizations which provide secure, sustainable and eco-friendly certifications.

A further field of investigation should be the one of the emission of carbon credits.

Potou's jatropha nursery (pépinière)

Localization of the agricultural investments made by companies with Italian participation

Examples of micro gardens carried out by the NGO ACRA in Dakar

Woman in a certified organic cotton field which has been given by the support from the 'NGO M.A.I.S.

### TEN YEARS OF COOPERATION ON SUSTAINABLE AGRICULTURE BETWEEN CHINA AND ITALY

Maria Lodovica Gullino\*, \*\*, Angelo Garibaldi\*, Massimo Pugliese\*, \*\*, Corrado Clini\*\*\*

\*University of Torino, AGROINNOVA, Via L. da Vinci 44, 10095 Grugliasco (TO)

\*\*University of Torino, DISAFA

\*\*\*Italian Ministry for Environment, Land and Sea

Ministero dell'Ambiente e  
della Tutela del Territorio e del Mare

#### Abstract

In the year 2000 the Italian Ministry for Environment, Land and Sea and the State Environment Protection Administration of China jointly launched the Sino-Italian Cooperation Programme for Environment Protection. In this framework several cooperation and technology transfer projects in different rural areas of China have been carried out with special attention to sustainable crop protection.

The projects, located in Inner Mongolia, Xinjiang, Shandong, Hebei and Chongming Island, were aimed at increasing yields and quality of vegetable crops (e.g. tomato, eggplant, pumpkin, and cabbage), fruits (e.g. grape) and cereals.

Fig. 1 – Watermelon field trial with organic mulching.

#### Achieved Results

The implementation of innovative technologies characterized by low cost of application, simple set up and management and economic suitability to the local conditions provided successful results. Obsolete, polluting pesticides were replaced with chemicals having a lower environmental impact. Drip irrigation systems in substitution of the old, water-consuming techniques of flood irrigation were used to distribute fertilizer at reduced dosages. Polyethylene mulching films were replaced by the use of starch-based biodegradable plastic films and organic mulching (Fig. 1). Grafting on resistant rootstocks (Fig. 2) was used to reduce plant stress to soil salinization and disease caused by soil-borne pathogens. In the demonstration areas, consumption of water, pesticides and fertilizers were reduced by 5–6 times, while the new mulching films, being completely biodegraded a few month after the cropping cycle, solved the problem of white pollution.

#### Objectives

- Transfer of innovative technologies for sustainable agriculture
- Reduce agricultural pollution caused by chemicals and plastics
- Increase food safety and security
- Increase farmers income

#### Methodological approach

Academic institutions, public research centres and private companies have joined the Programme with the aim to ensure the replicability and long-term sustainability of the new technologies adopted. Workshops and seminars have also been organized in order to inform stakeholders on scientific, technical and economic feasibility of the new proposed techniques.

Fig. 2 – Grafting on resistant rootstocks

#### Conclusion

Sustainable agriculture systems were able to reduce the environmental pollution, resulting in an increase in incomes and positive economic benefits, while maintaining production costs similar to that of the conventional systems in many cases. Meanwhile, the innovative technologies also improved the agricultural product quality and safety.

Victorin Codjia<sup>4</sup>, Carlo Semita<sup>2</sup>

<sup>1</sup> University of Turin-Department of Veterinary Science, <sup>2</sup> University of Turin-CISAO, <sup>3</sup> University Abdou Moumouni of Niamey-Faculty of Agronomy, <sup>4</sup> Ministry of Agriculture, Livestock and Fisheries (MAEP) of Benin

**Abstract** - Thanks to financing provided by the **Piedmont Region** and the **Associazione delle Fondazioni delle Casse di Risparmio del Piemonte**, in 2009, some of the researchers of the CISAO (Interdepartmental Centre of Research and Scientific and Technical Cooperation with Sahelian and West African Countries – [www.cisao.unito.it](http://www.cisao.unito.it)) of the University of Turin, supported by the associated **Universities of Niger, Benin and Burkina Faso**, pursued two training courses in Niamey (Niger).

#### Achieved results

- Course for technicians in Artificial Insemination (AI): 17 technicians and veterinarians (from Niger, Benin and Burkina Faso) have been learned; three of them were women.
- Course addressed to skilled workers: 22 subjects (from Niger, Benin and Burkina Faso) have been trained.
- Learning assessment with questionnaires and custom tabs, containing observations and comments to fill the gaps of every apprentice.

#### Methodological approach

**2 courses** have been structured:

- a) Training of higher-level and graduated technicians in AI;
- b) Training of not high school graduated skilled workers in livestock and milk production techniques.

Step 1 in Italy: stage of the 3 African coordinators which provided some common tasks and other specifications according to their skills.

Step 2a in Niger: training in AI techniques with lectures supplemented by several practical training including relatively innovative issues in the African context such as animal welfare and occupational safety.

Step 2b in Niger: training of skilled workers with lectures, translated into the local languages, and practical exercises about the correct approach of cattle and cattle chute, also highlighting the risk associated with the work and the need to adopt safety precautions.

#### Objectives

- Sustainability of agro-livestock development programs.
- Capacity-building and improvement of the expertises of the employees.

#### Conclusion

Course participants showed that they were satisfied with the activities. The technicians in AI were contacted to evaluate comments and experiences after implementation of the acquired expertises. The skilled workers expressed enthusiastic appreciation demonstrating a certain pride in being joined by a training initiative, as a first experience for many of them.

## ENVIRONMENTAL RESOURCES AND DECAY IN CAPE VERDE. A SURVEY IN SANTO ANTÃO AND SÃO VICENTE

Stefano Orlandi, Angela Calvo

Department of Agricultural, Forest and Food Sciences – University of Turin

### Abstract

The research in Santo Antão and São Vicente (Cape Verde) has been undertaken from August to September 2007 as part of the multidisciplinary project "From waste to resource" focused on Sahel and funded by Regione Piemonte. The survey concerning water and energy availability and waste production has been carried out through semi-structured interviews, based on specific questionnaires, addressed to local authorities, to some associations of producers and to processors of agricultural products (small farmers, local liquor producers, small retailers, etc.).

The analysis of the collected data allows us to formulate the following considerations:

- as regard water resources, it seems essential to keep on the reforestation program, with species adapted to the Cape Verdean climate (e.g. *Prosopis juliflora* L.), of which local population has now directly experienced the benefits. Educational programs should be carried out especially in urban areas, while in rural areas facilities for drip irrigation should be extended.
  - as regard energy development, it was found that the wind turbines, in absence of proper maintenance, have a limited use over time, while the evaporative desalination provides a longer service life. This observation, far from theoretical hypotheses, teaches how much in cooperation projects is necessary to take into account the local and the actual conditions, which determine the project outcome over time.
  - as regard the problem of waste, awareness and habits of local population are, at the moment, inadequate; in many areas, the ground, despoiled from the tree, is covered by waste. Proper waste management would stop the environmental decay and initiate a new deal, with the reappropriation and the safeguard of habitat by a responsible population, able to make progress
- International aid is still fundamental in terms of financial and technical contribution, but only the involvement of an aware enough local population can allow and truly guarantee a sustainable development.

### Objectives of the research

The main objective of the study was to acquire a deep knowledge about environmental decay in Cape Verde islands, inhabited by humans from the discovery (1445-1462), Portuguese colony until the proclamation of independence on July 5th 1975. In particular, Santo Antão and São Vicente, characterized by a rapid population growth and a hasty modernization process, are at risk of reducing water and forest resources and of increasing waste production.

### Methodological approach

The survey concerning water and energy availability and waste production has been carried out through semi-structured interviews, based on specific questionnaires, addressed to local authorities, to some associations of producers and to processors of agricultural products (small farmers, local liquor producers, small retailers, etc.).

When the interviewee was more available (as in the case of the Director of the Ministry of Agriculture of Santo Antão), a second interview was made on possible solutions to face the problems of water shortage, desertification and uncontrolled presence of illegal dumping.

### Achieved Results

The collected data show:

- the lack of water and energy resources that can be addressed, at least in urban centers, with desalination plants;
- the need for continuing the reforestation program initiated since independence, promoting the conscious participation of the population, especially in protecting planted areas;
- the urgency of a proper waste management, the extent of which is such that not only collection and disposal are needed, but also separation and recycling are mandatory.

### Interviewed people

Small farmers

- Agricultural producers and processors
- Officials of the Ministry of Environment and Agriculture
- Employees of the Environmental Sector of the Municipality
- Leaders of environmental associations
- Managers of food industries
- Craftsmen

 - Reduced from 40s  
 - Wells dried-up since 75  
 • Drop by drop  
 • ELECTRICITY  
 - Problems  
 • CROP TYPES  
 - Many types  
 • WASTE  
 - Packaging reusing  
 - Pesticides packaging incinerated or scattered

### SANTO ANTÃO – Agricultural processor in the municipality of Ribeira Grande

SANTO ANTÃO INDUSTRIAL SOCIETY  
 • ACTIVITIES  
 - Sugarcane processing (grogue, honey, liquor, vinegar)  
 • WATER  
 - Water system  
 • ELECTRICITY  
 - Diesel central  
 • WASTE  
 - Packaging non-recoverable thrown in municipal bins  
 - Sugarcane waste joined to maize for animal feed

### Conclusions

Considering population growth and increased tourism, financial and technical contributions are necessary to ensure water and energy supply and waste management.

The interventions should be realized through:

1. Economic investment for a better management of municipal waste, consisting in:
  - more staff;
  - more equipment (bins, containers, garbage trucks);
  - programs for disposal and recycling.
2. Local population involvement:
  - spreading of water saving culture (drop by drop irrigation system);
  - reduction of illegal dumping;
  - forest protection.

In this context, international aid must cooperate with the Cape Verdean people to safeguard their environment, restoring the basic habitat elements for life.

An authentic cooperation implies coming together to find a way to sustainable development, which certainly passes through the respect for the environment but, above all, for the local population.

### FORESTRY 3.000 ha (<1%) in 1975 → 95.000 ha (>20%) in 2007

OBJECTIVES:  
 - Fight against desertification with species adapted to the Cape Verdean climate (e.g. *Prosopis juliflora* L.)  
 - Soils protection against erosion  
 - Water conservation  
 - Biodiversity safeguard (Euphorbia luckeyana Bleed)  
 - Wood, coal and fuel production  
 - Creation of jobs

### WASTE

PROBLEMS:  
 - Population growth (urban expansion)  
 - 34% of the population not reached by waste collection  
 - Illegal dumping  
 - Smells and fumes from incineration  
 - Dispersal by wind and stray animals  
 - Groundwater pollution  
 - Negative impact on the landscape

## LA RIFORMA SILENZIOSA -COME LO STATO RUBA LA TERRA-

Dott.ssa Alessandra Portis  
Università degli studi di Torino

### Land grabbing in Senegal e la debolezza normativa

Il fenomeno del *land grabbing* è stato oggetto di innumerevoli analisi multidisciplinari nel corso degli ultimi anni, avendo catturato l'attenzione di ricercatori dai back ground più disparati, per via delle implicazioni globali drammatiche date dalla sua diffusione. Tuttavia, vi è pochezza d'analisi del fenomeno dal punto di vista giuridico. Sulla base di questa considerazione, il mio progetto ha cercato, nel suo piccolo, di colmare questa lacuna. Attraverso un caso studio in Senegal, tramite l'analisi della disciplina proprietaria e fondiaria senegalese, ho messo in evidenza come la debolezza normativa abbia permesso un atteggiamento elusivo da parte dello Stato che, non rispettando la legge formale, svendendo la terra dei suoi cittadini.

### Approccio metodologico e modalità di svolgimento della ricerca

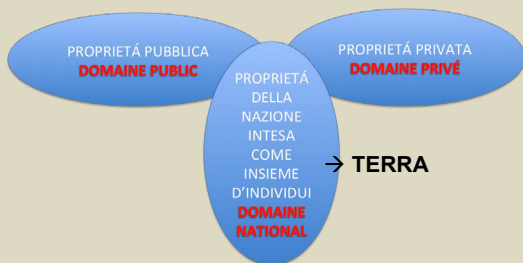

- ✓ **Why?** Dimostrare come lo Stato senegalese eluda la disciplina formale per garantirsi maggiori benefici economici e per incentivare le possibilità d'investimento in campo agricolo nel paese;
- ✓ **Where?** Dakar e zona del Ferlo, Regione di Louga;
- ✓ **When?** Da gennaio a marzo 2013;
- ✓ **Who?** Gli attori coinvolti nella ricerca sono stati: esperti di diritto fondiario, funzionari della Pubblica Amministrazione implicati nei processi di concessione e locazione di terre, presidenti delle Comunità Rurali, come ultimo livello di decentramento amministrativo, ed infine beneficiari di concessioni amministrative sulla terra;
- ✓ **How?** Attraverso l'analisi del *corpus* normativo disciplinante il diritto fondiario e il diritto di proprietà per lo studio della struttura formale di accesso alla terra, attraverso interviste in loco agli attori coinvolti nel processo di concessione per la modalità pratica di accesso alla risorsa terra;

### L'obiettivo: disciplina formale vs applicazione sostanziale

#### DISCIPLINA FORMALE

##### 1. Tripartizione del diritto di proprietà

##### 2. Domaine National (DN)

Sulle terre del **Domaine National** è esercitabile solo un **diritto d'uso** tramite concessione (**Affectation**), approvata con delibera dal Consiglio Rurale. Sono **vietate** locazione (**Bail**) e diritto di proprietà (**Titre Foncier**).

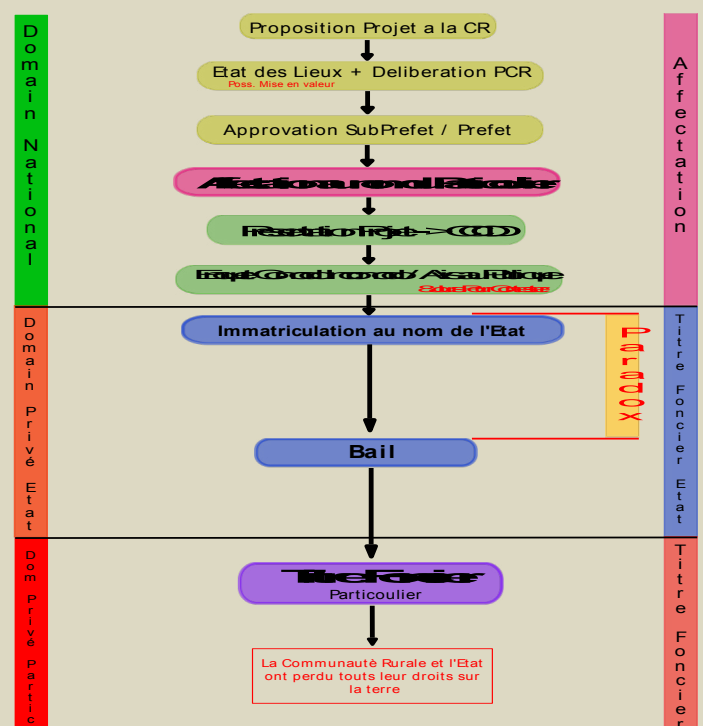

##### 3. Affectation

- ✓ Concessa solo agli appartenenti alla Comunità Rurale;
- ✓ Con obbligo di valorizzazione della terra in 2 anni;
- ✓ Vietata agli stranieri.

##### 4. Pubblica Utilità

**Eccezione:** in casi di **pubblica utilità**, stabiliti per legge, le terre del **Domaine National** possono essere oggetto di **Bail** e **Titre Foncier**.

#### APPLICAZIONE SOSTANZIALE

# Immaginare culture della cooperazione: le Università in rete per le nuove sfide dello sviluppo

III Congresso scientifico CUCS  
Torino, 19-21 Settembre 2013

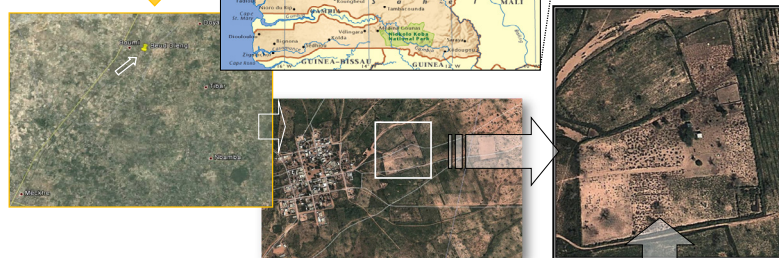

- Sun and Water management for a reliable and sustainable horticultural production -

Maurizio Previati, Stefano Bechis UNIVERSITY OF TORINO – DISAFA  
Davide Canone, Stefano Ferraris UNIVERSITY OF TORINO – DIST

## The H<sub>2</sub>Ortisol Model

### Introduction

Rural areas of most Sahelian countries are characterized by subsistence agriculture with productivity rather poor and a consequent exodus of people from country zones to cities. Having that in mind, many governments are developing plans for a "return to agriculture" with the objective of stabilizing communities in their areas of origin and revitalizing the local economy by increasing the agricultural production, especially horticulture. However, an increase in productions and domestic incomes should necessarily pass through the implementation of new strategies aiming at the sustainable development of agricultural infrastructures, the adoption of new equipments, and the training of people in order to improve the sustainable utilization of the factors of production: soil, water, and energy.

### Objectives

H<sub>2</sub>Ortisol aims to be a sustainable and replicable modular system of a vegetable garden, conceived to minimize operating costs and reducing the waste of natural and energetic resources.

### Methodological approach

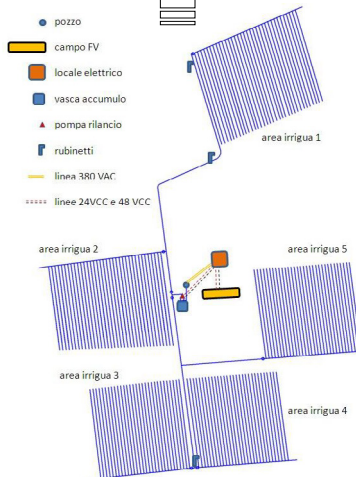

The H<sub>2</sub>Ortisol pilot project has seen the installation of 5 drip irrigation sectors (for horticultural purposes) with pumping systems powered by solar energy without the support of any battery.

More over, this system adopted a water tank located at ground level and a booster PV pump tailored to supply the necessary water volume calculated on the base of cultivated plants physiological needs.

Finally, security devices have been adopted to preserve the integrity and the functionality of the whole system, both in case of energy imbalances, lack of water, and/or abnormal pressures.

### Achieved/Expected Results

- Increase and improvement of production areas;
- creation of jobs places and reduction of local exodus;
- raise of domestic incomes;
- increase of knowledge and awareness on the good local development capability;
- activation of local microeconomies;
- food local prices mitigation and stabilization;
- better nutrition;
- contribution to the decrease in illnesses due to poor nutrition;
- valorization of soil and water.

### Conclusions

The widespread of H<sub>2</sub>Ortisol projects on the sahelian territory can strongly contribute, (especially if coupled with solar drying systems or for the food conservation), to:

- the self-sustenance of rural communities,
- the revitalization of the local economies,
- the reduction of the rural exodus,

According with the main political programs implemented by governments in the area and with a particular attention to the

### TRANSFER OF AGRO-LIVESTOCK TECHNOLOGIES FOR BIODIVERSITY PRESERVATION IN SAHELIAN ENVIRONMENT

Carlo Semita<sup>1</sup> ([carlo.semita@unito.it](mailto:carlo.semita@unito.it)), Riccardo Fortina<sup>2</sup>, Francesco Cristofori<sup>1</sup>, Ousseina Saidou Touré<sup>3</sup>, Moumouni Issa<sup>3</sup>, Marichatou Hamani<sup>3</sup>, Alhassane Yenikoye<sup>3</sup>, Tiziana Nervo<sup>4</sup>

<sup>1</sup> University of Turin-CISAO, <sup>2</sup> University of Turin-Department of Agriculture, Forest and Food Sciences, <sup>3</sup> University Abdou Moumouni of Niamey- Faculty of Agronomy, <sup>4</sup> University of Turin-Department of Veterinary Science

**Abstract** - Between 2001 and 2011 the Interdepartmental Centre of Research and Scientific and Technical Cooperation with Sahelian and West African Countries (CISAO – [www.cisao.unito.it](http://www.cisao.unito.it)) of the University of Turin has supported many activities to preserve and enhance biodiversity at the Experimental Sahelian Station of Toukounous (Niger). These activities and projects provided for the transfer of techniques and innovative but sustainable agro-livestock technologies to the staff of the Faculty of Agronomy of the University of Niamey and of the Ministry of Animal Industries of Niger. All the actions were part of the Food Security and Poverty Reduction Programme in West Africa of the Piedmont Region.

#### Achieved results

- Improvement of milk production through the application of a model of management of forage resources and the improvement of the composition of the herd.
- Progressive knowledge of the operational context.
- Dissemination of the project on a larger scale through to awareness-raising and diffusion of the activities and the results both in Italy and locally.
- The Toukounous Station has assumed a considerable educational value becoming a location for practical works and stages for the local universities students.

#### Methodological approach

Adoption of a scientific approach progressively adapted to the social, economic and cultural local situation.

#### Objectives

- Analysis of the priority needs and available local expertises;
- Development of a model for the use of local forage resources.
- Proper management of a herd of the dairy native zebuine breed Azawak.

Cages for the evaluation of local forages

Milk analysis

Involvement of consultants

Expertise transfer

Breeder bulls selection, semen production, artificial insemination.

#### Conclusion

The participatory process has proven to be one of the keys to the success of the project which is replicable for further safeguard actions of other local breeds of Niger (e.g. Kouri cattle, red Maradi goat) and which has been applied in similar contexts in other countries of the Sahel (e.g. Burkina Faso) by other groups of decentralized cooperation.

<sup>3</sup>S.C. Igiene degli allevamenti e delle produzioni animali – Dipartimento di Prevenzione - ASL TO 4 - Regione Piemonte, Italy.

<sup>4</sup>Fepp-Fondo Ecuatoriano Populorum Progressio – Quito, Ecuador.

<sup>5</sup>Ufficio Solidarietà e Immigrazione – Comune di Settimo T.se (TO), Italy

**Abstract.** The decentralized cooperation activities of Piemonte Region (2007-2011) funded a three inter-linked projects to support the rural areas of Ecuador (Provinces of Cotopaxi, Canar and Tungurahua) with the aim of improving the whole dairy production system (milk, dairy products and marketing), through technical support and a training repeatable model. The project activities, through informative meetings organized in Piemonte, contributed to raise the local population awareness on the problems of the Ecuadorian Andean communities.

**Objectives.** Even if in recent years Ecuador has been experiencing major social and political changes, the majority of the population is still living in a chronic poverty condition, worsened by the global economic crisis. The project was focused on strengthening the capacity of the actors involved in the milk/dairy production chain through the provision of multi-disciplinary training, in order to achieve a repeatable teaching model for rural areas of Ecuador, in Cotopaxi, Cañar and Tungurahua Provinces. In rural areas there is a strong need of education/training programs<sup>1</sup> because the small producers hardly have access to local public and private institutions, due to logistical and economic reasons. In Italy the project aimed at raising the citizens' awareness to the problems of developing countries, particularly of the Ecuadorian Andean communities.

**Methodological approach.** The Piemonte Region (Italy), through decentralized cooperation programme, from 2007 to 2011, funded three inter-linked projects presented by the Municipality of Settimo Torinese (TO), aimed at improving the milk/dairy sector and the creation of a teaching repeatable model for rural areas of Ecuador. The partners of the project were: Dipartimento di Scienze Veterinarie, University of Torino; AVEC-PVS Associazione Veterinaria di Cooperazione con i Paesi in Via di Sviluppo (<http://www.avec-pvs.org/>) and Dipartimento di Prevenzione - ASL TO 4 - Regione Piemonte; FEPP - Fondo Ecuatoriano Populorum Progressio (Ecuador) and Fondacion Consorcio de Queserías Rurales Comunitarias (Ecuador).

In consideration of the participatory needs assessment the following training courses have been planned and conducted: dairy production techniques; management, feeding and welfare of dairy cows; milking hygiene and animal health; control of the quality of milk and dairy products; production of new types of cheese; optimization of the administrative management and HACCP plans for dairy processing plants; marketing strategies for dairy products.

**Achieved Results.** From the training courses, held by local and international experts and attended by 225 breeders and producers, technical manuals have been obtained (milking hygiene, marketing guidelines, HACCP simplified and milk/dairy chain technical manuals). The publications, in Spanish language, have been distributed to the rural associations and local and international development organizations. A small laboratory for the analysis of milk quality was set up (*Solex* equipment, densimeter and *Milk Analyzers Lactoscan*). Four mobile and three fixed refrigerated units have been appointed for dairy products marketing. A small scale feed manufacturing plant was also established for cattle feeding. Three dairy local experts attended a 55-day formation course in Italy. In Italy cultural awareness evenings and meetings in some schools have been held (project activities presentation, ethnical dinners and short course of cheese tasting).

**Conclusion.** The collaboration among all the stakeholders, in a long term project, has permitted to assess the real needs of Ecuadorian rural population involved in milk/dairy production, changing over time the strategies of intervention by a "backwards" process, from an enhancement of the final product to an improvement of the raw material. The creation of a repeatable teaching model, which identifies among its objectives the production of operating manuals and/or guidelines by the participants themselves, ensures more sustainability to the project, improving its efficacy and efficiency. In Italy, the sensitization activities have certainly increased the knowledge and awareness of the rural Ecuadorian population problems and needs.

Turin, 19-21 September 2013

## A MULTILINGUISTIC APPROACH TO PRESERVE VINEYARD LANDSCAPES' AGROBIODIVERSITY. Francesca Varvello Università degli studi di Torino-Dipartimento di Giurisprudenza

### Abstract

The purpose of this study consists in examining the function of language in the vineyard landscapes' development outlining the need of a "multilinguistic" approach to preserve their agro-biodiversity. Indeed, as authenticated by international legal instruments, traditional agricultural techniques - typical of indigenous cultures - are frequently in accordance with contemporary environmental needs and constitute the solution for the conservation and use of rare resources - soil and water in this case. Then, the vine-makers become directly partners of the International Community in conserving the agrobiodiversity of landscapes. Furthermore, it is widely admitted, in doctrine, the proportionality between the safeguard of native language and the preservation of biological diversity, because of the fundamental role of the nominal identification of natural elements and managing techniques and, of course, the role of language in oral transmission of knowledge.

### Achieved Results

1. The reflection starts with a case study of the vineyards already inscribed into the World Heritage List or under nomination through the Tentative List: the importance of the **cultural element** emerges, by definition, considering them as cultural landscapes. Indeed, human contribution is evident in all the wine-sites examined, making them rich in "biocultural diversity".
2. The second step underlines the importance of traditional and local agricultural techniques for the preservation of biological diversity: an agricultural landscape characterized by a low-intensive cultivation (as vineyards) is typically **rich in agro-biodiversity**.
3. The subsequent reflection represents the connection between the previous considerations: as traditional techniques, expression of the cultural identity of the local community, are essential for biodiversity conservation, **the preservation of the cultural peculiarity safeguards the agro-biodiversity of vineyards**.
4. The fourth and conclusive reflection takes into consideration language as one of the most representative cultural elements: it is widely admitted, in doctrine, the proportionality between the safeguard of native language and the preservation of biological diversity, because of the fundamental role of the nominal identification of natural elements and managing techniques and, of course, the role of language in oral transmission of knowledge. Considering, than, that some of the vineyards already inscribed under the World Heritage List are located in a territory reported by the Atlas List for the language in danger, is possible to assume that **a policy of multilingualism preservation could directly affect the agro-biodiversity of the related vine - but not just them - cultivations**.

### Objectives

The principal objective of this study was to demonstrate the mutual correlation between the safeguarding of language - as a manifestation of the cultural background and identity of a local community - and the preservation of agro-biodiversity of cultivations, providing, as such, an exemplification of the consideration that «*cultural diversity is as essential for humanity as biodiversity is for nature*».

### Methodological approach

A step-by-step approach has guided this study, starting from an analysis of the related international instruments (signally the World Heritage Convention; the Convention on Biological Diversity; the Universal Declaration on Cultural Diversity and the further 2005 Convention; etc.) and moving towards a case-study of vineyard cultural landscapes to reach, with the sustain of the contemporary doctrine, the following conclusion.

### Conclusion

## TRADITIONAL MEDICINES AND LOCAL KNOWLEDGE: POLICIES, INTERNATIONAL AID AND ACADEMIC RESEARCH

Elisa Bignante\*

\*Università degli Studi di Torino - [elisa.bignante@unito.it](mailto:elisa.bignante@unito.it)

The panel developed a reflection on the relations between the so-called systems of “traditional” healing, ‘western’ medicine and the health policies and interventions of international aid implemented at the different scales. The discussion revolved around the following questions: what are the multiple characters of traditional medicines, which role do they play and how are traditional medicines transforming themselves? What are the tools, practices, strategies of international organizations in the field of traditional medicines? What are the national policies implemented in different countries? What is the role of international aid? What is the possible role of academic research? The projects of development cooperation which aim to improve access to the right to health confront themselves with different concepts of illness, care, health which coexist, conflict and dialogue. How to meet and interact with these dynamics? How to protect traditional knowledge at the different scales, and ensure the recognition of intellectual property rights in the hands of indigenous peoples?

With reference to this last aspect the tools made available by national and international law in order to protect the traditional knowledge of indigenous peoples were discussed during the panel. The use of traditional medicines and the local knowledges on which it is based are closely linked to the cultural diversity of the people involved, as well as to the right to life. Both aspects are protected on the basis of legal principles recognized by legal systems at the different scales, from the international to the regional level. The protection of traditional knowledge has been at the core of several complaints, which were brought in front of national courts, for the recognition of intellectual property rights in the hands of indigenous people. These complaints are mainly aimed at protecting the originality inherent in traditional medicine against commercial exploitation by multinational corporations. At the international level, traditional medicine is protected through the action of tribunals in order to ensure respect for fundamental human rights. It is relevant, in particular, the case law of the Inter-American Court of Human Rights. This body has explicitly recognized a collective right of indigenous people to the use of land and natural resources, as indispensable to their material and spiritual life. The binding between those rights and the right to life has brought out two aspects that are particularly innovative in terms of international protection of human rights. On the one hand, the purely collective rights to land and its use (including the production of traditional medicines) have been recognized and, secondly, the assimilation of the violation of the rights in question to a violation of *ius cogens*, in the name of the close link with the right to life has also been recognized.

A second theme approached in the panel has been the relationship between traditional medicines and conventional medicine (also referred as modern or western medicine), with specific reference to the Senegalese context. The process of interaction between traditional and western medicine in Senegal is one of the most delicate terrains of divergence between what is announced in policies and what actually happens in practice. The results of two field studies conducted in the urban areas of Louga and Saint Louis have been presented. The studies discuss the positions of the various parties involved in the traditional-western medicine integration debate (healers, herbalists, patients, government representatives, Ngos, medical doctors, nurses, etc.) collected through participant observation and the administration of semi-structured interviews. The analysis of the therapeutic itineraries of the local population in Louga and St. Louis shows that the dialogue between traditional and mainstream medicine today revolves primarily around herbal medicine and the joint examination of the results of the case studies allowed identifying some possible guidelines for the integration of traditional medicine into the national health system.

A third theme explored in within the panel has been the balance (or absence of balance) between the demand for and supply of care which are at once a dynamic component and an obstacle in the relationship between various medical knowledges. In equatorial Africa, in political and social contexts characterized by widespread insecurity and the overlap of local and foreign macro and micro economic interests, often in conflict with each other, "traditional medicine" continues to be an area of interaction, and sometimes clash between subjects with different logical a priori. Representations of illness such as those of western and traditional medicines, the etiology of "mysticism" that calls into question witchcraft in its various forms, the diagnostic device of divine healing introduced by immigration from the East, all these representations often collide within the equatorial market of healing, giving rise to new etiologic and therapeutic devices that continuously change to meet the needs and demands of local populations. Through the analysis of some ethnographic cases collected in the Central African Republic and in Benin between 2005 and 2012, dilemmas related to the interaction of biomedical and "traditional" healing practices have been analyzed and discussed. The case studies show how the use of multiple therapeutic approaches can not erase some of the tensions and misunderstandings that arise among traditional healers' and biomedical doctors. A long history of contacts, violence and impositions cyclically re-emerges in the practice of traditional healers and their colleagues trained in the universities and in the hospital wards in Central Africa.

Finally, the panel concentrated on development cooperation projects in the field of traditional medicine which aim to improve access to health, where concepts such as health, infection, care, gender coexist and can acquire contrasting meanings. An international aid project which promotes access to health integrating western and traditional medicine must reflect on the health models implicit in the various systems of care within the different health knowledges. Studying therapeutic itineraries allows in this framework to highlight the diversity of care resources available and how they are used. Several studies in Western Africa confirm the complexity of therapeutic itineraries, which are influenced by the meanings and causes attributed to disease, by the perception of pain, by urgency, by the priorities assigned to the geographical, economic and cultural aspects which determinate access to health facilities. The panel discussion focused on how contemplating these issues not only affects the fundamental right to health of people but it also helps promoting policies in which the richness and plurality of traditional and western medicine interaction generates wealth and knowledge for all, and the capability of accepting the coexistence of different forms of knowledge and different systems of care.

## LES RELATIONS ENTRE LA MEDECINE TRADITIONNELLE ET LA MEDECINE OFFICIELLE AU NORD DU SENEGAL: UN ETUDE COMPARATIVE.

### ABSTRACT

L'intervention approfondit l'étude de la relation entre la médecine traditionnelle et la médecine conventionnelle au Sénégal. Le processus d'interaction entre les deux médecines semble être l'une des terres les plus délicates de l'écart entre ce qui est annoncé dans les politiques et ce qui se passe réellement dans les pratiques. L'étude montre, dans une perspective comparative, les résultats de deux études menées sur le terrain dans les zones semi-rural de Louga et urbaines de Saint-Louis. Les positions des différentes parties prenantes (les guérisseurs, médecins, patients, gouvernements, ONG) ont été recueillies par l'observation participante et l'administration des entretiens semi-structurés. L'analyse des dynamiques spatiales et des itinéraires thérapeutiques de la population locale nous a permis de comprendre les dynamiques d'utilisation des deux méthodes de traitement. Il a été constaté qu'il y a beaucoup de pratiques comptés comme médecine traditionnelle, et que le dialogue entre eux et la médecine officielle repose aujourd'hui principalement sur la phytothérapie. Dans ce cadre, nous avons analysé le rôle des organisations de la coopération dans la promotion (ou opposition) de l'interaction de ces pratiques et la fonction de la recherche en proposant des modèles d'interprétation capables de soutenir et de maintenir un possible dialogue. L'analyse conjointe des résultats des études de cas a permis d'identifier quelques orientations possibles d'intégration préliminaire de la MT dans le système national de santé.

### INTRODUCTION

À partir d'une première analyse d'emprunte politologique, on vise à identifier les limites de la réglementation des pratiques de guérison traditionnelles et ensuite on offre un examen comparatif des résultats spécifiques des deux études de cas. Les activités de recherche sur terrain qu'on a menées et qui ont été financés par l'Université de Turin, et réalisées ensuite en collaboration avec l'Université Gaston Berger de Saint-Louis et le Centre de Recherche Girardel, nous ont permis d'étudier les modalités d'interaction et d'intégration entre la médecine traditionnelle (MT) et la médecine conventionnelle (MC) à partir de plusieurs points de vue: géographique, politologique, économique, social et culturel.

Pour mieux comprendre si et comment l'intégration parmi les différentes thérapies se vérifie effectivement, on a examiné les itinéraires thérapeutiques propres des populations locales afin de trouver les facteurs qui déterminent les choix et les préférences de soins.

On s'est donc posé des questions spécifiques: est-ce qu'une réelle intégration parmi MT et MC réponde aux besoins des populations locales? Quels sont les facteurs qui déterminent le choix parmi une thérapie de MT ou de MC? Comment les différents contextes territoriaux (urbain / rural) influencent sur les choix de traitement médicale des populations locales?

Le point de vue d'un bon nombre de sujets impliqués dans notre réseau de recherche, à voir Agences techniques, ONG, personnalités et institutions politiques, professionnels de la santé et d'autres groupes de recherche, nous a permis de compléter le tableau des limites et des potentialités de l'intégration des deux pratiques à l'intérieur du même Système de Santé National (SSN) et de rédiger une série des possible orientations qui pourraient améliorer l'assistance sanitaire primaire au Sénégal.

### LA MEDECINE TRADITIONNELLE ET LA MEDECINE CONVENTIONNELLE AU SENEGAL: POLITIQUES, ORIENTATIONS ET OBSTACLES AU PROCESSUS DE REGLEMENTATION

Le thème de l'intégration entre la MC et la MT domine le débat international depuis les années 70 du XX siècle, produisant toute une série de réactions et opinions contradictoires. Les organismes internationaux et régionaux les plus importants ont toujours eu comme objectif la réalisation d'une collaboration entre les deux disciplines en attendant de formaliser une intégration effective de la MT au sein du SSN.

Pour supporter cet intérêt, on cite les événements des premiers 20 ans dédiés à la valorisation de la MT et le Plan d'Action stratégique de l'OMS en 2002-2005 [1]. Profondément ancrée dans le débat international est la définition de

Santé Publique donnée par l'OMS en 1946: "La santé est un état de complet bien-être physique, mental et social, et ne consiste pas seulement en une absence de maladie ou d'infirmité" [1] et la Déclaration d'Alma-Ata issue de la Conférence sur les Soins de Santé primaires en 1978 [2]. Pour la première fois dans le monde la Déclaration permet l'utilisation de méthodes de guérison traditionnelles dans le but d'atteindre des standard de santé adéquats pour tous et reconnaît le rôle du thérapeute traditionnel qui, si correctement préparé d'un point de vue professionnel et technique, est capable de répondre aux besoins de santé des populations au même niveau que les docteurs conventionnels.

La MT fait donc pleinement son entrée dans le débat international et l'OMS, et les agences qui lui sont reliées, ainsi que plusieurs organisations internationales (régionales et locales), commencent à planifier des stratégies diversifiées et à mettre en œuvre des politiques spécifiques. C'est le défi d'un mouvement en faveur d'une santé publique renouvelée, qui réitère l'importance de la justice et de l'égalité comme conditions préalables pour un état de santé décente et qui souhaite la mise en place de nouveaux partenariats à différents niveaux [3].

L'idée de base est que la MT puisse contribuer de façon substantielle, même si pas exclusivement, à la santé des citoyens, car il est certainement nécessaire que pour son intégration avec la médecine conventionnelle, elle doit se doter de normes de qualité et d'instruments de fiabilité typiques des autres prestations sanitaires.

Avec le début du XXI siècle, les interventions dans le champ sont de plus en plus intensives et possèdent plus d'information sur les spécificités territoriales.

Les objectifs se font plus vastes, pour inclure la garantie de qualité et de sécurité des pratiques de guérison traditionnelles; l'échange d'informations et de bonnes pratiques se propage et la recherche appliquée et la formation des acteurs sur le terrain se développent.

Néanmoins, de nombreux obstacles se posent dans le processus de réglementation et par conséquent dans le processus de collaboration formelle entre les deux domaines. Les différents aspects critiques du processus de mise en œuvre varient en fonction de l'échelle régionale que l'on prend en considération : problèmes d'ordre politique et économique à côtés d'autres d'origine socio-culturelle.

Les obstacles au processus de réglementation et de législation dans le domaine de la MT sont donc différents [4].

<i>Obstacles d'ordre épistémologique:</i>	une Médecine d'emprunte holistique est en conflit avec le modèle biomédicale réductionniste de la médecine conventionnelle.
<i>Obstacles d'ordre scientifique:</i>	la recherche dans le domaine de la MT complémentaire/alternative est encore trop faible et hétérogène.
<i>Obstacle d'ordre politique et culturel:</i>	<i>opinion leader</i> d'excellence s'opposent fortement à toute tentative de réglementer la lois du cas, et surtout s'opposent à tout projet de financement voué à la recherche ou aux services à la population.

D'après un premier examen des opinions dominantes en littérature, comme par exemple les études de Christophe Bouramoué, Amidou Sekou, Charles Katy Diouf et Piero Coppo, on montre que même les partisans les plus ardents de cet échange de connaissances, conscients des grandes différences entre les la médecine moderne et les pratiques traditionnelles de guérison, ne recherchent pas une véritable synthèse entre les deux. Ce que l'on veut obtenir c'est plutôt un consensus collaboratif qui puisse assurer le mieux la santé et le bien-être de la population, devenue enfin libre de choisir le type de thérapie préférée [5].

Seydou Nourou Faye en *Médecine Traditionnelle et Dynamiques Interculturelle: Les implications socio-anthropologiques de la formalisation de la Traditeraphie à l'Hôpital Traditionnel de Keur Massar*, identifie comme but ultime une collaboration basée sur le respect mutuel, la non-ingérence et une volonté d'auto-amélioration [6]. Sa position se reflète dans celle d'autres nombreux auteurs, dont Charles Katy Diouf qui, dans *Les médecines moderne et traditionnelle: Deux écoles complémentaires sur le continent*, décrit la médecine moderne et traditionnelle comme les "sciences du jour et de la nuit". Celles-ci, selon l'auteur, ne diffèrent pas pour leurs fonctions, mais plutôt pour le contexte social et historique qui les caractérisent: les connaissances traditionnelles thérapeutique sont une véritable culture, où connaissances et savoir-faire du guérisseur deviennent une véritable discipline loin de la simple observation empirique des phénomènes [7]. Ça devient nécessaire, par conséquent, mener une critique des deux, au cour de laquelle les limites de chacune soient en évidence pour comprendre comment l'autre discipline peut être plus utile, sans écouler dans une lutte exclusive à la maladie [8]. Une légitimation de la MT au niveau international devient urgent, afin d'en permettre la proximité avec les pouvoirs publics et à la médecine moderne dans la mise en œuvre des différentes actions politiques sur la santé.

Ce modèle d'intégration reflète pleinement la volonté de la majorité des organismes, qui poussent les pays membres à procéder à un recensement des guérisseurs présents sur le territoire nationale depuis plusieurs décennies, mais aussi des associations de guérisseurs traditionnels, comme le témoigne l'interview soumise à Mamodou Ba, Président des guérisseurs traditionnels ouest-africains. La littérature toutefois, pour ce qui concerne la MC, partage l'idée qu'il faut travailler sur l'aspect social du rapport avec le patient, surtout sur la réception. Comme Yannick Jaffré et Olivier de Sardan ont déclaré dans *Une médecine inhospitalière: Les Difficiles relations entre et soignants et soignés dans cinq capitales de l'Afrique de l'Ouest*, l'expérience de la maladie est déjà choquante au départ, et le froid détachement qui signe la relation entre le médecin et le patient dans un établissement moderne empire encore plus la situation [9].

## Médecine traditionnelle au Sénégal: un système de tolérance non reconnu

Le Sénégal, par rapport à d'autres Pays de la région du Sahel, semble-t être en retard dans le processus de régulation et d'intégration de l'MT dans son SSN. Bien que ce Pays joue un rôle clé dans l'élaboration de stratégies communautaires, visant à la promotion du secteur au sein de l'espace CEDEAO et l'engagement des organisations non-gouvernementales et des groupes de recherche soit particulièrement intense, on dirait que la classe politique n'est pas encore prête à promouvoir des mesures concrètes dans ce sens. L'État sénégalais ne reconnaît pas officiellement la MT et ceux qui travaillent dans le secteur, mais en autorise tacitement la pratique. Les causes de cette paralysie sont nombreuses, mais d'après des études récentes ces obstacles peuvent être résumés en trois grands paniers: l'opposition des grandes sociétés pharmaceutiques, un problème de sondage et d'évaluation des pratiques thérapeutiques et, par dernier, la tension entre le désir de se conformer pleinement au modèle occidental de modernisation et ce de garder ses propres valeurs [10].

De plus, légiférer dans le domaine de la MT signifie faire face au système religieux et maraboutique (car la spiritualité et la religion jouent un rôle important dans les pratiques de guérison traditionnelles) créant des questions pas faciles à résoudre. Le gouvernement semble nier d'un côté les engagements pris lors des grandes conférences continentales, comme l'Accord de Lusaka de 2001, et réaffirmés chaque année lors de la célébration de la Journée africaine de la MT. Les activités des organes de l'État, établis dans le but de réglementer le secteur, en raison d'un manque de financements sont pratiquement nulles et le projet de loi proposé en 2004 n'a jamais été approuvé par les Chambres et par le Chef de l'État.

L'absence de réglementation dans ce champ constitue un fort obstacle à l'exploitation des pratiques de guérison traditionnelles principalement pour deux raisons: en premier lieu, si l'État ne reconnaît pas un secteur, les investissements étrangers se font plus faibles et donc il y a moins de fonds pour mettre en œuvre une intervention de revalorisation, deuxièmement, le phénomène de charlatanisme continuera à se répandre.

La prolifération des charlatans dans le Pays est la conséquence d'une réglementation de la MT dans les nombreux Pays voisins (par exemple le Mali), en obligeant ceux qui l'État n'a pas reconnu à se déplacer au Sénégal, où la pratique de toute technique thérapeutique est tacitement tolérée et où les contrôles sur l'expertise des TT sont très faibles. Même si les obstacles que le gouvernement sénégalais rencontre sont nombreux, des efforts doivent être reconnues: tout d'abord la création en 2003 d'un Comité de Pharmacopée traditionnelle et d'une Commission de Pharmacopée Nationale, ensuite la rédaction d'une proposition de DDL en 2004 (pas encore approuvée) et le recensement partiel des TT, réalisé par le Ministère de la Santé dans le but de parvenir à la création d'associations autonomes. Identifier le nombre de TT au niveau national permettrait, une fois approuvé le DDL, la création d'un conseil national qui leur garantirait une reconnaissance formelle en les doutant d'un code de conduite éthique.

Seulement ce processus pourrait libérer le médecin traditionnel de la vision négative qui s'est développée autour de son rôle pendant la période coloniale et qui le dénigrerait en comparaison avec la figure du médecin occidental moderne. À partir des paragraphes suivants, les aspects traités jusqu'ici seront développés par rapport à ce qui ressort de l'analyse comparative de deux études de cas.

## ÉTUDES DE CAS: INTEGRATION ENTRE MT ET MC DANS LES PRATIQUES DE SOINS DES POPULATIONS LOCALES

Si au niveau politique national et international les positions et les objectifs semblent correspondre, c'est au niveau local qu'il existe des faiblesses et des criticités dans le champs de la médecine traditionnelle. C'est ce qui ressort des deux projets de recherche sur terrain, de la durée de trois mois chacun, que nous avons conduit dans le contexte rurale de Louga et urbain de Saint Louis.<sup>1</sup>

L'analyse comparative des résultats des deux recherches nous a permis de pénétrer le contexte sénégalais et analyser les dynamiques qui sous-tendent au champs de la MT: les politiques internationales, qui ont comme but l'intégration entre les deux domaines, ont-elles un effet sur la population? Est-ce que cet objectif est partagé et soutenu par tous les acteurs impliqués? Quels sont les obstacles qui freinent cette voie à l'intégration? Quelles sont les parcours possibles vers l'intégration et/ou la coopération?

### La méthode

La collecte de données et d'informations a été possible grâce à une recherche documentaire minutieuse, à l'observation attentive et à des interviews semi-structurés faites à une cible de sujets privilégiés. La méthode d'échantillonnage non probabiliste dit "snowball", comme une boule de neige, étend progressivement l'échantillon de départ. Chacune des personnes sélectionnées suggérait de temps en temps d'autres personnes et le processus a procédé jusqu'à ce que, compte tenu des hypothèses, tout nouveau cas reportait des données plus sensibles. Cela nous a permis

<sup>1</sup> Les recherches sur terrain ont été faites en coopérant avec le Centre de recherche Girardet, le Centre d'Etudes Interdipartimentaux sur l'Afrique Occidentale (CISAO), le Centre pour les Etudes Africains de la Région Piemonte, la ONG CISV sigé à Tourin et l'ensemble des sujets impliqués dans le champ présents sur le territoire, AMPHOT et Enda en particulier.

d'intercepter des sujets informés et directement ou indirectement impliqués dans le secteur de la santé. On a décidé de procéder par interview semi-structurés afin de laisser au locuteur la pleine liberté de s'exprimer et de ne pas manipuler la réponse. D'un point de vue méthodologique, l'approche qualitative a été le plus approprié pour comprendre les interrelations entre les individus et le contexte local, car nous a permis de saisir les nuances et les détails des processus d'intégration et interaction thérapeutique [11].

ECHANTILLON LOUGA	ECHANTILLON SAINT LOUIS
30 thérapeutes traditionnels	13 thérapeutes traditionnels
10 opérateurs de santé	23 herboristes
32 patients	40 patients

Les interviews avec les guérisseurs traditionnels, les médecins, les infirmiers et les patients ont pu tracer les itinéraires thérapeutiques entreprises par les populations locales et ont révélé les opinions et les points de vue des acteurs directement impliqués dans le traitement et la prévention des maladies.

La structure des sondages s'est caractérisée par un premier groupe de questions portant sur des informations personnelles, (caractéristiques sociales et économiques) et un deuxième groupe de questions concernant les comportements thérapeutiques (caractéristiques des itinéraires).

Pour avoir une panoramique plus étendue sur la situation des sujets impliqués, les opinions et les points de vue des opérateurs de la coopération au développement ont été aussi bien analysés.

Les questions posées aux fonctionnaires des organismes institutionnels et non gouvernementaux ont identifié les limites de cette matière, les mesures importantes à prendre et les positions et atteintes respectives.

### Itinéraire thérapeutiques : syncrétisme dans les pratiques de soins

La MT du Sénégal se compose de techniques et pratiques thérapeutiques diverses et transmises oralement de génération en génération. Cela permet de préserver une grande biodiversité culturelle.

D'après les données sorties des études sur terrain, illustrées dans le tableau ci-dessous, et faisant référence au syncrétisme thérapeutique à Louga, ça ressort que la plus part des thérapeutes utilise plus qu'une techniques de soins au même temps.

Pour simplifier l'élaboration des résultats, on a décidé de repartir les thérapies traditionnelles utilisées dans trois groupes principaux: les thérapies phytothérapeutiques des guérisseurs; les pratiques mystiques qui s'appuient sur la divination, les sortilèges et la production d'amulettes (TT) et les thérapies religieuses qui se basent sur les écritures du Coran, les "marabouts".

Cette distinction toutefois risque d'enfermer l'aspect holistique de la MT derrière des cages conceptuelles et des définitions statiques, par conséquent, il ne faut pas regarder aux limites de façon limitative mais plutôt de façon représentative. De même, à côté de nombreuses pratiques et

méthodes de guérison traditionnelles, il existe d'innombrables parcours et choix thérapeutiques faits par les populations locales.

À Saint Louis, contexte urbain, l'influence du colonialisme français a eu un fort impact sur les choix de soins des résidents. Les informations recueillies montrent que les jeunes et les gens les plus aisés préfèrent recourir à la médecine

moderne et traditionnelle. La première action, à ce propos, semble-t être s’adresser au district sanitaire, sauf que pour les cas des maladies “typiques de la société africaine”.

Le graphique ci-dessous a été élaboré sur la base des données prise dans le contexte de Saint-Louis et démontre que les gens font appel à la MT quand des pathologies spécifiques apparaissent. 23% de la population locale s’appuie sur la MT pour des problèmes mentaux et psychologiques, 25% demande le support des TT pour le traitement des dermatoses causées par des aliments à base de poisson (*ndokhum siti*); et 33% qui reste recourt aux méthodes traditionnelles en cas de maladies chroniques, pour lesquels la médecine modernes est trop chère, par exemple diabète, rhumatismes, hypertension artérielle, hémorroïdes.

A Louga, les traditions rurales sont décidément plus profondément enracinées et vivantes, par rapport à d’autres régions du Pays, et la quasi-totalité de la population recourt presque massivement à la MT et conventionnelle. Parmi ceux qui adoptent les solutions proposées par la médecine traditionnelle, 87% en recours pour soigner des maladies bénignes et des maladies non graves (rhumatismes, abcès, migraines, problèmes dentaires, gastrites, insomnie, fatigue, circulation sanguine, hypertension artérielle, catarrhe). 6% est recouru aux méthodes traditionnelles lors de graves maladies, comme la malaria, le sida, le tétanos, troubles des articulations, le diabète et problèmes cardiaques. Seulement 7% a déclaré de s’appuyer sur la MT pour traiter et des maladies graves et des mineures.

De même, certaines études du Bureau régional pour l’Afrique de l’OMS soulignent que la MT est utilisée pour traiter la plupart des maladies non graves, qui n’ont pas besoin d’un service d’urgence [12].

Les pourcentages ci-dessus confirment que la majorité des patients interrogés utilise la MT pour soigner des maladies bénignes ou chroniques et, par contre, recourt à la médecine moderne pour des affections graves et urgentes.

D’après l’histogramme en bas, le traitement des données recueillies permet d’observer que la consultation multiple constitue la base du parcours thérapeutique, c’est à dire qu’en cas de besoin l’on consulte à la fois le médecin, le guérisseur et/ou un herboriste. Pas forcément cela arrive au même moment, même si cela se produit fréquemment dans le traitement des différents aspects de la même maladie ou parce qu’il n’y a pas d’amélioration dans la condition de santé du patient [13].

L’histogramme confirme que la quasi-totalité de l’échantillon de Saint Louis et de Louga mélange les deux méthodes de soins, faisant, c’est à dire, systématiquement usage de MT et MC simultanément ou comme alternative. D’après les témoignages recueillis, les facteurs qui contribuent à la définition du comportement thérapeutique adoptée par chaque individu sont distingués par: les facteurs liés à l’accessibilité spatiale et financière, facteurs socio-culturels liés à la “proximité culturelle”, et le niveau de scolarité.

Toutefois, il convient de noter que, comme d’après Didier Fassin, le type de maladie affecte le patient dans le choix de soins, plus que l’argent et le niveau de scolarité [13].

Si en Sénégal les différentes méthodes de thérapie pouvaient coopérer ensemble de manière efficace, “le choix dans la lutte contre la maladie répondrait au vrai besoin de la population : le patient aurait un plus large éventail de choix thérapeutiques valables et sûres et il serait, enfin, libre de préférer les soins les meilleures en fonction de ses besoins économiques et culturels” [14].

Le patient aurait un plus large éventail de choix thérapeutiques valables et sûres et il serait, enfin, libre de préférer les soins les meilleures en fonction de ses besoins économiques et culturels” [14].

#### Avis en comparaison: valorisation et règlementation des connaissances thérapeutiques traditionnelles.

Le thème de l’intégration entre les deux Médecines a toujours suscité un grand et controversé débat entre les acteurs directement et indirectement impliqués. La remarquable différence d’objectifs et d’ambitions, qui caractérise les sujets engagés dans la préparation de projets à niveau local, ralentit le processus.

Qu’est-ce que donc l’amélioration des pratiques traditionnelles de guérison ? Est-ce que l’intégration est le but primordial pour tous?

Les sondages menés sur terrain et le travail de recherche bibliographique veulent recomposer le désordre et les

contradictions typiques de l'argument pour identifier les acteurs les plus réticents et ceux plus enclin à la collaboration. Les opérateurs de santé, dans leur qualité de figures conventionnelles en contact avec la population locale, ont la tendance à coopérer avec la MT. D'après les mots d'un infirmier de Louga: "La MC est complémentaire à la MT, n'y s'oppose pas. J'ai confiance dans une coopération entre les deux, surtout parce que la MC rencontre des difficultés pour soigner certaines maladies. Par exemple la MT offre des soins valables dans le traitement de maladies de la peau et de maladies chroniques, la population fait beaucoup confiance aux TT et croit que la MC ne peut pas guérir ces maladies. Je pense donc que travailler ensemble puisse créer des avantages". D'autre part, la catégorie des thérapeutes traditionnels admet les limites de leur Médecine et trouve qu'une coopération puisse aboutir à une amélioration et croit aussi bien que la MC sera à son tour renouvelée grâce à la sagesse offerte par les pratiques de guérison traditionnelles. Un TT interviewé à Saint Louis constate : "les gens vont là pour se faire diagnostiquer le mal et puis continuent le traitement chez nous. Parfois, c'est même moi qui leur conseille de contacter l'hôpital et ensuite de revenir chez moi. De cette façon, je suis sûr du trouble de mon patient". Malgré un scepticisme général réciproque, des accords informels se produisent entre les deux champs. En cas de fractures, d'entorses ou de maladies qui nécessitant d'une opération chirurgicale, le thérapeute traditionnel encourage le patient à s'adresser aux soins de l'hôpital et la même chose arrive si un patient manifeste des crises hystériques, de folie, de migraine et d'allergies causées par des raisons inconnues, mais dans ce cas, c'est même le médecin qui conseille au patient de contacter le guérisseur [15].

L'analyse serait trompeuse si l'on ne considèrerait pas le point de vue de certains guérisseurs qui condamnent les méthodes modernes et ne visent pas à mélanger leurs savoirs traditionnels et religieux dans la rationalité scientifique typique du monde occidental. La divergence d'opinions ne touche pas seulement les guérisseurs et les marabouts, mais aussi les ONG, les associations et les institutions qui travaillent dans le domaine de la médecine. Les organisations internationales, comme l'OMS, régionales, comme le WAHO, et locales, comme le Ministère de la Santé du Sénégal, insistent beaucoup pour renforcer la coopération entre le médecin traditionnel et le médecin moderne. À ce propos les fonds adressés à l'organisation de séminaires pour l'échange d'informations et de bonnes pratiques sont nombreux: la MT devrait soutenir la médecine moderne pour ce qui concerne le traitement des maladies typiques de la société africaine et au même temps recevoir une formation sur le diagnostic, le contrôle et l'hygiène.

Les organes techniques liés au domaine spécifique de la phytothérapie s'opposent à l'organisation de ces rencontres, car ils estiment que la formation du personnel ne sera jamais efficace si l'on ne trouve pas une collaboration fertile pour laquelle tous peuvent obtenir de petits avantages et être encouragés à continuer dans le chemin.

Afin d'atteindre des objectifs concrets comme la régulation du secteur et, par conséquent, une majeure incorporation dans la médecine moderne, les groupes de recherche prétendent d'oublier l'aspect mystique et symbolique de la MT pour mieux se concentrer sur l'étude des propriétés thérapeutiques et des principes actifs typiques des herbes. Au même temps, il ne faut pas isoler la MT de l'environnement socio-culturel qui l'identifie en la privant de légitimité [16].

## CONCLUSIONS

En termes de santé, la comparaison entre la MT et la MC reste une question centrale dans la situation sanitaire d'aujourd'hui en Afrique. Pour promouvoir une coopération efficace entre les deux systèmes de soins, le Gouvernement du Sénégal devrait accorder une certaine légitimité aux praticiens de la MT. Cela signifie reconnaître officiellement toutes ou partie de leurs compétences.

Une collaboration est complexe parce que les deux systèmes de soins ne disposent pas d'un même niveau de développement. Ils parcourent des chemins parallèles très différents: c'est l'expérience qui détermine la connaissance empirique du guérisseur, et de l'autre côté, la médecine moderne s'appuie sur des diagnostics précis et détaillés de la maladie du patient [17].

La tendance de la MC est celle de subordonner les savoirs de la MT à ses propres lois scientifiques, bien que la MT, en raison de sa capacité à satisfaire un besoin culturel et de sa plus grande accessibilité géographique et économique, offre des traitements plus abordables [18].

Les deux sujets du processus de guérison (thérapeute traditionnel et patient) partagent la même idée sur les causes, l'importance et le traitement de la maladie.

D'après ce qui ressort de l'analyse des deux itinéraires thérapeutiques, les deux domaines coexistent dans les pratiques de soins adoptées par les populations locales. Malgré cela, ils ne coopèrent pas, c'est à dire qu'ils n'interagissent pas et ne s'intègrent pas au niveau formel, alors que cela arrive sporadiquement au niveau plus informel. La MT au Sénégal garde une certaine richesse, et à cause de cette diversité il est plus difficile d'établir des critères scientifiques de qualité, d'efficacité et de sécurité comme le demandent les politiques et les directives supranationales. La complexité de la MT avec ses multiples aspects obstacle sa pleine entrée dans le SSN, et c'est pourquoi la tendance est d'intégrer la médecine la plus simple, c'est à dire la phytothérapie.

L'on dirait que cela s'avère d'être la seule branche de la MT qui peut être testée et réglée en fonction des standards scientifiques, en en faisant un domaine privilégié pour l'intégration entre les deux champs de la médecine, et pourtant, cela pose encore des questions essentielles pour en permettre l'admission dans le SSN.

L'on pourrait donc mieux valoriser le domaine de la phytothérapie en supportant la recherche rigoureuse et appliquée, permettant aux experts d'identifier une trajectoire politique axée sur l'étude du commerce et de la diffusion

des plantes médicinales (production, stockage et distribution) ainsi que de créer une pharmacopée traditionnelle officielle. Il faut encourager la coopération parmi les opérateurs, avec l'aide de modérateurs pour favoriser, ainsi, la création et le développement de centres d'expérimentation, qui soient au moins au même niveau, et possiblement meilleurs de celui de Malango et de l'Hôpital Traditionnel de Keur Massar.

L'échange d'informations et de bonnes pratiques avec les Pays voisins, qui ont déjà réglementé le domaine de la médecine traditionnelle, pourrait favoriser le chemin de l'institutionnalisation en Sénégal.

À côté des problèmes d'ordre politique et institutionnel, il faut entreprendre une action décisive pour surmonter certaines limites concernant l'utilisation et la distribution des traitements à base d'herbes médicinales. Les organes techniques du Service d'Hygiène et de l'inspection régionale des Eaux et Forêts de Saint Louis, déclarent que dosage, stockage et conservation inadéquats des plantes, souvent causés par une mauvaise formation des opérateurs de la MT, sont la raison principale pour laquelle la phytothérapie n'est pas considérée comme un champ scientifiquement sûr de la médecine traditionnelle.

Ce genre de connaissances se transmet oralement. Cela implique, d'une part, le risque d'une perte progressive du savoir collectif, et de l'autre pose un problème épineux touchant la notion de propriété intellectuelle qui mérite une étude ad hoc. À ce propos, on assiste à une forte méfiance des praticiens de la MT relative à l'échange d'informations en dehors de leur environnement. Un autre risque pour l'environnement est la perte massive de biodiversité, en raison de l'exploitation intensive des plantes médicinales.

Ce ne sont pas seulement les organisations nationales, internationales et gouvernementales et non gouvernementales qui poussent pour protéger ce phénomène, mais aussi les multinationales qui ont un intérêt dans l'exploitation de ces ressources car la phytothérapie est encore un secteur en expansion. Le risque réside dans la peur que ces pratiques ne soient pas adressées pour le bénéfice exclusif des populations locales, mais pour le bénéfice des lobbies pharmaceutiques.

L'analyse des données a indiqué que le processus plus efficace pour atteindre l'institutionnalisation de la MT dans le SSN est du type *bottom-up*: à partir d'une opération de sensibilisation et formation des premiers maillons de la chaîne il faut remonter jusqu'au sommet de la pyramide pour inclure finalement l'État.

Cette approche est la seule à permettre que la simple formation des opérateurs traditionnels aboutisse à la création d'associations autonomes, qui reçoivent une reconnaissance officielle au niveau nationale et qui leur permette de participer activement à l'élaboration des politiques de santé.

Le recours à méthodes innovantes devrait être guidée par des conditions préalables de justice et d'équité qui valorisent le niveau local, le potentiel social et l'utilisation de ressources alternatives, dans l'espoir de développer de nouvelles formes de collaboration au sein et parmi les différents niveaux [19]. Cela étant, l'on peut résumer le rapport entre MT et MC dans trois catégories de relations. *L'opposition*, par premier, prévoit que la MT soit éradiquée pour le bien du patient, car préjudiciable à son bien-être. *L'intégration*, deuxièmement, favorise l'inclusion dans le SSN sur la base des standards et des mesures vouées à la validation scientifique des traitements. *Le pluralisme*, par dernier, opte pour une coopération entre les différents systèmes de santé de manière cohérente avec le principe d'autonomie du patient, car cette approche reconnaît la valeur de la liberté dans le choix de traitement. Le pluralisme encourage la recherche et la communication ouverte, tout en respectant l'intégrité de chaque système thérapeutique [20]. Pour conclure, l'une des possibilités de promotion d'une politique organisée, visant au pluralisme thérapeutique, est celle de profiter des infirmiers en tant que sujets-ponts entre la MC et la MT. Comme cela a déjà été mentionné, les infirmiers sont ces personnes qui maintiennent un lien très fort avec les traditions et les populations. Ils sont considérés des médiateurs qui facilitent la collaboration entre les médecins traditionnels et conventionnels à l'intérieur des différents lieux thérapeutiques mis en place dans le but de poursuivre un chemin parallèle. Un champ fertile de collaboration est le diagnostic et le monitoring de la maladie, considéré comme un moment où l'on écoute le patient sous deux différents "loupes": celle traditionnelle, soutenue par l'enracinement socio-culturel et celle conventionnelle, soutenue par l'analyse clinique scientifique.

## COOPERATING FOR CULTURAL HERITAGE CONSERVATION

Francesca Declich\* and Cecilia Pennacini°

\*University of Urbino, Italy - [francesca.declich@uniurb.it](mailto:francesca.declich@uniurb.it)

°University of Turin, Italy - [cecilia.pennacini@unito.it](mailto:cecilia.pennacini@unito.it)

Many courses of anthropology, ethnology and archaeology in Italian Universities have set up long term research project in many countries of the world addressing the conservation and valorization of the cultural patrimony jointly with local partners in Africa, Asia, Europe and Oceania. The idea of putting up this panel stemmed from an urgent need to highlight the role universities can play in carrying out activities of cultural cooperation; these are similar but different from activities of cooperation to development. The latter are mainly driven by the desire to address specific problems for their solution while the former stems from a shared interest in investigating aspects of tangible and intangible cultural patrimony within a country.

The experience of participating to long term Ethnological Missions in Malawi and Mozambique (MEIMM) as well as to activities of cooperation for development suggest to highlight a number of differences whose added value should be considered carefully. The long term relations set up among researchers and academics in the countries of the research usually are long lasting good and exponentially durable relations of intellectual interchange among the partners. Research is usually an activity that entails personal passion for the personnel involved and it creates communication among the researchers of the different countries that lasts beyond financial limits. The long term cultural relations between the actors involved could also be considered an added value in the relations between countries whose outcomes of soft diplomacy<sup>1</sup> could be viewed as an important added value of a financial investment in these cultural activities.

The boundary line between development cooperation and cultural cooperation is often overlooked. Cultural cooperation holds its own specificity that should be preserved and valued. Cultural cooperation involves universities and research centres engaging project focused in the field of ethnology, ethnography, archaeology, and history. In Italy there is a specific tradition within this domain: the ethnological and archaeological missions promoted by the Ministry of Foreign Affairs. Similarly, the French Ministry of Foreign Affairs support scientific cooperation through the CORUS (Cooperation pour la recherche universitaire et scientifique) Programme. In both cases, cultural cooperation works for the study, the protection, and the value of local cultural heritages.

The panel compared different international experiences, in particularly French and Italian initiatives, in the field of cultural cooperation for local heritages conservation. Cultural heritage and the processes of identification of such heritages have arisen as a key field study in human and social sciences. They also represent a main sector within development policies in the “Global South”. There is a growing awareness about critical issues related to risk managements as threat to cultural heritages, both at the level of single sites and at regional level. Universities and research centres play a role in terms of training, management, knowledge transfer and dissemination among different stakeholders (local communities, public institutions in charge of cultural policies). The main goal of the panel has been to encourage critical thinking within academic and scientific research on the process of identification and protection of cultural heritages in the “Global South” and beyond it. The panel addressed the need of improving the knowledge and develop the skills of the people working in the field of cultural heritage, as well as of the local communities, in terms of protection mechanisms, heritage conservation and management. The overlapping of scientific and political interests within this field might offers a potential in terms of funding; it might also bring material benefits to local actors, universities and research groups. By addressing different case studies, and the experiences of three of the several Italian Ethnological Missions in Ghana (MEIG started in 1954 by V. L. Grotanelli and followed from 1989 by a second phase directed M. Pavanello), Mozambique & Malawi (MEIMM started in 2007 and directed by F. Declich), and the Equatorial Africa (MEIAFE) started in 1979 by F. Remotti and directed by C. Pennacini since 2004), the panel took into account the plurality of actors involved in the projects, as well as the processes of negotiation that shape the different phases of the projects. More broadly the panel addressed also the conflicts and the political implications related to cultural heritage conservation projects. Only some papers discussed in the panel are published here. Yet, some of the question addressed were the following, from tackled from an inter-disciplinary approach:

- how to build scientific knowledge on cultural heritage taking into account the complex issues of identity, memory, and claims over land;
- how to protect the cultural heritage and how to transform it in an opportunity for economic empowerment of local communities;
- how to create and strengthen cooperation networks between universities and research centres belonging to the Global North and the Global South;
- how to support research teams working on cultural heritage and how to contribute to the training of human resources in the Global South;
- how to strengthen research networks at regional and international level.

**CULTURAL COOPERATION BY WAY OF ETHNOGRAPHY:  
A UGANDAN CASE STUDY (CORUS PROJECT)**

Anna Baral\*

\*Uppsala University, Department of Cultural Anthropology and Ethnology, Sweden - [anna.baral@antro.uu.se](mailto:anna.baral@antro.uu.se)

**ABSTRACT**

The paper moves from my experience as Italian anthropologist doing research both for the CORUS (cultural cooperation project) and for the Italian Cooperation (development cooperation). The aim of the article is to highlight some specificities of the ethnographic approach in matters of dialogue and cooperation between actors from different backgrounds. For this purpose the article draws upon the case study of Buddo Naggalabi, explored in the framework of CORUS Project. Some methodological and ethical aspects of fieldwork will be emphasized to suggest that ethnography is an ideal tool, particularly appropriate on the micro-level, to engage participants and scholars in broader frameworks of cultural cooperation.

This paper draws upon a research I carried out in Uganda for the CORUS Project<sup>1</sup>, to which I took part as a member of the “Missione Etnologica Italiana in Africa Equatoriale”<sup>2</sup> in 2008-2010, and which dealt with sacred sites and heritagization in East Africa. Other authors in my panel have introduced both the project and the Missione, therefore I will not talk about them in more detail. I will instead move from a personal experience in Uganda, which made me confront with the concept of “cooperation” from the perspective of an Italian, anthropologist, with multiple loyalties (to “my” ethnographic field and to the Italian Cooperation which was temporarily hiring me). After sketching out this background, I will describe the site of my CORUS ethnographic research in more details, in order to give an example of the kind of knowledge that fieldwork can provide us with. I will use this case study to suggest that such knowledge makes ethnography a proper example of “cooperation” - “cultural” cooperation, of course, with little to envy to “development cooperation”.

**PREAMBLE – SOME REFLEXIVITY ON MY ITALIAN BACKGROUND AND ON “COOPERATION” IN UGANDA**

As I was doing research in Uganda for my university studies, the Italian Cooperation (Ministry of Foreign Affairs) hired me to write a publication about the Italian presence in the country. I had two months to reconstruct the history of the interaction between the two countries, and to explore the contemporary context. The work was going to become a publication [1] which, as I discovered in the review process, had to follow implicit guidelines impressed by the commissioning institution. Research was enjoyable and inspiring as only fieldwork can be, while the writing up became a subtle (and I suppose, sometimes unconscious) negotiation around the narrative that should emerge from the book.

As a number of reviews and interpolations went on, the chronological organization I had chosen for the book – explorers, missionaries, development workers, business community – acquired more and more an ideological meaning. Italian governmental and non-governmental cooperation for development is well established in Uganda, and stakeholders wanted the publication to give relevance to its history. The order of chapters thus acquired a sort of teleological flavour, where everything before the establishment of “cooperation for development” seemed to prepare the ground for it, while everything after it could not but benefitting from it.

Therefore, I had an occasion to reflect upon the meaning of “cooperation” from an unusual perspective. Was it consistent to read the first travels of Italian explorers in the region as a prodrome of a future of “cooperation”? Was the Catholic mission a “cooperation” effort? The travel memoirs from 1890s-1910s that I was reading were unsurprisingly rich in colonial time stereotypes, fear and horror for the *difference* experienced in the field and paternalistic empathy for the poor “little blacks” (in the words of Comboni), which did not really resound with modern cooperation’s vocabulary. Was Italian food-import really “cooperation” with the Ugandan partners? Uganda was described by businessmen as the land of opportunities, where a booming economy was giving concrete chances of success, also (although not only) because of loose regulations and cheap labour. What was the *fil rouge* between the 19<sup>th</sup> century Italian explorers in the Great Lakes Region and the 21<sup>st</sup> century NGO officers on white pick-ups in Karamoja (where Italian efforts are nowadays focused)?

<sup>1</sup> “Approche socio-historique de sites sacrés naturels et enjeux contemporains autour de la préservation de ce patrimoine (Kenya, Madagascar, Ouganda)”, funded by the French Ministry of Foreign Affairs and IRD (Institut de Recherche pour le Développement).

<sup>2</sup> “Italian Mission in Equatorial Africa”, founded by Prof. F. Remotti and presently directed by Prof. C. Pennacini.

If I had to find a common denominator, this was represented by the fascination of interviewees with a specific narrative on Italians, in which hard work, joyfulness and passion for “bella vita” (“good life”) were naturalized as Italian genetic fingerprints. Such characteristics, in turn, were thought of as the reason why “cooperation” worked so well, smoothly and “naturally” with Ugandans. When racist comments made me hesitant, the interviewees would quickly add a paternalistic comment on how Ugandans were, after all, funny - funny like Italians, always cracking a joke or forgiving wrongdoings. This narration is neither new nor rare: already in 1959, a speaker at the III Congress on economic and trading relations with the African continent observed that “our workers have left in Africa a memory of lively sympathy for their humanity, hard work and generous spirit” [2]. A development worker in Karamoja, referring to the missionaries’ experience, told me that “Italians are more inclined to create bonds with other cultures”, while a presenter of the Italian Festival held in Kampala in March 2012 opened the show by reminding the audience that “the relation between Ugandans and Italians have always been of friendship, never of colonialism”. As the anthropologist Favero [3] has brightly explained, the *topos* of “Italians, good people” has marked the Italian identity construction process in the last 50 years at least. It has probably been reinforced by the peculiar characteristics of the Italian “scramble for Africa”, a “demographic imperialism” with minor (in quantity, although not in quality) impact than other nations [3]. This narrative, in my view, encourages a “cooperation” talk in which other expats communities are not as much soaked as Italians.

Since I was there as a member of the Missione, which works in Rwanda, Congo and Uganda – here within an agreement with Makerere University - I insisted to include in the publication a chapter on Italian scientists and researchers in Uganda. If something like food-import could be displayed as a step in that ideal line of evolution along a “cooperation” paradigm, I felt even more authorized to consider students exchanges, cultural agreements and the collaborations between university departments or museums as a relevant aspect of our mutual cooperation.

In more or less the same period, the Italian Cooperation funded a TV program, “Brothers in Cooperation”<sup>3</sup>, aimed at portraying the Italian presence in Uganda in 10 episodes. Creative and eye-catching, the program was an interesting channel through which the narration of the “good Italian” was reconfirmed. Live interviews from the studios of WBS TV were combined with pictures of the works realized countrywide: hospitals, cultivated fields, schools, but also trading enterprises and financial partnership with local entrepreneurs dominated the scene. Invited to present the work of the Missione on behalf of the other members (which were in Italy at that time), I sat in the studios with Prof. Nannyonga Tamusuzza and Prof. Ndoleriire, from Makerere University. It was a wonderful occasion to reflect upon my and our positionality in Uganda: while “development cooperation” programs are publicized by the media and openly supported and echoed by the expats communities, social researchers that produce knowledge and encourage respectful, peaceful and creative human relationships usually carry out their fieldwork far from the public attention. Through WBS we finally had a chance to explain to a diverse audience what anthropologists are and do, and the value of the “immaterial bridges between cultures” that they build. We had no picture of hospitals built or school developed to show, but we talked about the marvels of intercultural sharing and affinity that only field research offers. At the end of the day, it seemed that we had legitimately gained our little place amongst the “brothers in cooperation” (although my colleagues are mainly women and sisterhood is way more relevant to our work).

This sudden visibility through a cooperation-related program made me realize something very simple, yet significant: devoting time to the diffusion and restitution of knowledge improves the interaction with the general public and with the institutions, something we should not dismiss, especially in time of cuts to funding to cooperation in general, and cultural cooperation in particular. However, we should pursue that without betraying the nature of our discipline. The rapport that anthropologists build with participants, the intimacy and durability of networks they establish in the field, the knowledge they produce are as precious as building schools, but represent an endeavour of different nature and as such it should be valued .

In this paper I want to sketch out some reflections that the above narrated anecdotes triggered in me. I do not want to pursue this reasoning in a theoretical way, but to articulate it with the research carried out for the CORUS Project. If ethnographic fieldwork shares something with development interventions, it is that both represent an “encounter” [5], and the encounter always “takes place”, with a fitting expression [6], somewhere. Therefore, I am proposing here to see an example of ethnography “taking place” in Buddo Naggalabi; to explore how the anthropological approach can build knowledge, on the micro level; and I suggest that such knowledge legitimately fits, on the macro level, in broad projects of “cultural cooperation” as CORUS. By reflecting on ethnography’s specificities I do not want to discredit the cooperation-for-development initiatives, but to propose that our endeavour is equally pertinent to the “cooperation” discourse and did deserve that little chapter in the publication on Italians in Uganda.

### ETHNOGRAPHY “TAKING PLACE” - BUDDO NAGGALABI, A “MORAL” PLACE

Buddo Naggalabi hill is located about 15 km south west of Kampala, central Uganda. Upon arrival on the site, the visitor first passes along the gates of King’s College Buddo, an excellent college established by the Church Missionary Society in 1906 for the education of the ruling elite and royal families in the Uganda Protectorate. On the top of such illustrious hill, the *kabaka*, kings of Buganda<sup>4</sup>, are enthroned, given the regalia and introduced to the world. A number of natural spots on the hill are named after salient episodes of one of the origin myths of Buganda: in the myth, the first king Kintu kills the tyrant-snake Bemba and takes power as a *primus inter pares* among the Ganda clans. Taboos and rules apply to such spots.

My research, explained elsewhere more in detail [7], dealt with the powerful “official” narration surrounding this site, which portrays it as a sacred place for the Baganda due to its close interconnection with royalty, main *raison d’être* of this society. Crucial to the vicissitudes of the kingdom, Buddo seemingly condenses meanings of centrality (geographical and symbolical), authenticity and continuity. The latter materialises in the reiteration of the coronation rite from king to king, but also in the path which connects the named spots mentioned above: every visitor’s walk, by the act of moving along spatial directions under the guide of the locals, revives and re-enacts the memory which sprouts from myth, spot after spot.

Anthropological literature is particularly appropriate to understand how different societies attribute meaning to space and place; the connection between place and mythological knowledge is pointed out already by Malinowski [8], and it is still a focus of interest. If, as Tilley notes, “naming and identification of particular topographic features... is crucial for the establishment and maintenance of their identity” [9: 18], the act of moving around in the landscape, “encountering” such features, becomes a way to tell stories about the place and the people emplaced there. The individual and collective memories which are bound to that very geography are given temporal depth. The concept of “spatial stories” [10], upon which Tilley draws, is useful to understand how a surface as Buddo’s hilltop can be seen not just as a space, but as a combination of places, through which a narration on the clans and the society of Baganda is carried out. As Augé aptly notes: “strangely, it is a set of breaks and discontinuities in space”, exactly our named spots on the hill, “that expresses continuity in time” [11: 60]. Obviously, such interpretation of the hill is particularly fitting in the context of heritagization plans (the path can quickly become a ready-made tour for visitors): hence, the relevance of Buddo for the CORUS Project on heritagization of sacred sites in East Africa.

However, walking along a path is not only narrating a story: “geographical features of the landscape act as mnemonic pegs on which *moral* teachings hang” [9: 33, italics mine]. When places scattered in an “existential space” are attributed meaning, individuals and groups anchor their identity discourse on the ground and the place itself becomes charged of morality. After some years from my fieldwork in Buddo and more research on the Baganda’s identity claims in the Ugandan context, I feel all the importance of such observation for understanding the issues at

<sup>4</sup> Buganda is a (neo)traditional kingdom in central Uganda. People from here are called Baganda (sing. muganda), and speak the Luganda language. I will use “Ganda” as an adjective throughout the paper, according to the British literature fashion.

stake on that little hill.

In Buddo, the “atmosphere of the place” [12] is striking. The rural setting, silent and afar from any urban sound (the only exception being the radios working also in case of power outage) is particularly prone to romanticization; countryside, here as elsewhere, is charged with meanings in contrast with the city, and as a “locus of *moral* purity and wholeness” [13: 152, *Italics mine*]. In the place where royalty comes to being, a proper moral behaviour is required; morality is heightened by the presence of sacred spots, protected by rules and taboos, and by a hierarchy of culturally specialized people, whose head is represented by a clan chief with functions of traditional healer. He and his clan men (from the *mamba* clan) regulate the access and the use of the land on the hill, which is mostly property of the king. Their position has been enhanced by the cultural revival ensued in Buganda after the restoration of the traditional institution in 1993, that has revived old cultural traditions and dictated the criteria to define a “good muganda”. “Cultural brokers”, “tradition bearer” [14] (people who actively commit to the reactivation of traditional knowledge and to its transmission) and elders capitalize on the revival: they have become the gatekeepers of the Ganda identity, repository of authenticity and morality. In this way they can negotiate powerful roles within the administration of the kingdom, or within the arena of their own clans or villages. In Buddo they protect the place, synecdoche of the kingdom as an institution and its people, from strangers. Events like the fire which unknown people set to one of the sacred houses in 2012 are seen as bewildering wounds to the security of Buganda, a further deterioration to the custom and traditions of a once united kingdom.

Moral meanings are aptly explored by ethnographic fieldwork. As Lambek claims, “fieldwork is an intensely moral activity in the Aristotelian sense” [15: 32]: coherently with the position of many scholars of anthropology of morality in the last decade, morality here is not a set of rules, but an “ethical practice” which provides us with the chance of a “meaningful engagement with the others” [15: 33]. Navigating a place soaked with morality, through participant observation and sharing, the ethnographer can also more easily acknowledge (or foresee) how this can trigger absolutistic claims of belonging. When fear of the “immoral” Other is felt by self-asserting “moral” first-comers, autochthony discourse is activated, with little if any historical contextualization [16]. In Buddo, the origin myth gives pre-eminence to the *mamba* clan that dwells on the hill, and seems to provide it with an exclusive right to the land. However, research can also help to understand that even the harshest and most essentialistic discourse on rooting and belonging has a constructed nature and reflects to partisan needs and interests, contextually elaborated.

## ONE SITE, MANY INTERESTS: SUBJECTIVITY, RELATION AND CONFLICTS AROUND THE PLACE

As I said, the official narrative on the site insisted on Buddo as a crucial, shared heritage for the whole kingdom. However, when between 1999 and 2003 a project of heritagization attempted to transform the site into a touristic attraction, a Pandora’s vase opened and revealed a number of tensions and conflicts within and around it. I detail such tensions better elsewhere [7]. Here it will be enough to say that these conflicts can productively be interpreted as sprouting from the divergent meanings that the place has been given by the actors and from the heterogeneous relations between them. For the inhabitant of Buddo (clan *mamba*) the hill represented an “existential place” where every rock reminded of ancestors’ deeds and reconfirmed emplacedness and belonging. Some were eager to develop the site and to open it to visitors, but had their own peculiar vision of how this was to be done: sacred space was not supposed to be invaded by people, and being a relational space of interaction between the living and the dead it was not supposed to be “frozen” within fences or labelled by generic touristic signposts. For the officer of the Buganda Ministry of Tourism, the interpretation had minor phenomenological importance: Buddo was conceived as an asset capable to generate income. Several “ethnically defined entrepreneurs, community leaders and cultural brokers” [14: 8] started interacting in new ways, some of them seeing that “it paid to be native” [14: 6], and unwilling to step back in the management of the site. People from the national museum and from urban institutions, however, claimed expertise and cultural knowledge on the site as much, if not more, than the locals. The museum’s officers, on their part, eager to apply UNESCO directives on intangible heritage, brought expert craftsmen, architects and professionals to the site; workshops with the local people were intended to teach the basis of tourist reception.

The confrontation between these actors - all Baganda, but with different statuses – showed how the morality, sacredness and even the taboos in Buddo were in reality contextual and negotiable constructions. As anthropological literature shows, indeed, moral discourse on place is not stated once and for all: it ideally unfolds at its best in the relationship between locals and outsiders, but it can also be articulated to serve different aims, tackling different levels of social relationship, even *within* one place, within one community [17]. None of the several perspectives really won, and the place was left to itself, shabbier than before.

Each of the above positionalities in relation to the site engaged differently with it. As Thilley maintains, “there is no space that is not relational” [9: 17]. Subjects engage with space differently, through “embodiment” [12]; space, and the navigation into a place, trigger different sensibilities and attitudes. Since I was interested in the consequences of heritagization, the relation between tourists and Buddo was an interesting aspect. The tourist in a site has to be reminded of other experiences, of other places, activating memories and resonating with higher values and ideals, in order to feel the “atmosphere of the place” [12: 45]. However, the tourists’ comments that I gathered were often negative: the place was dilapidated and disorganized, and for some “not authentic enough”; they could not get the “sense of place” that Crouch defines as a “suitable mood or ambiance related to that [tourist] attraction” [12: 365].

One place, many interpretations and relations: hence, the conflicts and negotiations that I encountered in my research. When a selected “stewardship” is called to manage precious resources [18], conflict seems inevitable. Sites undergoing heritagization processes “are destined to be sites of controversy, as different groups embracing different narratives seek to assert symbolic (or economic) ownership of them” [19: 434].

Ethnography, through the continuative interaction and the accurate construction of rapport with informants, brings us closer to the concrete power relations between actors that have different rights to the place, a real “system of domination” [9] which restricts and regulates access. While the development workers I interviewed for the Italian Cooperation often described with surprise the “skirmishes” among the interventions’ receivers, anthropologists take the power relation in the field as an essential part of their research. They know how to avoid culturalist stereotypes pretending that a place is inhabited by a uniform and united people [11][13] and they bring the duality power/place to the forefront in their analysis. Nobody, let alone myself, could access all the corners on the hill: rules and taboos applied to Buddo’s sacred houses, the shrines, the *kabaka’s* land on the hill, and different people had different rights of movement on the site. Place and power were closely interconnected there as elsewhere, and one of the duties of the anthropologist is exactly to extricate this nexus. Projects of cultural cooperation like CORUS cannot but encourage a reflection upon these themes, and prove how ethnography is a privileged tool to approach them.

## ETHNOGRAPHIC FIELDWORK AND CULTURAL COOPERATION

This case study inspires a number of observations on the potentiality of ethnographic fieldwork in the framework of cultural cooperation programmes. There is, I feel, continuous need not so much to justify our presence as social researchers or cultural practitioners among the “VIPs” of cooperation, as probably to remind ourselves and the general public of the specificities that we are called to bring on the ground as a “plus”.

First, critical anthropology can deconstruct taken-for-granted concepts as “heritage”, culture or tradition, investigating the historical and cultural context that produced them [20]. This effort implies a responsibility towards the people we interview and the public we target: “our [of the anthropologists] writings challenging or reifying particular narratives associated with [heritage] sites have the potential to be read not only by local stakeholders but also by visiting tourists and representatives from granting agencies” [19: 434]. Reflexivity around this issue represents a duty, but also a great strength of our discipline.

Despite the effort to demystify essentialistic concepts, researchers also have clear that emic categories have very real consequences in terms of inclusion and exclusion. Therefore, the second point I want to underline here is that the ethnographic stance gives the researcher a privileged view on conflict. As Buddo case study shows, certain fields like heritage become more easily arenas of conflicting relationships. “How do we situate ourselves in these frequently contentious sites? ... What role, if any, are we to play in the articulation and negotiation of various stakeholders’ claims surrounding heritage sites?” [19: 434]. Ethnography gives room to these questions and avoids simplifications.

The attitude of the ethnographer towards issues of conflict can be inspired by different approaches: it could be one of “applied”, or “action”, or even a “public interest” anthropologist, all of them requiring active involvement of the researcher as practitioner or vocal advocate of local’s claims. As external observer, the researcher can learn of “disparities in power across involved groups” and he might act to “readdress imbalance in the debate”, or have a voice in the “planning, management, and conflict resolution” [18: 368]. I have not had the chance to participate to the (failed) attempt of heritagization process in Buddo, but I had to deal with its consequences. I chose a lower profile: my informants were frustrated for the divergent interests competing around the site, and I tried to communicate their discontent to the higher levels of the hierarchy, when possible. I thus mainly concentrated on “[mapping] out the regimes of power connected to [the] site” [19: 434], and tried to act as a mediator, but I could not act upon the process of heritagization which had occurred much earlier.

The result of this very modest role is that instead of helping the people on the ground to learn something about heritagization, I was the one who learnt more about the place. My normative knowledge about Ganda custom and society was insinuated by doubts, cracks on the surface, which made more evident the multidimensional dynamics of power in that society. This small community, claiming to be the caretaker of such an emblem of Buganda’s unity, was torn by tensions. Power layers unfolded before me, something that I have tried to interpret here also through the lens of place and space.

As Lambek points out, it can be “demoralizing” to realise how little we know, when we are in the field. There we adopt an attitude of “perpetual student” [15], and the participants often have the right to the last word. And here comes a third peculiar aspect of ethnography: the anthropologist at work *learns* from the people with whom he or she studies, and has rarely, if ever, the intention to teach. This makes a cooperation based on cultural research quite different from a development intervention, where expertise from the “developed” world has to be taught in form of “transfer of knowledge/technology” (although there has been a reevaluation of local knowledge in the last decades, also thanks to anthropology [21]). One should however not romanticize ethnography as a democratic, egalitarian, naive enterprise: power relations are at work also between the researcher and the research field, and reflexivity is again necessary to avoid rhetorical statements.

As a fourth and final point, I have already mentioned above that ethnographic fieldwork represents a “moral” activity, an ethical enterprise with a focus on *praxis* and bodily dispositions. If the ethnographers, in the “hermeneutics

of fieldwork” [15], gets to know the others and engages with them, such engagement is a holistic activity: with his/her body, the ethnographer navigates space that the participants navigate and tries to take part into the process of attribution of meaning that they consciously or unconsciously perform in everyday life. Even speech is ethical practice [22]: while speaking, the ethnographer creates conditions which are bounding in the exchange with others. Moreover, as Paul Stoller loves to remind (cf. his speech at Vega Day in Stockholm, April 2013), anthropology seeks for an “existential convergence” with the participants. Ethnography, the “bedrock of anthropology”, “sometimes enables readers to understand the wisdom of others, which, in turn, can open their being to an increasingly complex and interconnected world” [23: 156].

All this may sound too reflexive and even intimate, when we are talking of “cultural cooperation” between big institutions. However, I am convinced that the success of such a peculiar kind of cooperation lies exactly in what happens on the ground. Moreover, we are called upon a serious consideration of the consequences that such potentialities have for us. Among the heterogeneous actors and practitioners of development, we are certainly better equipped to engage local participants and scholars in our research. We can do it through the diffusion and restitution of knowledge, but we also have the duty to support their active involvement in the research designs. As I have said above, fieldwork cannot be romanticized as an egalitarian enterprise: availability of funds, facilities, documents, marks a difference between scholars from the “North” and from the “South” that cannot be naively underestimated.

The “good” anthropology, as Susan R. Whytes has said in a speech at SANT conference, Uppsala, in April 2013, is “one whose engagement ‘ramifies’ along different trajectories”. Scholar with participants, scholars among themselves in the field, “North” with “South”: anthropology must create connections deemed to remain in time, and has to do so also by involving scholars from other background in the conceptualization of the research. In this sense, “cooperation”, I suggest, might be just another label for such engagement, and for the multidimensional relations which anthropology builds. Ethnography, for the aims of this paper, is the smallest in a series of nesting dolls – where the biggest represents the huge administrative and institutional framework of cooperation projects like the Missione or CORUS.

## CONCLUSIONS

Back to the first setting of this paper, governmental and non-governmental cooperation for development remains the Italian success story in Uganda. Cultural cooperation, overshadowed by her bigger sisters, is cheaper yet more affected by budget cuts and receives less public recognition. However, agreements between Italian and Ugandan universities are still on-going<sup>5</sup>, and the Missione represents an important actor on this scene.

As long as the results of cultural cooperation are measured against the standard of development interventions, the lack of public and institutional confidence in what we do will affect our working conditions. The risk I see from my personal experience on the ground is the fragmentation of research - each researcher seeking funds and support on his or her own, at the expenses of a broader coherence with other researches carried out on the same ground. Another risk is the lack of material support for the scholars from the “South”, which are deemed to be excluded by the elaboration of the research questions and run the risk of being “dragged” into our projects only after all is said and done. These are the risks that must convince us to disclose our skills to the broader public and to the institutions, asking for the recognition of our role and for the support of a real engagement with our “Southern” colleagues.

This is why frameworks like Missione Etnologica Italiana in Africa Equatoriale and broad international projects like CORUS are important: they should create the conditions to channel energies towards the achievement of congruent research designs, to support a concrete exchange and engagement between researchers, and to legitimize anthropological knowledge as a tool for cultural cooperation.

## ACKNOWLEDGMENTS

I would like to express my gratitude to the director and colleagues of the Missione Etnologica Italiana in Africa Equatoriale for the opportunity they gave me to work in Uganda; to the directors of CORUS Project for the fascinating experience; to Uppsala University (Dept. of Cultural Anthropology and Ethnology) for covering travel expenses and allowing me to participate to CUCS 2013 in Turin. I thank also Dr. Ilaria Buscaglia for her inspiring suggestions.

### ABSTRACT

In the last fifteen years the Italian Ethnological Mission to Ghana (IEMG), established in 1956, has been supporting cultural cooperation projects aiming to the valorisation of natural and cultural heritage of the Nzema area (South-West Ghana). The long-term relationships between IEMG anthropologists and local actors have led representatives of Ghanaian communities and institutions to ask for a restitution of knowledge gathered throughout the years by researchers.

In order to meet these requests, in mid-1990s IEMG opened the way to the international cooperation in the area, and promoted development projects focused on micro-credit. However, the restitution of ethnographic knowledge has mostly been achieved through the cultural cooperation project *Fort Apollonia and the Nzemas. Community-based Management of Natural and Cultural Heritage, Western Region* (2008-2011). Managed by COSPE NGO (Cooperation for the Development of Emerging Countries) in collaboration with IEMG and many Ghanaian institutional actors, this project culminated in in 2010 in the establishment of a museum-cultural centre. Today, the *Fort Apollonia Museum of Nzema Culture and History* plays a leading role in the safeguarding and valorisation of local heritage, as it is testified by its recent participation to a project – founded by the British Library and Sapienza University of Rome – concerning the conservation and digitization of archival documents belonging to Nzema traditional authorities. This project is part of a wider program aiming to the establishment of a digital archive including the documents related to Nzema chieftaincy as well as the research materials produced by IEMG scholars, currently being catalogued and digitized at Sapienza University of Rome.

This paper will illustrate the main features of the ongoing ethnographic restitution process, focusing on synergetic interactions among anthropologists, local actors and NGOs. Thus, the authors will discuss how an academic Mission, within a specific area, can trigger development processes and then contribute to the shifting of development cooperation into cultural cooperation. Finally, they will point out the results of this multifaceted relation among academia, Ghanaian interlocutors and development operators, in terms of local empowerment.

### THE ITALIAN ETHNOLOGICAL MISSION TO GHANA AND ITS LONG-TERM RELATION WITH ETHNOGRAPHIC FIELD

In 1956, Vinigi Grottanelli, holder of the first chair of Ethnology in Italy, established the Italian Ethnological Mission to Ghana (IEMG), a multidisciplinary team of scholars carrying out its linguistic, historical and ethnological surveys in the Nzema area<sup>2</sup>, South-West Ghana. IEMG developed in two significant research phases, characterized by different methodological and epistemological perspectives, as well as by different relations with the fieldwork. The first IEMG research period (1956-1975) distinguished itself for a scientific approach enhancing the “authentic” and the “traditional” with the aim of obtaining a holistic and organic representation of the various components of society, «before the brutal impact of modernization could radically transform them» (Grottanelli, 1978, p. XIII, authors’ translation). Among the investigated topics, the classical themes of Africanist ethnography were extensively examined: the individual’s life cycle, with its rites of passage; magic and witchcraft; traditional medical practices; otherworldly entities and ancestors (Cerulli, 1963; Grottanelli, 1977, 1978; Lanternari, 1972; Signorini, 1978). Interactions among local people and colonial authorities, as well as slavery and any other process of cultural change, were at the same time

<sup>1</sup> The paragraph “The Italian Ethnological Mission to Ghana and its long-term relation with ethnographic field” has been written by Elisa Vasconi; “From development cooperation to cultural cooperation” has been written by Mariaclaudia Cristofano; “Fort Apollonia today” has been written by Stefano Maltese.

<sup>2</sup> We refer here to the wider coastal region, with the Ankobra (Siane) Estuary as a western border and the Tano (Tanoë) River and the lagoons separating Ghana from Ivory Coast (Eby and Tano-Ehy lagoons) as an eastern border. This territory, which is part of the wider Akan lands, covers two traditional areas (Western Nzema Traditional Area, with Beyin as capital, and Eastern Nzema Traditional Area, with Atuabo as capital) and roughly matches two regional district assemblies (namely Jomoro District Assembly and Ellembelle District Assembly).

neglected.

This phase ended with the publication of a comprehensive two-volumes monograph on Nzema society edited by Grottanelli (1977, 1978), including most of the researches of the so called “classical Nzema ethnography” (Pavanello, 1997-1998). The conclusion of this first period was marked also by Ghanaian political situation, characterized by coups leading to a military regime established in 1981 by Jerry John Rawlings, making anthropological surveys difficult to be arranged in a poor and marginal region as the Nzema area.

A second season officially started in 1989, when Mariano Pavanello succeeded to Grottanelli in the scientific direction of the Mission. In this period several scholars travelled to the area with the intention of examining issues left in the background by their predecessors. Their new approach did not mean to enhance an authentic and reified context, instead they tried to interpret the contemporary Nzema society taking into consideration the relations among the Nzemas, neighboring populations and Europeans. Distancing from what currently would be called an essentialist perspective, with the Nzemas portrayed as bounded and unchanging, a people without history, the second phase of IEMG has adopted a diachronic perspective, focusing on processes of transformation, cultural dynamism, negotiations of identities and sociopolitical order of the area. Pavanello’s studies on local economy and oral traditions (2000, 2007), as well as Valsecchi’s historical studies (2002), investigated the cultural interactions that characterised this territory at least since the arrival of Portuguese, presenting a different vision of history based on contact and relationships (Aria, Cristofano and Maltese, 2014, forthcoming). Thus, IEMG scholars deeply immersed themselves in Nzema society in order to cast an in-depth look on sensitive themes such as the relation with ancestors, local history, land tenure system and the creative dimensions of tradition.

In this framework Pavanello built deep relations with traditional rulers, in doing so achieving a near-chiefly status himself as well as the access to the most hidden levels of historical knowledge. Among them, a preeminent role has been played by Annor Adjaye III, *ɔmanhene* (Paramount Chief) of the *Western Nzema Traditional Area*, promoter together with Pavanello of development and valorisation projects throughout the territory. He paradigmatically embodied a new traditional authority model, in line with the extraordinary revival process properly suggested by the term “le retour des rois” (Perrot and Fauvelle-Aymar, 2003), and expressed in Ghana’s 1992 constitutional reforms<sup>3</sup>. The *ɔmanhene* has always seemed to contradict the stereotypical idea of traditional chief: he achieved academic qualifications and advanced his career in the ranks of the civil service. Moreover, the Paramount Chief has shown the ability to master the language of development, as well as to convincingly relate with anthropological knowledge. An evidence of this new relation with IEMG researchers is provided by his two journeys in Italy arranged by Pavanello: the first in May 1996, as a guest of honour of an international conference on Akan studies in Urbino; the second in June 1997, aiming to involve Italian local governments into decentralized cooperation programs to be developed in the Nzema area. At the same time, at the end of 1990s, Annor Adjaye III shifted his attention on the ethnographic studies carried out in his area throughout the years. As Pavanello pointed out: «he was starting to consider anthropological fieldworks as an extractive activity to be done in accordance with a permit, and which expect a compensation» (Pavanello, 2007, p. 135, authors’ translation). Thus, the Paramount Chief confronted the Italian scholars with the unavoidable issue of ethnographic restitution, that is the way to share the outcomes of IEMG activities with local communities.

Emphasizing the importance of the Italian scholars’ long-time relationship with the Nzema area since the time of Grottanelli, Annor Adjaye III reminded anthropologists of their duties to make the outcomes of their research available to the Nzema people, and stimulated them to undertake some kind of activities in order to provide a fair compensation to the local communities in return for their cooperation over the years (Pavanello, 2007). The restitution and development rhetoric fielded by the *ɔmanhene* in his interactions with the Italian academics become a key aspect of Annor Adjaye III’s political legitimization in front of governmental authorities, local chiefs and population.

In order to meet the requests of the most authoritative local chief, Pavanello was «forced to think about the stake of anthropological research» (Pavanello, 2007, p. 135, authors’ translation). Thus, he decided to promote new development programs introducing the Italian NGO COSPE (*Cooperation for the development of emerging countries*) and the Tuscan Municipality of Peccioli, where he resides. The first project, started in 1998, led to the creation of a mechanical workshop school in Bawhia (Jomoro District), carried out in collaboration with Ghanaian national and traditional authorities. This intervention opened the way to further decentralized cooperation programs, and marked the turn of Pavanello’s role from researcher to development promoter (Pavanello, 2007). This was followed by a second and more extended project founded by European Commission, entitled *Small and Micro Enterprises Support System* (SMESS). It aimed at sustaining micro-credit and encouraging the creation of a local network of entrepreneurs and artisans. Lasted almost ten years, the SMESS triggered the establishment of several associations and trained more than 2500 Nzema artisans – tailors, carpenters, mechanics, oil producers, etc. – in enterprise, budget and credits management.

At the beginning of 2000s, the completion of these programs and the experience and knowledge gained by development operators, led to a wider and different project, far from economic and development issues characterising

<sup>3</sup> Concluding the legislative reform process started in the late 1960s, the new 1992 Constitution recognized the traditional chieftaincy’s prerogatives but also established limits on the scope of their authority. Specifically, traditional chiefs were granted a status of autonomous institutional entities, but were at the same time forbidden to run in governmental elections. In this new context, chiefs reaffirmed the sacredness and the relevance of their role by staging ritual performances, and they also displayed great skill in gaining consensus outside the political arena, not least in their openness to new opportunities offered by international cooperation.

the previous interventions. The project *Fort Apollonia and the Nzemas. Community-based Management of Natural and Cultural Heritage, Western Ghana* was approved and funded in 2005 by the Italian Ministry of Foreign Affairs. It represented a turning point within the development cooperation in the Nzema area, in which the IEMG anthropologists have played an outstanding role.

## FROM DEVELOPMENT COOPERATION TO CULTURAL COOPERATION

Throughout its history, IEMG has not only distinguished itself for scientific works and peculiar relations with fieldwork, but also for its special link with a symbolic site both for Europeans and Nzemas: Fort Apollonia. It is a British stronghold built at the end of the Eighteenth Century at Beyin, capital of Western Nzema Traditional Area.

In 1968 Kwame Nkrumah, the first President of independent Ghana, promoted its restoration to enhance the Nzema area – his place of origin – and contrast its backwardness and marginality, at that time seeming to be inevitable. He also accorded to IEMG anthropologists the permit of housing in the castle during their surveys: therefore Fort Apollonia became their residence. The situation started to change in 1998, when *Ghana Museums and Monuments Board* (GMMB) – the governmental body in charge for the administration of both national museums and historical buildings – granted the anthropologists exclusive use of the fort. In return, GMMB asked them to work out a strategy to turn Fort Apollonia into something useful for local population. Soon after, Pavanello encouraged Italian scholars to leave the fort and spread out into the territory, as himself did in 2002 moving into a raffia-hut in Old-Kabenlasuazo, a coastal village not far from Beyin (Aria, Cristofano and Maltese, 2012).

In this changing scenario, thanks to the joint efforts of different actors, both Ghanaians and Europeans, *Fort Apollonia and the Nzemas* started. This project, managed by COSPE from 2008 to 2011, was strongly supported by Italian anthropologists in order to meet the above mentioned restitution claims. It was also the outcome of national and international cooperation programs, which in mid-1990s were making of cultural and natural heritage valorisation a central feature of their actions. These are indeed the years of heritage policies promoted by international organizations like UNESCO, which find their achievement in an increased number of development projects aiming to actively involve local communities. In tune with the described new directions of international cooperation, also the Nzema area benefitted from valorisation programs. At the end of 1990s the NGO *Ghana Wildlife Society* (GWS) settled in Beyin to promote actions of eco-touristic requalification and conservation of the area<sup>4</sup>. Thus, anthropologists and COSPE included the already started GWS interventions within *Fort Apollonia and the Nzemas* project.

Therefore, in *Fort Apollonia project* conservation and valorisation of local cultural and natural heritage were identified as two key-elements for the human development of the Nzema people and for the improvement of their living conditions in an eco-compatible and self-sustainable way. The project aimed to carry out this complex purpose through three main objectives: 1) strengthening of possibilities and capabilities for the safeguarding and valorisation of local natural and cultural heritage; 2) improvement of entrepreneurial skills and chances for local people, with particular reference to economical activities related to the enhancement of local resources. 3) making local people aware of the importance of conservation and sustainable use of ecosystems and natural renewable sources. Each objective included different actions combining development of the area with the safeguarding of cultural and natural heritage<sup>5</sup>.

Among them, the setting up of the *Fort Apollonia Museums of Nzema Culture and History* has played a central role. The museum-cultural centre was inaugurated on October 30<sup>th</sup> 2010 within the newly restored Fort Apollonia, to the presence of local population and representatives of the institutions involved within the project (Fig. 1).

*Fort Apollonia and the Nzemas* has gathered different actors: on the European side IEMG, responsible for the design and the implementation of museum exhibitions; Italian Ministry of Foreign Affairs, as main founder of the project; and COSPE, managing funds and interventions. On the Ghanaian side: GWS; representatives of traditional rule (*Western Nzema Traditional Council* and *Eastern Nzema Traditional Council*); decentralized governmental institutions (*Jomoro District Assembly* and *Ellembelle District Assembly*); GMMB; and other institutions dealing with the valorization of national cultural heritage (*National Commission on Culture*) and touristic promotion of the territory (*Ghana Tourist Board*).

In this framework, anthropologists have not only played the role of observers, instead they have become active agents of a collaborative heritage-making process. As young IEMG probationers who had focused their studies on heritage and museums, at the end of 2008 indeed COSPE employed two of us<sup>6</sup> to develop a museum proposal including

<sup>4</sup> The first important project carried out in the Nzema area by GWS is the ACID project (*Amanzule Conservation and Integrated Development project*). It aimed to the conservation of Amanzule lagoon ecosystem and to the «enhancement of its scenic beauty, ecological integrity, eco-tourism potential, and the economic well-being of the local community» (Abban, et al., 2009). It reinterpreted the Nzema area as a natural heritage and opened the way to the eco-touristic development of the area.

<sup>5</sup> Concerning point 1), the action focused on: the restoration of Fort Apollonia and the setting up of a museum-cultural centre within the stronghold; the support of local communities in the management of the museum; the identification of touristic trails which, starting from the museum, could lead to the discovery of the Nzema area. The essential purpose of the action described at point 2) was to make Nzema cultural and natural heritage an income-generating resource for the communities. Through production and selling of handicrafts, access to credit and training of local entrepreneurs, the project aimed to develop employment opportunities for local people. In accordance with point 3), the project aimed both to spread a new ecological awareness and to enhance hygienic conditions through the setting up of local sanitary infrastructures.

<sup>6</sup> The authors of this essay have played different roles in the process of cultural valorisation started in the frame of the *Fort Apollonia and the Nzemas* project. Since 2009, Mariaclaudia Cristofano and Stefano Maltese curated the museum project and set up its exhibits. Elisa Vasconi has collaborated

a number of key-topics to be developed in the exhibition, with the idea to submit such a proposal to the Project Management Committee (PMC) for close examination and approval. After negotiations and exchanges among us, local representatives and the PMC, these subjects came to include: the Nzema system of kinship and its seven clans; the hierarchy of traditional power; the *Kundum* festival; historical narratives of the area; the relationship between the human population and local ecosystems; and traditional medicine<sup>7</sup>.

Notwithstanding, at the beginning of the project the character of the museum to set up was not unambiguous. The actors taking part to its realization were wondering if Fort Apollonia should become an eco-museum, a historical and ethnographic museum, a gallery filled with showcases displaying objects, a cultural centre, a strategic tool for the economic growth of the area, a place mostly visited by tourists or local people. Another important issue was related to the method to be adopted to implement the exhibition. The development project charged us with “translating” into museum exhibits the knowledge gathered throughout the time by IEMG anthropologists. We were conscious that this task threatened to result in reifying and exoticising representations, marginalising local people’s agency, even if it was in accordance with the cultural restitution programme at the basis of the project. Thus, we tried to join the anthropological knowledge, with a kind of museum able to relate with the contemporary Nzema, through a reflexive operation of mediation and intentional contamination among different imaginations and languages. Our approach was informed by studies of heritage-making processes (e.g. Handler, 1988; Herzfeld, 1997; Lowenthal, 1998; Palumbo, 2003) and by the perspectives of museum anthropology (e.g. Karp and Lavine, 1991; Karp, Mullen Kreamer and Lavine, 1992; Clemente and Rossi, 1999; Karp, et. al, 2006; Padiglione, 2008). We aimed to avoid essentialising and classifying ideas of museum and cultural heritage, to connect “an anthropology *within* museums with an anthropology *of* museums” (Padiglione, 2008, p. 92), taking into account the intellectual and political contexts in which the heritage-building processes take place. In order to do so, we were encouraged to continuously shift from the role of museum designers to that of critical ethnographer and vice versa, which was the only way to reflexively analyse the representations that we ourselves had a hand in producing.

The two methodologies adopted gave us the opportunity to show in *Fort Apollonia Museum* a plurality of views on Nzema society, avoiding the knowledge and the academic authority of the anthropologists to prevail. Thus, in the participatory spirit of museum anthropology, both the outline and the setting up of the exhibition were carried out through a series of workshops involving different actors. Throughout the process, constant collaborations were taking place among us as anthropologists, with the *Nzema Art and Crafts Association* (a regional craft association), and other Ghanaian individuals who played a role in the development of the museum thanks to their skills or position in the community.

The setting up of *Fort Apollonia Museum* represents the outcome of continuous negotiations among different actors’ representations. It has revealed conflicts and problems usually characterizing the establishment of a museum as an institution (Clifford, 1997), as well as the carrying out of a development project (Oliver de Sardan, 1995). However, *Fort Apollonia and the Nzemas* project has also promoted the museum as a new cultural institution strongly rooted in the Nzema area, today representing a point of reference for local communities, drawing the attention of national and international tourism, and promoting cultural cooperation programs.

## FORT APOLLONIA TODAY

Since its inauguration, the Fort Apollonia Museum has been acquiring relevance at local, national and – thanks to the projects recently undertaken – also international levels.

In 2012 a Scientific Committee including the major Ghanaian scholars has been instituted, with the support of the IEMG. Besides the promotion of the institution in the academic and institutional scenario, the Committee’s main objective is to facilitate the engagement of the Museum in new research projects. The political consequences of this operation have been so relevant to expedite the process for the employment of the museum staff by GMMB, which started immediately after the end of the *Fort Apollonia and the Nzemas* project and has been recently finalized. Since July 2011, the three professionals selected and trained by COSPE and the anthropologists have indeed been working for free, despite the fact that the official employment dates from December 2012. Although the staff employment looks as an important achievement, its instability has been delaying so far the activities of the Museum, such as educational programs for the schools and tourist promotion of the area.

Nevertheless, the Museum has been able to gain an important role in raising awareness about cultural and environmental issues, by organizing locally-based activities for the schools children, as well as by hosting summer schools for Italian students in cultural anthropology. Such a commitment gradually led the Museum to stand as a leading agency in several projects aimed at implementing cultural activities throughout the territory.

By the way, the implementation of some kinds of cultural cooperation with more defined objectives seemed particularly appropriate in order to intervene where the *Fort Apollonia and the Nzemas* project could not, as, for instance, in the sensitive matter concerning the history of the area. During the months in which the Museum exhibition was developed, and even earlier, the issue of local history had proved to be one of the most relevant and conflicting, no

<sup>7</sup> On the patrimonialisation of traditional medicine in Fort Apollonia see Cristofano, Maltese and Vasconi, 2013.

matter of the actors with which it was discussed within the project framework. All the partners agreed on the idea of dedicating a significant space in the exhibition to the issue, but the great conflicts among different oral traditions, strongly catalyzed by the lack of a documentary historiography based on archival materials, very soon proved to be a too big obstacle to be passed in the few weeks available to finalize the exhibition. However, some previous events could suggest a solution. In 2002 Pavanello had started, though he couldn't complete it, the re-organization of the Western Nzema Traditional Council historical archive, stored at the Paramount Chief's private residence. From then on, the *omanhene* often demanded the completion of that project, asserting the importance of archival material for the preservation of the historical memory in his area. Moreover, at the initial stage of the research which shaped the exhibition of the Fort Apollonia Museum, many traditional rulers expressed the idea that the Museum had to become the place where they could entrust the documents belonging to them. According to this idea, Fort Apollonia should have become something halfway between a museum and an archive, in which the documentary heritage scattered in the various villages of the area could have been preserved for future generations.

In this frame, a concrete opportunity to follow up the requests coming from the chiefs as well as to enable the Museum to play as a propulsive agent in the valorization of local history was provided by a cultural cooperation project aimed at safeguarding and digitizing endangered archival material. In February 2012 the Fort Apollonia Museum, supported by the IEMG, applied for funds to the British Library in the frame of the Endangered Archives Programme ([www.eap.bl.uk](http://www.eap.bl.uk)), as implementing agency of a ten-months pilot project named *Safeguarding Nzema History: Documents on Nzema Land in Ghanaian National and Local Archives*. Ended on the 30<sup>th</sup> of June 2013, the action had among its main objectives the securing, sorting and digitization of the documents kept in the archives of Western and Eastern Nzema Traditional Councils. This includes records that are relevant both for outlining the relations between written documents and oral sources, and for reconsidering the historical dynamics the area went through in the last two centuries. The European partners in this project were the British Library, the Department of History, Cultures, Religions of Sapienza University of Rome, the Centre for Research and Services DIGILAB of Sapienza and the Italian Ministry of Cultural Assets – Archives Directorate General. On the Ghanaian side, besides the Fort Apollonia Museum, the Western and Eastern Nzema Traditional Council Archives have been involved as beneficiaries of the action, while PRAAD (Public Records and Archives Administration Department, Accra central branch and Sekondi regional branch) and the Information Studies Department of the University of Ghana contributed by providing training and technical support.

The project *Safeguarding Nzema History* represents the first phase of a wider and more complex action of re-organization and digitization of the archival materials in possession of the Paramount Chiefs of the Nzema traditional areas. The museum staff and the anthropologists of the IEMG have recently applied to the same Programme for a major project aimed at completing the digitization of the materials in the Western and Eastern Nzema Traditional Council Archives and also at broadening the action in the Nzema-Evaloe traditional areas, namely Upper and Lower Axim, Edwira, Apateim and Nsein. The final objective, strongly backed up also by the hierarchy of the local traditional rule, is to establish a digital platform capable to host both the interactive exhibition of the Fort Apollonia Museum and the digitized records of Nzema chieftaincy. The IEMG is actively cooperating with local interlocutors to design such a platform, and is facilitating its development by providing technical know-how and mobilizing financial resources available both in Ghana and Italy.

As part of its restitution program the Mission is also engaged in a project aimed at cataloguing and digitizing the materials produced by its scholars, which will be eventually uploaded on the internet and made available for research purposes. Sapienza University of Rome is currently funding the digitization of selected pictures, slides, audio and video recordings, papers and books; such materials will become part of Sapienza Digital Library, the digital archival system of the University, and will be made accessible through the portal dedicated to the Fort Apollonia Museum.

By promoting cultural cooperation programs that are in tune with local interlocutors' claims for restitution and self-representation, the IEMG may actually be considered as one of the agents active in the shared heritage-making processes that are taking place in the Nzema area (Aria, Cristofano, Maltese, 2014 forthcoming). In a scenario characterized by a long-time relationship with its fieldwork, the Mission is currently trying to further its scientific vocation by promoting cooperation projects able to trigger original developments in the research activities. By doing so, it is committed in building upon and even fostering the ethnographic relationship between the Nzemas and the Italian anthropologists, whose peculiarity lies in its long duration as well as in the fruitful interaction established over the years with a network of Ghanaian local and national institutions.

## THE PROMOTION OF HERITAGE INSIDE THE POLITICS OF TOURISM DEVELOPMENT OF MOZAMBIQUE. THE ROLE OF INTERNATIONAL COOPERATION

Elisa Magnani\*

\*Dept. of History and Cultures, Alma Mater Studiorum, University of Bologna, Italy - [e.magnani@unibo.it](mailto:e.magnani@unibo.it)

### ABSTRACT

The development politics that Mozambique is promoting has started improving the economic growth of the country but is still struggling to improve the living conditions of the local population, together with empowerment and capacity building.

Tourism may be a significant tool to help the country improve both aspects: increasing the GNP and creating real well-being; in fact, in the first decade of the XXI century, the Government has implemented a policy aimed at helping the development of tourism, the *Plano estrategico para o desenvolvimento do turismo*. This Plan identifies several institutional weaknesses such as a shortage of infrastructures and of financial tools to sustain local and international investors, and also a lack of skilled human resources; and it aims at increasing the tourist accommodation capacity, the tourist infrastructures and the human resources by the year 2015.

Thanks to its natural and cultural heritage, and to its climate and biodiversity, Mozambique could promote a wide range of tourist products, supported by public and private investments and by the creation of cooperation partnerships with other Countries and Ngos.

The Country has since long started several programs of international cooperation, but the experience in the field of tourism is quite recent and is now focusing on the realization of several programs promoted by the *Plano Estrategico*, such as the construction of infrastructures and the creation of capacity building initiatives.

This paper analyses the governmental policies aimed at the promotion of tourism and focuses on several case studies to highlight how much the international cooperation is contributing to the development of the sector, supporting the local communities in realizing the tourist policies promoted by the *Plano*. Despite an evaluation of such experiences is still impossible due to their being still *in fieri*, we will try to observe them with a critical eye, focusing in particular on the role played by the Ngos and other international institutions working in the country in training, creating capacity building and obtaining empowerment for the local population, but aiming also at the preservation of the local natural and cultural heritage.

### TOURISM AND DEVELOPMENT: THE ROLE OF THE INTERNATIONAL COOPERATION

WTO figures highlight how international tourist arrivals have shown a continuous growth from 1950 (25 million) to 2012, when 1.035 billion tourists have been moving around the world, generating a revenue of US\$ 1,075 billion. Asia and the Pacific recorded the strongest growth with a 7% increase in arrivals, followed by Africa (+6%) and the Americas (+5%), while Europe, the most visited region in the world, recorded only a 3% growth. For the future, WTO estimates that the international tourist arrivals will increase to 1.8 billion by 2013, with a growth of 4.4% in emerging destination [1].

As for Africa, the continent reached a total of 52 million tourists in 2012, accounting for US\$ 34 billion international tourist receipts, while Subsaharan destinations recorded a global 5% increase, with South Africa, the largest destination in the subregion, accounting for a 10% growth in 2012, that is to say over 9 million arrivals. Other destinations with strong growth were Cameroon (+35%), Tanzania (+24%), Sierra Leone (+14%), Madagascar (+14%), Cape Verde (+13%) and the Seychelles (+7%) [1].

Tourism is nowadays recognized as a key feature for local development, especially to those countries with poor economies where it can bring large direct revenues, employment and satellite revenues.

These very countries, however, lack money and skilled human resources and they rely on the aid coming from international cooperation to sustain the development of the sector [2]; moreover, tourism may also create negative impacts, such as a general growth in the cost of life, social inequalities in the access to the revenues it brings, pollution and commodification of the local culture.

These drawbacks may impact both on the local population and on the environment: even if tourism is capable of diversifying the local economies, of bringing infrastructures to people in remote areas (and with them the access to social services such as hospitals, schools, markets, etc.) and of creating job opportunities, with its infrastructures and cultural contamination it may often lead to a change or to the destruction of the local natural and cultural environment.

Moreover, through tourism the local communities may lose control on their territory, the local resources and on how to use them, and on the number of tourist they are willing to welcome [3;4]. Without such control the population loses the faculty of choosing how to use its territory [5] and in the end this may to a loss of its identity, considering that nowadays the preservation of people is strictly connected to the preservation of their spaces [4].

As Lozato-Jotard [4] puts it, consuming images, dreams, time and places, tourism may threaten the very survival of the cultural landscapes it uses. As said, a major risk is that the local communities lose the control of their territory: the global tourist market, in fact, is strongly controlled by global economic agents, much stronger than the local stakeholders who often cannot oppose to the investments made on their territory [6]. However, as Lozato-Jotard [4] urges us to remember, the control on the territory is the only way that a community has to maintain the control on its history and tradition: once the control is lost, the community has no more the right to decide what to sell of the multiple resources they possessed and they can thus be exposed to a complete commodification of their cultural and natural environment.

This is the reason why the participation of local people and stakeholders to local development has been recognized as vital to the success of every project aimed at improving the living conditions of the resident population: participation should allow the satisfaction of the majority's interests, while promoting the process of sharing the benefits deriving from tourism and thus granting an improvement of the living conditions of the resident population [7].

Participation, together with capacity building, are key factors that the international cooperation has started promoting after the Millennium Development Declaration, that emphasized the role of (public-private) partnership, territorial integration, political dialogue and capacity building in helping human development. After this Declaration, in fact, the concept of need, that often has driven the actions of international cooperation subjects, has acquired a new, wider dimension: it is no longer connected exclusively to emergency situations, rather it has to focus on a wider conception of poverty, and work on the causes rather than on the effects. This has meant that international cooperation is no longer restricted to emergency actions such as bringing food or medicines in the places of a human crisis, but it has become more and more an action of investing money in training public workers, entrepreneurs and citizens in general. Much of this work has to do also with another key element of international cooperation: technology transfer. This may include the introduction of new agricultural techniques, the creation of communication and transport infrastructures, but also a general informatization of the target community, through a private action or more often through a public-private partnership, in the form of an international cooperation agreement [8].

## **A SHORT HISTORY OF TOURISM DEVELOPMENT IN MOZAMBIQUE**

Before independence Mozambique was considered a very important tourist destination in Africa insomuch as in 1973 it received 400,000 tourist arrivals, mainly from South Africa, Zimbabwe and Portugal. Obviously, during the independence war years and the civil war this flow collapsed, with great loss for the Government's treasury.

Only after the 1992 peace agreement Mozambique involved again in tourism and several accommodation infrastructures (mainly campsites and self catering) were constructed in Maputo and in the nearby area, such as Ponta de Ouro, Bilene e Inhambane. At the same time national parks and natural areas were developed and made accessible for tourists reception, such as the Bazaruto and Quirimbas archipelagos and the areas of Nacala and Pemba.

With 2,770 Km of coasts, a tropical climate with an average temperature of 23° in the North and 26° in the South, a great diversity both natural and cultural, the Country has enormous potentials for the development of tourism. The Northern region is known as "the tourism jewel" due to the presence of the Quirimba archipelago, the lake Nyassa and Ilha de Moçambique; the Centre offers both the coastal resources of Beira and the wilderness of the Gorongosa National Park, while the Southern region orbits around Maputo and the nearby coastal areas, where 50% of the total tourist infrastructures and 65% of the Country beds are located [9].

At present, the Country has been recognized only one World Heritage Site, Ilha de Moçambique, but has submitted four more sites to the tentative list, places of both natural and cultural value. In general, both the built and natural heritage have suffered greatly during the independence and civil war years, but the government is trying to restore it, recognizing its potential role in helping the development of the Country, in improving the living condition of the population and in strengthening the national pride for its culture and history.

WTO has estimated that in 2004 (the last available data) has received 470,000 tourists [10], with an income of 95 million dollars [11]. The figures show a growing trend but in 2007 the tourist arrivals in Mozambique reached only 1% of the total arrivals in the African continent. In the same year, the tourism share in Mozambique GNP was only 3.2% [12], and this because the majority of the tourist flows in the country were composed by domestic tourists (42% of the total) or by people coming from the nearby Countries, using their own cars and often sleeping at parents' houses or in low-costs accommodations. Moreover, the average stay is only 2.3 days and the average expenditure only 250\$, nearly half of the continent's figure (404\$) [13].

Mozambique rates only 119<sup>th</sup> in the world tourist rank compiled by the World Economic Forum in 2007 (on 124 countries), behind Tanzania, Gambia and Zambia. Among the weaknesses that affect negatively the County we may count the still strong presence of malaria, the unskilled human resources and the bad management of the cultural and natural resources [13], but also the lack of economic subsidies to encourage foreign and local entrepreneurs to invest in the country.

## MOZAMBIQUE TOURIST DEVELOPMENT POLICY

Tourism is rightly considered by Mozambique as a vital lever for development, both in respect to the revenues that it grants to the State's treasury, and to the social benefits that it is capable of bringing to the local population, emphasizing its role in poverty reduction. This is the reason why in 2004 the Country has promulgated a tourist policy called the *Plano estratégico para o desenvolvimento do turismo em Moçambique* (Strategic plan for the development of tourism in Mozambique), for the years 2004-2013 [14]. Tourism, moreover, is recognized as a tool to impact actively on the development of the whole country, due to its role in stimulating satellite activities, and thus reaching a wide range of economic sectors and impacting a large portion of the population. The Plano establishes the goal of reaching 4 million visitors by 2025, by becoming a dynamic and the most exotic tourist destination in Africa, mainly improving the promotion in the rich markets of Europe and North America:

«Até ao ano de 2025 Moçambique será o destino turístico mais vibrante, dinâmico e exótico de África, famoso pelas suas praias e atracções litorais tropicais, produtos de eco-turismo excelentes e pela sua cultura intrigante, que dá boas-vindas a mais de 4 milhões de turistas por ano. As áreas de conservação constituem uma parte integrante do turismo e os seus benefícios darão um contributo significativo para o PIB, trazendo riqueza e prosperidade para as comunidades do País» [14: 50].

The main goal of the *Plano* is to get to develop Mozambique as a global tourist destination, while contributing to the creation of employment, economic growth and poverty reduction. Tourism, though, has to become an instrument to help the conservation of the national biodiversity and the cultural values, promoting the national pride. Mozambique wants to promote the development of a sustainable tourism sector, dedicated not only to an economical growth but also to the well being of its population. Such plan is to be implemented through several actions:

- Integrate tourism in the general politics of the Country
- Plan and coordinate the development of the markets, of the products and of the tourist infrastructures
- Establish an institutional frame of planning and control tools
- Recognize the active role of the private sector
- Create consciousness on the importance of tourism and on the national natural and cultural heritage
- Train the human resource
- Promote the involvement of the local communities in the tourist development programmes [14]

The main challenges the Country has to face lie in the need to create an integrated national tourist system based on a diversified use of the national resources and on a set of public and private investments in tourist infrastructures, capable of increasing the total value of the tourist expenditures in the country: this can be achieved only by reducing the leakages effect and by developing the tourist and economic skills of the local communities involved in tourism [13]. Very important is also to secure the ownership of the resources that the local communities are managing in a tourist way, quite a critical issue in a country when only recently such right has been recognized, through the intervention of a foreign Ngo implementing a project that has mapped 45,018 urban land parcels and prepared titles for the right of use and benefit of land, known in Mozambique as a DUAT, or *direito de uso e aproveitamento da terra* [15]. Moreover, in 2003, the issue of ownership has been recognised by the OECD's Development Assistance Committee as one of the key features for the future implementation of every international cooperation project, in order to stimulate a bottom-up approach to local development [8]. Concerning the implementation of tourist initiatives, without such right a tourist activity will not be secured and is quite probable to fail.

This tourist promotion policy, starting from the Government, aims at reaching all the tourist stakeholders who work in the different areas, supporting investments aimed at improving the transports and the accommodation infrastructures and at diversifying the tourist offer. This is the only way the country can position itself in the global tourist market. Moreover, these actions have to be integrated with a greater environmental consciousness aimed at sustainably exploit the natural resources, both the coasts and the wilderness in the interior of the country, in order to avoid the environment depletion that would decrease the potential tourist attractivity, but also a worsening of the living condition of the local population, reducing their access to food resources [9].

The *Plano Estratégico para o desenvolvimento do turismo em Moçambique* focuses mainly on the development of ecotourism, maritime tourism, cultural tourism and the observation of flora and fauna, and it establishes three main areas where the efforts of the Government will concentrate:

- Priority areas for the tourist investment (APITs)
- Conservation areas (AC) and transfrontier conservation areas (ACTFs)
- Tourist routes

Among these, the areas destined to attract greater tourist investments are conservation and transfrontier areas, where the observation of flora and fauna is the main tourist attraction, but several projects have also involved some cultural areas, such as the islands of Ibo and Ilha de Moçambique. Concerning the natural heritage, since the beginning

of the XXI century they have been involved in a great programme to increase the population of wild animals, decreased during the civil war years, but they have also been characterized by the construction of transport and accommodation infrastructures [12].

To sustain the tourist development of these areas, the Plano has established three different forms of action, destined to the three areas [16] [17]:

- in the APITIs (regions of Gaza, Inhambane, Maputo, Nampula, Zambezia) the project Ancora do Turismo is developed: these initiatives are realized in collaboration with the International Finance Corporation in order to stimulate the growth of tourism through local initiatives aimed at constructing infrastructures and accommodation, and to remove the administrative barriers that constrain private investments in the sector. It is estimated that they will be able to attract 1.2 million dollars in the country and to create 26,000 new employments, plus 5,000 more once the infrastructures will be operating [18].
- At the moment only 4 projects have been realised: Reserva Especial de Maputo, Reserva de Gilé e Ilhas Primeiras (Zambesia), Distrito de Inhassoro (Inhambane), Distrito de Mossuril (Nampula).
- In the AC/ACTFs (regions of Gaza, Inhambane, Maputo, Manica, Niassa, Sofala, Tete) the Planos do turismo are developed: these receive much of the international attention, not only for their conservative value, but also for the role that transfrontier conservation areas in particular may play in stimulating peace keeping at a regional level.
- In the northern regions (Cabo Delgado, Nampula, Niassa) the Project Arco Norte is developed: it is a three-year project that has been implemented with the collaboration of USAID, (and financed with 5.5 million \$) to attract tourists and investors and to promote the conservation of nature [19].
- At the moment only 3 projects have been started: Cabo Delgado (Ibo and Pemba), Nampula (Ilha de Moçambique) and Nyassa (Lake Nyassa, Chuanga) [12].

### **Cooperating to the conservation of the cultural and natural heritage in Mozambique: a case study**

As an example of successful international cooperation, the case of the African Safari Lodge Foundation will be here presented. During the 3<sup>rd</sup> Conference of World Parks, held in Durban in 2003, the importance of protecting the rights of the local communities involved in tourist development programmes was once more recognized and Mozambique decided to support it by starting a cooperation with the African Safari Lodge Foundation (ASLF), a South African association that was already working in South Africa and Namibia [20]. Two years later the Foundation started working in Mozambique too, promoting the development of tourist activities in areas included in the regions recognized as priority by the *Plano Estratégico*, and with a participative approach.

In all the countries where ASFL works, it has promoted the implementation of participation, capacity-building and empowerment, the key features of international cooperation as recognized in literature. Its strategy, in fact, has always included two different kind of actions: collaboration on one side and training on the other. As for collaboration, ASLF aimed at helping the members of the local communities participate actively to the new tourist business, and creating a discussion forum on the theme of conservation, tourism and social development, in order to involve in the process all the possible stakeholders; finally ASLF means to work to establish an active partnership among the private sector and the communities involved. Training, on the other side, is meant to strengthen the skills of the local communities members to set legal tourist activities and to better understand this industry, in order to improve the quality they would be able to offer, and to become competitive in the global market in order to attract not only more tourists, but also more investments [20].

The work of ASLF in Mozambique has started with several pilot projects, where the two set of actions have been carried out in parallel [21]. The pilot projects are aimed at setting a standard for tourism development in Mozambique, helping “develop positive lessons from them and then disseminate these to those tourism companies, operators and NGOs who want to also play a positive role in terms of promoting development and poverty alleviation in the country” [22]. The first of these six pilot projects is Ibo Island: set in the Quirimbas Archipelago, in the Cabo Delgado province, the island has been included in the Unesco tentative list, for its natural and cultural heritage. It is also included in the Quirimbas National Park, that comprises 11 of the 32 islands of the Archipelago and is renowned not only for its outstanding natural landscape, but also for its historical past: colonized by the Portuguese, it became a trading port where the slaves were traded. The project was realized with the collaboration of the Ngo Technoserve, that works in several countries around the world to “develop business solutions to poverty by linking people to information, capital and markets” [23] and has been working in Mozambique for several years. Together they cooperated with the local Ibo Safari Lodge to encourage the development of tourism-related businesses on the island and, with the help of the Aga Khan Foundation, they succeeded in involving the island’s silversmiths in creating silver jewels and objects to be sold worldwide. Nowadays ASLF is not involved in the management of the programme any more but the Ibo Island Lodge Foundation continues raising money through tourisms but also through international fund raising for the community, to be invested in education and training in entrepreneurship [21, 20].

The second pilot project is Manda Wilderness, on Lake Nyassa, in the Niassa Province. The project includes a lodge, the Nkwichi Lodge, built several years ago by a group of private individuals to introduce tourism as “a force to stimulate conservation and community development” [21]. ASLF has also supported the creation of a Charity registered

in the United Kingdom, that helps raising money for the project, and of the Manda Wilderness Community Conservation Area, that protects 120,000 hectares of land, while working with several villages of the area, to improve their health and education and to support the creation of small tourism-related businesses. Moreover, in 2005 these villages constituted an Association, the Umoji Association, in order to be involved in the project and to advocate for property right (DUAT) on the land the project is run on: it is generally recognized that only with a proper ownership of the land the community will be able to attract more investors. Presently the projects has produced nearly sixty employments [20; 21].

Covane Community Lodge is the third pilot project, near Massingir in the province of Gaza, on the very outskirts of the Limpopo National Park. The construction of the lodge was promoted by a Swiss Ngo, and later left to the management of a Mozambican Ngo. A new lodge is actually being constructed and ASLF has helped the community getting a grant from the Ford Foundation and the World Bank, while negotiating the opening of a new partnership with Transfrontier Park Destination, a local tour operator that will market the lodge internationally. Not only ASLF has stimulated the opening of this collaboration, but it has also worked to train the local population to become better acquainted with tourism and its industry [21; 22].

The fourth pilot project is Chemucane Lodge, constructed inside the Maputo Special Reserve, south of Maputo, where elephants may be observed but also coastal resources are present to entertain the tourists. ASLF vision for Chemucane is to create an exclusive, environmentally sensitive eco-tourism development based on community ownership of the tourism concession [21]. In fact, the Government has recognized to the Ahi Zameni Chemucane Association (AZC), an association of local people, a 50-year license to manage the project on the territory; moreover the association has obtained a loan by the World Bank to construct a lodge at Ponta Chemucane, in joint venture with the Bell Foundation [24]. ASLF has also started a training programme for the local population, in order to help them acquire more skills in the management of a tourist activity.

The fifth pilot project is in Ilha de Moçambique, in the province of Nampula. This project focusses on cultural tourism with ASLF helping the realization of a community development plan aimed at refurbishing 100 historical building in the island and in the nearby area, to start tourist activities managed by the local community. The case of Ilha de Moçambique is quite interesting, first of all because it is the Country's only Unesco World Heritage Site and secondly because here the international cooperation has been working for a long time to sustain the preservation of the historical buildings but also to support education, health, promotion of traditional economic activities such as fishing, and training in the field of tourism, entrepreneurship but also in the learning of the English language, to help the tourist entrepreneurs become more skilled. Unesco is one of the major international boards that has been operating on the island since 1991, the year of its inscription in the WHS List, and its presence has incentivized the intervention of other international Ngos and donors, such as the already mentioned Technoserve, that is promoting the realization of a Community Foundation in charge of the management of the tourist activities promoted by the ASLF project [21]; but also the Japanese Funds-in-Trust, the Union of Lusophone Capital Cities (UCCLA) and the IPAD (Portuguese Institute for Aid and Development), as well as by the Netherlands Funds-in-Trust and Flanders Funds-in-Trust, involved in the rehabilitation of the São Sebastian Forte [25].

The sixth and last pilot project was started in Gorongosa National Park, in the province of Sofala. The Park was opened due to a public-private partnership between the Government of Mozambique and the Gorongosa Restoration Project, a US non-profit organization that helped protecting the wilderness and reintroducing part of the wildlife damaged after the civil war [27]. ASLF has started a wide programme aimed at promoting a sustainable management of the park, in collaboration with Technoserve and the Carr Foundation, that is helping the communities living in the Park's Buffer Zone define their boundaries in order to apply for the DUAT, the property right on the land where new tourist activities will be started. The agreement with the local communities includes training in the field of tourism but also in agriculture techniques aimed at producing higher yields but with a lower impact on the environment. Moreover, a plan to attract international donors and investors to restore the mountain's endangered forests has been promoted, that has allowed the implementation of a reforestation programme. Finally, Technoserve has promoted the establishment of a dry fruit factory that buys the fruit from the local communities [21].

As we have seen, tourism is only one of the multiple activities that international cooperation has been able to implement in the Country: it has promoted education, health improvement and capacity building, in the form of training in the field of entrepreneurship, tourism and agriculture. It has also advocated for greater empowerment for the local communities, and perhaps this is the greater success of the case here presented, because with the support of ASLF and its partners not only the communities have seen an empowerment in their living conditions, but they have also been supported in their struggle to obtain land rights: in 1997 the country has passed a new legislation allowing local communities to secure formal rights to their ancestral land.

## CONCLUSIONS

Mozambique has great potentials for the development of tourism connected to its natural and cultural heritage, however it is constrained by several weaknesses that the Government is trying to handle with a wide spectrum of initiatives. As seen, international cooperation is a vital tool to help the Government in its quest for a better tourist industry that will grant larger incomes, but also improved living conditions for the local population.

We have here discussed the case of international cooperation aimed at the development of sustainable tourist areas, implemented by a South African foundation, that works in several countries in the sub region and whose main objectives are advocacy, capacity building, empowerment, transfer of land rights. All these are implemented through a bottom-up, participative process, that includes the local stakeholders and general citizens in all the phases. All the projects promoted by ASLF are aimed at establishing tourism businesses owned by local communities but operated with private partners, allowing the local residents and their communities obtain not only an employment but also new skills and new rights [21].

These goals are obtained through advocacy and through the establishment of partnerships with other international cooperation subjects – other Ngos, Foundations, international agencies – that contribute to the realization of the primary goal of eradicating poverty. The results, up to now, seem to be quite positive.

However, despite the good practices described, a final judgment of their results is still impossible due to their very short history, but the improvement in the local communities living conditions will have to take into consideration not only the elimination of poverty, but also the creation of trained and skilled people that will work in tourism activities, and a real empowerment of the communities involved in the development programmes: only this will enable the local communities become active members on the territorial development.

## SPERIMENTAZIONE DI MODELLI PER IL RAFFORZAMENTO DELLE ISTITUZIONI ALLE QUALI È AFFIDATA LA CONSERVAZIONE DEL PATRIMONIO CULTURALE: CASI DI STUDIO IN CINA E IN EL SALVADOR

Mario Micheli\*

\*Dipartimento di Studi Umanistici, Università degli Studi Roma Tre, Italia - [mario.micheli@uniroma3.it](mailto:mario.micheli@uniroma3.it)

### ABSTRACT

Nella parte introduttiva di questo contributo, allo scopo di evidenziare le origini delle strategie di intervento settoriali adottate oggi, si ripercorrono le tappe principali che precedono la nascita della Cooperazione Italiana allo Sviluppo.

Infatti l'ambito specifico della conservazione del patrimonio culturale aveva registrato già a partire dagli anni '50, una intensa attività di scambio a livello internazionale e di vera e propria cooperazione con paesi in via di sviluppo.

Sono poi analizzati modelli settoriali di *capacity building* particolarmente efficaci e adattabili ad altre realtà geografiche e culturali, sperimentati nella Repubblica Popolare Cinese e in El Salvador. L'azione italiana in Cina ha avuto inizio nel 1988 ed è proseguita senza interruzione per venticinque anni. La creazione di centri di formazione di livello regionale prima, e successivamente di livello nazionale, ha prodotto un cambiamento profondo nell'intero paese del livello professionale degli specialisti che si occupano della conservazione del patrimonio culturale tangibile.

L'America Centrale e in particolare El Salvador rappresentano una seconda area geografica particolarmente adatta alla sperimentazione di modelli di intervento caratterizzati da evidenti collegamenti con problematiche sociali.

Tra le attività condotte in El Salvador nel quadriennio 2009-2013 dalla Cooperazione Italiana attraverso l'Istituto Italo-Latino Americano, assieme all'Università Roma Tre, alle università centroamericane e alle istituzioni nazionali competenti per i diversi settori di intervento, particolarmente rilevante è stata la realizzazione del *Seminario. Centroamericano sobre la conservación y la valorización del patrimonio cultural - CULT 2011* che ha prodotto la *Declaración de San Salvador para la potenciación de la conservación y de la tutela del patrimonio cultural Centroamericano y del turismo sostenible*, punto di partenza per una azione di sviluppo organica e condivisa a livello regionale.

### LE ORIGINI DELL'IMPEGNO ITALIANO PER LA CONSERVAZIONE DEL PATRIMONIO CULTURALE MATERIALE NEI PAESI IN VIA DI SVILUPPO.

L'attenzione che da molti decenni è rivolta all'Italia come paese di riferimento per la conservazione del patrimonio culturale trova un evidente collegamento con la ininterrotta sequenza di contributi sul piano normativo e metodologico che costituiscono una delle più ricche vicende nazionali nel campo della tutela del patrimonio culturale. Particolarmente interessante è la precoce tendenza alla collaborazione internazionale che si riscontra in questo settore e che rappresenta una chiave di lettura dell'impegno settoriale della Cooperazione Italiana allo Sviluppo fin dal momento della sua creazione.

L'azione all'estero degli specialisti italiani nel campo del restauro, quasi sempre limitata fino agli anni '40 del Novecento al restauro dei monumenti archeologici e storici con la mediazione delle missioni archeologiche attive nel Mediterraneo, si estende successivamente alla pittura e alla scultura grazie all'impegno di Cesare Brandi, noto storico dell'arte e fondatore nel 1941 dell'Istituto Centrale del Restauro. L'azione di Brandi si colloca in quel clima di cooperazione intellettuale che si era generato dopo la fine della Prima Guerra Mondiale. Lo storico dell'arte italiano assume un ruolo di primo piano nel dibattito internazionale sulla pulitura dei dipinti e sulla conservazione delle patine, scaturito nel 1947 dalla mostra *An exhibition of Cleaned Pictures* presso la National Gallery di Londra, stabilisce una forte relazione con l'UNESCO fin dal momento della sua creazione e successivamente con l'ICCROM a Roma.

Nonostante la scarsità delle risorse finanziarie e le numerose richieste di intervento sul territorio nazionale a cui l'Istituto appena rimesso in funzione dopo la fine del conflitto bellico deve far fronte con un organico assai ridotto, l'impegno all'estero voluto da Brandi è in continua crescita e rappresenterà un campo di attività fondamentale nei decenni successivi.

Aumenta la presenza di studenti e di stagisti stranieri ammessi a frequentare i corsi triennali nell'istituto romano e pertanto si crea in breve tempo una efficiente rete di collegamenti internazionali. Si costituisce una vera e propria *task force* per l'attività al di fuori dell'Italia. Molti degli interventi di successo effettuati all'estero riguarderanno la pittura murale, ambito per il quale veniva riconosciuto all'istituto romano un vero primato.

Per la realizzazione della strategia internazionale di Brandi saranno determinanti i rapporti di collaborazione con l'archeologo Doro Levi, fondatore e primo direttore della Scuola Archeologica Italiana ad Atene. Altra importante sinergia, avviata nel 1954, è quella con l'orientista e storico delle religioni Giuseppe Tucci, primo presidente dell'Istituto Italiano per il Medio ed Estremo Oriente (ISMEO) e attivo con missioni di studio in molte parti dell'Asia.

Nel 1954 Brandi e Tucci, consapevoli della necessità di migliorare urgentemente il livello degli interventi da eseguire all'estero, ipotizzano la creazione di gruppi di specialisti in grado di operare in ambiti geografici e culturali extraeuropei, ai quali viene attribuita una denominazione quasi dannunziana: le "Squadre di Restauratori Volanti" che dovevano essere formate da restauratori adeguatamente preparati attraverso un programma che comprendeva la conoscenza della lingua inglese, della storia dell'arte e della storia delle tecniche artistiche con specifico riferimento ai luoghi che sarebbero stati oggetto di intervento.

L'impegno internazionale dei restauratori di Brandi prosegue con cantieri e interventi in molte parti del mondo e nel 1958 all'Istituto Centrale del Restauro viene dedicata un'intera sala in occasione dell'Esposizione Universale di Bruxelles. Nei decenni successivi gli "ambasciatori" del restauro italiano nel mondo saranno Paolo e Laura Mora.

Nel momento in cui viene creata la Cooperazione Italiana allo Sviluppo attraverso la Legge n. 49 del 26/2/1987, l'Italia possiede istituzioni e specialisti noti all'estero e pronti a realizzare cantieri, corsi di formazione e ad esportare, con opportuni adattamenti alle diverse situazioni locali, il modello di centro di organico e interdisciplinare che era stato appunto inventato alla fine degli anni '30 da Cesare Brandi assieme ad un altro notissimo storico dell'arte: Giulio Carlo Argan.

A partire dalla fine degli anni '80 il campo specifico del restauro e della conservazione, come segmento del più ampio intervento sul patrimonio culturale nei paesi in via di sviluppo, assume una importanza sempre maggiore per la Cooperazione Italiana allo Sviluppo e si registrerà un coinvolgimento sempre maggiore del Ministero per i Beni e le Attività Culturali, delle Università, degli enti di ricerca e di istituzioni scientifiche come l'Istituto Italiano per il Medio ed Estremo Oriente (ISMEO), mutato poi nel successivo Istituto per l'Africa e l'Oriente e recentemente soppresso, e di organismi internazionali come l'ICCROM e l'Istituto Italo-Latino Americano.

## **SINTESI DELL'AZIONE DELLA COOPERAZIONE ITALIANA ALLO SVILUPPO NEL SETTORE DEL PATRIMONIO CULTURALE.**

Si ritiene utile tentare una sintesi dell'azione settoriale condotta dalla Cooperazione Italiana utilizzando dati provenienti da fonti ufficiali.

Durante i ventisei anni dalla promulgazione delle legge 49/1987 che istituiva la Cooperazione Italiana allo Sviluppo, si è registrata una complessa attività anche nel delicato settore della tutela e della conservazione del Patrimonio Culturale. Nel 1999, in occasione della Conferenza di Firenze "Culture Counts" organizzata dalla World Bank in collaborazione con l'UNESCO, erano state pubblicate dettagliate sintesi dei primi dodici anni di azione settoriale. Uno studio curato da Fabrizio Ago contiene una analisi approfondita delle strategie adottate in quella prima fase. Si riportano poi le schede relative a 52 iniziative per un impegno complessivo di Euro 30.871.000. Si sottolinea che 21 di quei progetti avevano riguardato la formazione delle professioni collegate al restauro e alla conservazione del patrimonio tangibile per un impegno complessivo di Euro 13.624.000. Tra questi particolare interesse rivestono 3 centri-scuole di restauro e conservazione (Cina, Territori Palestinesi, Giordania), 3 corsi di livello universitario post laurea (Algeria, Tunisia), corsi nei settori del restauro dei manoscritti (Egitto), dei dipinti murali (Siria), degli edifici architettonici.

Tredici anni dopo, nel 2012, la Scuola S. Anna di Pisa elaborava su incarico della Direzione Generale per la Cooperazione allo Sviluppo, le "Linee Guida della Cooperazione Italiana su Patrimonio Culturale e Sviluppo. Ben 47 pagine del documento contengono in forma di tabella la sintesi dell'attività nel settore in questione e relativa al periodo 2000-2012. Sono state censite in totale 249 iniziative con un impegno economico complessivo pari a Euro 117.404.405.

Per l'Africa sono state indicate 17 iniziative in 10 paesi (Angola, Camerun, Eritrea, Etiopia, Ghana, Mauritania, Mozambico, Repubblica Democratica del Congo, Senegal, Sud Africa), a cui si aggiungono 8 iniziative di livello regionale o continentale, con un impegno complessivo pari a Euro 15.807.767.

Per il Nord Africa e Medio Oriente sono menzionati 96 interventi in 13 paesi (Algeria, Egitto, Giordania, Iran, Iraq, Libano, Libia, Marocco, Siria, Territori Palestinesi, Tunisia, Yemen, Israele), a cui si aggiungono 2 iniziative di carattere regionale, per un impegno complessivi pari a Euro 48.879.031.

Per l'America Latina e Caraibi nel documento si indicano 39 iniziative in 13 paesi (Argentina, Bolivia, Brasile, Cile, Colombia, Cuba, Ecuador, El Salvador, Guatemala, Paraguay, Perù, Repubblica Dominicana, Uruguay) a cui si aggiungono 20 iniziative di livello regionale continentale, per un impegno complessivo pari a Euro 11.382.861.

Per l'Asia e il Pacifico, si registrano 19 iniziative in 7 paesi (Afghanistan, Cambogia, Cina, India, Laos, Pakistan, Vietnam) per un impegno complessivo pari a Euro 20.471.513.

Per l'Europa si indicano 26 iniziative in 10 paesi (Albania, Armenia, Bosnia-Herzegovina, Georgia, Kosovo, Macedonia, Serbia, Slovenia, Jugoslavia, Balcani) per un impegno complessivo pari a Euro 12.468.927. Si aggiungono 2 iniziative di livello regionale, 18 iniziative realizzate in Italia, 4 iniziative di livello globale affidate all'UNESCO per un valore complessivo pari a Euro 8.394.306.

La formazione nel campo specifico del restauro riguarda 7 iniziative realizzate in Africa e Medio Oriente, 29 iniziative in Nord Africa e Medio Oriente, 22 iniziative in America Latina e Caraibi, 6 in Asia e Pacifico e 9 in Europa.

Resoconti come quelli pubblicati nel 1999 o come l'ultimo in ordine di tempo allegato alle Linee Guida a cui si è fatto cenno sono particolarmente utili. Si suggerisce la necessità di una verifica attenta delle informazioni poiché alcuni dati economici derivanti da documenti non conclusivi della singola iniziativa, possono aver subito variazioni e ciò può rendere inesatto il computo complessivo.

## I CASI DI STUDIO

### Gli interventi in Iraq per la protezione del patrimonio Culturale dal 2003 a al 2013 dopo la fine dei conflitti

L'azione italiana a sostegno del patrimonio culturale iracheno rappresenta un evidente esempio di organicità e di buona impostazione strategica di una azione di lunga durata in un paese.

La collaborazione tra Italia e Iraq nel settore del Patrimonio Culturale inizia nel 1969, quando Giorgio Gullini, uno dei più autorevoli archeologi italiani, fonda a Baghdad l'Istituto Italo-Iracheno di Scienze Archeologiche e il Centro Italo-Iracheno per il Restauro dei Monumenti, costola del Centro Ricerche Archeologiche e Scavi di Torino. Da quel momento, fino alla fine degli anni '80, il centro torinese ha realizzato campagne di scavo e interventi nel campo del restauro dei monumenti di enorme rilevanza. Si ricorda l'attività di ricerca svolta nei siti di Seleucia e Choche, Tell Yelkhi, Tell Hassan, Nimrud, Hatra, Kifrin, Babilonia; le campagne di studio e rilievo architettonico e fotogrammetrico e le attività di progettazione, restauro e conservazione condotte a Seleucia, Aqarquf, Ctesifonte, Hatra, Ukhaidir, Anah, Mossul.

A partire dalla prima guerra del Golfo, nel 1991, era stata avviata un'azione sinergica tra il Ministero degli Affari Esteri, il Ministero per i Beni e le Attività Culturali e l'Arma dei Carabinieri, al fine di fornire alle autorità irachene un importante supporto tecnico e metodologico per la protezione del patrimonio culturale mesopotamico.

Nel 2003, con la II<sup>a</sup> guerra del Golfo, ha inizio il periodo di maggiore rischio per il patrimonio culturale del paese e da quel momento l'Italia intensifica la sua azione di sostegno attraverso piani organici di intervento in settori diversi tra i quali anche il patrimonio culturale. I fenomeni di saccheggio e di trafugamento dai musei mettono a repentaglio quel patrimonio. Il nostro Comando Carabinieri per la Tutela del Patrimonio Culturale ha realizzato pertanto un censimento dei beni trafugati dall'Iraq a partire dal 1990 e ha identificato finora ben 2969 oggetti.

Attraverso un'azione sinergica e il sostegno finanziario di alcune direzioni generali del Ministero degli Affari Esteri (DGAP (ex DGMM) – *Task Force Iraq* e DGCS – *Task Force Iraq*) vengono avviate dal 2003 al 2013 17 iniziative, con un impegno di spesa complessivo di € 10.357.831,95, articolate in 4 aree di intervento. Nella sua globalità l'intervento italiano di assistenza all'Iraq nel decennio considerato ammonta a 3,2 miliardi di euro (doni, crediti di aiuto e cancellazione del debito) per un numero totale di 124 iniziative.

Rilevante è stato l'aiuto alla risistemazione del sistema museale iracheno, a Baghdad, Nassiriya, Diwania e Najaf. Di grande rilievo è stata l'azione condotta nel Kurdistan per la cittadella di Erbil e le altre iniziative condotte nella stessa Regione.

Di particolare importanza risulta l'azione condotta nella conservazione e nel restauro. Già tra il 2003 e il 2004 venne effettuato il primo intervento di ammodernamento del laboratorio di restauro del Museo Nazionale di Baghdad. Il nuovo laboratorio venne inaugurato nel marzo 2004 e in quel momento furono avviati i primi corsi di formazione condotti da esperti dell'Istituto Superiore per la Conservazione e il Restauro, sospesi poi a metà del 2004, quando le condizioni di sicurezza nel paese non consentirono di prolungare la presenza degli specialisti italiani. La formazione venne proseguita ad Amman in Giordania, dove gli allievi iracheni, guidati dagli esperti italiani, eseguirono interventi su circa 1500 manufatti sequestrati dalla dogana giordana e contrabbandati dall'Iraq.

Successivamente le tappe più significative dell'azione di rafforzamento del settore della conservazione e del restauro sono state le seguenti:

- riallestimento del laboratorio di restauro del Museo di Baghdad (2004).
- Riapertura della Sala Assira del Museo di Baghdad (2007).
- Progettazione del recupero di tre musei provinciali di Nassiria, Diwania e Najaf (2010).
- Corsi di formazione sul restauro degli avori antichi del Museo di Baghdad (2010).
- A partire dal 2011, ulteriore rafforzamento delle dotazioni tecnico-scientifiche del Museo Nazionale di Baghdad e avvio di corsi di formazione a Nassiriya in un laboratorio allestito all'interno della ex base militare italiana di Mittica e per la parte pratica direttamente sul sito archeologico di Ur. Attivazione di un cantiere-scuola nel cosiddetto E-Nun-Mah, parte del tempio chiamato Ekishnugal, "Tempio in cui non entra la luce", dedicato al dio Luna Nannar, costruito da Ur-Namma fra il XXII e il XXI sec. a.C. e restaurato fino all'epoca di Ciro il Grande nel VI sec. a.C.
- Realizzazione a Mosul di corsi sul restauro di libri e manoscritti antichi, avori e metalli archeologici.
- Attivazione a Erbil, capitale del Kurdistan iracheno, in un centro di formazione e di intervento sui materiali archeologici realizzato dal governo americano nel 2008 (Iraqi Institute for the Conservation of Antiquities and Heritage) e consegnato al governo iracheno il 31 dicembre 2010, di corsi trimestrali sul restauro di libri e dei

manoscritti antichi, avori archeologici e metalli archeologici. Avvio parallelo, a cura dell'Università di Roma La Sapienza, di corsi sulla lingua e la filologia sumera.

- Restauro della seconda Sala Assira nel Museo di Baghdad, condotto dal Ministero per i Beni e le Attività Culturali attraverso una convenzione con il Centro Ricerche Archeologiche e Scavi di Torino.

### **Venti anni di costante attività di cooperazione con la Cina**

Fu proprio il particolare impegno italiano all'estero e il prestigio conquistato dagli specialisti italiani a spingere alla fine degli anni '80 la Repubblica Popolare Cinese a richiedere l'aiuto dell'Italia per favorire il processo di modernizzazione del restauro e della conservazione del Patrimonio Culturale.

La Direzione Generale per la Cooperazione allo Sviluppo del Ministero degli Affari Esteri italiano a partire da quel momento ha sostenuto senza interruzioni numerose iniziative in Cina in questo campo.

Tra il 1995 e il 1998 a Xi'an venne creato il Centro per la Conservazione e il Restauro del Patrimonio Storico-culturale, competente per le cinque province del nord-ovest del paese (Shaanxi, Gansu, Ningxia, Xinjiang e Qinghai) e nell'ambito di quel progetto, nell'arco di due anni di costante impegno italiano, venne formato il primo gruppo di 20 restauratori che possiamo definire moderni nell'impostazione metodologica e che provenivano da tutte le province del nord-ovest della Cina.

Le attività formative in Cina vennero sostenute da 49 docenti italiani provenienti da istituzioni e università dell'intero paese. Il corso biennale di restauro era impostato seguendo il modello interdisciplinare messo a punto presso l'Istituto Centrale del Restauro italiano e prevedeva insegnamenti di discipline storiche, scientifiche e specifiche del restauro.

Il Centro di Restauro di Xi'an divenne rapidamente un'istituzione di riferimento ed i restauratori che erano stati formati intrapresero una intensa attività professionale, ricoprendo ruoli importanti nelle istituzioni a cui appartenevano ed attivando essi stessi iniziative di formazione.

Le autorità della State Administration of Cultural Heritage di Beijing nel 1998 richiesero pertanto all'Italia di proseguire l'azione di sostegno nella formazione dei restauratori attraverso un'intervento di potenziamento delle capacità formative del China National Institute of Cultural Property (CNICP).

Si trattava di un'occasione davvero speciale, attraverso la quale venivano coronati gli sforzi di anni ed anni di lavoro che un numerosissimo gruppo di specialisti dei due paesi avevano portato avanti con coraggio e determinazione. Il Centro veniva inaugurato il 9 febbraio del 2004 ed in breve tempo diventava il polo centrale di riferimento del settore per l'intera Cina (Figg. 1-3). Anche questa iniziativa veniva affidata all'ISIAO che si avvaleva degli specialisti provenienti dall'Istituto Centrale per il Restauro e da numerose università italiane.

Rispetto ad altre possibili strategie formative si scelse di innalzare il livello professionale di operatori già in servizio presso musei e istituti di ricerca attivi nel comparto dei Beni Culturali, dipendenti dalla State Administration of Cultural Heritage centrale o dagli uffici periferici dislocati nelle diverse province della Repubblica Popolare Cinese. In tal modo è stato assicurato un effetto tangibile in un territorio di così grande vastità ed è stato innescato un fenomeno di sviluppo a catena nell'ambito della generale modernizzazione del settore.

La principale conquista conseguita dai nuovi restauratori cinesi formati grazie al sostegno italiano fu aver capito che il restauro non è un'operazione meccanica ma al contrario rappresenta un momento metodologico che richiede un'analisi critica attenta.

Dal 2003 al 2010 sono stati formati nel Centro di Pechino oltre 700 allievi, di cui oltre 80 stranieri, I giovani cinesi che sono stati formati oggi sono divenuti affermati specialisti attivi nei musei dell'intero paese e costituiscono un autentico network del restauro (Tav. 1).

### **El Salvador e la Regione Centroamericana**

In America Centrale sono state recentemente realizzate due iniziative di valore metodologico: l'avvio di un processo di rafforzamento nel settore del restauro del patrimonio materiale a livello di paese (in El Salvador, elevata priorità per la Cooperazione Italiana), e l'innescamento di un processo di sviluppo dell'intero settore del patrimonio a livello regionale.

### **Creazione del Centro de Capacitación para la restauración, conservación y promoción del patrimonio cultural en El Salvador**

Negli anni 2009-2012 in El Salvador è stato creato il *Centro de capacitación para la restauración, conservación y promoción del patrimonio cultural*, cofinanziato dalla Cooperazione Italiana allo Sviluppo e realizzato dall'ILA con l'apporto della Secretaría de Cultura de la Presidencia, della Alcaldía di Izalco e della Universidad El Salvador.

Il Centro è oggi l'infrastruttura specialistica più moderna e attrezzata dell'intera regione centroamericana e El Salvador è divenuto il paese di riferimento per quanto riguarda la conservazione e il restauro.

Il centro è composto di due sezioni: la prima specializzata nel restauro di manufatti archeologici in ceramica (Museo Nazionale di Antropologia "David J. Guzmán"); la seconda, specializzata nella conservazione delle sculture policrome, è installata in un nuovo padiglione realizzato con il contributo economico della Municipalità di Izalco

all'interno dell'area occupata dalla *Casa de los Barrientos* (Figg. 4-5).

Nel 2009, presso la Scuola di Architettura dell'Università di El Salvador, sono stati organizzati due corsi di specializzazione nei settori del restauro urbano e del restauro architettonico. Negli anni 2011 e 2012 sono stati formati 18 specialisti in restauro e conservazione di manufatti archeologici e di opere d'arte in legno policromo. Elemento determinante per il raggiungimento del risultato atteso è stato lo studio approfondito del contesto e delle istituzioni che ha consentito la identificazione delle risorse umane da utilizzare all'interno di un sistema organizzato e ciò ha consentito di ridurre notevolmente l'apporto degli esperti espatriati.

### **Il Seminario Centroamericano sobre la valorización y la conservación del patrimonio cultural CULT 2011 verso azioni di sviluppo a livello regionale**

Il tema del dialogo interculturale sta diventando sempre più un elemento qualificante e determinante all'interno dei rapporti diplomatici bilaterali e multilaterali.

Tale fenomeno è diventato un nodo centrale nelle agende politiche nazionali e internazionali ad ogni livello di estensione geografica, dal locale al globale.

L'evoluzione dei sistemi sociali da una parte e delle strutture produttive e dei servizi dall'altra rende necessario ripensare la cultura non solo come valore in sé, ma come fattore integrante dei processi di sviluppo economico e sociale.

La crisi economica globale attuale induce a ripensare le strategie di sviluppo settoriale che ciascun paese adotta e rende indispensabile la messa a punto di piani di crescita condivisi tra i diversi paesi che formano regioni geografiche caratterizzate da vicende storiche fortemente connesse e da netti legami in generale sul piano culturale.

Ciò è particolarmente riferibile alla Regione Centroamericana, fortemente caratterizzata da una ricchezza di esperienze storiche fondamentali e di differenti interazioni socio-culturali, e attualmente al centro di dinamiche sociali e politiche in costante fermento.

Il Centroamerica appare pertanto come un "laboratorio" ideale per la sperimentazione di interventi atti a stimolare processi di crescita di carattere regionale che conducono ad una necessaria ottimizzazione delle risorse e potenziano l'integrazione tra i singoli paesi con effetti moltiplicatori sul piano sociale ed economico.

Questo era l'obiettivo del Seminario *Centroamericano sobre la valorización y la conservación del patrimonio cultural CULT 2011* che si è tenuto in Antigua (Guatemala) e a San Salvador (El Salvador) dal 9 al 13 del mese di maggio 2011. Il Seminario, promosso dalla Cooperazione Italiana allo Sviluppo, è stato realizzato dall'Istituto Italo-Latino Americano.

Le delegazioni dei paesi partecipanti e dei paesi osservatori erano composte da esperti e da funzionari che rappresentavano le principali istituzioni settoriali. Italia e Cuba hanno svolto il ruolo di paesi osservatori.

A ciascuno dei sei paesi centroamericani è stato affidato il coordinamento di una delle seguenti sessioni tematiche:

- recupero e riqualificazione dei centri storici (coordinamento: Guatemala);
- valorizzazione e turismo sostenibile (coordinamento: Nicaragua);
- i rischi: calamità naturali e fattori antropici (coordinamento: Panama);
- restauro, conservazione e rafforzamento istituzionale (coordinamento: El Salvador);
- sviluppo dei musei e dei siti archeologici (coordinamento: Costa Rica);
- catalogazione e lotta al traffico illecito (coordinamento: Honduras).

La *Declaración de San Salvador para la potenciación de la conservación y de la tutela del patrimonio cultural centroamericano y del turismo sostenible*, siglata al termine del Seminario, contiene gli elementi che caratterizzano il quadro specifico a livello regionale e le linee strategiche da seguire.

### **RIFLESSIONI CONCLUSIVE SULLE INIZIATIVE DI COOPERAZIONE COLLEGATE CON LA CONSERVAZIONE E IL RESTAURO DEL PATRIMONIO CULTURALE TANGIBILE**

La formazione dei restauratori, *punto focale e caratterizzante* della strategia italiana più recente, deve essere collegata a componenti più ampie di *sostegno istituzionale*, deve essere cioè indirizzata a rendere autonome le istituzioni del Paese beneficiario, privilegiando la modalità della *formazione di formatori* e gli aspetti organizzativi/gestionali delle strutture di riferimento.

Le esperienze condotte su campo e l'osservazione attenta dell'intera strategia adottata dall'Italia in questo delicato settore, consentono di sottolineare alcuni elementi fondamentali e imprescindibili che condizionano il successo di questa speciale categoria di iniziative.

- a. Realizzazione, durante la fase di identificazione e di formulazione del progetto, di una indagine accurata, non limitata al presente, ma estesa alla storia recente del paese beneficiario e che consideri:
  - il quadro istituzionale settoriale;
  - il quadro legislativo;
  - la consistenza del patrimonio culturale sul territorio;

- le istituzioni a cui è affidata la gestione del patrimonio culturale, sia a livello centrale, sia a livello periferico;
- il livello professionale e scientifico degli operatori.

Tale analisi permette di evidenziare le criticità che caratterizzano il contesto settoriale generale che sarà oggetto dell'intervento e rendono possibile la definizione degli obiettivi specifici e della strategia di intervento.

- b. Definizione della strategia generale e del piano operativo congiuntamente con la controparte al fine di favorire il processo di appropriazione e di condivisione.
- c. Definizione attenta delle componenti tecnologiche (attrezzature e apparecchiature di laboratorio). Dovrebbero essere evitate iniziative che prevedono la fornitura di attrezzature senza o con scarsa attività di formazione.
- d. Co-gestione dell'iniziativa per tutto la sua durata.
- e. Durata dell'intervento. La durata standard dei progetti è di 1, 2 o al massimo 3 anni. Affinché possano crearsi le condizioni per una appropriazione completa e il raggiungimento di una autonomia da parte del beneficiario sono necessari tempi ben più lunghi e fasi successive, caratterizzate da un impegno sempre più ridotto del paese donatore.

Riflessione conclusiva: le iniziative di cooperazione in tempo di crisi economica devono essere attentamente progettate con speciale cura verso l'ottimizzazione delle risorse.

# A BETTER KNOWLEDGE FOR A BETTER COOPERATION: THE CONTRIBUTION OF HUMAN SCIENCES FOR AN INTERCULTURAL COOPERATION TO DEVELOPMENT

Ilaria Micheli\* Mauro Tosco\*\*

\*University of Trieste, Italy - [imicheli@units.it](mailto:imicheli@units.it)

\*\*University of Turin, Italy - [mauro.tosco@unito.it](mailto:mauro.tosco@unito.it)

The panel aimed at bringing together researchers in human sciences who share an attentive eye to the specific import of local cultures, knowledge and tradition in the activities subsumed under the collective, and often too vague, concept of cooperation to development.

Our basic idea was that a good preventive analysis of the field, of the human groups living and interacting (and sometimes coming into conflicts) in it, of their specific cultures and languages (often widely divergent among themselves) – chiefly in the poorest areas of the countries in the South of the World – represents a priority in the planning of cooperation projects that aim at efficiency either in terms of empowerment or of assumption of responsibility and management by the local partners. We believe that achieving these aims could bring a better stability of the partnership and a better time continuity in the sustainable-development projects proposed and initiated by international partners.

These ideas derive of course from our direct field experience, and we think that they are – sometimes tacitly – shared nowadays among practitioners in cooperation and development. They are widely echoed in projects in such different fields as, to mention just a few, eco-farming, sustainable tourism and cultural and linguistic revitalization. Here and elsewhere the vision lying behind these projects and inspiring them has enabled, we dare say, a considerable level of success. It is a vision which stresses the enormous value of the specific cultures and traditions of the local people(s) in a perspective which can be labelled a *dynamic safeguard of the past*, and whose actual and final aim is to assure the safeguard of the traditional heritage of the communities involved or in any way interested in the project. As an additional – but far from secondary – bonus, these communities could therefore more spontaneously and confidentially join the project and accept the new perspective of eco-compatible growth promoted by the investors.

These ideas were developed and conjugated during the panel in such different areas as: ethnicity and their political exploitation (Fontana), language and educational policy (Manfredi and Tosco), agro-forestral cooperation among marginalized peoples (Micheli), the archaeological data on ancient farming systems with an eye to facilitate the design of future strategies for sustainable land-use (Sernicola), or, finally, socio-technical innovations and the collective participation of the community (Silvestri).

The proceedings put together all the contributions presented and thoroughly discussed at CUCSTorino2013, and namely, in alphabetical order:

- Lorenza Belinda Fontana: *The power of ethnic labeling: the role of international cooperation and academic community in shaping the new indigenous movement in Bolivia*
- Stefano Manfredi and Mauro Tosco: *Language uses vs. language policy: South Sudan and Juba Arabic in the post-independence era*
- Ilaria Micheli: *Safeguarding the past to guarantee a better future: the role of ethnolinguistics in the NECOFA projects among the Mariashoni Okiek community*
- Luisa Sernicola: *Strategies of land exploitation and management in the area of Aksum (Northern Ethiopia) between the 1<sup>st</sup> millennium BC and the 1<sup>st</sup> millennium AD*
- Federico Silvestri: *The case of Zimbabwe Bushpump like a socio-technical network*

We offer them in the hope that they may raise consciousness on the – in our view, fundamental – role of human sciences in cooperation.

## THE POWER OF ETHNIC LABELLING: THE ROLE OF INTERNATIONAL COOPERATION AND ACADEMIC COMMUNITY IN SHAPING THE NEW INDIGENOUS MOVEMENT IN BOLIVIA

Lorenza Belinda Fontana\*

### ABSTRACT

Since the electoral victory of the Aymara coca growers' leader Evo Morales in 2005, Bolivia has been undergoing a phase of political transition. One of the most important element within this process is the consolidation of a new discourse around the 'indigenous' that led to key instructional reforms inspired by the so-called 'identity politics'. This phenomenon cannot be fully understood without considering the role, over the last three decades, of external actors, including the international cooperation and the academic community, and their active support to the emerging indigenous movements as well as to the process of legislative reform. This paper will propose a critical perspective on normative paradigms inspired by the 'politics of recognition', through the presentation of two case-studies: the role played by the Danish cooperation in funding the titling of collective indigenous land, and the foundation of a native organization among aymara and uru communities, under the guidance and advice of a group of anthropologists.

*As policymakers, practitioners and researchers, we use 'frames' and 'labels' to help our analysis and to describe to others what we do (...) While they may be efficient, such labeling processes are also dynamic and political. Therefore they can produce unintended, and sometimes, unwelcome consequences. For example, labeling may shift – or sustain - power relations in ways that trigger social dislocation and prejudice efforts to achieve greater equality (IDS, 2006)*

### INTRODUCTION

Since the election of President Evo Morales in 2005, Bolivia has been undergoing a phase of political transition. This process undoubtedly constituted a breakthrough in contemporary Bolivian politics, especially for the sudden and massive inclusion of rural and popular sectors in the national political arena. However, the elements of continuity with the previous three decades are as well significant. One of the most important is the consolidation of a new discourse around the 'indigenous' that led to key instructional reforms inspired by the so-called 'identity politics'.<sup>1</sup> Indeed, with the end of the long cycle of military *golpes*, Bolivia has become a laboratory for testing of the political use of recognition. In this framework, the indigenous movements took a new shape, and developed discursive categories that had a strong cultural and ethnic connotation, starting as well to claim for the demarcation of their ancestral territories [1].

This phase of revitalization of indigenous identities and claims stands in opposition with the trend that dominated during the period between the national revolution of 1952 and the end of the dictatorial period in 1982. In this phase, the Bolivian post-revolutionary governments put in practice a systematic project of 'transformation' of indigenous into peasants. In the 1950s and 1960s, a process of massive *campesinization* imposed the peasant union as a new dominant form of rural organization. At the same time, the affirmation of the *mestizaje* ideology promoted class-based identities instead of ethnic-based indigenous identities as collective mechanisms of self-identification [2]. As a result, in the following 30 years, the very notion of citizenship in the rural world overlapped with the belonging to a peasant union [3]. However, these efforts didn't lead to the disappearance of the ethnic issue for complete. One of the main reasons is the historical and sociological relevance of ethnicity, not only, as it is often emphasized, in the pre-colonial epoch, but also as essential part of the way in which the Bolivian, and more in general Latin American states, were constituted over the last two centuries (what Paula Lopez Caballero, called the *régimes national d'altérité* [4]).

Between the 1970s and the 1990s, new highly politicized social organizations emerged, moved by a strong ethno-

<sup>1</sup> This is true at least during the first phase of *Movimiento al Socialismo* (MAS)'s government, until the approval of the new Constitution (January 2009) and Morales' reelection in 2010. In the second and current political phase, the relation with the indigenous sectors became tenser. The breakthrough was marked mainly by the conflict around the *Territorio Indígena Parque Isiboro Sécuré* (TIPNIS), where an indigenous-ecologist coalition was formed to mobilize against the State's project of contracting a road throughout the natural park and indigenous territory.

cultural identity and agenda, bringing the ‘indigenous issue’ back into the Bolivian public scene. Similar phenomena occurred at the same time in other Latin American contexts, pushed by socio-economic transformations within rural groups, changes in the political contexts as well as by a new international sensibility *vis a vis* this issue and the rise of a specific and unique legal framework. The latter was based on some striking assumptions, namely: that the issues regarding the treatment of ethno-cultural diversity had become “matters of legitimate international concern and consequently do not constitute exclusively an affair of the respective state” [5]. And that the indigenous issue, which has always had a unique standing within international law [6], had to be addressed through a series of special measures, which in principle constituted exceptions to the post-war set of international rules regarding ethno-cultural minorities. In particular: the recognition of land claims, language rights and customary law and their aspirations “to exercise control over their own institutions” [7].

The new dimension and strategic importance acquired by ethnicity and indigenous movements in Bolivia cannot be fully understood without considering the role of external actors. Under the influence of the international debate on multiculturalism, and of a wave of intellectual fascination towards indigenous issues, a multiplication of cooperation programs took place and a number of *ad hoc* organizations, often run by academics, with an ethno-developmentist focus emerged. In particular, international cooperation and the academics play an active role both in providing funds and advice to the emerging indigenous groups as well as in supporting national institutions in the generation of a new policy framework to address ethnic diversity. However, the operationalization of the differences between social groups through the introduction of ethnic labeling (as criteria of self-identification and of policy design) proved to be an extremely complicated task and entails both epistemological and operational challenges.

This paper will propose a theoretical perspective on normative paradigms inspired by the politics of recognition as well as an analysis of two case-studies drawn from Bolivian recent history. In particular, it will focus on the role of both cooperation agencies and academic community in ‘shaping’ the new indigenous movements as a relevant political subject. This fact was at the bases of both a pluralizing and more inclusive political transition as well as of new tensions between rural (peasant and indigenous) organizations.

## THE RISE OF NEOINDIGENISM AND THE ROLE OF EXTERNAL ACTORS

Although the 1960s and 1970s marked the rise of an intellectual stream – the *Katarism* – with deep ethno-cultural bases and of a political movement able to incorporate this discourse and bring it to the national stage, the ethno-cultural issue did not manage to reach a relevant position in the political agenda. It was in the 1980s that the historical situation of identitarian plurality and related problems of exclusion and discrimination (in the economic as well as in the political and cultural domains) was revitalized as discursive base of a new intellectual and academic current, able to give birth to its own political and social platform. To affirm itself, this movement had to develop new categories that, on the one side, were rooted on a strong cultural and ethnic base around the concept of ‘indigenous’, but, differently from *Katarism*, took distance from the syndical corporatist organization. Through a radicalization of the ‘indigenous’, it looked for the affirmation of new social and political subjects – the indigenous peoples –, through the consecration of cultural differences as fundamental lines of social differentiation. Moreover, this movement started to formulate specific territorial claims, arguing that the process of identitarian recognition should be accompanied by land titling and demarcation. In the following years, the indigenous identity became one of the most important factors of political shaping and, with the passing of time, would play a key role as mechanism of social aggregation with high potentialities in term of mobilization and antagonism.

During the 1990s, at the national level, a new political doctrine, generally referred to as ‘neoindigenism’<sup>2</sup> [9] started to emerge, which marked a breakthrough with respect to the assimilationist model that prevailed in the previous decades. Bolivia shared this process with other Latin American countries, where, in the same period, new constitutional and legislative reforms were implemented, which recognized the pluriethnic and multicultural character of national societies. These reforms entail a change of perspective in symbolic terms, but also a concrete turning point generated by the institutionalization of new rules to regulate the recognition of diversity through the positive right. This process, considering both its top-down and bottom-up mechanisms, was highly influenced by the international community (academics and practitioners)<sup>3</sup>.

From the 1970s, in Latin America and mainly in the Andean region, a number of anthropologists and ethno-historians, influenced by the work of John Murra, started to highlight the specificities of indigenous communities in past and present times, privileging ethnic over classist categories [11]. At the end of the 1970s, two meetings were organized in the Barbados islands, where, for the first time, a concern was expressed about the need, not only of studying, but also of assuming a concrete compromise to support the emancipation and the development of indigenous

---

<sup>2</sup> I define this phenomenon ‘neoindigenism’ to distinguish it from indigenism (*indigenismo*), an ideology that spread in many Latin American countries in the first half of the XX century as an “essential aspect of the ideology of national ethnogenesis, the creation of a new national identity based on the *mestizo*” [8].

<sup>3</sup> The role of NGOs and foreign intellectuals in Bolivia and particularly within social movements is not completely new. An example is constituted by the interrelations between *Katarism*, the theology of liberation and some NGOs with international support such as CIPCA. In this sense, key figures are the Catalan Jesuit and intellectual Xavier Albó and the sociologist Javier Hurtado [10].

peoples, through the strengthening of their rights and of their cultural and ethnic identities. In Bolivia, the German anthropologist Jürgen Riester, expert in lowland and Amazonian indigenous groups, decided to support a process of indigenous revitalization. In 1978, he obtained international cooperation's funds to build a shelter called *Casa del Campesino* for the Ayoreos<sup>4</sup> that migrated to the city of Santa Cruz de la Sierra and that lived in condition of poverty and marginalization. In 1980, Riester together with other colleagues, founded the NGO Support *Apoyo Para el Campesino Indígena del Oriente Boliviano* (APCOB), which received funds from the Danish cooperation (DANIDA) and the NGOs Hivos, Oxfam America and Cultural Survival, to bring about long-term projects that linked development programs with institutional strengthening. From that moment, lowland indigenous groups started to be politically structured and, in 1982, the *Central Indígena del Oriente Boliviano* (CIDOB), that later on changed its name in *Confederación de Pueblos Indígenas de Bolivia*, was founded. This organization became one of the main social actors of the lowlands and played a key role within national politics, proposing an innovative project of state reform and putting forward the issue of indigenous rights [12]. At the beginning, this fact generated tensions with other organizations that worked in the area, such as the *Centro de Investigación y Promoción del Campesinado* (CIPCA), which still followed a classist paradigm of development, working with the peasant unions of the *Confederación Unica de Trabajadores Campesinos de Bolivia* (CSUTCB), and considering the traditional organizations – especially the Guaraní traditional authorities, the *capitanias* – corrupted and involved in the exploitation of the population, especially in the sugarcane harvest.<sup>5</sup> However, in a few years, ABCOB and CIDOB became one of the most important receptors of international funding.

Contemporaneously, in the western part of the country, similar experiences of symbiosis between academic and development cooperation sectors took place, which started to implement projects of what was defined 'transnational ethno-development' or 'development with identity' [13]<sup>6</sup>. The most important was the *Taller de historia oral andiana* (THOA) created in 1983 in La Paz with the support of Oxfam America. This project developed researches on the indianist movement between 1869 and 1950, with the explicit aim to promote a policy of strengthening of indigenous history, culture and identity in the highlands [15]. The results served as discursive bases for the legitimation of a movement of 'reconstruction of the *ayllus*'.<sup>7</sup> The relationship of this initiative with the peasant unions was obviously tense, especially because an implicit critic was addressed to the syndical organization, accused to be a 'continuation of colonialism' [17]. In 1988, another linked transnational coalitions financed the creation of some federations of *ayllus* in the departments of Norte Potosí and Oruro [18], as will be described more in details in the forth section.

A second example of transnationally rooted ethno-development was the *Proyecto de Autodesarrollo Campesino* (PAC) started in the Oruro department in 1988 and sponsored by the European Union. In this case, 21 million dollars were invested to finance micro-projects with the aim to improve the small scale agricultural and livestock production [19]. The selected stakeholder for the program was the organization of the *ayllus* and its native authorities, which were thus legitimated to the detriment of local syndical leaders. Mainly thanks to these projects, at the end of 1989, three sub-departmental federations of *ayllus* existed, which promoted an alternative development and organizational model on an ethnic basis. As a culmination of this process, in March 1997 in Ch'allapata, the *Consejo Nacional of Ayllus y Markas del Qullasuyu* (CONAMAQ) was founded and consecrated as the "national authority of the Aymaras, Quechuas and Urus" [20]. In the first stage, this organization made great efforts to differentiate itself from its natural competitor – the CSUTCB – though an ethnic-based discourse that emphasized the 'genuineness' of this movement as expression of an 'original' Andean peoples' identity [21]. The key concept in this sense was the 'nativeness', which allowed this organization not only to take distance from the peasants, but also from the indigenous of the East, and to build thus its own identitarian boundaries. Here are some examples of this kind of discourse:

We are native. We are neither indigenous, nor peasants. Whoever could be peasant! Ruben Costas<sup>8</sup> could be peasant, since he has its own ranching activity. We didn't come from another country, but we are native, legitimated owners of our land and territory. (...) In the highlands there are no peasants. They call us peasants, but we are not. We are native. We are native nations.<sup>9</sup>

How could one say that the peasants, the syndicates are pre-existent to the colony? This is a serious matter. (...) In the past, they call us 'indians', 'aboriginal', 'ethnic group'. These concepts were rejected, buried, and new ones are rising to reach the true meaning. We are not indigenous, we are native.<sup>10</sup>

<sup>4</sup> An indigenous group of the Amazon.

<sup>5</sup> Interview with a former officer of APCOB, Santa Cruz de la Sierra, 22.8.2010.

<sup>6</sup> Guillaume Boccara and Paola Bolados studied similar processes in Chile, focusing in particular on ethno-development policies implemented by state or para-state institutions (ethno-government) with the aim to strengthen partnerships with indigenous communities, to hold them accountable and seek, following the World Bank's motto to 'help them helping themselves'. This and other works of Boccara aim to describe ethno-developmentism as the point of juncture between the capitalist, neoliberal market and cultural diversity [14].

<sup>7</sup> The *ayllu* is a form of extended familiar community originally from the Andean region, which work the land in a collective form in the framework of a commonly owned territory. In its origin, the *ayllu* was a territorial unity that gathered a lineage of related families, belonging to segmented and dual hierarchies, with different geographical scale and complexity [16].

<sup>8</sup> One of the most important leaders of the regionalist movement of Santa Cruz de la Sierra.

<sup>9</sup> Interview with a Jiliri Apu Mallku, most important authority of CONAMAQ, La Paz, 5.8.2010.

<sup>10</sup> Interview with an advisor of the CONAMAQ, La Paz, 5.8.2010.

Meanwhile, CONAMAQ started a 'proselytism campaign' in the highlands trying to 'convert' rural communities to the *ayllus*' cause through a discourse based on a shared historical memory and pre-colonial identity. Reinterpreting the anti-colonialist principles of the indigenous movement's ideology, the *ayllu*'s activists presented their organization and the native authorities as 'more indigenous' (in term of authenticity) and with more potential (in terms of development), rapidly creating a powerful rival movement for the peasant organizations of the highlands.<sup>11</sup> Nevertheless, CONAMAQ did not manage to replace the peasant union that, on the contrary, imposed itself in the national scene leading important social mobilizations after 2000. A multifaceted relationship was thus established between the two organizations that has been at the origin of a complex and fragmented socio-political scenario until today.

International cooperation agencies and anthropologists also played a key role in influencing the process of institutional reforms that underpinned this 'indigenous rise'. In the 90s, two reforms made by neoliberal governments contributed to change the rural identity-building process, and in particular to modify the political space around indigenous peoples: (1) The Popular Participation Law that, in 1995, introduced mechanisms of devolution of power and a formal distinction classifying communities as indigenous or peasant; (2) The Law of the National Institute of the Agrarian Reform (*Ley del Instituto Nacional de la Reforma Agraria*, INRA) of 1996 that legalized the Native Communitarian Lands (*Tierras Comunitarias de Origen*, TCOs), i.e. vast territorial areas assigned on an ethnic bases. Although the indigenous issues *per se* were not of particular interest to a wider electorate and not even to the vast majority of people who might be described as indigenous [23], these reforms triggered a process of political ethnicization [24], which, despite the explicit aim to deepen country's democracy, ended up generating a certain degree of fragmentation and the rise of particular, rather than national, identities. In fact, this process benefited geographically concentrated social movements, whether regionalist or ethnically rooted [25]. As Manuel Centellas wrote, "ironically Bolivia became politically unstable after reforms that improved the political system's representativeness and embraced multiculturalism" [26]. These legislative initiatives of the neoliberal governments benefited in their implementation by the fundamental support of the international cooperation, especially North European. One of the most interesting cases is the support of the Danish cooperation agency (DANIDA) to the process of titling of indigenous territories.

## DANIDA AND THE INDIGENOUS LAND TITLING

In Bolivia, one of the most important and effective indigenous-related cooperation programs in terms of impact was the DANIDA's program *Support to the Rights of Indigenous Peoples*, whose aim was to generate a "growing recognition and implementation of the rights of indigenous peoples, in combination with the active and democratic participation of the indigenous population in an economic and political development process" [27]. In concrete terms, the program, which developed along 15 years from 1995 to 2010, provided support and advice to the Bolivian state to implement the TCOs' titling, the process of decentralization and popular participation, the bilingual education in the lowlands, and the sustainable management of natural resources in the TCOs. All in all, it was an effort of mainstreaming of the indigenous issue in the design of development programs and public policies. However, reading the program's systematization documents, it often emerges a simplistic vision of the indigenous issue. Moreover, although there is a recognition of the strategic role of social movements in the generation of tensions over land tenure, the focus rests mainly on the vertical conflictive axes (*latifundio* vs. indigenous), neglecting the multiple horizontal conflictive axes (between social organizations).

Despite these problems, the Danish cooperation has considered its strategy of support to Bolivian indigenous peoples as one of its most successful programs, as it is clearly stated in the final report. A similar opinion has a Danish Embassy's officer that was in charge of the program for four years:

This program has been one of the most successful I have ever seen, since it was well formulated and it led to interesting results. In terms of land, 11 million hectares were titled, which correspond to the 70 or 80% of what has been titled for indigenous peoples.<sup>12</sup> It was not only a titling process but an empowerment process of these peoples.<sup>13</sup>

Clearly, the effects on identity-building processes and the positive discrimination criteria introduced in favor of the indigenous were not only well known, but explicitly incentivized.

A different and more critical opinion on the role of the international cooperation in the process of ethnic identities' revitalization is the one of a former officer of the Viceministry of Indigenous Issues:

<sup>11</sup> For a recent study of the fights between *ayllus* and peasant organizations in the Norte Potosí see Le Gouill, 2011 [22]. Focusing on permanent organizational tensions around the construction of identities and the definition of regional spaces of power, this article shows how the rise of the MAS at the national level triggered a process of reconfiguration and generates new forms of ethnicized political representations whose goal is the management of economic and natural resources based on a rather developmentist vision.

<sup>12</sup> During the first 10 years of implementation, the international funding contributed to cover the 67% of the total costs for the TCOs' titling process. Moreover, until December 2009, 135 TCOs were titled thanks to the support of DANIDA [28].

<sup>13</sup> Interview with a Project Manager of DANIDA, La Paz, 11.6.2011.

There are cooperation agencies that expressly supported exclusively indigenous peoples, and not the peasant sector, because they thought that, from the 169 ILO Convention, the logic of indigenous peoples was different and that it had been made invisible. This fact has been contributing to the resurgence of certain identities and to the empowerment of others. (...) In fact, distortions introduced by the international cooperation's funds generated conflicts, since it is true that there are cooperation agencies that only sponsor indigenous, and not peasants.<sup>14</sup>

Another important element that the interviewee mentioned is that the civil society's stakeholders of this kind of programs were mainly indigenous organizations – i.e. CONAMAQ and CIDOB – while CSUTCB, for its syndical nature, was not taken into consideration, ignoring thus, and in the long term probably contributing to weaken, its original indianist stream. According to the Danish Embassy's officer, the stakeholders' selection was made according to a criteria of 'most representativeness' in ethnic terms: "It was considered that CONAMAQ and CIDOB were the most representative within the indigenous world, the most organized and with national representation".<sup>15</sup> However, these decisions generated much critics and discontent within peasant organizations, which accused the international actors to benefit a social group to the detriment of another one. I quote here an example:

The cooperation is the empire and we are puppets that say what the cooperation wants us to say. The cooperation makes the agenda. Since there is money, invitations, good hotels, flight tickets, they buy interlocutors, ventriloquists. All the money that comes from Finland, Norway, Denmark, comes to destroy syndicalism, Marxism. Supposedly, they think they come to destroy communism. Who are the communists? Syndicates! Who should they support? The neutral, those that are not going to make any problem, the *carriñosos* [affectionate people]. And who are they? Indigenous and CONAMAQ (...).<sup>16</sup>

## ANTHROPOLOGISTS AND THE CREATION OF A NEW INDIGENOUS ORGANIZATION IN ORURO

Among the generation of young anthropologists that, in the 1970s and 1980s, started to get involved with indigenous communities carrying out an intense ethnographic and political work of historical reconstruction and memories collection, one of the most relevant and influential works was carried out by the *Antropólogos del Sur Andino* (ASUR) in the altiplanic department of Oruro. In the mid-1980s, they conducted an ethnographic research to trace back the historical trajectory of the 'ethnic unit' of the actual Quillacas community. The results of this study – entitled 'From aymara kingdoms to communities'<sup>17</sup> – had important and unexpected consequences in the local debate on the organizational fragmentation that the region was experiencing, eventually inspiring the conformation of a new explicitly native (*originaria*) organization called *Federation de Ayllus del Sur de Oruro* (FASOR). This organization and territorial unit, which coincided with the ethnic regional demarcation of the XVI century, was intended as a way of unifying the ancestral territory, consolidate a common ethnic identity and cohesively negotiate with the state and international NGOs operating in the region through important programs of local development.

FASOR was formally constituted in 1989 during a meeting of the traditional authorities of the *ayllus* of Southern Oruro, whose primary goal was to analyze the intervention and impact of NGOs and national development programs in the region. The anthropologies played a key role in supporting the organization of the event and in gathering funding (from the Swiss cooperation agency SDC) to sponsor it. During the meeting, the historical study was presented and, at least according to its authors [30], had a significant impact in influencing the minds of local authorities. On the one side, it generated a sense of urgency on the need to resolve problems of poverty and exclusion in the region and, on the other side, it rescued a long-term tradition as a basis for the reconstruction of a unifying political entity of the *ayllus* to contrast fragmentation. A decision was made to create a new organization, and, at the moment of defining its name, the authorities explicitly asked for the advice of one of the anthropologists present at the meeting, Ramiro Molina Rivera. As he reported in a later book, in his intervention, he emphasized the indigenous past and memory as the elements that articulated these communities in the past and that could serve as catalyzing forces against fragmentation still in those days. The opinion of external actors was greatly considered by local authorities. Answering to some leaders who feared racist reactions and prejudices around indigenous categories, an authority of the community of Pampa Aullagas said:

True, the Bolivians are so afraid to speak the Aymara language, the same happens with the Quechua, but foreigner people, the *gringos*, appreciate our language, while Bolivians say *indios*. On the contrary, we should be proud of our language. Therefore I agree to put the name of *ayllu* [31].

The creation of FESOR was the first step towards the rise of a new national native organization in the highlands. Two years later, the same group of anthropologists of ASUR was part of the creation of a similar federation of *ayllus* in

<sup>14</sup> Interview with a former officer of the Viceministry of Indigenous Issues, La Paz, 5.8.2010.

<sup>15</sup> Interview with a Project Manager of DANIDA, cit.

<sup>16</sup> Interview with an advisor of the Bartolinas, Santa Cruz de la Sierra, 19.8.2010.

<sup>17</sup> The research, coordinated by Rossana Barragán, was published in the book of Ramiro Molina Rivero (2006) [29].

the Norte Potosí region. There, a project was put in place with the aim of conducting a process of consultation with the *ayllus* on the Popular Participation Law. The hidden aim was the consolidation of a new native organization. The project was funded by the German cooperation agency. In this context, the resistance of the peasant unions was much stronger and started to feed and reactivate long-term conflicts. This was an unintended consequence for the anthropologists who participated in the process, since their idea was to create an integrated system *ayllu-union*<sup>18</sup>. However, the peasants strongly refused this option.

The culmination of this process was the foundation, in 1997, of CONAMAQ, as national organization of representation of the native peoples of the highlands. This organization played a key role in the mobilizations and ‘social wars’ (the water and gas conflicts in Cochabamba and El Alto) during the early 2000, was one of the main allies of Morales’ fist government, a crucial actor in the Constituent Assembly and still holds an important, although more critical, role in Bolivian national politics. In the words of one of the anthropologists that were part of this process, the rise of the native movement in the highlands was not endogenously driven, but rather the result of a symbiotic interaction between three main actors: local communities, anthropologists and cooperation agencies:

The very idea of indigenism and the new social movements does not arise only from their own conception and strength. It arises symbolically from non-indigenous intellectuals and mainly anthropologists and historians, some sociologists, and from the cooperation. (...) That creates a whole continental movement during the 80s. The same three axes generated the international conjuncture: indigenous leaders that started to articulate, supported by NGOs and cooperation, and anthropologists.<sup>19</sup>

Tellingly, some members of this group of anthropologists were, in the 1990s, part of the neoliberal governments, actively advocating for the incorporation of the international framework on the rights of indigenous peoples within Bolivian laws and Constitution. Ramiro Molina Rivero himself was the first National Secretary for Ethnic Affairs under the government of Gonzalo Sanchez de Lozada and one of the main players in the design of the Popular Participation Law and the INRA Law, as mechanisms to grant more power, participation and territorial control to Bolivia indigenous and native groups.

## CONCLUSIONS

In the case of Bolivia, and in particular, in the two case-studies that were briefly presented, a clear influence of external actors (academic and practitioners) can be detected, which actively influenced both the way people self-identified as well as the design of a new generation of public policies. These interventions were led by a political and ideological agenda, which somehow refers to the ‘theory of recognition’ and ‘identity politics’. The priority given to the classification and self-identification of social groups through ethnic categories was intended as a way to widening and deepening their rights through the recognition of their cultural and ethnic features. Although intellectual and political mechanisms inspired by the recognition paradigm contributed to the strengthening of the democratization process in the country and to the social and political inclusion of traditionally marginalized sectors of the population, the following paragraphs will briefly focus on some problems and limitations of those approaches and experiences.

One of the side effects related to the support of the international cooperation to indigenous organizations is the ‘professionalization’ of these movements – and of their leaders – as development actors. As Yvon Le Bot wrote referring to Latin America in general: “Indigenous actors and the militants that support them would tend to ‘professionalize’ themselves, to adopt essentially strategic conducts, fights of position and resources harnessing – financial, juridical and symbolic – and to enter, together with other actors, into a game of reciprocal instrumentalization” [32]. A ‘project-based logic’ is thus installed within the indigenous movements’ leadership, which converts them in sort of lobbies and managers of development, experts in fund-raising and in the use of a specific ethno-developmentist language [33]. This fact demonstrates a great adaptation capacity of these actors, while at the same time, it constitutes a consistent limit to their autonomy. Indeed, it triggers a vicious circle that strengthens the movements’ dependency from funds, advising and support of external agents, weakening their economic and ideological independence [34].

Secondly, the cases presented contribute to emphasize the normative reluctance of recognition. In the Bolivian context, traditionally characterized by a high degree of polarization of peasant and indigenous identities, it proves to be extremely difficult to identify the rules governing the conditions of success of (ethnic) recognition, formal procedures, as it were, that tell us when to recognize (in which contexts), and how to recognize (to whom is it appropriate to grant recognition, what counts as proper recognition). What rules the fact of conceding recognition to certain people, and not to others? This constitutive indeterminacy impinges tacitly on the normative use of recognition, with consequent problems at both the epistemological and political level. As the Bolivian case showed, it is generally very difficult (if not impossible) to operationalize the difference between social collectivities, making them viable on the basis of ethnic or identitarian categories. Moreover, institutionalizing the link between resource allocation and ethnicity (the

<sup>18</sup> *Ibid.*

<sup>19</sup> Interview with an anthropologists and former National Secretary for Ethnic Affairs, La Paz, 6.6.2011.

recognition of native title as a basis for land-claims by indigenous people) and, in particular, stating a policy of positive discrimination dependent on displaying acknowledgement of ‘authentic’ identities, turns identity into a target, hence increasing the risk of an instrumental use of identity for economic or political purposes, and potentially multiplying conflicts between social organizations. All these critical aspects were apparently underestimated both by anthropologists and cooperation agencies.

As I mentioned, the social and political weight both at symbolic and concrete levels of rural and popular sectors has increased, especially from 2005, after the electoral victory of Evo Morales. Nevertheless, although I definitely recognize these important improvements, I would like to mention here a still controversial as well as widely underestimated issue concerning the effective impact of this dynamic on post-colonial marginalized groups and individuals. Kymlicka argues that:

In (...) the struggle against ethnic and racial hierarchy, what matters is not the change in international law *per se*, which has had little impact on most people’s everyday lives. The real change has been in people’s consciousness. Members of historically subordinated groups today demand equality, and demand it has a right. [36]

The issue of right, equality and, before that, of consciousness of oppression is thus a key point in the analysis of ethno-cultural movements, and force to bring the analysis to the individual dimension, whereby the cognitive domain is strongly influenced by emotions and feelings. I argue that the process of development of this consciousness is not linear but it rather moves along a complex, multifaceted, non-teleological path. In particular, a difference might exist between predominately endogenously or exogenously-driven processes of emancipation, with respect to the ‘quality’ of the emancipatory dynamic itself. An hypothesis inspired by this paper that would need further research is that the ‘quality of emancipation’, in terms of its potentialities of enhancing a ‘consciousness of oppression’ and the very ‘ontology of freedom’ that this would imply, is directly proportional to the degree of endogeneity of the emancipatory movement. An exemplification coming from another historical context could be the ways in which the universal suffrage was implemented in different countries and the consequences for the feminist movements. Namely, the differences between the United Kingdom, where it was the result of women movements’ struggle after the drastic social changes triggered by the First World War, and Turkey, where it was included in the constitutional reform of 1924, under the Atatürk one-party government. The consequences inscribed in the genesis of the feminist movements in the two countries are still visible today. In the study of social dynamics, it is hence paramount to consider the conditions in which supposedly emancipatory dynamics take place, the role of external actors, and, when possible, the effects in terms of the very individual and collective ontology of freedom.

## **SAFEGUARDING THE PAST TO GUARANTEE A BETTER FUTURE. THE ROLE OF ETHNOLINGUISTICS IN THE NECOFA PROJECTS AMONG THE MARIASHONI OKIEK COMMUNITY**

Ilaria Micheli\*

\*University of Trieste, Italy - [imicheli@units.it](mailto:imicheli@units.it)

### **ABSTRACT**

Cooperation to development in rural Africa is often a matter of handling with technologically archaic societies, where tradition has still a very high cultural value. In such societies things must be done, “as they have always been done”, because “the forefathers said it was like that”. Shifting from a traditional way of doing things to a more modern one is a delicate issue, touching the very core of a people’s identity. How to handle with this identity matter, bringing people to open themselves to the new perspectives of modernity without infringing upon their traditions, their values and their right to choose their own way of life? Only a true reciprocal knowledge can result in true reciprocal confidence and therefore no project of cooperation to development can be successful if it does not consider the context in which (Western) highly educated volunteers are called to operate. Human sciences like anthropology, history, archaeology and linguistics, with their multifaceted views of the context, represent a precious key for accessing an often remote world, and the only means to get in touch and at the same time obtaining and showing respect to the communities living in a territory which is going to be subject to a project of development. Only reciprocal confidence and a real tentative of empowerment of the local people, adapting new technologies and modern ways of doing things to traditional methods can bring indigenous people to feel part and actors of the project.

As an object of discussion on the methodology of intervention proposed in the paper, the author presents a real case-study, which demonstrates the positive evolution of a sustainable agro-forestral project aimed at the implementation of beekeeping in the Okiek region of Mariashoni, Mau forests complex, Kenya, pursuant to the introduction of an ethnolinguistic study linked to the technical part of the project and aimed at facilitating the mutual comprehension of local Okiek and technicians in the domain of beekeeping. The study revealed itself not only functional to the correct execution of the project, but also fundamental to the constitution of a strengthened consciousness of the Okiek community as the bearer of a proper identity, stimulating the ideation, by the Okiek themselves, of further possibilities of cooperation on the field for the future.

### **INTRODUCTION. SAFEGUARDING THE PAST TO GUARANTEE A BETTER FUTURE**

In West Africa the glorious Ashanti Empire, whose capital was Kumasi, in modern Ghana, used to forge very sophisticated gold weights, a kind of bronze statuettes, in some cases, real artistic masterpieces, which represented symbols of their cultural tradition. Many of them were animals, whose role in traditional tales were well known, like the caiman, which represented the wise, patient, man, or the hare, which represented deceitfulness and a brilliant mind. Sometimes these animals were fantastic ones. This is the case of a mythical bird they called Sankofa. Sankofa is one of the most important symbols in the Ashanti world. It is a bird, standing on top of a hill, or pyramid. Its wings are closed, its tail kept straight upward. It has a long neck and its face looks down, backwards at its feet. The meaning of Sankofa is that no one can reach the top - read: become “someone”, a wealthy, respected or a rich man -, if he does not constantly remember his origins, and if he forgets his past. It is only on someone’s past that one can build his future as well as his (good) fortune. The same, according to the Ashanti, is true for every society in this world.

And the same, of course, is what is considered true also in our Western World, despite our untiring projection towards the future.

Even though the core idea is the same, the attitude we have towards the past is very different from the one showed by our African neighbors.

Trying to put things in the most simple way, we in fact look at our past as at the path we have followed to reach the place where we are. It can have been full of obstacles, but, thanks to our efforts and a certain degree of ideation and luck, we could go on and finally ameliorate our initial condition. What is in our past, has been necessary to forge us as we are now, and it is important to know it, in order to avoid repeating the mistakes we made in life. We do not long going back to an initial idillic heroic phase, rather, we aim to continue our way towards something new, which is located somewhere in our future, and which is always thought to be better.

African traditional (above all rural) peoples instead, educated at the school of their forefathers, are convinced that

in the past lays the secret of luck and good fortune, and only remaining attached to the traditional laws and ways of doing things transmitted unchanged to them from generation to generation, the world can go on, preventing the sky from falling, one unlucky day, on their heads.

This is of course an oversimplification of the matter, but sometimes oversimplification is more useful than philosophical meditation when we are in front of real, concrete problems, like, for example, the emergency caused by savage deforestation in an area, like the Mau Forests complex we will consider in a while, which until some 30 years ago, had always represented the main water catchment of Kenya, and which is now collapsing, due to the loss of forest cover and to climate change caused by pollution in the Western, modern world, with all the terrible effects we can imagine both on the fields and on the people living in the country.

In contexts like the one I depicted, knowledge of the past is not only synonym with understanding the habits, ideas or position of a single people in its local chessboard, rather, it is fundamental to avoid false steps in the construction of the relationships we aim to create in order to cooperate to *their*, and at the same time *our*, development, in a positive global vision of the world.

If the past continues to represent a model for the indigenous inhabitants of a region, it is important not only to know it, but also to understand what can be maintained and valued positively in a process of “forced” or “accelerated” evolution, and what is necessary to throw away. If the past is the guardian of a people’s identity, it is important to safeguard what in it is considered fundamental and unavoidable by the insiders. Many times this involves the necessity to negotiate and discuss what is moral or ethically correct in a determined society. In the last years this problem has often been on the table of discussion in our academic world. Can we really say that there is only one (Western) way to conceive issues such as *Human Rights*, *Morality* or *Ethics*? And anyway, once assumed that we could agree upon the idea that *Human Rights* must be respected everywhere in the world, we must admit that what we call a moral or ethical behavior is necessarily shaped by the context we live in. Thus, in different contexts we will differently perceive something as being *very much* or *not so much* against a determined *Human Right*<sup>1</sup>.

For example, in all societies hunger is seen as something nobody should suffer from, but in different contexts access to food resources is regulated in different ways. It is a Western concern that if there is little to eat, the first to be nourished must be children, because they represent our future and are most vulnerable. In many African societies, on the contrary, the first to be nourished must be elders, because if an elder dies, a treasure of knowledge disappears with him, while if a baby dies, just nine months later the mother can have another one.

Thus, many times it is a matter of perspective, deriving from cultural and traditional values, embedded behaviors and embedded ideas of what is considered *right* or *wrong*, what is *appropriate* and what *is not*. If we do not try to understand this point, and if we do not recognize to the *others* the same value as the one we recognize to *ourselves*, in terms of cultural starting position, we surely cannot hope to get to a really accepted, shared and empowered project of cooperation.

On many occasions and in many traditional contexts safeguarding the past, or what is pivotal in that past, according to those whom we are addressing, is the first step to obtain a reasonable degree of confidence and respect.

In this sense safeguarding one people’s past is often the key factor to guarantee a better future for everybody.

## THE ROLE OF HUMAN SCIENCES IN COOPERATION

The label *Human Sciences* covers such an enormous amount of disciplines and fields of research, that it is particularly hard to consider them really as a whole. Therefore I think it is important here to try to be a bit clearer and specify what I am exactly referring to. The *Human Sciences* I am thinking of here, are those aimed at the knowledge of the mechanisms of formation of determined societies, of their values, their beliefs, their way of doing things and interact with others, their view of the world and of themselves inside the world, their ways to cope with *otherness* and their ways to manage interpersonal relations according to their cultural and traditional habits in terms of gender distinction and distribution of labour, hierarchy and age class or political and economical prestige.

In other words, when speaking of *Human Sciences*, I think of history and archaeology, which are the tools we have to understand the situations, choices and events, which made a people adapting itself in a specific way to survive in its

---

<sup>1</sup> The academic literature on this kind of topics (Anthology of Moralities and Ethics, Development Studies in general and Anthropology of Development) is now very rich. I do not think it is the right place here to discuss the different positions. I just cite those I think are the most important productions: [1] A. Appadurai *Modernity at Large*. Minneapolis: University of Minnesota Press, 1986; [2] K. E. Browne & B. L. Milgram eds. *Economics and Morality. Anthropological approaches*. Lanham: Altamira Press, 2009; [3] D. Fassin “Beyond Good and Evil? Questioning the Anthropological Discomfort with Morals” in *Anthropological Theory* 8 (4): 333-344, 2008; [4] D. Fassin, *Humanitarian Reason: A Moral History of the Present*. Berkeley: University of California Press, 2011; [5] C. Grootaert & T. Van Bastelaer T. eds., *The Role of Social Capital in Development. An Empirical Assessment*. Cambridge: Cambridge University Press, 2002; [6] S. Howell, *The Ethnography of Moralities*. London: Routledge, 1997; [7] J. Lindlaw, “For an Anthropology of Ethics and Freedom” in *Journal of the Royal Anthropological Institute* 8 (2): 311-332, 2002; [8] G. McCann & S. McCloskey eds. *From the Local to the Global. Key Issues in Development Studies*. London: Pluto Press, 2003; [9] D. Mosse, *Cultivating development: An Ethnography of Aid Policy and Practice*. London: Pluto Press, 2005; [10] A. Tsing A., *Friction: An Ethnography of Global Connection*. Princeton: Princeton University Press, 2005; [11] R. A. Wilson & J. P. Mitchell eds., *Human Rights in Global Perspective*. London: Routledge, 2003; [12] J. Zigon, *Morality: An Anthropological Perspective*. Oxford: Berg Publishers, 2008.

natural and geo-political context. I then think of anthropology and ethnology, because these are the disciplines which handle specifically with the description and interpretation of the cultural heritage of a people and of the ways in which its values are estimated, expressed, preserved and transmitted to the new generations. I finally think of linguistics because every language keeps in itself the traces of successive contacts with other human groups, has the possibility to create genuine labels for what is typical of a culture and adopts terms from other languages when it needs to indicate objects or concepts which were not part of its speakers' tradition, revealing which kind of exchange there have been with those communities the term came from.

With the label *Human Science* I then refer to all these disciplines taken together, which I see as the different faces of an elaborate solid, each one mirroring just a part of the whole, a whole which comes out from the correct reconstruction of the original image, which can be obtained only through a constant confrontation and discussion of the same issue, taken from all the different points of view.

Aim of what I call *Human Sciences*, should be the reconstruction of this complicate image.

Assumed this position, the role I see for *Human Sciences* in projects of cooperation to development is fundamental.

On the one hand *Human Sciences* should provide for an accurate reading of the conditions, reasons and expectations of all the human groups living in the area interested by the project (never mind what is its final aim), and on the other hand they should evaluate, step by step, the effective possibilities of the project to be accepted, taken in charge and carried on by the local partners, once the intervention of the interested NGO or international partner is finished.

Historians, archaeologists, anthropologists or linguists should work side by side with the technicians involved in the project and act as mediators between them and the local people, in order to make their communication clearer, to stimulate the local people's involvement and their real empowerment, making new ways of doing things as something chosen and not only accepted, or, worse, badly suffered by indigenous people.

Even though in these last years from this point of view things are going much better than before, there is still much to do to make Western partners abandon the idea of being there just to *teach* to indigenous communities how to do things better, without showing any care for their traditional know-how and ignoring religious or moral constraints preventing their partner to do determined (taboo) things, or to act in a specific (immoral) way, work or live in a determined (sacred, or spiritually dangerous) place and the like...

Before being *teachers*, we have to learn to be *learners* and try primarily to understand where we are, which are the values our project could be contrary to, which are the categories of people who could never be asked to do a particular task, or how we could bring our partners to change their minds on specific important issues.

In short, Western or International partners of local projects of cooperation to development, should first of all make a thorough recognition not only of the technical possibilities for the project to function, but also of the human context the project is intended for and the possibility it has to be accepted.

An interesting case study, demonstrating how much important it is to consider all these factors before starting any kind of cooperation project, is presented by Lianne Holten in her "Mothers, Medicine and Morality in Rural Mali", edited in 2013 by LIT.

In her book, Holten reports her own experience in the village of Farabako, in the Mande Mountains of southwestern Mali. The author is at the same time a midwife and an anthropologist and in Farabako she has done the experience of being both things at the same time. She was there as a midwife, cooperating in a health care project funded by some Dutch charitable organization aimed at the setting up of a maternity clinic in the village, but at the same time she was there in order to gather first hand materials for her PhD thesis in anthropology. I will not resume her book here, but I suggest my readers to have a look at it. It is in fact a genuine description of the mistakes one can make, even in good-faith, applying the way of thinking of a Western biomedical expert in a context in which most of the times Western biomedical practice is seen just as one (and not the best, even though more expensive) possible healing method. Reflecting on her experience, Holten admitted to have been initially badly surprised by the fact that, despite the opening of a maternity clinic and the opportunity to refer to a Western midwife for consultation and prompt intervention, in such a remote Mande village as Farabako, when a child had a serious health problem, such as severe malnutrition, his mother hardly went to ask the midwife for help. Many women seemed not to take care of their children, because they seemed not to take any initiative to get rid of the disease of their babies, waiting for others to make a decision. Only after long months spent in the village, Holten understood that the women's attitude towards their children's illness was due to their social condition. Decision making in issues like health care in Farabako is a male task and if a wife doesn't respect this traditional rule of letting her husband decide for her and her child, behaving in a different way and looking for help elsewhere than in her family, this could cause her to loose even the very small social capital she can rely on in the patrilocal, patriarchal and polygamous society she lives in. In her book, Lianne Holten demonstrates in concrete facts the kind of in-depth comprehension there should be of the human and social context of people on the field before starting any cooperation project.

Many times good-will and technical know-how reveal themselves simply insufficient.

## THE ROLE OF ETHNOLINGUISTICS IN THE NECOFA PROJECTS AMONG THE MARIASHONI OKIEK COMMUNITY (KENYA)

Okiek have always been hunters and gatherers, moving periodically from the highlands to the lowlands of the Mau Forests complex, following the lifecycle of savage bees, whose honey was the Okiek's first source of energetic food. Living out from the common standards, speaking a Kalenjin language in a Bantu context, having nothing to offer on the market and limiting their trade to the barter of game food against the milk of Maasai or Nandi cows, they were considered "dorobo", that is "servants", of their Maasai or Nandi neighbors, and esteemed nothing.

Such a low social position caused them to be used to think of themselves as the savage, bad copy of their neighbors and, despite their rich traditional heritage, they had never done anything to value it.

In the last 30 years, due to the reduction of their original habitat, their life changed and they had to start sheep farming and garden activities to earn a living.

Despite their number, estimated at 79.000 between Kenya, Uganda and Tanzania<sup>2</sup>, the Okiek are generally considered an endangered minority, speaking an endangered language (even though a recent sociolinguistic survey I conducted in the months of January-february 2013 and now in print for the types of *Incontri Linguistici* demonstrates quite the contrary), living in an endangered habitat, which, since 2004, is the object of NECOFA's attention.

NECOFA, the Network for Ecofarming in Africa, is a Kenyan community based NGO, ruled by a Kikuyu, Samuel Karanja Muhonyu, and its aim is the promotion of ecofarming, that is of an ecologically and socially sustainable form of land management. In their website they declare that: "*It (NECOFA) works towards empowering communities to sustainably access education, health, food security and social dignity*"<sup>3</sup>.

NECOFA met the Okiek in the framework of its projects aimed at the forest conservation and management. Since the beginning, NECOFA involved the Okiek community in different projects, such as beekeeping and the establishment of combined traditional and modern apiary production, the establishment of forestal (and other) tree nursery and the establishment of environmental clubs in primary schools.

Principal partners of NECOFA in the area of Mariashoni are the Italian NGO "Manitese", which, in collaboration with Ethnorêma and the Province of Bolzano is involved in the apiary establishment, and SLOW Food.

One of the principles on which NECOFA and Manitese base their action, is the fact that local communities not only must be involved in the cooperative programs they finance, but, of course, they must be empowered.

All their projects provide for special trainings for all the figures they envisage being necessary to the operativeness of the project once it reaches its full speed.

In 2012 NECOFA, together with Manitese, supported in Mariashoni the birth of MACODEV, the Mariashoni Community Development SHG, engaged in "*the popularization of its initiatives in the community*". According to the 11/16/2012 post on NECOFA's website, MACODEV operators "*have been conducting meetings and barazas with community members so as to engage them to participate more actively in the process of community development. To strengthen their capacity to operate more efficiently the project (NECOFA) supported them with a one day training for its committee members. The training entailed Leadership and Management, Record Keeping Resources Mobilization, roles and responsibilities of committee members and growth and development of an organization. The CBO has also been coordinating the honey procurement from local farmers. This activity is ongoing considering that the harvesting season is approaching thus the CBO is trying to acquire as much as they can so that it can be refined at the Mariashoni honey refinery, then certified for by the Kenya Bureau of Standards. After the honey is certified the CBO will be in charge of Marketing the honey countrywide thus providing a path way for the Mariashoni Okiek community to earn some decent compensation for their honey production without being exploited by the middlemen who buy it at a throw away price. Other areas of the CBO engagement include commercialization of locally produced milk, wool purchase and value addition and pyrethrum commercialization and popularization in the area*"<sup>4</sup>.

The *case study* I discuss in this paper is that of the ideation, actualization and prosecution process of the project on beekeeping in Mariashoni, funded by Manitese and realized in cooperation with NECOFA and MACODEV, which I see as a model to be valued as a good method of intervention on the field.

Aim of the project was the establishment of traditional - modern combined apiaries and the promotion of a new way of doing beekeeping not only for personal sustenance, but also for commercial purposes.

I have already said that honey had always been the principal source of nutrition for the Okiek and, therefore, the introduction of modern methods, if on the one hand was supposed to be accepted as a modernization and simplification of traditional techniques, on the other hand touched and, in a sense, invalidated, many practices and beliefs which were taken for granted because "*the forefathers did it like this*".

A specific training phase had thus to be prepared and studied carefully.

Moreover, in the Okiek tradition, beekeeping and honey production had always been a male concern. Okiek

<sup>2</sup> <http://www.ethnologue.com/language/oki>.

<sup>3</sup> <http://necofakenya.wordpress.com/about/>.

<sup>4</sup> *Ibidem*.

women could never substitute their male partners in the collection of the precious nectar. Men stored their honey in a secret place in the forest, divided it among the women, who then could carry it to their locations and use it in their domestic activities, for cooking, the preparation of traditional medicine and as a preservative for smoked meat.

Far from being unaware of this, NECOFA and MACODEV decided to admit in their project also cooperatives of women and this implied a serious engagement in education, in order to avoid problems with the women's husbands.

The first step was financing the formation of the activity manager on the field, John Kemoy, an Okiek member of the NECOFA staff, at the Baraka college in Molo, one of the most renowned schools for beekeeping in the region.

Being an Okiot, John would then easily communicate with those other Okiek involved in the project.

Despite his success at the school, once back in Mariashoni, John had anyway to confront with some ethnolinguistic problems. On the one hand, in fact, he had no Okiek words to refer to the modern tools and garments he learned to use at the Baraka college, and therefore he had to use many English and Kiswahili terms his mates were not used to, and this caused initially a bit of confusion. On the other hand, during his training at the Baraka college, John learned a lot about the nature and roles of the different kind of bees and about the different products of the bees and the possibilities of use they have.

Much of this knowledge was completely new for his mates, and sometimes it was contrary to traditional beliefs.

The problem was then one of knowledge and consciousness. John's concrete problem was to find a way to explain all this new stuff to his Okiek, often very less educated, collaborators, during the training meetings in the different locations. A choice had to be made: abandoning tradition and adopting *tout court* modern beekeeping methods, or rather trying, with the help of an expert anthropologist, or better, of an ethnolinguist, to help the Okiek community preserving what was good in its tradition, implementing it with modern knowledge and technology?

NECOFA and Manitese discussed the problem with MACODEV and the community elders and the choice was taken: the intervention of an ethnolinguist was very welcome.

I do not describe here the selection process which was committed to Manitese, but finally the choice fell on me. My task as an ethnolinguist was manifold. My first concern, in agreement with my customers, Manitese and NECOFA, as we decided together in a meeting we had in Peschiera del Garda some months before my departure for Kenya, was to find a way to transpose Okiek phonemes in a graphic system understandable to the Okiek, and the second goal was the realization of informative materials (handbooks) in Okiek for the beekeepers who were already involved in the program, or who intended to join it.

Before my arrival in Mariashoni, NECOFA engaged itself in the selection of some Okiek youth, sufficiently educated to be trained in the methods of ethnolinguistics, who were supposed to act as interpreters for me.

The two young Okiek selected demonstrated to be ok, and even if one of them left the project one month later, because of another job he found elsewhere, I am still in touch with the second, Catherine Salim, daughter of the Mariashoni village chief, who is going on working for NECOFA. The day after my arrival in Mariashoni, a community meeting was organized with MACODEV and the elders of the various locations.

Samuel Muhunyu explained my role in the project to everybody.

I asked the permission to visit all the locations of the region, asking questions here and there to understand the Okiek traditional way of handling with bees and honey, explaining to them that my aim was helping them to document and preserve their beekeeping tradition and finally they would have decided how to use the materials I would collect in order to transmit their knowledge to modern and future Okiek beekeepers. The reaction of people was literally enthusiastic.

I believe that this happened not because of a particular ability from my part in resulting nice to others, but because the community elders saw that the need they had manifested had been taken seriously and cooperant partners were now acting to help them doing things as *they themselves* desired.

At their eyes this was in fact a concrete demonstration that in this synergetic relationship with NECOFA, Manitese and MACODEV they really had the power and the right to take part in the decision making process. Due to this, my work on the field in Mariashoni was very productive.

People were happy to help me and answer to my questions. Many of the elders invited me at their locations to show me traditional tools and techniques, and when we had to meet to discuss particular problems in group, all the elders, even though living some km away from Mariashoni, came to the NECOFA office to give me their contribution in terms of knowledge and traditional visions of things.

Soon, beekeeping became also an excuse to speak of many other traditional issues, and the idea to come back to go on working for the promotion and safeguard of the Okiek traditional culture started to live in my mind.

On my second community meeting, I shared this idea with my customers and hosts.

I proposed to go on working with them, training Catherine in the methods of material culture collection, and trying to study the grammar of their language for the production of a book which could be useful for the future generations.

The Okiek community did not only accept it, but autonomously proposed new fields of intervention, such as the study of oral tradition and the production of a book of tales for children in the school, or the combination of an ethnolinguistic work with the production of educational material in the framework of a health care project for mothers and babies which was then being studied, and so on.

I suddenly started to work on these new issues and before my departure in february 2013, besides the cultural lexicon on beekeeping and honey I had done 46 out of 142 interviews for my sociolinguistic survey (the other 96 were done by Catherine and sent to me via e-mail), I had collected more than 700 words belonging to the domain of

traditional daily life objects and practices, I had done some grammatical investigations, and recorded and analyzed a bunch of folktales.

Now the cooperation with Manitesse continues, I inserted the ethnolinguistic part of the project in the outline of the ATrA program presented in the *postilla* below, financed by the Italian Ministry of Universities and Research (MIUR) in the framework of FIRB 2012, and for the next three years I will go on working on it.

The *case study* I discussed here, demonstrates that today Okiek, through MACODEV and the system of community meetings, are autonomous in the decision making process and the projects promoted in the area following this method are firmly taken in charge by easily *empowered* local operators.

The synergetic and constant dialogue between NECOFA and MACODEV in fact caused the Mariashoni Okiek community to get a sense of dignity for itself and to start participating in the creative process of proposition of future interventions in order to ameliorate their living conditions as well as safeguard and promote their cultural heritage.

I must add here that recently NECOFA and MACODEV assisted the birth of the *Kaprop Cultural Centre*, ruled by a cooperative of Okiek women trying to preserve their ancient way of life (with the reconstruction of traditional huts, cooking tools, fur clothes, honey bags and containers, but also dances and songs).

After the success of my cooperation as an ethnolinguist in the beekeeping project and the very interesting cultural dimension it has assumed, the decision has been taken to improve seriously the *Kaprop Cultural Centre* and now NECOFA and MACODEV are thinking of the future, envisaging even the building of a hostel for *slow tourists* in Mariashoni.

## CONCLUSIONS

The Ashanti Sankofa teaches that a society cannot make any progress if it is not able to value what it inherited from its forefathers.

People have to struggle to go ahead, and their past should be kept in their minds and hearts as a treasure to be safeguarded, without becoming a chain impeding them to move.

You can understand where to go, only when you have a clear idea of where you come from.

Too many projects of cooperation to development in poor countries until now have ignored this important issue, trying to make people jump from tradition to modernity without taking enough time and spending enough energies to make the point with indigenous people, before changing their habits, behaviors, ways of doing things and values.

Too many projects have been imposed from outside and people had only the sad choice to be subjected to them or to refuse them.

Real *empowerment* cannot be obtained *during* the realization of a project on the field. The premises for it must be posed *before* any step on the field. People must be conscious of the meaning and aims of an intervention coming from abroad and thought for their sake. They must be put in the condition to understand its usefulness and be engaged in its promotion. They must feel actors and not victims of cooperative projects.

Even when a cooperative project has a very technical objective, as it was the case of the maternity clinic in the village of Farabako in Mali, or of beekeeping among the Okiek of Kenya, *human sciences* in general can be a useful tool to get to the point.

Whatever the issue, disciplines such as archaeology, history, anthropology, ethnology and linguistics can do a lot to suggest Western partners how to behave with their local counterpart, which are their values and modalities of relationship within their group and outside of it, in gender marked exchanges or in social hierarchies once on the field.

Valuing in an adequate way local traditions and culture and the history of the people we are going to work with, is a way to show them respect, a manner to tell them indirectly that they have the right, and the duty as well, to express their idea, to be *agents* also in the first phases of a cooperative project, which should always be designed together with those who live since generations on the field we are going to invest in.

Once we apply this simple rule and accept to be for a while just *learners* instead of *teachers* in a new environment, we can be sure that our project would gain a lot from the dialogue with our interlocutors and local partners.

It can gain so much that it can be extended as to reach a dimension of which at a first sight we would never have thought of.

I think that the two examples I brought here, the Mande case reported by Holten and the Okiek one I am personally involved in, can be considered a demonstration of what I have tried to explain so far.

## Postilla

Horizon 2020 and the ambition of creating inclusive, innovative and safe societies. The gamble of ATrA.

Horizon 2020 is the new EU program for Research and Innovation. On its website it is defined as “the financial instrument implementing the Innovation Union, a Europe 2020 flagship initiative aimed at securing Europe's global

competitiveness. Running from 2014 to 2020 with an €80 billion budget, the EU's new programme for research and innovation is part of the drive to create new growth and jobs in Europe"<sup>5</sup>.

Its aims should thus be merely financial and its attention focussed only on the EU countries and maybe on those international partners the EU considers central to its economic growth. The EU vision is however luckily much wider. The EU, of course, is not an isolated area in the globe and we are aware that everything that happens, in terms of climate change, global pollution, societal insecurity and health or demographic crisis has its repercussion on the whole world. Therefore, as the EU website says, "International cooperation will be an important cross-cutting priority of Horizon 2020"<sup>6</sup>.

This EU strategic priority is well understandable in a global perspective, and far from being just a void assumption, concrete initiatives, like for example the granting of funds for research projects in line with the objectives of Horizon 2020 to National Ministries of Education, Universities and Research, has already taken place in order to reach the goal.

In detail, the third priority of Horizon 2020, very closely related to the main issues of cooperation in developing countries, is that of coping with what they call the current Challenges of Society, which means studying possible solutions to problems like sanity, demographic changes and wellness (point 1 of the program), or alimentary security and sustainable farming (point 2) or even the creation of inclusive, innovative and safe societies (point 6).

All these factors, which mainly interest poor countries, represent key issues for the political and demographic stability of entire regions, for example in Africa, most times rich in raw materials, minerals and metal reserves. The solution of these problems, far from being only a matter of Human Rights' recognition, becomes also a question of (possible future) business.

Be it as it may, the EU interest in these kind of problems represents a first step towards the promotion of civil, human and cultural rights among many peoples who, until now, have always been ignored.

But the mission is not so easy.

The goal of building inclusive, innovative and safe societies, for example, cannot be reached if not passing through a correct, serious and respectful study of all the ethnic, cultural and linguistic parts of the human mosaic sharing one and the same territory and most times struggling for the same resources in terms of water, food and infrastructures.

This involves the eternal problem of identity constitution, shaping, reshaping and negotiation, in a game whose factors are always multiple choices represented by the different and always changing cultural, traditional and imported habits and values making up a people's peculiar heritage and representing those core traits of a culture for which one can decide to die.

It is in this context that the 3 years project "ATrA - linguistic and cultural zones of transition in Africa", financed by the EU through the MIUR (Italian Ministry of Universities and Research) in the framework of FIRB 2012, of which I am the Principal Investigator and which involves the Universities of Trieste, Torino and L'Orientale of Naples, with its mixed team of ethnolinguists, archaeologists, anthropologists and historians, has been launched.

Starting from the study of ancient and modern situations, mainly in the Horn of Africa, ATrA's aim is trying to offer an interpretation grid, valid also in different contexts, for all those phenomena which, from antiquity to our time, have been and still are characteristic of those melted areas where different peoples, cultures, languages and traditions get in contact, creating tensions and instability resulting too often in civil rebellion, genocides or civil suppressions.

Also in this case, I firmly believe that only the knowledge of the past and present ways of being human in a determined context can be at the basis of a significant dialogue. Only through a sane exchange of opinions and the true will to reach a common point, negotiating what can be negotiated, can bring to the realization of a pacific, even not idillic, cohabitation.

The gamble of ATrA is thus to give to those peoples living in such chaotic contexts the right tools to try to understand each other. We hope to give the start to a virtuous cycle in which the correct knowledge and recognition of the identity, history and culture of all the peoples living in an area of transition can be the first step towards reciprocal acceptance and mutual respect for the sake of a higher value than ethnical superiority, which is a peaceful and harmonious relationship of neighborhood.

The ethnolinguistic study among the Okiek of Kenya will continue, for the next three years, in the framework of this program, always in collaboration with NECOFA, Manitese and MACODEV.

## STRATEGIES OF LAND EXPLOITATION AND MANAGEMENT IN THE AREA OF AKSUM (NORTHERN ETHIOPIA) BETWEEN THE FIRST MILLENNIUM BC AND THE FIRST MILLENNIUM AD

Luisa Sernicola\*

\*University of Naples "L'Orientale", Italy - [luisasernicola@gmail.com](mailto:luisasernicola@gmail.com)

### ABSTRACT

Northern Ethiopian highlands, like most of the country and the whole Horn of Africa, have always been perceived as low-productivity regions with very fragile ecosystems, where local communities, often relying on a traditional ox-plough agriculture, are continuously exposed to the threat of drought, famine and starvation because of environmental and social factors.

This paper intends to contribute to the reconstruction of the long-term dynamics of human-environmental interactions in these regions by analyzing how agricultural land was managed, exploited and manipulated and how ancient farming communities faced environmental degradation phenomena like soil impoverishment and erosion. The study will focus on the area of Aksum, an important historical centre located in the region of Tigray, northern Ethiopia, which emerged between the 1<sup>st</sup> millennium BC and the 1<sup>st</sup> millennium AD as the capital city of a vast kingdom. Agriculture in Aksumite history is commonly regarded as a system in which problems of soil-exhaustion are linked to land clearance and population increase, and the intensification of agricultural resources' exploitation has long been considered the trigger for both Aksum's rise and decline. Nevertheless, archaeological and paleoagricultural investigations recently conducted in the area significantly clash with this model, suggesting that even during the periods of greatest extent of Aksumite kingdom the erosion rate was relatively low, proving the effectiveness of Aksumite farming strategies in managing and maintaining the soil. This unresolved debate is a useful spur to research, as understanding ancient farming systems may facilitate the design of future strategies for sustainable land-use.

### INTRODUCTION

The northern regions of Ethiopian highlands have, for many years, been perceived as low-productivity areas characterised by extremely fragile ecosystems where climatic fluctuations and/or conflicts among ethnic groups or polities periodically resulted in severe phenomena of environmental, social, and economic deterioration. Episodic events or long-enduring processes acting at local and regional scales, have threatened local communities with chronic drought, famine, and starvation. Land-use and land-management strategies and their environmental, economical and social consequences are therefore issues of great significance for present Ethiopia, as 85% of the country's economy is based on agriculture practiced with traditional techniques and equipment. In particular, soil erosion processes are considered a major factor heavily affecting rural ecosystems.

This paper will describe the results of over ten years of combined archaeological and paleoenvironmental studies conducted in the area of Aksum (Tigray, northern Ethiopia) by the University of Naples "L'Orientale"<sup>1</sup> in collaboration with geologists, geoarchaeologists and soil scientists from Boston University (USA), University of Cambridge (UK), University of Florence and University of Ferrara (Italy), and aimed at investigating ancient strategies of manipulation and exploitation of the territory and at reconstructing long-term dynamics of human-environment interaction in this area, also in the light of present phenomena of environmental degradation and soil erosion processes.

The basic theoretical assumption is that archaeology can give a significant contribution to larger debates on present environmental degradation and on the role played by human communities in ecological dynamics by providing evidence about long-term ecological processes and on their temporal nature. Archaeologists have developed very sophisticated procedures to recover, analyse and explain, by means of cultural materials, the traces left by human actions on a specific territory and to organize such evidence in spatial-temporal sequences with century scale resolution for the Late Holocene.

The research adopted a multidisciplinary approach that integrated innovative methodologies with well established

---

<sup>1</sup> The Italian Archaeological Expedition at Aksum of the University of Naples "L'Orientale" conducts archaeological researches in the area of Aksum since the early nineteen-nineties. From 1993 to 2003 has conducted archaeological investigations on the hilltop and northern slopes of Bieta Giyorgis hill in collaboration with the Boston University (co-directors Rodolfo Fattovich and Kathryn A. Bard). Between 2004 and 2009 has investigated the plain to the north of Aksum and the eastern, western and southern slopes of Bieta Giyorgis (director Rodolfo Fattovich). Since 2010 it conducts research at the pre-Aksumite site of Seglamen, ca. 12 km to the SW of Aksum (director Rodolfo Fattovich).

procedures. Archaeological, geoarchaeological, geological and ethno-historical investigations generated site-specific datasets necessary to model the ancient landscape of the area, and provided new perspectives for analyzing the causes and rates of ancient erosion dynamics, and the evaluation of the relevance and effectiveness of ancient strategies adopted by rural communities to face this problem. Archaeological investigations included the systematic, complete-coverage survey of the area of Aksum [1] in order to document the distribution of archaeological evidence within the region and to reconstruct the ancient settlement pattern. Geoarchaeological, geological and pedological investigations represented a basic component of the project as they provided paleoenvironmental evidence for a more detailed correlation between natural and cultural phenomena. Archaeological, geological, and geoarchaeological evidence were spatially positioned using GPS and related information have been uploaded, through geo-referencing, in a Geographical Information System and analysed through the implementation of thematic maps, statistical and spatial analysis, Remote Sensing and 3D modelling. Ethno-historical researches and enquiries were conducted to get information from written historical sources and local oral traditions about local and regional environmental changes, land-use and land-management strategies, and demographic pressure. In particular, ancient Ethiopian texts, reports by European travellers who visited the country since the 15<sup>th</sup> century and recent data published by International Agencies were scrutinised. Finally, information about traditional infrastructures has been recorded as a first step towards possible future strategies of protection and promotion of traditional knowledge as an important aspect of the cultural heritage.

### SOIL EROSION AND ANCIENT HUMAN COMMUNITIES: NEW EVIDENCE FROM ARCHAEOLOGICAL AND PALEOENVIRONMENTAL STUDIES

The city of Aksum is located in Tigray, the northernmost region of Ethiopian highlands (Fig. 1), at an average altitude of about 2,200 m asl, in an alluvial plain situated at the hub of a radiating network of river valleys linking the area with the surrounding regions. The plain is dominated in the centre by two prominent hills, Bieta Giyorgis and May Qoho while a ring of surrounding hills forms the natural boundary of the territory (Fig. 2). The geological and lithological variety of the area results in a mosaic of soils with a different degree of productivity [2].

The area is characterized by a tropical climate with an average annual temperature between 15° C and 20° C, and by highly seasonal rainfall, mainly concentrated between June and September. In moist periods, a second rainfall may occur between March and May. Paleoenvironmental studies suggest that, during the Holocene, this region experienced an alternation of wet and dry periods with an evolution towards more arid climatic conditions from 1000 AD [3][4][5][6][7].

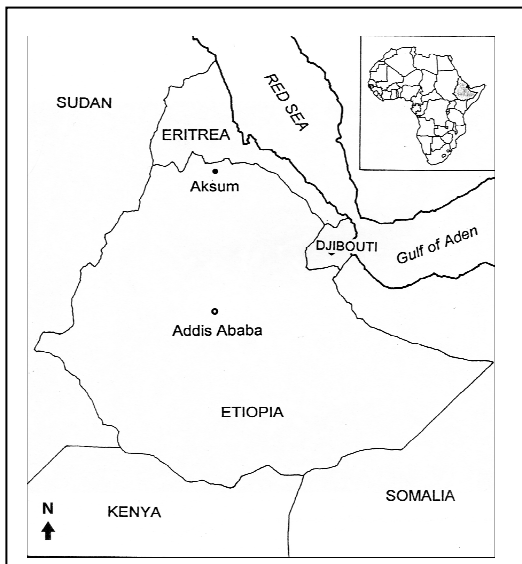

Fig. 1 – Location of the study-area.

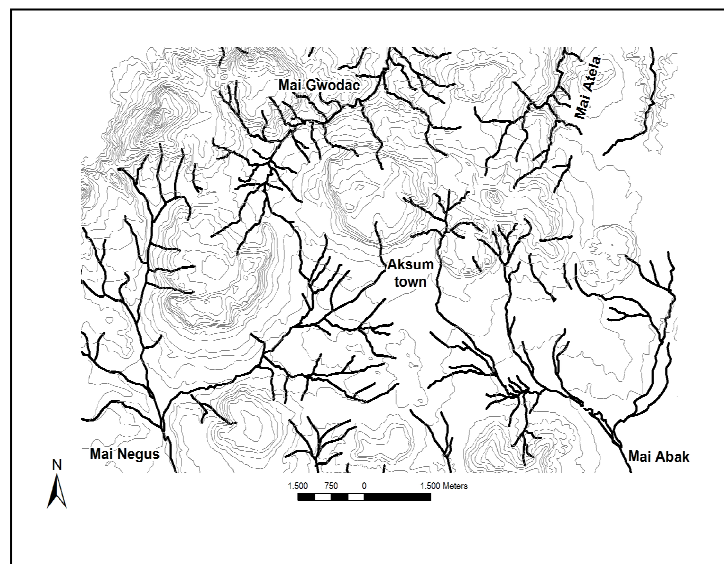

Fig. 2 – The plain of Aksum with major river valleys.

The vegetation pattern is characterized by perennial herbaceous plants, thickets of bushes and scattered, medium-height trees, including acacia and African olive. Eucalyptus have been planted since the beginning of the 20<sup>th</sup> century. Present domestic fauna includes dromedaries, asses, cattle, sheep, goats and poultry, while wild species are mainly represented by hyenas, baboons and a wide variety of endemic and other birds.

From about the 1<sup>st</sup> century BC, the area of Aksum emerged as the capital of a powerful and vast kingdom directly involved in a long-distance exchange circuit which included the northern Horn of Africa, the Nile Valley, the Mediterranean, Southern Arabia, and the western coastal regions of India [8][9]. Nowadays, Aksum is one of the most important religious centre of the Ethiopian Orthodox Church, and a very important symbol of Ethiopian cultural identity. Moreover, it is presently one of the major archaeological areas in the country, and is included in the UNESCO

World Heritage Sites List.

Due to its geographical position, the area of Aksum is exposed to severe phenomena of environmental degradation, the whole ecosystem being extremely sensitive to climatic changes. One of the most common forms of landscape degradation occurred in this region is soil erosion. The current model for ecological history of the area of Aksum, and of the whole Tigrean plateau, argues for a progressive increase in land clearance and human impact on the natural environment due to the intensification of agriculture since the 3<sup>rd</sup>-2<sup>nd</sup> millennia BC, which ultimately resulted in severe soil impoverishment and erosion processes [3][4][10][7].

On the contrary, recent archaeological, pedological, geomorphological, and paleoagricultural investigations in the area highlighted new and encouraging results concerning the effectiveness of ancient terracing systems and land-management for the conservation/exploitation of the hill slopes and provided significant information on the possible causes of soil depletion and erosion [11][12][13].

## ENVIRONMENTAL AND PALEOAGRICULTURAL STUDIES

Research, carried out at a local scale, involved the northern slopes of Bieta Gyorgis hill, an area largely devoted to farm-lands where the present landscape is characterized by scattered isolated rural dwellings or hamlets alternated with cultivated fields. A smaller portion of the total area is given over to grazing while most of the up-slopes is characterised by forests of eucalyptus planted to minimize soil erosion.

Here, as in many other parts of the Tigrean plateau, farming has been practiced along the slopes of the hills since atleast the mid-1<sup>st</sup> millennium BC, by means of a terracing technique which helps to reduce the gradient and improve the drainage of the soil [14][7]. The traditional plough still used in the region is the *maresha*, an “ard plough” drawn by a pair of oxen; it seems to have been introduced in Ethiopia by the 1<sup>st</sup> millennium BC [15]. The impact of the plough against the stones is frequent, and the stones are consequently scratched (Fig. 3): 1) on the top if rocks are at a lower depth than the tilling depth (8-16 cm), or 2) on the sides if rocks are protruding [11][12]. The occurrence of plough- marks, thus, is a safe evidence for previous cultivation on lands presently cultivated or abandoned.

In the case of Aksum, the finding of large outcropping rocks with ancient plough-marks in the now abandoned area between Enda Gyorgis and Ma Qono, on the northeastern slopes of Bieta Gyorgis hill, allowed reconstruction of ancient cultivation procedures and agricultural terracing systems. Systematic mapping and study of the thicknesses and orientations of the marks suggests that the ancient ploughing procedure was, similarly to present, characterised by concentric progress of the plough from the outer edge of the terraces towards their centres [11][12]. Moreover, as the plough-marks have been found at different levels on the outcropping rocks, these provide a reliable indication of soil erosion rates during the various chronological phases. Chromatic differences in the superficial alterations of the rock (becoming progressively darker as exposure to external pressure and atmospheric agents increases) show that the highest marks are the most ancient while those found lower down are progressively more recent (Fig. 4). Correlations between the heights of plough-marks on the rocks and phases of utilization of the terraces testified by the associated archaeological material, allowed us to estimate the rate of soil erosion that occurred in the area from the Aksumite period up to the present. The study suggests that the level of erosion that occurred in the area during the 1<sup>st</sup> half of the 1<sup>st</sup> millennium AD (which is a period of increasing demographic pressure in the area [16][17][18]) is between 1.9 and 4.8 t ha<sup>-1</sup> y<sup>-1</sup> Tons per hectare per year [11][12].

Fig. 3 – Plough impacting outcropping rocks.

Fig. 4 – Ancient plough-marks on a boulder.<sup>2</sup>

<sup>2</sup> Figures 3 and 4 are courtesy of Rossano Ciampalini.

This value, which is much lower than the threshold erosion rate commonly accepted by international soil conservation agencies, shows that ancient strategies of land management and exploitation were effective and that the whole ecosystem was extremely stable. On the contrary, the land reform begun in the early nineteen-seventies during the socialist regime of Menghistu Haile Maryam, which led to the abandonment of the area under examination, caused a significant increase in the rate of soil erosion which sharply accelerated environmental degradation processes. Thus, at least in this area, high demographic pressure and soil exploitation should not be considered the principal cause of soil depletion and erosion. On the contrary, anthropic presence and land-exploitation strategies appear to play a crucial role in preserving the landscape and maintaining environmental stability. Whereas soil erosion and impoverishment seem to be the result of a lack of maintenance of the infrastructures consequent on the abandonment of the area. The relationship between soil erosion and human activity in the Aksum area should therefore be considered in a new perspective, probably nearer to the paradigm “More people less erosion” introduced by Tiffen at the end of the last century [19]. This interpretation seems to be confirmed by modern data according to which the areas worst hit by soil erosion in the Ethiopian highlands are those which are not currently exploited (3.8% of the total) with an erosive intensity of 70 t ha<sup>-1</sup> y<sup>-1</sup> [20]. Geoarchaeological analysis conducted on exposed paleosoils in the same area confirm that between the 1st millennium BC and the 1st millennium AD the territory was characterised by stable environmental conditions with localised, low-energy erosional episodes [13][18].

## ARCHAEOLOGICAL EVIDENCE

The hypothesis revealed by paleoenvironmental data and ancient plough-marks is supported by the analysis of the ancient settlement patterns in the study-area, particularly, of diachronic changes in the spatial correlations among ancient rural settlements; a method commonly used for measuring anthropic reaction to environmental changes [21]. If, as has been claimed, excessive anthropic pressure degraded the local environment by accelerating soil erosion processes, the people who occupied and exploited the northern slopes of Bieta Giyorgis hill would have been compelled to abandon the degraded portion of their territory and relocate to more productive areas. Such relocation should be archaeologically detectable in the spatial segregation of sites from adjacent chronological periods, by a reduced number of settlements in the degraded area and increased settlements elsewhere. In the absence of erosion or environmental degradation, an economically productive area will be continuously exploited and the distribution of the settlements will remain relatively unchanged. Quantitative analysis and statistical measures of temporal and spatial correlation of residential sites have been employed to evaluate the extent of settlements relocation. Nearest-neighbour (NN) analysis is presented here. The NN coefficient is the ratio of the average distance between the nearest neighbours among a set of points, and the expected average distance if the same number of points were randomly distributed within the same area [22]. Values around 1.0 indicate a random distribution; values greater than 1.0 indicate spatial segregation; values less than 1.0 indicate a concentrated distribution with a high rate of spatial aggregation. In the present study, the coefficient of spatial correlation was correlated with the diachronic changes in the number of settlements recorded in the study area and in the wider Aksum territory.

Diagram 1 shows a spatially aggregated distribution of settlements during the 1<sup>st</sup> half of the 1<sup>st</sup> millennium AD with a NN coefficient reaching its lowest value (and thus the peak of spatial aggregation) during the Middle Aksumite period (ca. 350-550 AD, “Aksumita Medio” in the diagram). This apparently confirms the hypothesis obtained from geoarchaeological, paleoagricultural and erosional evidence, that despite intense demographic pressure and constant agricultural exploitation, Aksumite management system effectively minimised soil erosion along the north-eastern slopes of Bieta Giyorgis.

A slight decrease in settlements’ aggregation occurred between the end of the Middle Aksumite period and the Post-Aksumite period (ca. 550-1100 AD, “Post-Aksumita” in the diagram). This phenomenon may have been related to a demographic decrease which affected the entire area of Aksum during this period [17][18][23]. Whatever the cause of this demographic decline, progressive abandonment of the area may have accelerated soil erosion.

Geoarchaeological evidence suggests that, between the 7<sup>th</sup> and 8<sup>th</sup> centuries AD, the territory of Aksum conurbation was subjected to severe environmental degradation [3] and that, towards the end of the 1<sup>st</sup> millennium AD, the entire Tigrean plateau was affected by a period of environmental instability probably due to a phase of greater aridity [6]. The abandonment of areas within this territory may have resulted from the interaction of ecological, economic and/or social nature factors.

Diagram 1 – NN coefficient in the area of Aksum.

## FINAL REMARKS

Although present-day military actions strongly contribute to regional environmental degradation processes by forcing communities to abandon some areas, famines caused by drought, invasions of locusts or epidemics, are to be considered as well. These problems are not limited to recent history. Eastern Africa appears to have been affected by plague at least since the 6<sup>th</sup> century AD [17][23], when, according to Procopius, the so-called “Justinian Plague” spread from northeastern Africa to the whole of the Mediterranean [24]. Famine on the Tigrean plateau, as recorded in local and foreign chronicles, goes back at least to the 8<sup>th</sup>-9<sup>th</sup> century AD, and that the phenomenon has periodically recurred ever since [25]. The consequences of epidemics and famine on farming and on the organisation of the rural communities are well-known from ethnographical observations. As well as the loss of human lives and livestock, famine and epidemics reduce the energy of the farming communities and leads to the destruction of natural resources culminating in weakening social structures and the abandonment of populated areas. This process, which has been extensively studied by anthropologists and historians, is characterized by four phases: a) reduction of consumption; b) temporary migration, generally limited to the head of the family; c) exploitation of natural resources; and d) migration of the entire household [26]. In the most severe cases, the central government uses the mass relocation of entire communities from the areas strongly affected by the disease to less densely populated regions as a long-term solution to the problem of soil depletion and food starvation.

To conclude, the case-study here presented demonstrates that combining archaeological evidence, environmental and historical data, and ethnographical observation permits a long-term reconstruction of human-environmental interplay, the identification of ancient strategies of land exploitation and the investigation of how ancient communities faced environmental degradation. These insights may help to define the trajectories through which the present situation has emerged, to increase our knowledge of the possible causes of present-day environmental problems and, perhaps, to contribute to the design of future strategies for sustainable land-use especially in those areas, like the northern Ethiopian highlands, where many activities of daily life are still practiced by using traditional knowledge and equipment.

## THE CASE OF ZIMBABWE BUSHPUMP LIKE A SOCIO-TECHNICAL NETWORK

Federico Silvestri\*

\*University of Florence, Italy - [silvfede@hotmail.it](mailto:silvfede@hotmail.it)

### ABSTRACT

The paper presents a case study on the Zimbabwe Bushpump, a manual pump used for water supply in rural areas of Zimbabwe.

Assuming a point of view located, relational and dialogic, through ethnographic analysis of social practices, the analysis develops the concept of "fluidity" to indicate the variability, adaptability and flexibility of the operation of this technological artifact, as well as multiple identities it represents: subject to simplified mechanical, hydraulic system, installed and maintained through the collective participation of the community, but also hygienic intervention for the protection of health and the foundation of the process of nation building.

Through the analysis of the relationships between the technical object and the subjects involved in its design, installation, maintenance and use, we propose a reading of technology interrelated social environment, to demonstrate how social and technological realities are co-emerging from processes and negotiation practices.

The object is described as a collective product, defined by the network of relationships that keep it in place, demonstrating that the fate of a project depends on the resilience of these associations.

In the belief that the meaning of an intervention for development cooperation derives from the ability to take charge of contingencies and local specificities, it is proposed, therefore, the adoption of a normative "travel", adapted and modified to different contexts, or too fluid.

### INTRODUCTION

This paper intends to present the contribution to broader thinking on development cooperation and technology transfer as part of a case study done by Marianne de Laet and Annemarie Mol [9], whose goal is to analyze the particular quality of the technological artefact for the use of water resources. The authors, originally engaged in a research project on the path of patents within the countries in the developing world, arrived in Zimbabwe, have the opportunity to appreciate a remarkable piece of technology: the Zimbabwe Bushpump, a volumetric manual pump for uncultivated land that is characterized not only by the rapid spread of its facilities, including the fact that it was never recorded any patent<sup>1</sup>.

The supply of water resources in Zimbabwe takes place mainly through four models of water pump, cylinder heads from the Blair Research Laboratory in Harare, which differ in their technical characteristics and use. However, the intent of the study by De Laet and Mol is to formulate a set of theoretical statements using empirical materials - interviews with health professionals, experts in patents and manufacturers of pumps, visits to factories and research institutes government - about the nature of the technical object and its relations with the subjects and local practices.

The Zimbabwe Bushpump is the flagship of a policy of intervention that can be considered successful. First, because it effectively allows to make available clean water to rural areas of the country thus contributing to the health of the nation. Its mechanics has become the standard in the field of government water systems and its image is imprinted on the national currency. Its use is also being promoted by UNICEF in other countries such as Namibia, South Africa and Swaziland. However, as discussed by the authors of the research, the fact that a pump is or is not good depends on something more of the technical characteristics.

In this way, the study of Zimbabwe Bushpump is, in the opinion of the writer, relevant to development cooperation as the issue of technology transfer also involves the question of the "nature" of technology<sup>2</sup>. So, if in the conventional formulations the nature of the technical object is considered to be stable and fixed, this assumption is questioned here by using the metaphor of the "fluidity". Developing the theme of the fluidity of the object, in fact, the authors intend to offer a perspective opposed to analytical research of a specific nature, fixed and specific technology, ontologically distinct from the context in which it's inserted.

Through ethnographic investigation of the organization of social activities, able to take into account the multitude

<sup>1</sup> The materials of the search are collected in an essay originally published by the authors in the journal *Social Studies of Science*, April 2000. A revised version is published in Italy on the book by Alvise Mattozzi, *The sense of technical objects*, 2006 Meltemi.

<sup>2</sup> The question of the "nature of technology" is discussed by historians and sociologists of science and technology with the intention of detecting the critical importance of the social dimension in techno-scientific processes, including the action in the analysis of relevant social groups in the crystallization the technical artifacts. For a first review it against Bijker, Huhhes, Pinch, edited, *The Social Construction of Technological Systems*, 1987 Cambridge, MIT. Press.

of stakeholders around the object, is offered a detailed description of the tests, the successes and failures of the design, management and use of this particular manual pump for the water supply. The thesis of fluid is carried out emphasizing the collective nature, distributed and negotiated the technical object and showing that, although the Zimbabwe Bushpump is visibly a solid object and mechanical in nature, nevertheless “*its borders, rather than being clearly defined and stable, are vague and constantly moving*” [9: 157].

## HOW TO DEFINE THE ZIMBABWE BUSHPUMP? THE FLUIDITY OF BOUNDARIES

In Zimbabwe, water is scarce and the issue of water supply is one of the most critical for the development of the country. In many areas the Bushpump existed for more than half a century and its spread has been encouraged and supported by the programs of government policy for water resources. The current model, the type "B" produced by V & W Engineering in Harare under the charge of Dr. design. Peter Morgan, is therefore the result of improvement practices of an old manual water pump subjected to numerous adaptations and changes over time.

This mutability and variability are a first element to support the view of the fluidity of the object pursued by the authors in the attempt to analyze the specific qualities of this pump and its field of action.

Designed to be a simple object and durable, the Bushpump is composed of several parts. Those visible, above ground level, and those not visible, relative to the hydraulic system underground. But, as we will see, the Zimbabwe Bushpump is part inside a socio-technical network much larger, representing a node in a loop composed of multiple heterogeneous elements interconnected.

The current model offers above to view a harmonious design and inviting, able to convey messages of meaning: a blue color, which evokes the purity of water that provides a compact and essential that invites you to a simple to use. The unit water discharge - the upper part of the well - is formed from a base of steel bolted to the frame plate to protect the hole in the ground and by a lever, a wooden body fixed in a flexible manner to the pump body. The mechanical components are made of steel and wood to increase the durability of the object and at the same time make it a cheap product.

The pipeline slopes, composed of a series of technical elements functional to the instrument for pumping water from the soil and bring it to the surface, however, remains invisible since placed under the ground level. Here, in the place chosen, following the drilling of an artesian well, we proceed to install the hydraulic components: cylinder, piston, valves, bars lifts.

The borders which define the Zimbabwe Bushpump are however not limited to the aesthetic shape that characterizes it. The Bushpump is a technology with the aim of safeguarding and raising the level of health of the population. It does not just make itself available as a source of water that is otherwise inaccessible, it becomes a source of clean water, healthy. To ensure the hygiene and health of the water, a series of preliminary works are to be made: the installation of a frame that ensures the impermeability of the well to pollutants and sealing of the pump to prevent water poured on the surface.

So, for the pump to be defined as such and provide clean water to rural areas where it is located must be assembled and installed correctly. For this reason, a detailed set of instructions, illustrating the various components and describe the stages of construction - by carrying out preliminary work to put into use the object - accompany the transfer on-site pump distributed by V & W Engineering. A distinctive feature of this paper is that both the preliminary works that the installation and commissioning of the Bushpump are usually made by future users, local village to which it is addressed. Not only that. The same mechanism of hole drilling for water used, the rig manual Vonder product is made in the same factory where the Bushpump, is designed to be operated on a Community basis. The total drilling with the participation of the village community, where men sit on the axis of the drill to deepen while women pushing, turning around and punching the ground up to the proper depth.

Is through this involvement, this collective participation that the community appropriates the object and builds trust necessary for its maintenance<sup>3</sup>.

The involvement of the village, the authors remind us of bringing the views of technical experts interviewed, it is an essential feature for both the preliminary works and for the act of drilling for proper installation, operation and proper maintenance of the pump. In addition, in the person of the legitimate "nganga" the water diviner, the village contributes to the choice of site. So, unlike other development programs in which the excavations are conducted by NGOs and governments determined to maintain decision-making power on Intervention and implemented solely on the basis of geological surveys, in the instruction manual mentioned above is clearly stated the importance consultation of local water diviners to decide the location of the water outlet hole.

Shared ownership and collective responsibility are essential characteristics of Zimbabwe Bushpump. It is considered much more efficient as more capable of uniting people around him, to become a node in a larger network involving the social collectivity, a socio-technical network.

This technical artifact is part of a concrete political intervention that consists of a technology suitable for the

<sup>3</sup> The instruction manual states as the pump is designed so that the villagers can play by yourself maintenance [26]. The importance of taking into consideration the culture of the local community was reiterated on several occasions especially in reference to the need for consulting the "nganga" or water diviner.

purpose and placed at the service of the community, which reinforces the cohesion, improves health and helps to overcome the inequality on the division between those who, in population has access to water and who is excluded. This orientation has gradually become part of the national water policy and Zimbabwe Bushpump has become the standard model chosen by the government program in order to achieve water infrastructure capable of integrating the various village communities in the nation. Designed and built locally produced materials available in the country and incorporated into the local community, the boundaries of the pump have become those of a whole nation<sup>4</sup>. Zimbabwe is the only African country to produce its own pump.

The Zimbabwe Bushpump is defined by a multiplicity of different frames in connection between them. Therefore, to offer a definition, reference should be made to the fluidity of its multiple boundaries: it is a mechanism for the extraction of water, a hydraulic technique, but also a device for the maintenance of hygiene and public health. Its essential parts, besides the technical features, appear to be the mechanism and procedure for drilling, instructions to be followed during installation and maintenance, as well as the village community to which the entire process.

## HOW DOES ZIMBABWE BUSHPUMP? THE QUESTION OF AGENCY

Interestingly, the authors, describe in the fluidity of Zimbabwe Bushpump, articulate their text in symmetrical parts, where a first section dedicated to the pump as an argument in key physical-mechanical, sanitary and hydraulic national policies, useful in clarifying the definitional aspects of the object, corresponding to a next portion, which describes the operation, in which each of the preceding arguments is considered as a field in which the distinction between subject and object becomes fluid, revealing the continuous adaptations and associations between the technical and the social.

Since it is an effective technology to Zimbabwe Bushpump acts, works and continues to do so. The authors report the impressions of Dr. Morgan that, during the monitoring visits, proves surprised by the unexpected adaptability of the pump, which is able to operate even with defective or missing parts. The pumps, in fact, are not identical to how they are delivered, they are turned "on site" at the way in which users will repair the parts and they fit mechanisms. Worn gaskets and bolts skipped do not affect much on the operation of the pump that is wonderfully effective due to the repair with other materials produced by the ingenuity of the users of the village. The elasticity and flexibility of which is equipped with this technology allows so to adapt and run longer.

From the hydraulic point of view, the Bushpump reveals an unexpected fluidity compared to other models of water pumps. This is related to the ease of repair of those items which, although installed under the hole of the pit, have been progressively made less rigid and easily removable. The possibility of removing the lower parts of the device without having to remove the entire pump and thus risk of damage, and on-site repair or replace damaged parts without the need for skilled workers, gives the double benefit of reducing the costs and involve the community room that can be responsible for the repair. The changes made over time to the hydraulic components that make it up - pipeline lifts wider and thinner bars - increasing the fluidity and smoothness of the connections between these, make Bushpump, perhaps an object less rigid and less solid, but still more serviceable, then better in the long run.

A spring technology (mechanical repair, hydraulic components easier to replace) and permeable to the action of users proves to be able to adapt better and more effective to the contingencies of daily living in which it is located to act: through a more fluid design changes and the Bushpump turns constantly but the efficiency can remain unchanged.

What to say, however, about the effectiveness with respect to health? Recall that the goal is to supply Bushpump rural areas of pure water, clean and pristine. The hygienic aspect is an integral part of the intervention of Bushpump in Zimbabwe and that is what makes it attractive also for other parts of Africa. To answer this question, we must mention the existence of international quality standards for water - prescribed by the International Reference Centre for Community Water Supply and Sanitation - with which to make comparisons, but it is necessary above all to admit that the operations of measurement and comparison with these universal standards are difficult to apply in contexts such as Zimbabwe. The conditions observed at a well can easily vary over time and are never the same as found in other wells. However, health issues require to be addressed in practice by comparing concrete alternatives. It is thus that it is not appropriate to try to establish if the Bushpump safeguard the health on the basis of a universal standard, fixed once and for all. Would, if anything, more fluid required standards, able to collect the variability of concrete local situations. As for the mechanism for producing health the pump works in different ways and with varying degrees of success: between efficiency and inefficiency, between security and infectious contamination "*there are many intermediate situations, [...] we are once again in front of smooth transition*". [9: 192].

The criteria for the success of a technology, or more generally of a development project, cannot be clearly defined in advance. If the Bushpump Zimbabwe has a multiplicity of fluid boundaries, the evaluation of those activities should be equally smooth. In this way, there are also good reasons to think that a policy intervention more flexible, fluid and editable, you may be better able to deal with local contingencies. The Bushpump needs to function, and to continue to do so, to gather around him a community, usually represented by the village to take care of it. If this condition does not occur, if the reference group of the government program is too small or too large, the pump may cease to act altogether.

<sup>4</sup> In 1987, the National Action Committee of the Government of Zimbabwe decided to standardize hand pumps as part of the water distribution in rural areas.

But even if unused, the Bushpump, thanks again to the fluidity that is attached, can be transferred to some other place, in the course of work by changing the organizational unit of reference of the intervention. In certain cases, passing by the size of the village to that of the extended family, for example, it is possible to put the pump in the condition of most interest relevant actors, and then to continue to function.

In a sense, from the description of the authors, the Zimbabwe Bushpump is better understood when represented as a project and not as an object in itself, separate from the context in which it is immersed. The object-pump actually exists at a given time  $t$ , as if it were a still image in the film project. But it is never equal to itself, acting in continuing association with the practices of other actors forming a network socio-material. The pump acts on the social environment, incorporating it and modifying it, in the same way as the environment exerts an action in more ways than one on the pump. Rather than an object by rigid boundaries and well-defined, radically distinct from the machinations of relationships that involve, it is perhaps more appropriate to think the Bushpump as a hybrid socio-technical system, an assemblage of material and social elements together, the crossroads of the dynamic interconnections that define the existence at any given time. From this point of view, assuming therefore the fluidity as a key and as a characteristic inherent to the technology itself, it is reasonable to say that the pump works, has a role in the construction of social reality, changing, and this is simultaneously changed because his competence is evident from the performance of which in turn is capable.

### STS AND ANTHROPOLOGY COMPARED: A STANDARD OF "TRAVEL"

The study by de Laet and Moll on Zimbabwe Bushpump exemplifies the importance of the contribution of human and social sciences can offer to the reflection on development cooperation and technology transfer, in the belief that enlarged perspective, able to take into account the relationships and local specificities involved in a project, is necessary for the success of the intervention.

The argument put forward by the authors differs from traditional analysis technology, which explain the effectiveness of an artifact exclusively through its own intrinsic characteristics, and deliver a linear image of technological innovation, the introduction of which necessarily follows the transformation of 'social environment (if able to comply with it). In traditional approaches, technology is seen as a company that stands for quality and logical that ignore the social context [23] and that spreads in a linear and diffusive, or evolutionary, such as an inertial motion of techniques aimed towards the success.

The study of Bushpump shows us a different story, in which technological development is part of the social process, and in which technical change and social change are read as two sides of the same coin. Describes a path multilinear innovation where the social groups concerned contribute to the stabilization of the artefact through a complex trading practice between them and with the artifact itself. The methodological strategy and analytics with which we presented this case study reveals an empirical approach, contextual, and centered on a problem spatio-temporally located. The authors refuse to explain the fate of the project by invoking mechanisms of "technical necessity". These factors need to be studied in their concreteness and tangibility.

By postulating a radical relationality, it seems appropriate to re-establish the reflection on Bushpump analysis offered by the so-called "French school" of STS [5]. With this wording, which can be read as Science and Technology Studies, or as a Science, Technology and Society, it implies an approach that comes in opposition to the minimalist way, deterministic and utilitarian technology, in the name of a vision capable of asserting the character proceedings, collective negotiation and socio-technical innovation.

According to the assumption that objects have a role in the construction of social reality, as they are socially constructed by practices that they help to establish [17], the Bushpump is not evaluated in terms of utilitarian and functional, represented as a medium or because its social impact. It can be rather defined as an "actant" (Greimas & Courtes, 1979), a term borrowed from semiotics to refer to any entity that has an active role in defining the situation, is amended by amending and relationships that develop around it.

In an attempt to demonstrate how social and technological realities are co-emergent processes and trading practices, the technical artifact is taken as a collective product, defined by the network of relationships that keep it in place. In this sense, the fate of a project depends on the tightness of these associations. If the network of associations for any reason is not maintained, if the project is not open the necessary negotiations and changes about its status of objectivity, it's not quite fluid and flexible, then its reality is less and the operation fails.

In this way the Bushpump can be described following the route of the associations - between objects and subjects that compose it-and it can continue to exist if and only if it is proved capable of coagulating this association. In fact, remember that the success of an intervention depends on the installation of the pump, rather than the pump itself, its maintenance program, which in turn depends on the community of which is to run it. The Bushpump needs of a community that you take care of the maintenance and at the same time helps to establish this community. It is through development projects such as the one that includes the Bushpump Zimbabwe, which the local authority assumes consistency reassert itself as a community, attributing the material properties of the object and acquiring equipment that becomes part of its social order.

The Zimbabwe Bushpump successful, as a source of water, the guarantor of health, community builder, builder of a nation, as a collective instrument. The difference between a good and a bad technology based on the collaborative

effort then common.

Unlike traditional studies on technology that see the individual genius the origin of technological innovation that then spreads to the rest of society, postulating a kind of force of inertia to which the artifacts will propagate by virtue of their efficiency outside of their production context hampered or incorporated in different social contexts<sup>5</sup>. The Bushpump is described rather as a fluid project engineering collective, result of an evolution in time, whose realization and efficiency-and therefore also its transferability-depend on the degree of involvement of users. This, as we have seen, is locally developed and is in the public domain, belonging to the community that runs it.

The authors remind us that the users do not pay the right to use it as it was not expected it to any patent. Dr. Morgan who also has a lot of work to improve the Zimbabwe Bushpump, so it can be considered the father of type B, this has never claimed authorship because the pump is not the result of a single man, but of a collective action distributed which depends on the involvement of other stakeholders. So, leaving the control center, even its builder appears fluid, "*dissolved in the various areas of which he himself and the pump are part*" [9: 201].

There is an actor, not even the most brilliant engineer who can be referred to as the inventor of the Bushpump. All actors have a role in the collective work and, in particular, absorption by the artifact of forms and tasks from trading [22].

Highlighting the fluid nature of this technical object and the path contingent and socially co-constructed technological development, the authors are developing an anthropological model applied to the technique, with ethnographic gaze, joint analyzes the evolution of technology and society, mending context and content into a single fabric, assembly socio-technical system. In this case, then, the pump represents the social bond and material. The Zimbabwe Bushpump technology is responsible for building a nation and at the same time Zimbabwe as a nation is the pump manufacturer since it oversees its facilities: "*this pump helps to build Zimbabwe Zimbabwe to the extent that builds*" [9: 178].

The technology is a social product, but at the same time, the social context is produced by technology. By virtue of this process of mutual definition between technology and society is eliminated any causal hierarchy, so that artifact and social environment are seen as products, however, unstable and continually renegotiated, a network of associations between entities heterogeneous human and non-human, technical and cultural (materials, individuals, communities, state, health policy and development).

Underlining the interconnections between subject and world, technology and culture, through the notion of fluidity is highlighted, on the one hand the flexibility of the definition of the pump and the variability of its perimeter, on the other the contribution of this object in the shape the world of social relations. In the face of such complexity of social life, the Zimbabwe Bushpump, seen in this light, offers, if not the precise criteria for a technology development project, at least one method of observation that, through a sort of "estrangement anthropological, "in which the participant observer puts what is given in brackets for granted by his own culture, may prove to be able to grasp the specificities and both technical and cultural nuances of the actors involved, human and technical resources.

For these reasons, instead of an analysis that radically distinguishes the nature of an object by the recipients of an intervention, it is preferred to read the history of Bushpump as a case of collaboration between technology and society in a continuum of changes that define fluid both. Not that it was dashed a generalized idea of universally valid normative able to state that the principles of this development project are automatically transferable elsewhere. There was even recommended the adoption of a culturalist approach closely and pluralistic, founded an epistemology of points of view capable of taking into account the multiplicity of values and interests at stake, this because the same points of view are not stable defined from the outset, but tend to change the present circumstances and to be articulated in different ways in the course of the project.

In the name of non-hegemonic anthropology, the lesson that can be drawn from this story is to adopt a standard of so-called "travel", fluid and adaptable to different circumstances, be able to grasp the network of relationships that involve objects and associated subjects, technologies and human groups that interact. The success of a particular artifact cannot be used to explain the goodness of that process determined its character as a good practice, but we need to compete with the collective processes and hybrid production and articulation of socio-technical devices.

## CONCLUSIONS

In conclusion, it was considered useful to present the case study of Zimbabwe Bushpump as through the metaphor of fluidity we have tried to do justice to the many areas of society called into question by a development project that has made the foundation of a particular technology social bond, a node in the network of relationships which, thanks to it, making it more durable stabilize the whole association. It is as if the feature and the very notion of fluidity conceded almost paradoxically a surplus of force capable of consolidating the socio-technical assembly. Through this reading you are considered the many aspects that make the Bushpump a fluid technology. In fact, this item is not uniquely defined by its technical characteristics, but is equipped with fluid boundaries consist of multiple identities: one mechanical

---

<sup>5</sup> This is the so-called "diffusion model" for the interpretation of technological innovation. In such a model, which maintains separate technical fields from the social, the analysis is based on a principle of causality of the former over the latter, so that the successes are attributable to the intrinsic characteristics of an object and failures are reported to the lack of adaptation of 'social environment.

object, but also the hydraulic system to safeguard the health, installed and maintained by the community of users and around which constitutes the entire nation.

The fluidity of Bushpump is read primarily as variability over time. Its evolution shows that the object has its own historicity, then variable ontology that draws a range of processing capabilities. Moreover, fluidity becomes synonymous with flexibility and elasticity of sealing of the technical characteristics of the object, it indicates the high degree of adaptability and repairability obtainable with maintenance. Incorporating the possibility of its own break down, Bushpump appear to be sufficiently malleable and durable in the long term.

Another aspect related to the fluidity of this technology is that the relative response to its success or failure is a matter of degree. You cannot determine if the object is effective or not using dichotomous responses, it takes standard fluids, observable in the multiplicity of contexts in which the pump acts (technical, functional, political, health). In this context, a policy of ongoing development capable of modifying its own program of action and to adapt fluidly to local specificities and local contingencies, able to take into account all the elements associated with the network of social relations materials a specific environment, it may prove more fruitful in terms of empowerment and continuity of development over time.

A more fluid intervention, suitable to give space to the methods by which the different actors relate to the object in question, it could be a guarantee of the involvement and empowerment of local actors, on which much of the outcome of the project. In fact, the meaning of an operation for development cooperation, as can be seen from the history of Zimbabwe Bushpump, derives from the ability to take charge of contingencies by a community that, in fact, cooperate for one or more common goals.

The implementation of a technical project escapes an idealized vision of technology and technology transfer that interprets the realization as a mere diffusion of artifacts from individuals. Technological development is not a linear direction, there is always a portmanteau between the project and its implementation, since each device must fit within everyday routines and practices, to be matched with users, who typically change their routine but also change the artifact [6], in varying degrees to the degree of fluidity of the latter. For this reason it was considered useful to refer to Zimbabwe Bushpump not as an object itself, with the force of inertia, but as a socio-technical assembly in which the behaviors of activity differentiate converge, cooperating evolution of a hybrid process of association.

## LANGUAGE USES VS. LANGUAGE POLICY: SOUTH SUDAN AND JUBA ARABIC IN THE POST-INDEPENDENCE ERA

Stefano Manfredi\*, Mauro Tosco<sup>o</sup>

<sup>o</sup>University of Turin, Italy - [mauro.tosco@unito.it](mailto:mauro.tosco@unito.it)

### ABSTRACT

The paper summarizes the language and educational policy of the Republic of South Sudan against the backdrop of a sociolinguistic survey conducted in Juba, South Sudan, in the months of July-August 2013, and aiming at a better understanding of the role, uses and beliefs surrounding the use of Juba Arabic, an Arabic-based pidgincreole widely used in Juba and in a wide part of the newly independent country. The results highlight the fact that, although the government of the newly independent country does not recognize the very existence of Juba Arabic, this is the real lingua franca and the most widely spoken language. In a parallel way, although Arabic, the former official language, is not granted any special role and status, it still acts as the de facto "high variety."

### FOREWORD: LANGUAGE IN THE SOUTH SUDAN<sup>1</sup>

This is very much the report of a work in progress, and for two different reasons: the first and usual one is the preliminary state of our data, collected in Juba, South Sudan, in July-August 2013. The second, and most important one, is the very undefined and unstable political situation in the South Sudan.

South Sudan is widely known in the general press as the youngest nation-state, having acquired its independence on July 2, 2011. It is formed by the three historical provinces of South Sudan, dating back from the colonial times: the southernmost one, Equatoria, and, to the northwest and northeast respectively, Bahr El Ghazal and Upper Nile. The newly independent state, following various administrative reshuffles during the Sudanese times, is formed by 10 "states:" Western, Central and Eastern Equatoria; Warrap; Jongley; Lakes; Unity; Upper Nile; Western and Upper Bahr El Ghazal.

The linguistic picture is quite complex; *Ethnologue* (<http://www.ethnologue.com>) counts 68 spoken languages and three additional extinct languages. From a classificatory linguistic point of view, most languages in the country belong to the Nilo-Saharan phylum, a minority to the Niger-Congo phylum. From a communicative point of view, it seems safe to say that no single language, local or foreign, is shared by the totality, or even a majority of the population. It is apparent, nevertheless, that some form of Arabic has enjoyed such a role since at least the late 19th century and still is the most widespread medium. Which variety of Arabic is more difficult to say: broadly speaking, one can distinguish between a "simplified" variety of Sudanese Arabic (generally referred to as *árabi al besít*), used in the northern parts of South Sudan (around Malakal) and the West (centered in Wau), and a quite distinct language, usually called Juba Arabic, or, in Juba Arabic itself, *arábi júba*. The latter is traditionally labelled a pidgin, but a better label would be a pidgincreole (as per Bakker 2008) borne out of the contact between Sudanese Arabic and the local languages in the second half of the 19th century (cf. Owens 1985 for a general overview of the genesis of Juba Arabic, as well as Owens 1996 and Tosco and Manfredi 2013 for an overview of Juba Arabic within the Arabic-based pidgins and creoles). It is the status of this variety which was the object of our fieldwork.

The Provisional Constitution of South Sudan does not list each language and ethnic groups. In its Article 6 it states:

*All indigenous languages of South Sudan are national languages and shall be respected, developed and promoted.*

*English shall be the official working language in the Republic of South Sudan, as well as the language of instruction at all levels of education.*

On the other hand, the constitution of the single states of South Sudan may flatly contradict the central government's one; e.g., the Interim Constitution of Central Equatoria (hardly known in South Sudan itself) states inter

<sup>1</sup> Fieldwork in South Sudan was made possible by a grant from the Italian Ministry of Education, University and Research (MIUR) within the FIRB project "Areas of Linguistics and Cultural Transaction in Africa (*AtRA*). The research was done in partnership with the Department of Arabic of the College of Education at the University of Juba, and in particular its Director, Prof. Siham Osman. We thank her for her assistance in acquiring the entry visa to South Sudan and in making our research possible in the first place. We also thank Claudius Waran Patrick and Sara Bojo Lokudu for their precious help; the Embassy of France and the Ambassador, M. Christian Bader, for their logistic and practical help, and countless other individuals and institutions. All errors and omissions are our exclusive intellectual property.

alia that both ‘English and Arabic shall be the official working languages at all levels of the government of the State as well as languages of Instruction for higher education,’ and that ‘Bari shall be an additional official working language or medium of instruction in Schools at the State level.’

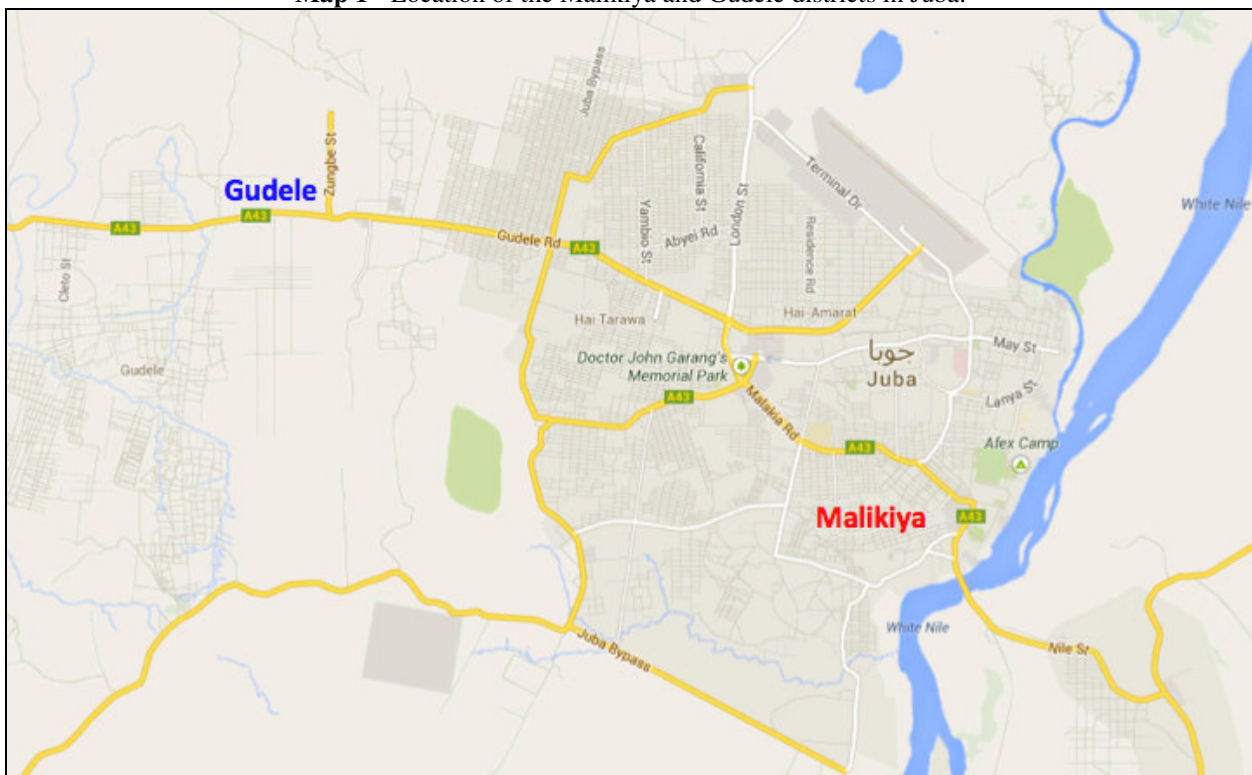

Provided that education in South Sudan is by and large in English, and that locally either Arabic or an indigenous language is used (the latter, in the first years of the primary school), the Government of South Sudan’s educational policy remains unclear, nor did various interviews conducted at the Ministry of Higher Education shed much light: primary education in a number of local languages is planned, but neither the exact number of the involved languages (Dinka, Nuer, Shilluk, Bari, Zande, and possibly a few others being the most likely candidates, due to the relatively higher number of speakers) nor a timetable were available to us. Most importantly, it is not clear *which* language will be taught *where* and *to who*. Education in the local language is planned for the first three years of the primary school, with English being introduced in the fourth class. If education in the local language will then be dropped altogether, or the language will be taught as a subject, is equally unclear.<sup>2</sup>

What is clear, on the other hand, is that Arabic is generally ignored at the official level – although, being much better known than English, it is very much in use practically, and probably at any level of government. The same applies to Juba Arabic, the pidgincreole which is the everyday language in the capital, Juba, and in much of the country; things are actually worse, because Juba Arabic is itself an exclusively oral language and it is not standardized at all. What do South Sudanese think about this language? How do they rate its degree of independence vis-à-vis Arabic (its main lexifier)? Even more: how do they use it, when and with who? Our research was aimed at providing a few preliminary answers to these questions.

## THE SOCIOLINGUISTIC SITUATION OF JUBA

The first part of our fieldwork was spent on a qualitative evaluation of the degree of multilingualism and the linguistic uses by means of a sociolinguistic survey. In order to assess the status of Arabic in Juba, two districts were chosen: Malikiya (alternative spelling: Malakiya), the heart of “old Juba,” traditionally inhabited by ethnic Bari and mainly Muslim; and Gudele (alternative spelling: Gudelle), one of the new residential areas extending to the West of Juba town.

Map 1 - Location of the Malikiya and Gudele districts in Juba.

Within each district 50 households were investigated and their members (with the obvious exception of infants) interviewed. This resulted in a total number of 314 interviews (190 Malikiya and 124 in Gudele; 12 additional

<sup>2</sup> Actually, the present-day South Sudan language policy finds its origins in the guidelines proposed by the Navaisha Comprehensive Peace Agreement (see Abdelhay 2007 for a full discussion).

interviews in Gudele were disregarded for the purposes of the present study). The higher number of interviews in Malikiya stems from a higher ratio of individuals per household (3.79 vs. 2.48).

The data also bring to the fore the very recent and still ongoing inflow of immigration: Juba is a town inhabited by young people (31.5 years in general, and 28.6 years in Gudele), and less than a half of the interviewees were born in town (36.6 of the total), while even in the historical district of Malikiya the percentage reaches 49% only. A grand total of 46% of interviewees settled after 2005 (the year of the Comprehensive Peace Agreement which brought to a substantial stop the Sudanese civil war, and paved the way to independence). Within Gudele, the percentage of newcomers rises to 74.1% – three out of four inhabitants.

**Tab. 1** - The sample.

	<b>Gudele</b>	<b>Malikiya</b>	<b>Total</b>
<b>Households</b>	50 (+12 not considered)	50	100
<b>Individuals = Ratio</b>	124/50 = 2.48	190/50 = 3.79	314/100 = 3.14
<b>Age (average)</b>	28.6	34.4	31.5
<b>Gender</b>	M 67 (54%) - F 57 (46%)	M 74 (39%) - F 116 (61%)	M 141 (45%) - F 173 (55%)
<b>Length of stay in Juba</b>			
- Born in Juba	22 (17.7%)	93 ( <b>49%</b> )	115 (36.6%)
- Arrived after 2005	92 ( <b>74.1%</b> )	54 (28.4%)	146 ( <b>46,4%</b> )
- Arrived before 2005	10 (9.2%)	43 (22.6%)	53 (17%)
<b>Education</b>			
- university	21 (17%)	62 (32.6%)	83 (26.4%)
- secondary	43 (34.6%)	68 (35.8%)	111 (35.3%)
- primary	34 (27.4%)	42 (22.2%)	76 (24.3%)
- none	26 (21%)	18 (9.4%)	44 (14%)

Juba is also, of course, highly multiethnic and multilingual (more so in the new area of Gudelle than in Malikiya). Table 2 aims at capturing multilingualism on the basis of the interviewees'.

Half of the population of Gudele claims to speak three languages; Malikiya – home as we have seen to an older couch of the population – has a slightly but significantly lower multilingualism rate, with 45.2% of the interviewees claiming to speak two languages.

**Tab. 2** - Degree of Multilingualism.

	<b>Gudele</b>	<b>Malikiya</b>	<b>Total</b>
<i>More than 4</i>	8 (6.5%)	6 (2.1%)	14 (4.5%)
<i>4 languages</i>	31 (25%)	16 (9.5%)	47 (15 %)
<i>3 languages</i>	63 ( <b>50.8%</b> )	69 (36.4%)	132 ( <b>42%</b> )
<i>2 languages</i>	21 (16.9%)	86 ( <b>45.2%</b> )	107 (34%)
<i>1 language</i>	1 (0.8%)	13 (6.8%)	14 (4.5%)

Against the backdrop of multilingualism, Juba Arabic is by large the first language for almost a half of the respondents (47%, but as many as 60% in Malikiya).

Flying in the face of an official policy of utter disregard (if not overt hostility) for Arabic and its speakers, Arabic ranks second in the list in Table 3., with almost 10% of the interviewees declaring it their first language.

Most importantly, Juba Arabic is the only medium shared by a very high portion of the inhabitants (6.37% only claim *not* to speak it, the majority of which located in Malikiya).

**Tab. 3** - 1<sup>st</sup> language.

	<b>Gudele</b>	<b>Malikiya</b>	<b>Total</b>
Juba Arabic	33 (26.6%)	114 ( <b>60%</b> )	147 ( <b>47%</b> )
Arabic	5	26	31 ( <b>9.8%</b> )
Bari	6	22	28 (9%)
Moru	11	8	19 (6%)
Zande	13	0	13 (4.1%)
Pojulu	6	6	12 (3.8%)
Dinka	5	4	9 (2.9%)
Madi	6	0	6 (2.0%)
Mundari	6	0	6 (2.0%)
Baka	5	0	5 (1.6%)
Kakwa	3	2	5 (1.6%)

Acholi	3	1	4 (1.3%)
Kuku	4	0	4 (1.3%)
Nyangbara	4	0	4 (1.3%)
Nuer	3	0	3 (1.0%)

other	2	0	2 (0.7%)
<b>Juba Arabic unknown</b>	<b>7 (5.65%)</b>	<b>13 (6.84%)</b>	<b>20 (6.37%)</b>

The use of the different languages is also revealing: Juba Arabic is present in all of the four investigated domains (even, partially, “in the public offices,” where English, the official language, and Arabic, the other de-facto high variety – which are also written media – clearly predominate). On the other hand, Juba Arabic is not the preferred medium at home, within the family: here, as expected, the ethnic language wins out. Juba Arabic is instead the preferred medium to talk with neighbours and, to a lower extent, in the market. Juba Arabic is therefore, first and foremost, the language of socialization.

## CONCLUSIONS: THE SPEAKERS VS. THE GOVERNMENT ON JUBA ARABIC

A second part of our fieldwork concerned the attitudes towards Juba Arabic vis-à-vis Sudanese (or “High”) Arabic, but also English on the one side and the ethnic South Sudanese languages on the other.

The answers to these questions were elicited through a number of interviews in Juba Arabic with a limited number of the interviewees of the first questionnaire. In total, 35 interviews for a total number of around 40 hours of recording were obtained.

In general, the interviewees agreed on the following:

- Juba Arabic is an independent language of South Sudan and *not* a “part” of Arabic;
- Juba Arabic is the main first and vehicular language in “greater” Juba (possibly in Greater Equatoria);
- although the lexicon of Juba Arabic is by and large Arabic-derived, Juba Arabic speakers in general have a very clear metalinguistic consciousness of its distinctiveness and show a positive attitude toward it (this nicely correlates to the results of a previous survey conducted by SIL South Sudan (SIL, n.d.)
- such a positive attitude towards Juba Arabic does not contrast in the speakers’ minds with a general appreciation of the other indigenous languages and of English.

It was also apparent that, by and large, Juba Arabic speakers would like to have this language taught at school and more widely used (either in Latin or Arabic script). We investigated their attitude towards the national educational policies, and in particular towards the hypothetical adoption of Juba Arabic as a teaching or subject language. In this regard, it is interesting to note that, in contrast to the state’s ideological understanding of language, according to which Juba Arabic is a form of Arabic (i.e. the only official language of the previously unified Sudan) and it therefore has no official status within South Sudan, the majority of our informants showed a positive attitude towards the adoption of what they consider their first and foremost language. In particular, they adopt a pragmatic perspective in arguing that Juba Arabic is the only means that can facilitate interethnic communication in South Sudan.

Although ideology is not absent in the speakers’ attitudes toward language(s), and it is apparent for example in a frequently heard statement about Juba Arabic being “the language which unites South Sudanese,” pragmatic considerations play a much bigger role: the speakers stress the usefulness of an already existing local lingua franca in order to surmount the communicative problems of their communicative settings.

The relative role of ideology and practical considerations is reversed in the case of the government’s attitude toward the language problem: on the one hand, the choice of English as the language of education may be supported by economic and practical considerations, while the recognition of the indigenous languages may be seen as a tactic move to prevent possible criticisms of a scarce attention to the diversity of the country. But ideological considerations are rampant in the choice of English as the sole official language of the country, although it is barely if at all known by the majority of the South Sudanese. Conversely, Arabic, which, in one form or another, is widely used as an interethnic medium, is utterly disregarded. Indigenous languages are paid lip-service in the Constitution, but Juba Arabic, as a “non-ethnic” language, is not even acknowledged.

## Imagining cultures of cooperation: Universities networking to face the new development challenges

III CUCS Congress  
Turin, 19-21 September 2013

### **Formazione linguistica e interculturale: i laboratori di francese per studenti non italo-foni e di lettura comparata dei miti letterari**

**Patricia Kottelat  
Laura Rescia  
Monica Pavesio  
Università degli Studi di Torino**

#### **Abstract**

#### **Obiettivi**

Il Dipartimento di Lingue e Letterature Straniere e Culture Moderne dell'Ateneo torinese ha da tempo orientato le proprie attività di didattica al dialogo interculturale e interlinguistico. Creare culture della cooperazione nel nostro ambito significa valorizzare le singole e diverse appartenenze, compresa quella del docente, accettando di rimettere in discussione il punto di vista dell'istanza formatrice, non più eurocentrica, bensì disponibile ad attuare strategie multifocalizzate. Il percorso di apprendimento diviene così vettore di consapevolezza della propria *identità multipla*, ai fini di contrastare l'emergere di localismi e/o nazionalismi, e fenomeni di ripiegamento difensivo nella propria comunità di appartenenza.

#### **Metodologia**

#### **Il laboratorio di francese per studenti non italo-foni – dott.ssa Patricia Kottelat**

Attivato nell'anno accademico 2010-2011, il laboratorio di perfezionamento di lingua francese per studenti non italo-foni si rivolge a studenti francofoni africani provenienti dal Maghreb e dall'Africa subsahariana. Concepito inizialmente per colmare i bisogni e le carenze linguistiche di questa nuova tipologia emergente di discenti, il laboratorio si è rivelato un terreno di sperimentazione di cultura della collaborazione, agendo su tre livelli: quello linguistico, per il rafforzamento delle competenze comunicative scritte e orali; quello sociolinguistico, che consente la presa di coscienza delle interferenze multiple dovute al contatto fra le lingue, il riconoscimento del plurilinguismo e dei problemi ad esso collegati; e, infine, quello interculturale che, a partire dalla matrice francofona comune, tramite l'identificazione delle variazioni linguistiche e culturali del francese, attiva una dinamica interculturale di valorizzazione delle identità multiple dei discenti.

#### **Il laboratorio di lettura comparata dei miti letterari – dott.ssa Laura Rescia e dott.ssa Monica Pavesio**

L'apporto degli studi letterari e culturali al pieno raggiungimento della cultura della cooperazione può avvenire tramite l'esercizio della lettura comparata di miti letterari, a cui si intende dedicare un laboratorio sperimentale. La recente pubblicazione di inediti di Furio Jesi ci permette di ritornare sulla sua idea di *macchina mitologica*, applicandola ad una nuova ipotesi didattica. L'analisi della contestualizzazione culturale, laddove il sistema di riferimento è variabile, porta a constatare che gli elementi mitologici sono "simboli riposanti in se stessi", ovvero che non rinviano a nulla se non a se stessi (Bachofen). La scienza del mito, così intesa, rifiuta dunque la ricerca dell'esistenza di un'origine, più autentica delle altre, dimostrando che, nel suo stesso nascere e divenire funzionante, il mito non "significa" altro che se stesso. Partendo da questo assunto, la proposta di approccio a testi letterari di culture diverse, provenienti dal mondo francofono, può divenire esercizio utile per constatare il funzionamento della *macchina mitologica* e decontestualizzarla dall'aura ideologica alla cui dipendenza è spesso stata utilizzata.

#### **Conclusioni**

Attraverso il percorso linguistico e culturale, il Dipartimento di Lingue e Letterature Straniere e Culture Moderne intende offrire un contributo allo sviluppo e al rinnovamento della formazione

## **BLURRING BOUNDARIES, RESHAPING TECHNOLOGIES, MERGING KNOW-HOWS: A REFLEXIVE APPROACH TO ICT4D IN DEVELOPING COUNTRIES**

Iginio Gagliardone\*, Daniele Trincherio°

\*Programme in Comparative Media Law and Policy, University of Oxford, United Kingdom -  
[iginio.gagliardone@csls.ox.ac.uk](mailto:iginio.gagliardone@csls.ox.ac.uk)

°Dept. of Electronics and Telecommunications, Politecnico di Torino - [daniele.trincherio@polito.it](mailto:daniele.trincherio@polito.it)

Since the Millennium Development Goals first met digital media, initiatives harnessing ICTs to improve health services, empower civil society, enhance emergency response and increase the competitiveness of small producers have proliferated across the Global South. In particular, the widespread adoption of mobile telephony has been increasingly shaping aid policies and coalescing strategies of actors driven by diverse aims: Ngo's cultivating innovation for social change, businesspeople reaping profits at the bottom of the pyramid, activists seeking greater political accountability and governments (sometime) willing to concede it, but in their own terms. The emphasis on the transformational potential of the ICTs often conceals tensions arising from the encounter of different ways of knowing and of acting and from the emergence of new socio-technical arrangements in which deep-seated dichotomies are challenged: profit/no-profit; surveillance/sousveillance; civil society/uncivil society; formal economy/informal economy. Processes of appropriation and reshaping of technological innovations problematize linear views of technology transfer based on the North-South axis and call upon academics to elaborate new frameworks and methodologies to grasp the ongoing transformations.

The purpose of the panel was to promote a dialogue on the way ICTs are bridging and blurring the boundaries between opposed categories, on the expectations ICTs have spurred, and on the practices individuals and communities have already developed to make sense of the technologies that surround them. In doing so, it intended to bring to the fore approaches developed in different disciplines (from anthropology to economics, from cryptography to political science) and in different locations to understand how ICTs can be studied and understood both for the transformative potential, but without forgetting how old forms of power and domination learn to thrive in new scenarios and to appropriate new tools to support their agenda. Papers for the panel could include issues of design-implementation gaps; ICT between power and counterpower; technological gatekeeping in humanitarian spaces; controversial ICT driven social changes; hybridization of old and new technologies; changing forms of participation.

## CHINA AND THE AFRICAN INTERNET: PERSPECTIVES FROM KENYA AND ETHIOPIA

Iginio Gagliardone\*

### ABSTRACT

Through the lens of China in Africa, this paper explores the transformations in the relationship between the Internet and the state. China's economic success, impressive growth of Internet users and relative stability have quietly promoted an example of how the Internet can be deployed within the larger political and economic strategies of developing states, moving beyond the democratization paradigm promoted in the West. New evidence suggests that this model is becoming increasingly popular, but it is not clear why and how it is spreading.

Through a case study comparison of an emerging democracy, Kenya, and a semi-authoritarian country, Ethiopia, where China has recently increased its involvement in the communications sector, this paper investigates whether and how the ideas of state stability, development and community that characterize the strategies pursued by the Chinese government are influencing and legitimizing the development of a less open model of the Internet. It analyses how new ideas, technologies and norms integrate with existing ones and which factors influence their adoption or rejection. It is based on fieldwork conducted in Ethiopia and in Kenya between 2011 and 2013, where data was collected through mapping Internet related projects involving Chinese companies and authorities, analysing Internet policies and regulations, and interviewing officials in Ministries of Communication, media lawyers, Internet activists, and Chinese employed in the media and telecommunication sector in Kenya and Ethiopia.

Since the third Forum on China-Africa Cooperation (FOCAC), which took place in Beijing in 2006, the Chinese media have begun a steady march to get closer to Africa and to gain influence in its mediasphere. This process has displayed signs of continuity and discontinuity with China's previous attempts to influence ideas and perceptions on the continent. It has included both old and new communication technologies, and has developed through a mix of bold policy decisions as well as trials and errors.

The relocation of the Regional Editorial Office for Africa of the state controlled news agency Xinhua from Paris to Nairobi in 2006 represented the first symbolic step of this new strategy.<sup>1</sup> The same year, China Radio International also began to seek partnerships with national broadcasters in Africa to relay some of its content and make it more accessible to local audiences [3]. The expansion of traditional media has been followed by some unprecedented initiatives in the new media and telecommunication sector. In 2011, Xinhua launched what it labelled as the first "mobile newspaper" in Africa [20]. Developed in Kenya in partnership with Huawei, China's largest telecommunications and service company, and Safaricom, Kenya's leading mobile operator, it allowed mobile subscribers to receive news selected by Xinhua via Multimedia Messaging Service (MMS). The project was only partially successful and it was discontinued in 2012, but it signalled a willingness on the part of Chinese companies and media to experiment with new formats and find alternative ways to compete in an increasingly crowded "market for loyalties" [14]. Alongside these media initiatives, which have been aimed at reaching wider audiences in Africa through different channels, since 2006 the Chinese government and Chinese companies have also begun to play an increasingly important role in the continent's telecommunication sector, as symbolized by the multi-billion dollar loan from China's EXIM Bank to the Ethiopian government's Ethio-Telecom, the country's sole telecom operator, to increase access to the Internet and mobile phones, a project later undertaken by Chinese telecom giants ZTE and Huawei [8].

These initiatives present both signs of continuity and discontinuity with the past. China's diplomatic relations with Africa date back to the 1950s and have been characterized from the very beginning by the provision of aid and by attempts to communicate not just with elites but with African audiences at large [1] [2]. China's Prime Minister Chou En-lai first articulated China's strategy of engagement with Africa during his visit to the continent 1964, and, despite claims that today's China is transforming development practice in Africa, the modes of its engagement seems to have remained almost unchanged. As Chou's first two points indicate:

1. the Chinese Government always bases itself on the principle of equality and mutual benefit in providing

<sup>1</sup> Xinhua's correspondents had historically been China's eyes and ears on the continent, even before China had established embassies in Africa, but while Xinhua's had established numerous national bureaux (the first in Egypt in 1956), it had never had a regional office for Africa.

aid to other countries. It never regards such aid as a kind of unilateral alms but as something mutual and helpful to economic cooperation.

2. In providing aid to other countries, the Chinese Government strictly respects the sovereignty and independence of the recipient countries, and never attaches any conditions or asks for any privileges [9].

Together with the other six principles, which offer a more detailed indication of the financial instruments that China would employ when providing aid and of the lifestyle Chinese workers should adopt abroad, these continue to represent the pillars of China's engagement with the continent also in the new millennium [3].

Some important differences, however, do exist between China's past and present efforts in Africa. I focus on three here, which are particularly relevant for the media. The first is the disappearance of ideology from the language of China-Africa cooperation. In 1964, together with the eight principles regulating aid and cooperation highlighted above, Chou enunciated other five principles substantiating the type of political engagement China was concurrently seeking in the continent. The first principle declared that "China supports the Arab and African peoples in their struggle to oppose imperialism and old and new colonialism and to win and safeguard national independence" [9: 8]. China's efforts in Africa during de-colonization were closely linked to its efforts to export and strengthen the socialist revolution in the continent [2][19]. Today, these have largely been replaced by admissions of China's interest in Africa's resources and untapped potential. It is as if the deletion of the socialist cause as the goal of China-Africa engagement had promoted the principles of "mutual benefit" and "sovereignty and independence" to the rank of ideological guides of the new engagement.

A second major difference between China's earlier and current presence in Africa depends on the sheer scale of resources China is now able to deploy on the continent. While in the 1960s-1970s China had to partially disengage from Africa because of the damage the "great leap forward" and the "cultural revolution" were causing to its own economy [16], the 2000s-2010s belong to an era of plenty and Chinese actors, including Chinese media, have been able to invest and operate in spaces where others simply do not have the resources to act.

A final, closely connected, element characterizing contemporary China-Africa relations is the mix of interest and fear they are producing among traditional donor countries. While during the Cold-War China's presence in Africa was minimized by the competition between the USA and the USSR [2][16], today's China is acting as a game changer. In 2011, the then US Secretary of State Hillary Clinton in her visit to Tanzania made the USA's concerns clear about the possibilities of a "new colonialism" in Africa and a few months later, UK Prime Minister David Cameron's warned its audience in Lagos that new forms of "authoritarian capitalism" may take root in the continent. Similar concerns have been expressed also about the detrimental role China may have in the media sector in Africa, increasing authoritarianism and undermining Western efforts to promote openness and freedom of expression [4][11]. These concerns are largely based on the assumptions that, as Western countries have tried to promote their models in Africa, China will try to export its own. No studies to date, however, have proved this to be the case, and greater empirical evidence is needed to fully understand the nature, scope and implications of China's new role in the African mediasphere. This article aims at providing a contribution in this direction, adding to ongoing efforts to understand China's role in Africa in empirical rather than ideological terms that have characterized works in development studies and international relations (see for example [1][16]), but have so far had little application to the media.

## PARTNER, PROTOTYPE OR PERSUADER?

China's increasing involvement in the media in Africa can represent a critical entry point to understand the broader political implications of China-Africa relationship. So far, however, similarly to what has been the case in other areas where China has stepped up its presence, there has been a tendency to frame its role in relation to what Western countries have done or are doing on the continent, rather than in its own terms. Hillary Clinton has warned Africans about risks of a "new colonialism", a concept that belongs to the history of Europe in Africa rather than of China, while David Cameron has spoken of "authoritarian capitalism", suggesting how China may be adding darker tones to ideas the West has tried to promote on the continent for decades.<sup>2</sup> In the case of the media, this tendency has been evident in the alarms raised about the possibility that China could act as a net exporter of authoritarianism [4], selling its own strategies of media development and media control abroad and countering the efforts of countries such as the US and the UK which, while stressing the role of the media in the democratization of Africa, have encouraged the adoption of aspects characterizing their own media models [14][15].

Elsewhere I have proposed a framework that can encourage understanding of Chinese engagement in the African mediasphere for its original contributions, and not simply as a negative of the impression left by the West [8]. This framework emerged as part of a collective effort among scholars from Africa, China and Europe who gathered in Oxford in 2010 to explore ways to approach the study of China's emerging role in the media in Africa, balancing out

<sup>2</sup> For Hillary Clinton's remarks see for example Flavia Krause-Jackson, 'Clinton Chastises China on Internet, African 'New Colonialism' <http://www.bloomberg.com/news/2011-06-11/clinton-chastises-china-on-internet-african-new-colonialism-.html>. And for David Cameron's see Jason Groves, 'Cameron warns Africans over the 'Chinese invasion' as they pour billions into continent' <http://www.dailymail.co.uk/news/article-2016677/Cameron-warns-Africans-Chinese-invasion-pour-billions-continent.html>. Last accessed 13 July.

different perspectives and building a shared research agenda. The framework was tested and further refined through fieldwork in Ghana, Kenya and Ethiopia.<sup>3</sup> This framework breaks down China's actions on the continent according to China's ability to act as a *partner*, a *prototype*, and a *persuader*. These categories are meant to add greater nuance to the analysis of China's actions on the continent, questioning whether or not China's role as a partner sponsoring media and ICT projects on the continent is facilitating the diffusion of some aspects that characterise its domestic media system, rather than assuming this will be the case. They seek to de-ideologise the debate on Western versus Eastern developmental models, enabling research findings to show, for example, how the partnership between China and a given African country may enhance some aspects of the local media that fit within a Western liberal framework while they do not belong to China's media system. Finally, they allow research to highlight areas of collaboration between different development actors, where their relative strengths can enable common goals to be reached, but also common patterns of exploitation, where the interventions of different donors contribute to empower specific actors, such as government's, and disempower others. Each category is briefly described below.

China's role as a *partner* is apparent in the resources it provides to African countries to implement projects that are deemed important for social and economic development. China has provided substantial financial and technical inputs to the expansion of the ICT infrastructure in authoritarian regimes (as in the case of Ethiopia discussed below), but also in democratic countries such as Ghana, where its contribution of US\$ 180 million has helped realizing one of the most ambitious e-government projects in West Africa, reinforcing the ability of the central administration to communicate with the peripheries of the state and to provide more effective services to citizens [8]. China has similarly offered support to state broadcasters in selected countries: Kenya and Zambia are the most popular examples. Even if China has traditionally felt uncomfortable with the term 'donor', the activities it sponsors in this area are those usually funded by bilateral and multilateral donor agencies, and, in some cases, China has offered an alternative to traditional donors for African countries willing to develop projects in this area. But while the role of Western donors as partners has usually been conditional upon the acceptance of at least some of the elements characteristic of Western media systems, China has stressed its intention to maintain a separation between these two dimensions and its willingness to simply respond to the demands of its African partners. While this 'no strings attached' policy may be consistent, this does not mean that it is neutral or free of impact. For example, while Western donors have tended to favour media projects benefitting the private sector and the civil society, or projects creating incentives for the state to open a dialogue with other forces in society, China has displayed a tendency to privilege government actors, thus increasing governments' capacity vis-à-vis other critical components in the development of a media system. Within this dimension, assessing who benefits from China's increased role as a partner in the media sector becomes particularly important.

China is also increasingly perceived as a *prototype* by countries seeking to balance between investment in ICTs and containment of the risks of political instability new technologies may bring. In a Wikileaks cable reporting a meeting between Sebhat Nega, one of the Ethiopian government's ideologues, and the then US ambassador Donald Yamamoto, for example, Sebhat was reported to have openly declared his admiration for China and stressed that Ethiopia "needs the China model to inform the Ethiopian people".<sup>4</sup> Some have called its mix of proactive and reactive measures aimed at facilitating a controlled expansion of the Internet while leaving the established power structure unchallenged, 'Chinese media model' [4]. China, however, has historically been reluctant to label its own as a model ready to be exported, preferring to refer to specific, but not necessarily cohesive, strategies it has adopted to face the problems it encountered throughout its own development. Some of these strategies may be copied and adapted by other countries but Chinese leaders and diplomats have tended to challenge the idea of China as an "active teacher", a term coined by Martha Finnemore (1993) [5] to describe international actors attempting to socialize other countries to new ideas and practices.

Finally, China's role in Africa can be assessed according to its modality and ability to act as a *persuader*, shaping opinions in ways that favour either its image abroad or a particular agenda it supports. This third dimension is in the realm of public diplomacy, which China has stepped up through expanding the reach and content of its international broadcasters, including China Central Television and China Radio International, and of its news agency, Xinhua. Furthermore, cultural diplomacy has grown through the continued establishment of Confucius institutes, and programs that offer scholarships for foreign students and journalists to study in China. Still within its role of persuader, China has concurrently pursued a strategy that has distinguished it from its Western competitors, maximising the symbolic value of some of the projects it sponsors in Africa, such as roads, theatres, libraries and hospitals, which can symbolize China's support to both literate and illiterate populations.

This paper adopts this framework to compare the influence of China on the development of telecommunications, and of the Internet more specifically, in two countries that have adopted very different approaches towards shaping their national information societies. One is Kenya, which is often referred to as Africa's information hub, because of its leading role in promoting local innovation, from mobile banking to crisis responses systems. The other is Ethiopia, the only country on the continent where Internet provision is still a state monopoly, whose government actively blocks opposition websites, but has also heavily invested in Information and Communication Technologies (ICTs) to improve service delivery, even in the most remote areas.

Since 2006, China has become an important player in both countries, at a diplomatic level, offering an alternative to

<sup>3</sup> More information about the workshop's programme, participants and outcomes can be accessed at <http://pcmlp.socleg.ox.ac.uk/research/project/china-and-africa-media-policy>. Last accessed 10.09.2013.

<sup>4</sup> Wikileaks cable: #09ADDISABABA149. Last accessed 13 July 2013.

traditional donors and allies, especially in moments of political crisis; and as new development actor, sponsoring projects that are deemed important by respective governments. This paper seeks to address some of the consequences China's renewed engagement is having on the development of the Internet and of national information societies in both countries. It first offers a brief overview of the development of the internet and of telecommunication in Kenya and in Ethiopia and then examines which impacts China has had on these countries' trajectories.

## THE ETHIOPIAN INTERNET BEFORE CHINA

The development of the Internet in Ethiopia, while similar to the path taken by other authoritarian and semi-authoritarian regimes, has certain distinctive characteristics. Together with Djibouti, whose population is less than a million, Ethiopia is the only other country in Africa with a single, state controlled Internet Service Provider. As argued by Ethiopia's Minister of Information and Communication Technology when he was at the helm of Ethiopia's ICT Development Agency: "Monopoly is a crucial factor. It is exactly because ICTs are so important and they have the capacity to penetrate every aspect of our lives that we have to make sure that it is the state that is in charge of using and implementing them. In this phase we cannot leave it to the market. ICTs are too key for our development. They are a priority. Behind the decision of leaving the monopoly in the ICTs and telecommunication market there is big philosophical thinking. It is not just because we want to make money from the use of telecoms."<sup>5</sup>

The mix of commitment to using new technology and fear that the same technology could unsettle existing power structures is reflected in the government's massive efforts to use digital media in schools and government offices, and the neglect of providing reliable and affordable internet connections in the major towns, including the capital [6]. Ethiopia has historically had one of the lowest internet penetration rates in the world.<sup>6</sup> Despite the very limited diffusion of the internet among Ethiopian citizens, in 2006 the government began to actively filter the websites of opposition groups and human rights organizations, specifically targeting those that gathered the voices of Ethiopians living abroad [13].

One reason for blocking these online spaces can be attributed to the composition of the Ethiopian diaspora and to the ability of the discourses it articulates to reach beyond the digital media. Similar to other national groups that migrated from the Horn, Ethiopians living abroad represent a large and powerful force that have historically been involved in wars and politics back home [12].

But, in sharp contrast to the cases of Kenya, Eritrea and Somaliland, the great majority of politically-minded Ethiopians in the diaspora have opposed the political agenda of the incumbent government led by the Ethiopian People's Revolutionary Democratic Front (EPRDF). Many posts hosted in online spaces such as Nazret.com or Ethiopianreview.com, two popular websites blocked in Ethiopia, aim at the very core of the EPRDF national project, refusing to recognize the current government as either legitimate or as the expression of the people's will. It is not uncommon to find a blog post labelling the prime minister as "crime minister" or describing the government as a dictatorship led by an ethnic minority. On the other hand, pro-government websites have responded by accusing opponents of chauvinism and of encouraging tensions within multi-ethnic Ethiopia similar to those that led to the Rwandan genocide in 1994 [7].

This vehemence and polarization are not exclusive to online spaces and are evident in the long history of engagement — or lack of engagement — between the EPRDF on one hand, and other political forces in Ethiopia and the diaspora on the other. Since coming to power the EPRDF has chosen not to negotiate with its adversaries, preferring to expand its influence and presence on the ground by delivering progress rather than enlarging its base by incorporating new forces and perspectives. This strategy has been applied to both old and new media. After coming to power, in response to internal and external pressures, the EPRDF allowed for unprecedented levels of freedom of expression, but they did not develop a strategy for reconciling or negotiating with the forces that were defeated or marginalized [7].

As a result, journalists who were fired from the Ministry of Information and sympathized with those opposed to the EPRDF were given the opportunity to set up independent newspapers and use them as platforms for criticizing the government. The decision of the EPRDF to ignore these voices, or attack them without engaging with their arguments, exacerbated the polarization over time. A few years later, when the first websites were created for an Ethiopian audience, the EPRDF took a similar approach and largely ignored them.

The divide between pro- and anti-government forces has widened over time, having consequences in the aftermath of the elections in 2005 when the EPRDF reacted to its substantial electoral losses by imprisoning opponents and firing on demonstrators. Prominent journalists were arrested, their papers closed, and, the following year, blogs were also blocked to silence all alternative voices. As a result, both old and new media in Ethiopia now carry pro-government information or criticism that can be easily managed by the ruling elite and does not challenge its fundamental political goals of retaining power and reinforcing its vision of ethnic federalism.

## KENYA BEFORE CHINA

The history of the Internet in Kenya cannot be more different. Kenya has been one of the first countries in Africa to liberalize telecommunications and to develop a strategy that, while offering limited privileges to the former incumbent telecom (Telecom Kenya) such as the monopoly to operate the Internet gateway and backbone until 2004, allowed different companies to immediately enter the market, driving down prices and expanding access. As a result Kenya has now one of the most competitive Internet sectors in East Africa, with national and international companies offering both mobile and landline services. As of 2012 Safaricom had 69% of the Internet market, Aritel 14%, Orange 9% and Essar 8%. Of these subscriptions, 99% were through mobile [17].

The Kenyan government has also taken an innovative approach towards involving a variety of actors, from private companies to civil society organizations, in shaping the national internet. Kenya was the first country in Africa to create a national Internet Governance Forum after the creation of a Global Internet Governance Forum in 2007. Other initiatives, such as Vision 2030 which was set up to define the priorities for Kenya's development and has placed significant emphasis on the role ICT can play in national growth, included consultative processes that could allow a variety of actors to contribute shaping the future of the nation. As a result, the evolution of the Kenyan internet has been characterized by the inclusion of different interests at different stages, with the state acting both as a facilitator and as a driver of innovation.

## ETHIOPIA AFTER CHINA

After the elections in 2005, which were considered the most democratic and contested in the country, but also led to violence and a crackdown on oppositional forces contesting the results, the Ethiopian government became the object of increased criticism from the International Community, especially from Western donors, and started looking more insistently at China for support. This led to an increasing number of agreements between the two countries and the telecommunication sector emerged as one of the most important to realize the EPRDF's goal to promote economic growth and maintaining control over the country. At an ideational level, China's ability to balance control of information and dramatic growth of Internet users started to be looked at as a model and source of legitimation for the restrictive practices the Ethiopian government had started employing in the aftermath of the elections. The conception of the information society that has progressively emerged in China appeared more in line with the EPRDF's ambition to make Ethiopia a developmental state that could pursue sustained growth and stability. But China has not supported Ethiopia only ideationally and indirectly. It has also offered technical and financial means to support the government's strategy. In the second half of the 2000s, as privatized telecommunication markets were booming in most of Africa providing cheaper and increasingly reliable access to mobile phones and the Internet, Ethiopia faced the challenge of having to balance between its decision to retain monopoly over telecommunication and the inability of expanding access without opening to competition. The EPRDF's stubbornness could not last for long, unless a new partner could provide enough resources to introduce a dramatic increase in access and quality of service in a regime of monopoly. China obliged by offering the largest loan in the history of telecommunication in Africa: 1.9\$ billion to overhaul Ethiopia's telecommunication system, expanding mobile service and Internet connectivity while keeping Ethio-Telecom as the only player in the market.<sup>7</sup> Some of these resources also went to upgrading the infrastructure on which the e-government projects were based, allowing a system that many had considered unsustainable to become an even stronger component of the government communication strategy towards the periphery.

The role China had in Ethiopia was of paramount importance. Without China's support in extending the infrastructure and expanding the plan the EPRDF had devised, the government of Ethiopia would have been either forced to change its course and liberalize, or to condemn the country to suffer from lack of connectivity to the Internet and mobile communication on which many countries on the continent have been relying to support both economic growth and state operation.

## KENYA AFTER CHINA

Given the different context in which the Internet developed in Kenya, the role China came to play was significantly different from Ethiopia, but also presented some elements of similarity. As in Ethiopia, China has been deeply involved in the extension of internet connectivity in different capacities. First, through telecom companies Huawei and ZTE.

Together with French company Sagem, they participated in the first National Optic Fibre Backbone Infrastructure (NOFBI) expansion, bringing fibre optic to the main urban centres and allowing a first series of e-government projects to be delivered regionally.<sup>8</sup> The country was split into three sections namely Western Kenya, Coast and North Eastern, and

Last accessed 13 July 2013.

<sup>8</sup> See, for example, Okuttah Mark, 'Telkom Kenya set to run fibre network on behalf of government' <http://www.businessdailyafrica.com/Corporate-News/Telkom-Kenya-set-to-run-fibre-network-on-behalf-of-government/-/539550/929626/-/m96mry/-/index.html>. Last accessed 13 July 2013.

Central — each region handled by one company. Sagem has laid out cables in Coast and North Eastern, Huawei in Nairobi and Central, and ZTE in Western Kenya. Also investors such as internet service providers (ISPs) and telecommunication operators have benefited as NOFBI lowered the cost of entry to business. A second round of NOFBI (known as NOFBI II) was directly funded with Chinese resources. In 2012 China's EXIM Bank provided a \$71 million loan to support further extension to 36 administrative district centres across the country, with the objective of allowing also people in remote areas to access faster internet. A condition for the loan was that the implementing agency had to be Huawei, which is now in charge of the realization of the project.<sup>9</sup> As in Ethiopia, the Chinese government and Chinese companies have thus supported the expansions of government led initiatives aimed at extending Internet connectivity and improving e-government services. In the Kenyan case, however, Chinese support has fitted in a much wider context, where a plurality of actors have been competing to offer better services at lower prices. For example, soon after the signing of the agreement for NOFBI II, Kenya's leading telecom operator, Safaricom, decided to invest additional \$95 million to build an additional 2,400 kilometre fibre optic cable to support its growing customer base. Interestingly, a large share of the contract has been assigned on a commercial basis to Huawei, which had already worked in collaboration with Safaricom to roll out the 4G network at a cost of \$143 million. A remaining share of Safaricom's expansion project was assigned to Ericsson.<sup>10</sup>

As it had been the case in Ethiopia, after Kenya's highly contested and violent elections, that took place in 2007 and led to numerous deaths and displacements and to condemnation from the international community, the relationship between the Kenyan government and the Chinese government increased both in quantity and in quality. This is mostly connected to the Chinese policy of providing aid and engaging in agreements without any strings attached. Therefore, as relations with governments such as the US and the UK reached a low point in the aftermath of the elections and later with the indictment of the two presidential candidates Uhuru Kenyatta and William Ruto by the International Criminal Court in relation to the alleged role they played in the incidents of 2007-08, China managed to keep a low profile, stressing its faith in the legitimacy of Kenyan institutions.

## CONCLUSION: GLOBAL AND NATIONAL RHETORIC OF THE INTERNET

Both in the case of the Kenyan and of Ethiopian governments, the violence that followed their respective elections was employed as a reason to stress the potentially disruptive role that technology, including the Internet, could play in increasing divisiveness and harm peace. While in the case of Ethiopia this discourse had been used for a long time to justify state monopoly, Kenya, a country that had heavily invested in the idea of an open internet, woke up to a new reality and progressively developed a new discourse framing peace as the overarching goal each Kenyan, from media houses to bloggers to telecom operators, should give priority to in shaping the country's future. As one interviewer put it, "Kenya has been slowly sliding from democracy to a peaceocracy". This rhetoric was employed to justify for example the censoring of thousands of SMS considered harmful and inciting ethnic hatred or to ask media houses to downplay cases of ethnic violence still happening in the country.<sup>11</sup> In both the Ethiopian and the Kenyan case, however, it was not just incumbent governments, but also Western donors that stressed the importance of creating mechanisms that could lead to peaceful elections and prevent outbursts of violence. With regard to the media the idea that progressively emerged was that of a harmonious information space, where people could still be allowed to be critical and comment negatively on political actors, but could not incur in actions possibly leading to forms of mobilization considered harmful by public authorities. The idea of the internet that progressively emerged was not different from the one offered by the detailed study of the Chinese internet carried out by King, Pan, and Roberts (2012) [10], which showed how it was mostly posts leading to the organization of protests that were removed, rather than those attacking the government for misconduct, for example for corruption. And this idea progressively emerged and gained momentum without the Chinese government or Chinese companies engaging in any notable activity to support this particular model abroad. From the interviews carried out with Ethiopian and Kenyan members of the government, civil servants, but also with members of the civil society and private entrepreneurs in 2012 and 2013, none of them referred to Chinese authorities as trying to suggest that their model could be productively applied to the Ethiopian and Kenyan cases.

The conclusions are still highly tentative, but it seems that some of the strategies adopted by the Chinese government in China to control and contain the national internet are gaining popularity in both countries, despite no attempts from the side of China to promote them abroad. It can be argued that China's appeal as a *prototype* has increased, without its government necessarily having to engage in activities to *persuade* its African counterparts. In a

climate where local actors, such as the Ethiopian and the Kenyan government, and in the case of Kenya also the local media, private operators, and international organizations, created a political context privileging peace and development over allowing a plurality of voices to compete in the marketplace of ideas, China had simply to act as a *partner*, offering unconditional help to governments, to put forward a concept of harmony that it supports. While there was satisfaction that the Kenyan elections were conducted peacefully, as peacefully were the elections that took place earlier in Ethiopia in 2010, privileging peace also meant downplaying critical voices, such as those of civil society organizations, lamenting that grave misconducts and violations of human rights had been marginalized in the name of a peaceful development that could benefit both countries.

## MAPPING MAP KIBERA: WHAT IS BEHIND THE MAP?

Elisabetta Demartis\*

\*University of Turin, Italy - [eliz-de@hotmail.it](mailto:eliz-de@hotmail.it)

### ABSTRACT

The general purpose of this paper is to problematize the idea of map as a visual representation of a given territory. In fact, it is based on the assumption that what we see on a map is the outcome of an exploratory process that hides several social dynamics like political power, popular belief or traditions. This research is the result of three meetings with a group of mappers of Map Kibera Trust, a no profit organization based in Kibera slum. Mapping a particular territory like a slum requires indeed a good understanding of what are the steps, roads, secure and insecure places that allow people to easily perform the job. Moving along an informal settlement is quite complicated due to narrow streets interspersed with rivers carrying waste and contaminated water, but also to insecure places, especially as we penetrate into the slum. For this reason, all the mappers of the Map Kibera project live, or used to live, in Kibera.

The implications are significant in understanding the set of social, spatial and human values that connect people with their own space, going over the use of an ICT like an open source mapping software. What makes possible the realization of the map is not the technological tool itself, but the people who have the appropriate tool and use it in their own ground. And speaking about people who map a slum means to speak about relations between people themselves and between people and their networks. With this paper, there is a desire to find out what are the links between beneficiaries of the project and territory, territory and binding agents that led to the creation of the map, work that otherwise could be impossible or not leading to the same result. Simultaneously, a reflection about the sustainability of this project will be provided, as well as the efficacy and the effective participation in GIS activities like OSM related to the contest of Nairobi slums.

### INTRODUCTION

This research inquiries into the creation of a participatory maps achieved by the young mappers of a non-profit organization based in Kibera: Map Kibera. Before Map Kibera's work, the slum was a black spot on the map and this mapping project was initiated in response to the lack of available public and open map data of the zone. The general idea is that behind the creation of a map, in the particular locations like the informal settlements, what allow to work and to create a map is the power of the human and social networks. This hypothesis was confirmed by following and observing the mapping processes of this group, conducting interviews and focus groups that gave me the instrument to analyze the concept of participatory mapping in a slum.

With my research I intend to make a contribution to the broader theme of ICT4D, reflecting on how the use of a technology increasingly underpins a series of links and social values that go well beyond the technological innovation itself.

Before to analyze the fieldwork, I need to define the framework that allowed me to place the facts I have observed on the ground. The analysis of the mapping process of Map Kibera can fit with the Actor-Network Theory (ANT), that focuses on the mechanisms of power and the concept of knowledge as they emerge from the interactions between human beings and artifacts [1]. Power is intended as the product of the interactions among elements of heterogeneous networks. Heterogeneous is the key term that drew my attention as it refers to the participation of different materials: human and no-human, people and machine. In ANT, there is no point in differentiating between the elements of a network because the relevance rests on the relations among the actors rather than in their nature. ANT is a theoretical approach that help re-conceptualize many of the issues behind the dilemmas of development theories and practices, highlighting "how people's actions and interactions are part of what stabilizes objects, processes, texts, and ideas to become things" [2]. ANT scholars claim that this theoretical perspective is particularly useful to analyze "situations where interactions of the social, technological and political are regarded as particularly important" [3].

Thanks to this theory, it is possible to overcome the distinction human/machine and thus consider social and technical networks as a continuum, bridging the networks of institutions, organizations and individuals which constitute Kibera's civil society and the technical networks revolving around participatory mapping processes. The actors implicated in development projects like citizens, community based organization (CBOs), local and international NGOs and institutions are powerful and affect the success of the same actions. However, even among the development professionals who act participatory approaches continue to face problems and this raises important challenges concerning the role that an actor holds in its community, obfuscating sometime the voice of marginalized groups

and the weak they are meant to serve [4].

What is behind a map built in a slum? What are the relationships between locals? What kind of influence the stakeholders have in Kibera community and its activities? I argue that what makes possible the creation of a map in a place like an informal settlement is the connection between the mappers and the social agents, redefining the bonds of power that affect the social activity in the community of Kibera.

## THE PARTICIPATORY AND OPEN SOURCE MAPPING SOFTWARE: OPEN STREET MAP

Map Kibera was launched in response to the lack of available map data and other public, open, and shared information about Kibera, the second largest slum in Africa. Its mission is to increase the potential impact of the map data, making the final products available for the entire Kibera and Kenya community.

For the creation of the maps was chosen an open source GPS, Open Street Map, that allowed them to begin to focus on the mapping process in more detail in four areas, health, security, education, and, thanks to an UNICEF partnership, to undertake an issue-based mapping with a focus on mapping girls' security [5].

Created by Steve Coast in the UK in 2004, OSM was inspired by the success of Wikipedia and preponderance of proprietary map data in the UK and elsewhere [6] and provides free geographic data such as street maps to anyone who wants them, inviting people to view, contribute and use the map in collaborative and creative ways.

As Yu-ei Lin says:

*“whereas the complexities of the world have long been simplified and reduced to a known geometric scale in their maps by professional cartographers, the advent of OpenStreetMap has transparentised and democratized cartography; non- cartographers are now provided with an opportunity to participate in the map-making process”.* [7]

Fig. 1 - Map Kibera's map created by using Open Street Map.

Participatory GIS is, therefore, an attempt to utilize GIS technology in the context of the needs and capabilities of communities that will be involved with development program in the production of GIS data and spatial decision making, involving local people by integrating participatory mapping information, capturing local knowledge and combining it with more traditional spatial information. [8]

## KIBERA: THE LARGEST INFORMAL SETTLEMENT OF NAIROBI

Kibera is the second Africa's largest, densest and poorest slum (the first is Soweto, South Africa) and the population depends on the source (one other estimation varies from 235,000 to a maximum of 270,000 people [9]) and on the period of the year. [10]

The exact number of people who live in this settlement was never been discovered, due to the constant displacement of people and the indifference of the government to a place considered informal.

Kibera is located at 7 km from the center of Nairobi and is at the core of the Kibra constituency. It extends on 256 hectares, with a population density of more than 2,000 people per hectare [11], and it is bisected by the railway to

Uganda. According to the figures available, only 17% of the adult population is permanently employed [12]; the rest are casual workers and migrants, mainly employed in Nairobi's industrial area. The official definition for Kibera is 'informal settlement', although the area has been occupied since 1912.

Nowadays, it is formed by 14 villages, mainly divided along ethnic lines. Almost all Kenyan tribes are represented in Kibera but Luos are the main ethnic group. The topography undulates with two heavily polluted streams running through the settlement and forming corresponding valleys; the railway line along its northern perimeter, the abandoned dam to its southern edge and infrastructure on its eastern side further add differentiating parameters to the fabric of a highly complex settlement.

The entire territory of Kibera is government property and, by a complicated set economic, political and social factors, who hold a right to occupation of the land often lack economic resources, generating interests of a circulation of capital linked to numerous rented properties.

Humanitarian NGOs are often one of the very few actors operating in these conditions of disadvantaged and, despite the lack of almost all public services, Kibera is a big recipient of international aid. Every international agency funds initiatives and projects in the slum, starting with UN-Habitat, the United Nations' body for human settlements, which is located, ironically enough, few kilometers away from one of biggest informal settlement in the world. There are an estimate 100 NGOs and over 400 Community based organizations (CBO's) in the slum, engaged in wide range of activities such as providing HIV information and advocacy, empowering groups of women and training kids and teenagers. These CBO's include also self-help groups, mainly women organizations which keep a fund and loan small amounts of money to members in need.

## MAP KIBERA

Before the organization's idea, a research project led by an Italian researcher, Stefano Marras, was called with the same name, but the projects are two different entities, also if their intentions are really similar.

'Map Kibera project' was launched in May 2008 and was aimed to take a **census of the structures, infrastructures and population** of the entire shantytown, but the pilot project has focused just on the village of Kianda, situated on the northwestern end of the slum. [13]

'Map Kibera' was a project of GroundTruth Initiative and started in October 2009 with a small grant from Jumpstart International, a non-governmental organization specializing in community-based mapping, and the grant was meant to facilitate the creation of the **first public, digital map of Kibera**, through the training of the local youth in the use of GPS and open source GIS tools.

In November 2009, local young people motivated to work for Kibera community learned to create maps using OpenStreetMap techniques. Kibera was not actually unmapped but the problem was that none of the existing maps were shared with the public or used by Kibera's residents [14]. So, thanks to the Nairobi tech scene and some American start up help, the young Kibera volunteers created a group of mapper included surveying with GPS, digitization of satellite imagery and paper based annotation with Walking Papers. Map Kibera Trust is a project of Erica Hagen and Mikel Maron and the current executive director is Kepha Ngito. They worked in partnership with local and international organizations like Social Development Network (SODNET), Carolina for Kibera, an international NGO based in Kibera that seeks to promote leadership, women's empowerment and community development, and the Kibera Community Development Agenda (KCODA), a community media organization that publishes the Kibera Journal, the only local newspaper.

In 2010 Map Kibera became a Trust and the founders established two additional projects aiming to create an interactive community information platform. The first was Voice of Kibera (Vok), an SMS reporting project that uses the Ushahidi platform to enable residents to text in reports on events happening in Kibera. The reports are approved by an editorial team and integrated on the website with the digital map of Kibera. The second project that was introduced in this period was the Kibera News Network (KNN), a video journalism initiative where videographers create short documentaries and news stories about Kibera that are published on their YouTube channel.

Ushahidi is a non-profit software company that develops free and open-source software for information collection, visualization, and interactive mapping. Ushahidi (Swahili for "testimony" or "witness") was created in the aftermath of Kenya's disputed 2007 presidential elections to collect reports of violence reported by email and text message, placing them on a map.

The platform is built to collect information from the general public and citizen about events happening in near real-time. It is also, assisting areas that are not well covered in the mainstream media; for this reason it has been named crowdmap. The main concept of the crowdmap is crowdsourcing for social activism and public accountability, empowering citizen journalism activities in different part of the world. [15]

The reports can be submitted by using a mobile phones or internet and many countries from all over the world have benefit of the Ushahidi crowdmap for several emergency projects: Russian bloggers to co-ordinate a relief effort, Haiti to identify natural disaster locations and others in Chile, Pakistan, Congo, Philippines, Peru etc.. [16]

In 2013 Map Kibera Trust is integrating the use of different ICTs and tools to improve his work and to better interact with the slum communities, as the monitoring election project during the March presidential elections or a current project concerning accountability and transparency of community funds.

Map Kibera Trust works for the community and with the community, thanks to a participative approach used by the team in every project lead in the slums where the organization works: Kibera, Mathare and Mukuru. [17]

## THE RESEARCH

Mapping a particular territory like a slum requires a good understanding of what are the steps, roads, secure and insecure places that allow people to easily perform the job. The implications are significant in understanding the set of social, spatial and human values that connect the mappers with their own space, going over the use of an ICT like mapping software. The methodology and approach used in this research are focus groups and interviews, carried out to discuss and identify those elements that led to the creation of the map using an open source technology. With this research, there is a desire to find out what are the links between people, territory and binding agents that led to the creation of the map, work that otherwise could be impossible or not leading to the same result.

According to Erica Hagen, in the implementation of the project:

*“Equally important was the fact that the mapping experience validated the knowledge that participants already held: their intimate knowledge of the paths, businesses, and social relations of their own neighborhood. Now they were regarded as holders of important information rather than poorly educated slum dwellers”.* [18]

As I explained in the introduction, the framework that supports my analysis is the conception of the social relations power and the role of the local actors in influencing development projects in a territory. In this case, the development program is a participatory mapping project and the actors are those groups and community leaders identified by the mapper team during the meetings and interviews. The focus groups were divided in three parts and were aimed to:

- Get the general understanding of the mapping process in a slum
- Know the implication of the mapping process in to the community and discover the background of the mappers
- Draft a map of the slum to underline the networks and relationship between them and the slum spots

### First meeting with the mappers

The main purpose of this meeting was to get the general understanding of the mapping process.

There were submitted some general questions about the mapping phases and the interaction between the mappers and the community stakeholders, but the conversation was really free and people easily interacted and exchanged opinions. By analyzing observations and notes, I identified eight processes.

The main question was: “how do the mapping process works?”

#### 1. Finding the point of interests for the entire community

First, they start to identify and understand the needs of the people living in a particular area of the slum and the final choice depends on several aspects that I deepen later.

#### 2. Getting in touch with the community stakeholders

Secondly, after they have decided the point of interests, the mappers try to contact the community stakeholders using their personal contacts.

Then, they meet the stakeholders to discuss about their findings to proceed later to work with the stakeholders belonging to the matter they are considering. They need to meet stakeholders to get the permission to map a particular area, to take picture, to collect information from them and to share ideas about the needs of that place.

But my question was: “who are the stakeholders?” They really mention those actors but it was not clear who they are and what they do in Kibera community. During the meetings, we were able to identify a number of actors in Kibera, including:

- local administrators
- opinion leaders
- village elders
- service providers (the professional in different fields like water, education –like teachers, garbage etc....)
- religious institutions

Another goal of this focus group was to understand how the mappers get in touch with those stakeholders and they explained that it depends on the type of actor with whom they were dealing with.

If they want to interact with some public administration people, they just walk to the offices to explain the mapping

project, in order to get the permission to work and ask the institutions to provide the mappers security. With the other stakeholders, they use the mobile phones to contact them and to arrange a meeting.

The mobile phone is the most used technology between the organizations in Kibera. Many time internet connection does not work and most of these groups do not have a website or a social platform so that the mobile device becomes essential.

### 3. *Organizing general stakeholder meetings*

After the previous stage, they arrange meetings involving different stakeholders of the area they want to map to reflect and to compare the people needs. Sometime both the mappers and the local actor require several meetings before to agree about the problems concerning the mapping process.

### 4. *Participatory mapping: involving the community in the process*

During the meetings with stakeholders they look for some volunteer from the area they want to map, sharing their ideas and analysis with the Kibera actors and engaging young people with a strong motivation to learn and to support community development. Further, they select just people from the zone they want to map and people who know well the place and the number of people they involve depend on how the area is big. Then, after they have nominated a volunteer's coordinator, the mappers train the volunteer team, giving them technical skills to map.

### 5. *Editing data in the office*

In this step, the mapping team try to find out what kind of data they want to collect brainstorming together, creating a "data collection form", that is a paper to submit to the organization/CBOs/institutions to collect information about them. They speak about logistic issues like the money they need to buy lunch, airtime, printing, gum boot etc...Then, they check if every device is working well: GPS, software and internet connection.

### 6. *The practical work: to the field*

Once they have spoken with stakeholders and people from the slum they go to the field with GPS, notebook, cameras and the "data collection form", in order to register every structure they map and the people who work in these places. After being asked how long it takes to map an area they answer that it depends on how depth and specific should be their job and the size of the area to be mapped.

If the mappers did not have the questionnaire and the camera, it can take just three weeks, like the time they spent to map their first Kibera general map. When they started to use the questionnaire and the camera to take pictures of the place and create thematic maps, they spent three months to complete their work.

So, the time they take to map an area depends on the size of the area and on the tools that they want to use during the mapping process (if they take pictures or not, if they bring the questionnaire – the "data collection form"- or not).

### 7. *The sharing process: sharing the results with the community*

They organize a Community Forum, where they compare their work with the community opinions changing, if necessary, the map structure. Maybe they forget to map something and the stakeholder give them new inputs to add into the map . After that, the final map can be printed and distributed among the institutions, NGOs and CBOs offices and around the stakeholders like schools, churches and youth centers.

### 8. *Using the maps for a common interest*

According with our interviews and visits to the CBOs and Kibera organizations places, most of them have the map hanging on their office wall and they say that they use the map to locate and recognize other points of interest, otherwise impossible without a map. Further, the map undertake the role of identification with the community and therefore with the slum itself. As the mapper coordinator, Millicent, says, "is also a special way for the community and the people who visit the office to locate their house and their workplace into the map. They feel happy and excited".

Mapping a particular place like a slum with an high number of difficulties involves some challenges for the people who ride through the narrow streets of the shantytown, like Map Kibera mappers. By asking them "What kind of challenges you face in doing your job?", they identified two main areas where they sometime encounter a problem.

#### *In the field*

The mappers admitted that, at the beginning of their activity, many people did not trust them, especially in the health sector, where the employees that should have a specialization to work, did not have it; "they see the mappers like a spy", a mapper says. One other challenge is that in some not really safe areas they have to hide the GPS while they work, also if they can recognize "tricky people, thief or dangerous situations", one other mapper says, "and to map Kibera we have to be from Kibera".

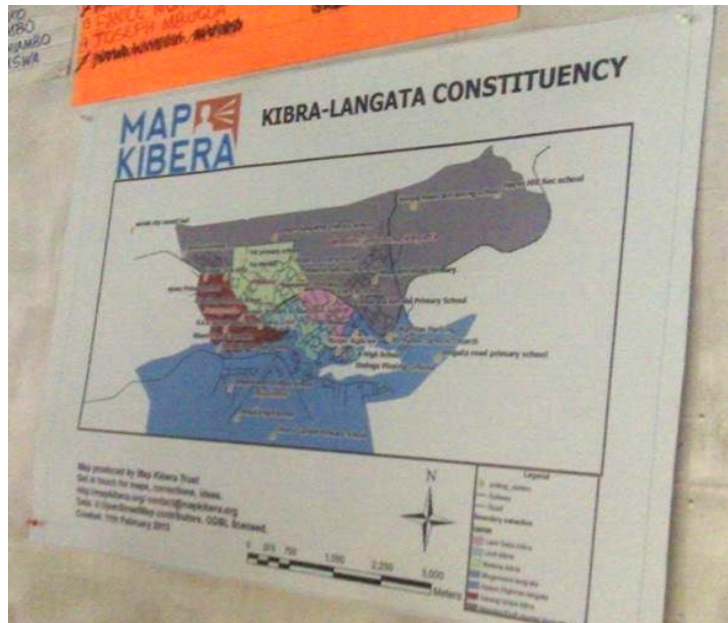

#### *In using the equipment*

Occasionally there are problems related to the weather conditions that can impede the mapper to bring the GPS to the field and sometime, in narrow and covered passages , can lacks the connection between the GPS and the satellite.

### Second meeting with the mappers

The second meeting was aimed to focus on the mapper background and relationship with Kibera community and institutions. To learn more about those connections, I gave them a notebook for each and a pen and explained the exercise. They were told to write down every important connection they have in the slum as a community person and as a Map Kibera mappers. For example, the typology of link of a person living in a given territory (like the church environment, village elders, water vendors etc...) could be different from the personal links and contacts achieved in the work field. This meeting was used to collect data for the next stage and to make the mapper understand about the importance of their network in the slum area, a net of relationship that allows them to perform their job.

**Fig. 2** - Map Kibera political map hanging on Langata District Peace Committee wall in Kibera.

### Third meeting with the mappers

The final meeting was the last step of our focus groups and included the principal activity: the construction of a social relations map. First, they were told to copy what they previously wrote in the notebook in some stickers, divided for the two categories of social relations: people, stakeholders and institutions they know as a citizen of a slum and as a mapper. Then, the post-it were hanged on the wall and discussed all together, identifying the sectors and categories of stakeholders from a collective analysis.

**Fig. 3** - A mapper hanging their social relationship stickers on the wall.

The categories found – each one identified with a different colour - were six and reproduced both the personal and professional relationships that the mappers have in Kibera slum:

- church
- CBOs
- NGOs
- school
- administrations
- health facilities

**Fig. 4** - Some actor categories identified during the meeting.

Using the same colors the participants drew a map on a transparent sheet, tracing the profile of the Map Kibera paper map and allocating in the same map, one by one, structures and places forming part of the categories identified earlier and connected with the life of everyone.

**Fig. 5** - The mappers drawing their personal relationships on Kibera map.

The final result is a map of social networks and personal relationships in the slum community, from the school to the health center, from the administrative institutions to the no profit organizations that work for the public interest.

**Fig. 6** - The final map representing the mapper social relations in Kibera community.

## CONCLUSION

Having a perfect knowledge of the zone to map is a necessary prerequisite for every person who want to do this job in Kibera and, I guess, in every informal settlement of the world. A key aspect of this case study is that all mappers who have mapped Kibera live, or used to live, in Kibera, revealing how being a resident of the slum was a basic prerequisite in facilitating the mapping process. In Map Kibera case behind the use of the ICTs and technology, there are a range of relationships between people, places, workplaces and institutions that are fundamental to maintaining confidence among the community and implement participatory mapping activities. Churches, CBOs, NGOs, schools, administrations and health facilities are the finding results of a learning process that allowed the realizations of these three meetings, reconstructing together what are the key steps of their mapping processes and the typology of relationship they have in Kibera community. Doing so, it has been possible to understand the main characters that represent the most influencing actors for Kibera citizens, denoting how there is a hidden power that affect social relations and also projects or actions involving the whole community of the slum.

This paper is the result of three days focus groups and the short time spent did not allow me to get to the bottom of many other important issues and in-depth analysis. My work aims to provide food for thought for a wider research that addresses the social role and power of certain realities inside the slum of Kibera and in any existing informal settlement. Who are the most influential stakeholders in the slums? What tribe and which political party they belong to? What relationships have with other local actors and with the same slum community?

Moreover, the representation of space is always a sensitive issue because of the different perceptions that a population can have of its own territory, which may not coincide with what should be circumscribed by a system of PGIS [19].

Is the knowledge of indigenous constructed through a “Western way” to do cartography and participatory mapping

processes or can a system like OSM be regarded as a suitable means of self-representation? The use of GPS in developing countries and, in this case, in a slum, is often externally driven and technocrats, despite seeking to make these technologies more and more inclusive, leave some outstanding issues that sometimes do not allow projects to get a positive result. As Rambaldi et. Al. argue, some important questions that should be addressed are:

*“Who’s GIS is it? Whose questions are addressed? Who’s set the agenda? What will happen when experts leave or when donor funding dries up? What is left with those who generated the data and shared their knowledge?”*. [20]

In order to make an ICT4D project succeed and pass to what Heek called ICT4D 2.0 [21] phase, a participation of beneficiaries in the design and construction phase of the project is required, as well as a construction of skills and capacity at the local and institutional level and a continuous learning phase. Despite Map Kibera activities have been led with a bottom up approach and the maps produced have been used by many Kibera organizations and seen as reference point for the slum inhabitants, mapping activities are concluded because of lack of funds and its efficacy and sustainability is compromised.

Furthermore the current availability of spatial data and the large choice of open source software and user interfaces could increase the gap between those who have the ability to access these tools and who is excluded, especially in a fragmented environment like that of Nairobi, where town and slums are two independent and non-communicating entities living in the same space.

These and other questions can be the beginning of a new research and reflection on the social dynamics embedded in a slums, which, according to Mike Davis, “are growing at twice the speed of the continent’s exploding cities” [22].

## ACKNOWLEDGMENT

This research paper would not have been possible without the support of many people. First, I wish to express my gratitude to the mapping team: Zack Wambua, Millicent Achieng, Dauglas Namale, Regina Aluoch, Mildred Anekeya, Lucy Fundo Fondo, Kevin Otieno, Hassan Abdala, Mourine Amimo. Millicent, the mapper coordinator, helped me with the coordination of the meetings and activities. A special thanks goes to Kepha Ngito, executive director of Map Kibera and friend and to the founders of the organizations, Mikel Maron and Erica Hagen, who allowed me to conduct this work with Map Kibera members. I would also like to convey thanks to Gianluca Iazzolino for his help in advising me the framework and the initial idea of this paper and for his continuous valuable tips and insights and Joshua Owino for his help in the logistic coordination and for the useful advices on fieldwork. Finally, a special thanks to the University of Turin and to professor Egidio Dansero, my research supervisor, for supporting my project idea in Kibera slum.

## NOMENCLATURE

ATN	Actor Network Theory
CBO	Community based organizations
GIS	Geographic information system
ICT4D	Innovation Communication Technologies for Development
NGOs	Non-governmental organizations
OSM	Open Street Map
PGIS	Participatory GIS

## M.U.S.I.C. - MEDITERRANEAN URBAN SOUNDS INTERACTIVE CULTURE

Antonella Contin\*, Alessandro Frigerio\*, Paola Bellaviti\*

\*Department of Architecture and Urban Studies, Politecnico di Milano, Italy - [antonella.contin@polimi.it](mailto:antonella.contin@polimi.it)

### ABSTRACT

Citizens are now able to produce cultural localized knowledge; ICT technologies can integrate data-sharing platforms into the spatial dynamics of cities. This can promote a sustainable enhancement of local communities through cooperative activities setting culture as growth-driver. The M.U.S.I.C. (Mediterranean Urban Sounds Interactive Culture) project promoted by the University of Tunis and Politecnico di Milano-DASStU (International Cooperation Lab and Measures and Scales of the Contemporary City Lab) aims at reinforcing the awareness of a shared regional culture in the Southern Mediterranean Region. The project gives structure to the relation among digital media as catalyst tools and urban regeneration as spatial rooting device, setting an innovative exportable cooperative strategy. The action plan applies sounds analysis to geo-localized user-generated content to extract patterns of perception of urban and rural spaces. A visualization platform archives and diffuses these data, working for synergies between formal and informal economies. The project helps to improve the responsiveness of urban systems to the cultural requests of citizens and customers. It reinforces the need of new professional figures and more structured relations among them. The digital platform, as engine of spatial regeneration for built heritage, fosters economies of scale determining a spatial rooting in specific urban or rural spaces suitable to host permanent or temporary, profitable or non-profit activities. The gathering of actors around specific nodes will transform them in Mediterranean antennas transmitting the sound of places for a cultural and economical exchange among people and countries. The economical balance is reached through an equilibrated management of profit and no-profit initiatives setting relations among stakeholders at various scales. A cultural sustainability framework could make the music industry able to sustain local emerging realities and to promote education.

**M.U.S.I.C.** (Mediterranean Urban Sounds Interactive Culture) is a project promoted by the University of Tunis and Politecnico di Milano-DASStU (International Cooperation Lab and Measures and Scales of the Contemporary City Lab) with the aim of reinforcing the awareness of a shared regional culture in the Southern Mediterranean Region. In the South Mediterranean countries the national analysis allowed us to identify some specific problems valuable at Regional level in the field of cultural economies: lack of structures offered by institutions and city administrations for cultural activities; lack of interest by the investors to enhance cultural spaces and activities; insufficient awareness of the value of local heritage; difficult relationship between the cultural institutions and single artists; people and local communities are not involved in documenting living heritage; the documentation of cultural heritage (tangible and intangible) is not spread by social network and new media; the relationship between tangible and intangible heritage is not well developed. The aim of the project is to contribute to solve these problems stimulating the local population to keep a direct role in finding right solutions and supporting the local and national authorities to improve their support to the creative and cultural field. In each country the situation is very different and in this framework all the actions implemented by the EU, Unesco, World bank give a real contribution to move different southern countries towards similar solutions. The international crisis and the specific situation of many Arab countries push the Governments to other directions considering culture as a privilege for few people. What is relevant is that the civil society growing its capacity to address the political decision and young generation are very interested in saving their heritage, in sharing their culture, and in creating job opportunities in their own country. The project will not refer to some specific governmental plan but it is strongly linked with a social plan produced every day by the civil society. The role of the Universities is fundamental to involve the students as well the intellectual people in this process. The M.U.S.I.C. project is an instrument to improve the application of two Unesco Conventions: the Convention on the Protection and Promotion of the Diversity of Cultural Expressions (2005) and the Convention for the Safeguarding of Intangible Cultural Heritage (2003). The project is also linked to the "Medina 2030" programme implemented by FEMIP, Unesco and Arab Town Organization and with the following projects: Athena (Euromed heritage IV) closed in 2012 and lead by the Department of Antiquities of Jordan. It concerns the Ancient Theatres in the Mediterranean and proposed innovative methodologies to produce management plan for the theatres and their clusters involving local communities; DOREMIHE (Enpi Italie – Tunisie), actually under negotiation, a project to create a common doctorate in the field of cultural heritage with the University of Palermo. Another link could be created with the Unesco Chair (Intangible Heritage) managed by Evora University and already involving Tunisia, Morocco, Egypt Palestine and Italy.

## WEB 2.0 OPPORTUNITIES AND INTANGIBLE CULTURAL HERITAGES

The background of the project is the growing production and availability of cultural information with geo-references, generated by non professional web users and supported by technologies generally known as Web 2.0 [1][2]. Citizens are now capable to produce cultural localized knowledge and to contribute through local engagement and by the use of new, widely diffused technologies such as mobile phones [3] to sensing and monitoring aspects of the urban environment. Hence, ICT technologies can be deployed to integrate data-sharing platforms into the spatial dynamics of the city. As Mitchell noted, the spaces and places of twenty-first century cities provide contexts for communication serving not only to shelter and protect their inhabitants, but also to ground and sustain meaningful interaction among them, and to construct community. Emerging critical practices have proposed new models to describe the city that stress the collaborative, constructionist dynamics of the mapping processes. The underlying idea of this approach considers the geographic, urban experience through a network of multiple, fragmented and temporary data and information generated by human-place interactions and collaborative dynamics. Based on these theoretical premises, several experimental GIS focusing on cartography emerging from users' perceptions and activities have been produced. As Zook and Graham noticed [4], traditional methods used to register users' perceptions and activities about the cities and its fruition - like surveys and ethnographic reports - seem to be inadequate to meet the need of information of contemporary society both because they require a considerable amount of resources (in terms of time and money) and because they do not consider the temporal dimension.

Web 2.0 applications, the growth of online mapping tools and the development of networks of "sensors" capable of recording and geo-reference a variety of signals can transform human beings in potential "sensors" that not only have the intellectual ability to process and interpret what they "feel" but also to geo-localise the information (sometimes involuntarily) and spread it globally through the Internet. The combination of these factors produce and disseminate an immense amount of geographical information which can be: voluntary/conscious and involuntary/unconscious. The first type stems from web mapping activities, while the second type is generated by digital footprints left by web users in the cyberspace without being aware they are producing geographic information.

This user generated information, termed Volunteered Geographic Information (VGI; a controversial definition), differs from conventionally produced geographic information in several aspects: the source of the information, the technologies for acquiring it, the methods and techniques for working with it and the social processes that mediate its creation and impact. Traditionally geographic information has been produced by experts and institutions: so certain types of information have been privileged and other types ignored or marginalized [5]. VGI represents a powerful shift in sources, content, characteristics, modes of data production, mining, sharing, dissemination and use. This approach could support transfer of knowledge, exchange of expertise and best practices among cultural actors, support the structuring and strengthening of professional cultural associations and networks.

Can geo-tagged and user generated content be useful in the creation of meaningful, real time indicators of urban quality related to the cultural heritage? Is it possible to plot the very many and co-existing perceptions in cities and neighbourhoods, relying on User Generated Content? What kind of GIS-based spatial analysis techniques can be applied to geodata to produce real-time maps of citizens' cultural perceptions, sentiments and emotions related to them? How does an urban semantic layer - the meanings we attach to places - look like? How can this data be validated, in order to verify if they are significant and accurate proxies of common perceptions toward city spaces? How can user-generated information be applied to the design, implementation and evaluation of urban policies and spatial design and planning related to the cultural heritage? How can well-being and happiness related to the cultural issues be defined and observed from user generated content? And what use can we make of ubiquitously connected things and sensor data of various kinds towards the aims of the stakeholders? And how can we design such infrastructures to support human communication and cultural meaning-making?

Besides UGCs that are explicitly spatial and can be easily geo-localized, as long as they are made available through on-line mapping platforms, produced through GPS-integrated (mobile) devices, are geo-tagged or can be geo-referenced by using IP addresses, there is an enormous amount of web content that is merely textual and that is not possible to geolocalize directly. Moreover, the recognition of the geographical origin of contents, does not guarantee that they are actually referring to the places where they are produced, nor that they include information which is relevant for the purpose of the project. In order to overcome those limitations and to extract relevant and appropriate information, it's possible to apply entity recognition (NER) methods to assign geographical scopes, through automatic GeoReferencing, including GeoParsing (or GeoExtraction) and GeoCoding processes. Analysing geo-localized contents to explore emotional indicators and topics will result in a number of dynamic maps on perceived urban quality, using visual representation to enhance the detection of patterns, reducing the search for information and enabling perceptual inference operations. That fact produces huge audiences for cultural productions at local and regional levels and increases and represents a stronger incentive for possible investors.

M.U.S.I.C. focuses on the possibility to constantly extract quantitative and qualitative indications on how places and cities are perceived by inhabitants and city users. End users would be able to count on information which is relevant for their cultural purposes. The project aims at reinforcing the awareness of a shared regional culture and setting synergies between formal and informal cultural dynamics. This can be envisioned giving structure to the relation among digital media as catalyst tools and urban regeneration as spatial rooting device. M.U.S.I.C. aims at providing multi-dimensional and vivid experiences of physical space throughout the music and sound related to different times of city

inhabitants, tourists and visitors as well as a sophisticated and specialized data base for experts. Within this framework, the project aims at providing a wide range of stakeholders (which includes urban managers and public administrations as well as citizens) with meaningful cultural inquiry information about the city environment they live or work in. Starting from the historical physical manufacture and passing through instruments and sounds, the project focuses on the contextualization of cultural heritages within the so called “Intelligent Expert System of Digitalization”. So that, after a data mining through independent and flexible media, it will be possible to know if some archives already exist, or to create them. Through natural language and network analyses, the project will identify a cultural behavioural and semantic background for the entire city, related to the sound, rhythms, music of a place, making it possible to extract and depict specific patterns of subjective perception and use. This will allow the cultural economical energetic sustainability of the conservation through a project related with the music as a propeller for a cultural awareness.

## **FOSTERING CULTURAL AWARENESS TO ENHANCE CULTURAL POLICIES AND ECONOMIES**

The project will develop a strategy to archive cultural data, - sounds music and rhythms in particular - extracted from different sources, such as independent social networks, web platforms, mainstream media, specific information by population, which will be delivered to Public Administrations involved, to implement through these a cultural awareness. The envisioned action plan applies sounds and places analysis to spatial and geo-localized user-generated content in order to extract patterns of perception of city and rural spaces. With the project’s focus on the operational level of the city the aim is to constantly extract indications on city cultural uses related to the sound of places. In particular the project platform will allow end-users to analyze users’ perceptions related to specific geographic areas, detect the lack of structures related to the culture offered by institutions and city administrations, discover possible emergent structures and bottom-up initiatives responding to uncovered needs and desire, discover meaningful relationships and connections between places, people and cultural uses. The data display and diffusion will be provided through a visualization engine, helpful to understand how the cultural heritage is perceived within a city and how it can be managed. The visualization engine, will provide both geographic and non-geographic features.

Geographic visualizations will be the main access point to information, showing the intensities and qualities of the captured data under the form of graphical layers which are stackable onto the map, allowing for comparative visualizations across times, information sources, themes and other parameters. Maps will be completely navigable and filterable, allowing Municipalities to visualize only the information they want to focus on, including the other data sources which will be provided in the platform, as gathered from databases coming from institutional, verified sources. The non-geographical visualizations will show classical statistical and analytical information about the data contained in the system and its subsets, including distributions, correlations, indexes and dissemination across time and subjects. Specific visualizations will provide insights on the interpretation of the harvested information, expressing it under the form of semantic graphs directly obtained by the processes which will use semantic classification techniques. From this set of visualizations users will be able to focus on specific subsets of data, and then visualize them geographically. All data and visualizations will be exportable using internationally recognized open formats, allowing for easy integration to other databases and documentation forms.

The project will also develop meaningful ways to represent spatial cultural heritage and sounds for an immediate reading, understanding and interpretation of the information to convey and to archive. Many practices rely on the act of ‘mapping’ the world in order to make decisions; in the case of Urban Design, mapping is an integral part of the design process. Maps are used to support and argue for specific design and development decisions even though they are often built from limited sources of data or even from the perspective of a single person (thereby greatly increasing the subjectivity of the artefact).

Geo-spatial data (the visualization of real-time feeds of data on maps), with regard to the resulting cultural heritage indicators and sounds, will be a central point: particular effort will be put in developing an effective representation and sound system, that will allow the user flexibility and the possibility to highlight data related to specific issues, with the aim of providing an easy to use tool for designers, cultural operators and decision makers. Unlike traditional maps, which are often static representations of distributed phenomena at a given moment in time, M.U.S.I.C. will provide tools for grasping the moving picture of citizens expressions, as they are constantly changing and evolving with the city itself. The result will be a map/archive of the geo localized territory sounds and cultural places.

Building a notion of time into computer-generated maps would definitely help urban planners, cultural operators and designers to present a more dynamic notion of what places and experiences in cities are and are fundamental to create an awareness of cultural identity. The graphic user interface will be specifically designed to meet final users' needs, and specifically to make complex data effectively accessible, easily searchable in a visual and “hearable” way, through a visual and sound language that will allow the users to intuitively catch a temporal understanding of people, places and sounds in the city.

The tool we wish to develop would help the whole range of cultural operators, stakeholders involved in decision-making processes that result in planning activities, in urban design, in the definition of urban policies related to the cultural heritage. It would be a monitoring tool, offering information interpreted and mapped in real-time to the cultural elements of the city and its citizens, deploying de facto a cybernetic feedback loop between them. It would be helpful in understanding how the cultural heritage is perceived within a city, but it could also give hints to central and local public

administrations who are willing to adopt a more human-centred approach toward our cities' transformations.

The awareness of the presence of renovated cultural opportunities related to the sound and music in the Mediterranean area, will reinforce the need of new professional figures as cultural private and public administrators, curators, and producers. Festivals and informal performing occasions in the north Africa context do not produce durable skills for cultural operators neither for Arab artists mobility. The relations between cultural operators, decision makers and citizens have to be enhanced in a more structured way. Only acting constantly, cultural operators will better influence their political, administrative and economic environment. The project platform will work as a catalyst in setting synergies between formal and informal cultural economies. Under a regional management setting the general framework, local stakeholders and cultural associations will operate as curators able to coordinate activities at the local and inter-regional scale of the network and to work on the formal-informal interactions. The possibility of finding meaningful ways to inquire citizens' patterns of use, cultural spatial experiences and related perceptions of the urban environment brings in fact many important promises to the fields of urban design, planning and management.

## MAPPING SOUNDS, SPATIAL ROOTING AND URBAN REGENERATION

In every city, there are areas with strong character and identity. It's clear to everyone where and what a historical centre is, how to define an urban park or a hilly countryside. But how can we define and how people name areas in transition? For example the terrain vague of areas that used to be rural, areas of suburban fragmentation, areas characterized by enclosed technological infrastructures that often disappear from the mental representations the inhabitants build to navigate and communicate their environment. We think that sounds identify cultural places historical and not, which can define the identity of a place.

A domain where VGI (Volunteer Geographic Information) has been demonstrated to have considerable potential is in the identification and description of so-called vernacular place names – that is to say the often unofficial place names that people use in their everyday life, whose borders do not coincide with administrative regions. For example, Jones et al. (2008) investigated the use of web mining to identify place names associated with vernacular names and thus derive a “shared” idea of the definition of large vernacular regions such as Switzerland's Mittelland or the Midlands in the UK. Hollenstein and Purves explored how place names were used in Flickr, in particular with respect to the naming of city centre neighbourhoods. Edwardes and Purves [6] looked at the use of so-called basic levels, that is to say terms commonly used to describe place, in Geograph, a large collection of volunteered georeferenced images, and demonstrated that similar results could not be obtained from previous empirical studies, thus demonstrating that VGI has the potential to be used as an alternative means of gaining knowledge of shared concepts of space. We think that sound rhythms and music of a place could be a red line to define a new trans national space along the Mediterranean area.

Is it possible that cultural heritage makes people talk about an area? How many different cultural activities make people talk about an area? Is the sound theme possible in a district? How do cultural heritage awareness change over time (on a daily, weekly, monthly and yearly base)? What are the public's perception of a few central elements often associated with “good” cultural environment and thus increasing the liveability of a city: how accountable is its government (fiscally as well as in transparency); what is its accountability to the public in terms of this perceived performance which presume citizen interest. Thus different components of “access” and participation are key in stimulating both the elicited perceptions of liveability as well as prioritization of citizens in order to better target and special design and policy related to cultural issues and sounds, which satisfies their criteria for a “liveable” city. This could be done with an initial scoping or “digital emersion” phase where the research team identifies the appropriate mechanisms, places and ways to build relationships based on their sounds mapped, through networks of social hubs and focal points where further participation could be elicited. These links should be traced in order to see where a social change agent (or blocker) has been identified through an expression of values of what liveability in certain geographic areas means and what is needed as expressed by the inhabitants within the community, as issues, alternatives, and their position on the current status of the liveability.

Through the application of sentiment analysis techniques, a method first developed for businesses aiming to market their products, within the textual analysis of UGC, it will be possible to identify generic sentiments from citizens toward cities, specific neighbourhoods within cities or single urban infrastructures, landscape and urban projects. Sentiment analysis will allow to extract information about, on the one hand, users' judgement and evaluation, classified according to their polarity (positive, negative, or neutral) and, on the other hand, about the affective/emotional state of the writing author, e.g. happiness, fear, etc. While there is extensive research about sentiment analysis per se, and a growing interest for applying sentiment analysis to UGC and social networks (see Golder S.A. et al. in Science 333, 2011), the application of sentiment analysis to spatial and environment data has not been experimented yet. The integration of sentiment analysis, UGC, and spatial analysis techniques, can provide relevant information about urban perceptions and emotions through space, that would be otherwise impossible to obtain, to map and to visualize.

The Project platform would benefit from the explicit possibility to highlight emerging trends in how people declare their desires, wishes and visions on the city relating to cultural heritage, describing the possibility to identify opportunities for business, new models, new possibilities to create collaborations, groups, policies and infrastructures.

There are a lot of different software solutions already used for urban planning. The main issue is that they rely on

static data coming from governmental or manually surveyed data sets, or on data coming from users which are already aware of the possibility of contributing information using digital tools and networks. The use of a dynamic flow of social data is a huge advancement over this current practice as described in the following sections.

The Project assumption is that by conducting an analysis of data sets based on data extracted from UGC (User Generated Content) there is the possibility to recognize multiple stories, as they emerge, overlap and influence each other, unfolding from city users' mental representations and spatial experiences of city spaces.

Through the awareness derived from this knowledge the digital platform could empower public administrations, private stakeholders and citizens to foster economies of scale for the cultural sector that could determine a spatial rooting of the platform in specific urban or rural spaces suitable to host permanent or temporary, profitable or non-profit activities linked with the themes of the project. According to this dynamic the digital media initiatives can become engine of spatial regeneration. Urban or built heritage in need of regeneration could take advantage from the settlement of stakeholders from the cultural sectors. The economical balance can be reached through an equilibrated management of profit and no-profit initiatives mixing stakeholders at various scales, sponsors, investors, NGOs, producers, artists, beginners, amateurs. A cultural sustainability framework can make the music industry sustain the local emerging realities and promoting education.

## CONCLUSION

M.U.S.I.C. aims at reinforcing the awareness of a shared regional culture and setting synergies between formal and informal dynamics to foster cultural economies. This means increasing audiences and access to markets and raising the interest for investment; fostering administrative skills to better influence their political and economical environment; creating new cultural and creative small and medium enterprises; enhancing cooperation synergies among public and private stakeholders and citizens. We can resume the main actions of the project in the following list:

- a harvesting engine that collects real-time cultural data streams from geolocalized UGC streams;
- a web interface that will allow users to perform specific searches within pre-defined domains (e.g. show all the content related to 'places' within the domain of 'a kind of music');
- a visualizing engine that will generate dynamic infoaesthetic representations on top of standard Google Maps visualizations;
- a mutually interactive set of sounds visualizations which allow operators to move between different analytical approaches, leveraging the benefits of each of them toward the creation of valuable interpretations of the expressions and behaviours of users in social networks;
- combination of user profiles information and geospatial data to generate several levels of analysis based on selected target groups (residents, tourists, age groups, ...) ensuring inclusion of minor groups;
- an approach focusing on the support of multilingualism at different levels;
- an urban monitoring tool to set policies and planning initiatives;
- an urban regeneration strategy to root the intangible aspects of the project into specific places in need of economical investments for regeneration.

The gathering of actors around specific nodes will transform them in Mediterranean antennas amplifying and transmitting the sound of places to the region and the world promoting cultural and economical exchange among scales and countries. The project proposes a global, regional, cross-countries expandable approach. The digital platform could become exchange tool among countries and populations, setting the basis for the strengthening of common identity, but also for the fostering of contamination and dialogue, protecting differences and minorities. The digital dimension allow a widespread access to the cultural contents from the countries involved, but effectively from everywhere, opening an unprecedented showcase to the cultural products of this part of the world.

## ACKNOWLEDGMENT

This paper has been inspired by the research and experimental work carried out by the Authors to apply for the "Media and Culture for Development in the Southern Mediterranean" European Commission Project. For this reason Authors like to thank the research partners who chose to support the M.U.S.I.C. vision: University of Tunis (Prof Yassine Khaled); CIDEHUS – Centro Interdisciplinar de Historia, Culturas, Sociedades of the University of Evora; Cairo University; Built Environment Collective (MEGAWRA); GAIA–HERITAGE; Jordan Ministry of Tourism and Antiquities (MOTA). Special thanks also go to Roberto Albergoni for his helpful support and Paolo Patelli for his scientific contribution.

## COMUNICARE LO SVILUPPO E LA COOPERAZIONE INTERNAZIONALE

Silvia Pochettino\*

\*Consorzio ONG Piemontesi, Italy - [cop@ongpiemonte.it](mailto:cop@ongpiemonte.it)

Obiettivo del Panel è indagare su come si comunica la cooperazione internazionale sui media, come comunicano i soggetti che fanno cooperazione, quali relazioni si instaurano fra media-ong-istituzioni, e in che modo la tipologia di comunicazione influisce sulle scelte finali.

Le ricerche presentate intendono fornire un quadro generale dell'interazione tra Università, giornalisti e operatori della cooperazione internazionale.

Tali ricerche sono state effettuate nel quadro progetto triennale europeo **“Comunicare in rete per lo sviluppo”** che si svolge in Italia, Francia, Spagna, con l'obiettivo di migliorare la quantità e la qualità della comunicazione sui temi dello sviluppo e della cooperazione internazionale. In Italia è promosso da COP - Consorzio Ong Piemontesi ([www.ongpiemonte.it](http://www.ongpiemonte.it)) in collaborazione con Università degli Studi di Torino, Associazione Stampa Subalpina, Regione Piemonte, Coordinamento Comuni per la Pace della Provincia di Torino. In Spagna e Francia i partner sono invece la Federazione delle Ong Catalane ([www.fcngd.org](http://www.fcngd.org)) e RESACOOOP – Réseau Rhône-Alpes d'appui à la coopération internationale ([www.resacoop.org](http://www.resacoop.org)).

Un rapporto difficile tra media e Ong o enti che lavorano nella cooperazione è stato evidenziato da tutte le ricerche presentate e dal dibattito successivo. La prima ricerca, realizzata da Sara Minucci ha monitorato i media piemontesi tra il 1 aprile e il 30 giugno 2013: ne sono emersi 237 articoli che in qualche modo trattano il tema (secondo le parole chiave individuate), ma la maggioranza risulta di piccole dimensioni contenuti nella sezione cronaca locale (60,7%). A testimoniare che i piccoli eventi locali sono più ripresi delle tematiche generali e la cooperazione internazionale non è percepita come una rappresentanza dell'Italia all'estero.

Interessante anche il confronto con i dati di Francia e Spagna (visibili nei paper allegati) in cui pur in contesti sostanzialmente differenti alcuni tratti comuni si riscontrano nella scarsa notiziabilità dei temi della cooperazione internazionale, la bassa salienza, la predominanza del termine umanitario su quello di sviluppo e cooperazione.

La parola chiave più riscontrata è infatti, in tutti e tre i paesi “Umanitario” (50,2%), a scapito di scarsissimo coverage sullo sviluppo o sulla cooperazione. Il tema della cooperazione appare più complesso da comunicare, soprattutto in modi comprensibili ai media e al pubblico in generale.

A questo proposito, tornando al caso piemontese, sono emersi molti dati anche sulla necessità di professionalizzazione dei comunicatori delle Ong e degli enti che fanno cooperazione: solo il 59% delle 32 Organizzazioni di cooperazione interpellate in Piemonte si serve di comunicati stampa per raccontarsi all'esterno. Il 91% di loro comunica attraverso il proprio sito web, attuando una strategia autoreferenziale. Appena il 15% possiede un ufficio stampa, mentre il 41% si serve di volontari per comunicare. Una comunicazione che appare più a spot basata sui pochi o tanti contatti personali che strutturata strategicamente e in modo continuativo.

Interessante anche l'approfondimento sull'uso dei social network da parte delle Ong italiane, presentato nella terza ricerca italiana, condotta da Donata Columbro: se è forte da parte della maggioranza delle Ong italiane la voglia di seguire le nuove tendenze del web 2.0, manca però un cambiamento ‘strutturale’ del lavoro, che si lasci permeare da una comunicazione in cui il contenuto è creato anche dagli utenti.

Spesso le Ong tendono a usare siti, blog e social network come vetrina delle proprie attività nel senso più tradizionale del marketing: cioè come “canale” per informare o lanciare eventi e campagne come farebbero con uno spazio pubblicitario in tv.

Più strategia, meno frammentazione e un rapporto strutturato tra Ong e media, è emerso come indicazione di fondo dal panel. Emerge anche come le linee guida sulla comunicazione vadano aggiornate. La cooperazione internazionale gode di una bassa presenza sulle reti televisive nazionali, e in Italia se ne parla poco. Sono rari i documentari sulla cooperazione.

Esiste inoltre un effetto della comunicazione sulla memoria storica della cooperazione: si dimentica che “fare comunicazione” è aggiornare una riflessione per il futuro. Questo perché anche i progetti molto interessanti, se non comunicati, perdono di significato e di impatto sulle società.

L'altro ostacolo è quello posto al “data journalism”, ovvero l'uso dei dati permesso dai sistemi informatici. A questo proposito, mancano o non sono accessibili le informazioni.

Emerge anche un nuovo bisogno di formare i giornalisti sui temi di solidarietà e della cooperazione, e la necessità di costruire un network di comunicazione: solo così i media possono raggiungere la gente e la società.

## THE COMMUNICATION OF INTERNATIONAL COOPERATION AND DEVELOPMENT IN PIEDMONT

Sara Minucci\*

\*Osservatorio sulla Comunicazione Politica, Dept. of Cultures, Politics and Society, University of Turin, Italy-  
[saraminucci@hotmail.com](mailto:saraminucci@hotmail.com)

### ABSTRACT

This work is part of the European project "Network of Journalists and Communicators for cooperation and development" ([www.devreporternetwork.eu](http://www.devreporternetwork.eu), DCI-NSAPVD/2012/279-805) and deals with the communication of international cooperation and development in the media of Piedmont.

The goal is to offer a snapshot of how local media address the issues related to international cooperation and development that can provide elements to reflect on which are the strengths and the weaknesses of the information landscape in Piedmont.

The research focuses on the coverage of issues related to international cooperation and development in local newspapers distributed in Piedmont and in the evening edition of TgR Piemonte, the regional newscast on the national broadcast RaiTre. The discussion also uses the information collected through a questionnaire to editorial staffs working in Piedmont that aims at understanding how they organize the communication of these issues.

### INTRODUCTION

This article presents the first data on the presence of international cooperation and development in the local media of Piedmont.

The research is part of the EU-funded project "Communication Network for Development" ([www.devreporternetwork.eu](http://www.devreporternetwork.eu), DCI-NSAPVD/2012/279-805). The leader of the initiative is the Federación Catalana de ONG para el desarrollo (85 member organizations), based in Barcelona, together with the two partners: the Consorzio delle ONG Piemontesi and RESACOOOP, the coordination of the Region of Rhône-Alpes based in Lyon (the latter consisting of several NGOs but also by French local authorities and universities).

The project has three main objectives: 1) to establish a network of journalists and media professionals for development, 2) to improve the quality of local news about international cooperation and development and the Millennium Development Goals and 3) to enhance the skills of the people in charge of communication among the members of the three regional platforms. The analysis presented here participates to the achievement of the second objective and will be completed by November 2013.

This paper is organized as follows: first, we will discuss the results of the research carried out in the local papers of Piedmont, then we will show the data about the regional newscast of RaiTre and, finally, we will present the first results of a questionnaire to editorial staff working in Piedmont.

### LOCAL NEWSPAPERS

Local newspapers in Piedmont have a strong journalistic tradition, rooted in the territory. Local newspapers reach their readers with thousands of copies by postal subscription and on newsstands, with a high loyalty rate. Readers bases mainly consist of territories inhabited by 80 to 150 thousand people.

The spread of local newspapers in Piedmont reaches a total of about 600,000 copies a week [1], with an actual readership of more than 2 million people out of a total of approximately 4 million and 400 thousand inhabitants. Since the local newspapers are in majority weekly or bi-weekly, they remain more days in homes and they can thus be read by more than one person. This aspect highlights one of the most important features of local press, which is to be primarily in-depth newspapers, in contrast to the steady stream of information coming from the other media.

The analysis was conducted by querying the database of the Piedmont Region "MenteLocale", a storage platform of printed Piedmont developed by the Press Office.

The list of newspapers consulted shows a geography of Piedmont extremely interesting from the point of view of the vitality of local journalistic system (see Graph 1).

The research was carried out in the following newspapers:

- Province of Alessandria (AL): *Ancora, Monferrato, Nostro Giornale, Novese, Panorama Novi, Panorama Tortona, Piccolo, Popolo, Vita Casalese, Voce Alessandrina.*
- Province of Asti (AT): *Corriere Astigiano, Gazzetta di Asti.*
- Province of Biella (BI): *Biellese, Eco Biella.*
- Province of Cuneo (CN): *Bisalta, Bra Oggi, Corriere Alba, Corriere Bra, Corriere Saluzzo, Corriere Savigliano, Cuneo Sette, Fedeltà, Gazzetta Alba, Gazzetta Saluzzo, Guida, Idea, Idea Sport, Nuovo Braidese, Piazza Grande Fossano, Provincia Granda, Saluzzo Oggi, Saviglianese, Unione Monregalese.*
- Province of Novara (NO): *Azione, Corriere Novara, Novara Oggi, Tribuna Novarese.*
- Province of Verbania (VB): *Eco Risveglio Arona, Eco Risveglio Ossola, Eco Risveglio Verbano, Prealpina.*
- Province of Vercelli (VC): *Corriere Eusebiano, Corriere Valsesiano, Gazzetta, Notizia Oggi Borgosesia, Notizia Oggi Vercelli, La Sesia.*
- Province of Torino (TO): *Canavese, Corriere Chieri, Corriere Moncalieri, Corriere Sportivo, Cronaca Qui Torino, Eco Chisone, Eco Mese, Gazzetta Canavese, Luna Nuova, Mercoledì, Monviso, Nordovest, Nostro Tempo, Notizie Comune, Nuova Periferia Chivasso, Nuova Periferia Settimo, Nuova Voce, Nuovasocietà, Risveglio Canavese, Risveglio Popolare, Sentinella Canavese, Sprint e Sport, Valsusa, Vita Diocesana Pinerolese, Voce Canavese, Voce del Popolo.*
- National newspapers with local editions: *Il Giornale, La Repubblica, La Stampa.*<sup>1</sup>

**Graph. 1** - Number of newspapers/ province.

## Methodology

The digital archive *MenteLocale* collects the pages of newspapers that regularly send the material in PDF format. The database allows users to search pages by selecting from one to three textual units (key words), which can be searched by combining three Boolean operators "and", "near" or "not". The limited amount of search fields, it should be remembered, does not allow to refine that much about the query string. However, the method of investigation allows the definition of quantitative flows that, once defined, may be repeated, giving rise to significant trends.

## Results

The research was divided into two phases. The first one has detected the frequency with which, in the period between April 1<sup>st</sup> and June 30<sup>th</sup> (2013), articles have appeared with at least one of the keywords selected: *cooperazione internazionale* (international cooperation) 85, *cooperazione e sviluppo* (cooperation and development) 200, *ONG* (NGO) 80, *internazionalizzazione* (internationalization) 158, *umanitari/o/a/e* (humanitarian) 353. In this way we collected 877 articles in total. In the second phase, all articles have been read to verify their actual relevance to the topic under investigation. Once the analysis was completed, it emerged that there are 237 articles related to the topic of this study<sup>2</sup>. The presence of the articles varies over time: in April were 101, to May 82 and June 54 (see graph 2).

<sup>1</sup> *Il Giornale* and *La Repubblica* have regional editions, while *La Stampa* has a local issue for each of the 8 provinces of Piedmont, each with its own pages. Therefore, in this paper, articles published by the various provincial editions of *La Stampa* will be counted among the articles published in each province, while the articles of *Il Giornale* and *La Repubblica* will be kept separate.

<sup>2</sup> The value is calculated net of the cases (34 in total) in which the same article has been identified using multiple keywords.

**Graph 2** - Number of relevant articles/month.

From the reading of the collected material emerges as, among those used, the keyword 'humanitarian' is the one that collects the largest number of articles (50.2%), followed by 'international cooperation' (20,8%) and 'development and cooperation' (14.5%) and 'NGO' (14.5%)<sup>3</sup>. No article on topics related to international cooperation for the development was instead found by using the term 'internationalization' (see graph 3). The fact that 'humanitarian' in its various forms appears to be the most used word in the articles confirms that the term humanitarian ended up becoming an overused adjective [2] used both to create emotional involvement and to legitimize external interventions [3]. Other keywords are evidently being too technical and specific and therefore of limited use to outside their specific field.

**Graph 3** - Relevant articles/ keyword.

The number of articles by province (Alessandria 16, Asti 21, Biella 23, Cuneo 52, Novara 21, Torino 71, Verbania 8, Vercelli 16, Piedmont 7), on the one hand, reflects the disparity between provinces in terms of number of newspapers, with Turin and Cuneo which are clearly distinguishable. On the other hand, it reveals how some provinces - in particular Asti and Biella - have a significant number of articles about international cooperation and development in relation to the number of newspapers published. Similarly, one can observe a lack of attention to these issues in the regional editions of *Il Giornale* and *La Repubblica*. The limited presence of articles on these titles may be due to the fact that, since they have to cover the news from the entire region, it is more difficult for news on international cooperation for development or on NGOs to respond to so-called "substantive criteria" [4] of newsworthiness that define the importance that a news can have: the type of actors involved, the geographical proximity, the number of people involved, the possible future developments. The more geographically limited is the area covered by a newspaper, the greater is the possibility that news stories – in particular those referring to specific events on the ground - get visibility on its pages.

<sup>3</sup> In this case values are calculated including all keywords found in the articles, then n = 271.

Graph 4 - Number of relevant articles/ province.

The section where most of the articles are is the Cronaca Locale (Local News), which collects 60.7%, followed by the pages of Cultura e Spettacoli (Culture and Shows) with 12.6 %. All other sections, including Attualità (Current, 2.9%), Esteri (Foreign News, 2.5%) and Economia (Economics, 1.2%), have a very limited number of articles. This fact, together with data about the occasion of the article - which in 73.4 % are originated by events - even very small – on the territory (e.g. fundraising concerts, book presentations, ethical markets) confirms the fundamental importance of the geographical proximity of the events or people involved as a means of access to the pages of local newspapers.

We also found that in 114 articles there are references to specific countries or areas: the majority of them uses generically the term Africa (25 articles), while the most mentioned country is Mali (16 articles), followed by Kenya (7), Burkina Faso (6), Brazil and India (5), Ethiopia, Nepal and Tanzania (4). The other countries or areas have very few references. This result, on the one hand, shows how journalists tend to use generic geographical references ('Africa') instead of precise indication of a country and, on the other hand, it points out how emergency cases such the one of Mali can be presented even in local newspapers.

The result of the study on the visibility of the articles shows that they are in majority of small size (35.4%) or medium (33.3%). The fact that the largest number of items does not bear the signature of the author (64.9%) and that the majority of them are of small or medium size would seem to suggest the direct use of press releases by the newspaper. To find a reply to that hypothesis, we crossed the data regarding the items with greater visibility, those that are big sized and high-cut, which is 19.8% of the total. Of these, only 17% is published without signature. This result seems to strengthen the hypothesis that, for the items with poor visibility into the page, newspapers tend to make use of texts already written, while news to which is dedicated more space tend to be processed by the journalists of the magazine.

In this analysis, it is important also to highlight the presence of local newspapers that host sections on topics such as associations, aid and the South of the world which can thus offer a space to inform also about issues related to international cooperation and development and its actors: *L'Eco di Biella* (Biella) has the heading *Associazione della settimana* (The association of the week) and *La Bisalta* (Cuneo) 'Cuneo-Associazioni' (Cuneo' Associations), *Cronaca Qui Torino* (Torino) hosts 'Volontariato e solidarietà' (Volunteering and solidarity), while *La Voce del Popolo* (Torino) has 'Sud' (South). It is an important element of context that could contribute to the creation of a relevant frame in the communication of these issues and that therefore may be taken into account for the purposes of improving the quantity and quality of the communication of issues related to cooperation and development and its actors.

## LOCAL TV NEWS : TGR PIEMONTE

TgRegione of Piedmont (TgR) is the regional television news broadcasted on the national broadcast RaiTre, produced by the Regional Newspaper. It constitutes the main mean of television news about Piedmont for the region's inhabitants.

## Methodology

The analysis of TgR examined the main edition of the newscast, that of 7.30 p.m., in the period April-June 2013. The survey was conducted in two phases. The first was developed through a keyword search (using 'international cooperation', 'development and cooperation', 'internationalization', 'NGO', 'humanitarian') in the database of Teche

Rai in Turin, where all the services of all editions of the TgR are archived by keywords. It was decided to use the same keywords used for searching the local papers both because it was considered they were those that could better identify relevant services for the diagnostic study, both because this allows to create dialogue between the results obtained in the two samples.

In the second phase, to deepen the research, the entire 7.30 p.m. edition in the first week of April (1-7), the second week of May (6-12) and the third of June (17-23) has been watched to check the presence of services relating to the topics of interest that had not emerged using keywords. In this way it was possible, on the one hand, to check the possible margin of error given by the use of keywords and, secondly, to verify the possible presence of relevant topics eventually excluded from our survey.

## Results

The conduct of the two stages of the inquiry on 7:30 p.m. edition of TgR did not reveal any service related to the issues of international cooperation and development. This result can depend on the absence – in the period of time taken into account - of news on international cooperation and development (i.e. events on the territory) considered significant enough to merit a space in the TgR main edition. Anyway, this lack of data is in itself an important result and must be taken into account for the achievement of the specific objectives of the project "Network communication for development".

## LOCAL EDITORIAL STAFFS

After having examined the communicative products, the study focused on the communication actors that operate in Piedmont to understand how they are organized, whether and how they deal with the issues of international development cooperation and how they evaluate their contribution in the communication of these issues. To do this, more than 250 newsrooms in Piedmont (including the press, internet, radio and TV) were contacted via email between June and October 2013 to answer to an online questionnaire. 16 answers have been received so far (12 newspapers, 2 radios, 2 websites).

## Methodology

The questionnaire was structured through a first part of questions designed to reconstruct how the editorial staff is organized – how many journalists work in it, how many freelance journalists work for it. A more specific second part focused on the subject of this research: it asked if there is at least a specialist in international cooperation, how often news related to international cooperation are published, what the main focus given to these kind of news is, what sources are used, if they have a specific section on international cooperation. Finally, a question asked to describe cooperation in 5 words.

## Results

Although this part of the research is still going on while we write, we try here to sketch the partial results obtained from the small number of responses obtained so far.

As for the journalistic routine, the data collected so far confirm what was observed in the study of the newspapers: the majority of editors who claims to treat, even infrequently, information concerning Co-operation and Development (14) does so especially in the section of Local News (5), 3 in Economics, 2 in Foreign News, one has a special section, one uses the Front Page, one in the section 'Society', one in Politics.

In addition, four say they feature at least a specialist on issues related to international cooperation and developing countries: in two cases it is a collaborator, in one case it has an internal editor who is specialized in this area and in one case the tested claims to have more than one specialist in the field but does not specify what their classification. Among those who declared that they have specialists, 6 stated that they never or almost never deal with these issues, 3 admit they do not have sufficient resources to have them, while 2 claim that they do not consider necessary to have a specialist in this field.

Moreover, among those who responded to the questionnaire, 6 claimed to have hosted public awareness campaigns related to the issues of development cooperation promoted by cooperation actors at international, national or local level. In all cases they did it for free.

Regarding the sources of information used by editorial staffs, it is relevant to note that the vast majority of those who responded (11) said that, when they talk about international development cooperation, they mainly use as sources direct personal contact with the actor/s involved. The others declared to use press agencies or institutional sources of information (press releases, newsletters or websites of Ministry, Region, Province, City etc.).

Graph 5 - Main focus of pieces concerning cooperation according to journalists (multiple answers were possible).

Editorial staffs were also asked to describe in five words what international cooperation is according to them. Figure 1 shows their answers (the bigger a word is, the more it has been used).

Fig. 1 - Words describing cooperation and development according to local journalists.

Even if Figure 1 has not any statistical relevance, it shows a mainly positive conception of international development cooperation by the frequent use of terms such as ‘solidarity’ and ‘collaboration’ but also ‘future’, ‘rights’, ‘commitment’ and ‘justice’. The result, however, has to be confirmed at the end of this part of the study.

## CONCLUSIONS

The analysis conducted so far lets us drawing a first reflection on "communication for development".

Data show that the presence of news related to international development cooperation and its actors is in general poor and mostly linked to events in the area. Furthermore, data collected from newspapers seem to suggest a lack of specialization of journalists on these issues although cases of thematic headings on some newspapers are a good example of how the presence of development and cooperation and of the actors involved in it can be improved on the pages of the newspapers Piedmont.

In a context of scarce competence of journalists, the professionalization of NGOs communication constitutes the basis to increase the information about international cooperation both in local and national newspapers and broadcasters. The result can be obtained by improving the newsworthiness of NGOs’ activities: examples can be 1) the organisation of events – even small – on the ground, 2) to show clearly the link between the territory and the economy of Piedmont and the work and the activities of local NGOs (i.e. describing the work and the personal stories of Piedmontese development workers).

Actually, a better communication can create a favourable ecology for international cooperation programs by making development interventions more vernacular and thus facilitating interactions between the actors of cooperation and the public [5].

## ONG E SOCIAL MEDIA: I RISULTATI DI UN'INDAGINE DI MAPPATURA DELLA PRESENZA ONLINE DELLE ORGANIZZAZIONI NON GOVERNATIVE ITALIANE

Donata Columbro\*

\*CISV, Volontari Per lo Sviluppo, Italy - [donata.columbro@gmail.com](mailto:donata.columbro@gmail.com)

### ABSTRACT

Il paper raccoglie i risultati di un'indagine online somministrata alle organizzazioni non governative italiane nel mese di febbraio 2012, nell'ambito di una ricerca sulla comunicazione della cooperazione internazionale attraverso i nuovi media cofinanziata dalla Fondazione CRT e della Fondazione Giovanni Gorio per il Master dei Talenti della Società Civile.

Attraverso un questionario è stata osservata la presenza online delle Ong con riferimento al sito internet, alla capacità di creare comunità attraverso i social network e all'impiego di tecniche di fundraising su web. I risultati hanno evidenziato un utilizzo ancora sperimentale dei nuovi media da parte della maggior parte delle Ong italiane, con una percezione errata del ruolo ad esempio del mezzo "social network", comparabile a quello degli "old media", dove il modello di comunicazione broadcasting consente a un soggetto di diffondere il suo messaggio a un'ampia audience di utenti. In realtà i social network o social media sono prima di tutto luoghi di conversazione, dove la comunicazione non è unidirezionale ma viene formata dai contributi di ogni attore. In generale, dai risultati dell'indagine emerge la volontà, da parte delle Ong rispondenti, di esplorare nuovi strumenti, ma manca la disponibilità a cambiare strutturalmente il proprio lavoro facendosi permeare dalle novità. Il che rende per lo più improduttivo il lavoro. Secondo Beth Kanter, studiosa statunitense dell'evoluzione delle Ong in relazione all'evoluzione del web, "Le Ong devono cambiare strutturalmente l'organizzazione del proprio lavoro e non solo applicare vecchi modelli a nuovi strumenti".

Nel mese di febbraio 2012, in corrispondenza del cronoprogramma previsto dalla ricerca, è stata avviata un'indagine qualitativa sulla presenza online delle organizzazioni non governative italiane. L'indagine, pubblicata attraverso l'applicativo Survey Monkey, è rimasta aperta per 90 giorni, raccogliendo in totale 76 questionari.

### CHI SONO LE ASSOCIAZIONI INTERVISTATE

Il 65,3% dei rispondenti all'indagine sulla presenza on-line delle associazioni ha segnalato il proprio profilo come Ong idonea per il Ministero degli Esteri, secondo la legge 49/87. Il 28% dei rispondenti è un'organizzazione di volontariato iscritta al registro delle Onlus, un altro 28% si definisce 'associazione', mentre due si riconoscono nella categoria 'fondazioni' e due come 'comitati'. C'è poi un 8% che si definisce come avente diversa natura, in particolare: un ente autorizzato dalla Commissione adozioni internazionali, un giornale online, una Fondazione di partecipazione e un coordinamento di associazioni. Tra i rispondenti all'indagine, il 38,7% dichiara un numero di personale a contratto tra 1 e 5 persone; il 30,7% tra 6 e 15; il 22,7% più di 30 e l'8% tra 16 e 30.

### INDAGINE – PRIMA PARTE: UN SITO INTERNET PARTECIPATIVO

La prima parte delle domande riguardava il sito internet, l'interazione con gli utenti e il collegamento con uno o più blog. Nell'era del web partecipativo "la struttura di un sito dovrebbe tendere sempre di più verso l'apertura all'esterno" secondo Luca Conti, consulente di social media marketing e docente dei corsi di Ong 2.0, dove ha spiegato che "Web 2.0 è passare dal web marketing al content marketing, non basato sulle metodologie tradizionali di diffusione del messaggio pubblicitario su siti vetrina, ma attraverso gli strumenti che si avvalgono dei contenuti come elemento che genera valore per l'utente".

**L'ultima versione (struttura o design) del sito risulta aggiornata al:**

I siti web delle Ong italiane stanno andando in questa direzione? Tutte le Ong coinvolte nell'indagine hanno un sito internet e il 39,7% ne ha aggiornato la struttura nel 2011. Per il 24,7% l'aggiornamento del sito era in corso nel momento in cui si è svolta l'indagine, mentre il 35,7% lo ha aggiornato per l'ultima volta prima del 2010. Solo nel 28,1% dei casi il sito è stato predisposto dalle Ong con la possibilità di commentarne il contenuto, mentre il 9,4% ospita uno spazio con uno o più forum per gli utenti. L'81,3% dei siti delle non profit prevede inoltre uno spazio per donare online via carta di credito, PayPal, bonifico bancario o altri servizi di pagamento.

A proposito dell'apertura verso l'esterno, alcuni rispondenti (16% in totale) hanno segnalato un collegamento con i social network attraverso social plugin (speciali strumenti che permettono di incorporare le funzionalità del Social Network direttamente all'interno di un sito) con cui condividere il contenuto, la possibilità di scaricare materiale, il collegamento a blog esterni e una form apposita per iscriversi come donatore. Inoltre, il 24,7% delle associazioni dichiara di gestire un blog e il 16,4% ne gestisce più di uno.

Per le Ong partecipanti all'indagine la cadenza di aggiornamento è per lo più settimanale (38,5%), di solito da parte dell'ufficio comunicazione/promozione del proprio organismo (70%). Il 26,5% invece è aggiornato da un team di autori dedicati a questa attività, mentre nel 20,6% dei casi sono i cooperanti espatriati a occuparsene o i volontari in servizio civile (11,8%).

Solo in un caso il blog viene utilizzato solo in fase di "emergenza", in un altro non viene più aggiornato perché la comunicazione è stata spostata integralmente su Facebook. Solo una delle organizzazioni rispondenti fa partecipare i beneficiari dei progetti nella scrittura del blog, tre Ong chiedono invece agli stagisti di occuparsene.

**Con quale frequenza viene aggiornato?**

## INDAGINE – SECONDA PARTE: USO DEI SOCIAL MEDIA

La maggior parte delle Ong partecipanti all'indagine (92,6%) ha attivato almeno un profilo sui social network: Facebook (92,5%), YouTube (76,4%) e Twitter (69,8%) i più gettonati, seguono LinkedIn (32,5%) Google Plus (27,9%), Pinterest (8,6%) e Foursquare (2,8%).

Alla domanda sui motivi per cui sono stati attivati canali di comunicazione social, i partecipanti all'indagine hanno risposto con commenti liberi che abbiamo raggruppato secondo le loro affinità:

- velocità, semplicità e immediatezza del mezzo (9)
- per raggiungere target diversi di persone allo stesso tempo (oltre newsletter/oltre rapporti face-to-face) (7)
- per la quantità di persone che è possibile raggiungere (effetto moltiplicatore) (4)
- per aumentare la propria visibilità/per promozione (16)
- per informare (3)
- facilitare la comunicazione con gli stakeholders (2)
- per aggiungere i giovani in particolar modo (2)
- perché ritenuto indispensabile/fondamentale (3)
- per l'interazione e il networking (informare e ricevere nuovi input) (9)
- per il contatto diretto con i volontari/simpatizzanti (7)
- trasparenza (1)

La maggioranza delle motivazioni fornite dai rispondenti evidenzia una percezione errata del mezzo "social network", comparabile a quello degli "old media", dove il modello di comunicazione broadcasting consente a un soggetto di diffondere il suo messaggio a un'ampia audience di utenti. In realtà i social network o social media sono prima di tutto luoghi di conversazione, dove la comunicazione non è unidirezionale ma viene formata da i contributi di ogni attore. Questo punto di vista emerge anche nelle risposte date sui tipi di argomenti trattati nell'aggiornamento dei social network. I principali riguardano la comunicazione sulle attività e gli eventi promossi in Italia (57,1% ha risposto 'sempre', il 31,7% ha risposto 'in prevalenza'), ma talvolta i profili sono usati anche per dare informazioni sul mondo della cooperazione in generale (47,2%, solo l'11,3% li usa 'sempre' per questa pratica). Sono poche le Ong che sfruttano i social network per coinvolgere in modo diretto i sostenitori con sondaggi e contest (il 44,4% non li usa mai in questo modo, il 3,7% li usa 'sempre' e il 7,4% li usa in prevalenza con questa modalità). Il 28,1% aggiorna 'sempre' i profili con campagne di raccolta fondi (in prevalenza per il 22,8%, mai per l'8,8%), mentre per il 14,5% l'invio di notizie in situazioni di crisi è l'argomento trattato in prevalenza (mai per il 15,5%). Talvolta (36,4%) le Ong usano i social network per riportare testimonianze dai cooperanti espatriati e dai beneficiari dei progetti (sempre nel 18,2% dei casi, mai nel 12,7%), mentre in prevalenza il 32,7% pubblica aggiornamenti sull'andamento dei progetti (sempre per il 21,8%), e solo il 10,6% li prende in considerazione come canale di ricerca personale e pubblicazione di vacancy (mai nel 36,4% dei casi).

Principali argomenti trattati sui profili dei social network attivi:

Ad aggiornare i profili istituzionali dei social network nelle Ong sono in genere persone dell'ufficio comunicazione/promozione nel 73,2% dei casi, mentre si tratta di un'attività integrata nei compiti di ogni dipendente e del personale a contratto nel 21,4%. Solo in due casi il lavoro risultava appaltato a un'agenzia esterna, mentre il 10% delle Ong hanno una figura di 'social media manager' al proprio interno. Nella casella di risposta libera all'indagine, il 10% dei rispondenti hanno specificato che si tratta di un'attività portata avanti dai volontari dell'associazione, in un caso solo viene esplicitato che "ogni membro dello staff propone contenuti e talvolta li pubblica". In un altro caso è invece il direttore ad aggiornare i profili istituzionali sui social network.

Solo l'11,3% dei rispondenti afferma di dedicare da 2 a 5 ore al giorno per la gestione dei social network, che diventa un'ora al giorno per il 41,9% dei partecipanti, un'ora alla settimana nel 30,6% dei casi e meno di un'ora la settimana per il 16,1%.

## INDAGINE – TERZA PARTE: LA PERCEZIONE DEI SM NEL LAVORO DEGLI OPERATORI DEL NON PROFIT E NEL FUNDRAISING

Ma qual è la percezione delle Ong nei confronti dei social network come nuova modalità di comunicazione del proprio lavoro? Per capirlo si è loro proposta una serie di affermazioni su cui si potevano dichiarare totalmente in disaccordo, fortemente, in parte d'accordo, molto d'accordo, totalmente d'accordo.

La maggioranza delle Ong è convinta che la presenza di un profilo sia fondamentale per raggiungere i sostenitori della propria organizzazione (57,4%), mentre non è opinione condivisa che la gestione dei social network vada affidata solamente a personale specializzato (35,2%). Solo il 15,21% crede poi che il personale non facente parte dell'ufficio stampa non dovrebbe essere autorizzato a usare i social network per divulgare informazioni sull'attività della propria Ong. Come invertire questa tendenza? "Pensare ai social media come competenza dell'organizzazione e non come il lavoro di qualcuno", suggerisce Beth Kanter, consulente del non profit nel settore social media con esperienza internazionale (vedi in allegato).

Quanto al nodo centrale del coinvolgimento dei leader dell'organizzazione e della presidenza nella strategia di comunicazione con i social media, solo il 25,8% dichiara che la dirigenza della propria Ong non riconosce il valore del tempo e delle risorse impiegate nella gestione dei social e questo è un dato molto positivo, poiché se manca il coinvolgimento dei vertici dell'associazione manca un'ottica di investimento a lungo termine: "I social network non sono strumenti che si usano un mese all'anno e poi si abbandonano, vanno coltivati, e se necessario si cerca di colmare le lacune seguendo corsi di formazione", raccomanda Luca Conti.

### Quanto reputa soddisfacenti i risultati della raccolta fondi online avviata dalla sua organizzazione?

Il 41,4% è in parte d'accordo quando si afferma che ogni cooperante espatriato dovrebbe gestire un blog o un account personale per eliminare le distanze tra gli operatori umanitari e i sostenitori delle Ong, mentre il 34,4% ritiene

che la trasparenza sulla gestione dei fondi potrebbe migliorare se ogni progetto venisse condiviso con i sostenitori delle Ong attraverso i social network.

Per quanto riguarda il fundraising online, il 92,2% non ha mai fatto uso di piattaforme di crowdfunding (processo di finanziamento dal basso), anche se il 28,6% si dichiara molto d'accordo nel sostenere che si tratti del fundraising del futuro. Chi ha utilizzato piattaforme di crowdfunding si è rivolto a Rete del Dono e a Indiegogo.

Che si tratti di fundraising online tradizionale o crowdfunding, Paolo Ferrara, da dieci anni fundraiser, docente di Ong 2.0 e responsabile della comunicazione di Terres des Hommes Italia, è convinto del fatto che è la chiave del successo delle raccolte fondi risieda nel “credere nelle persone, farle sentire protagoniste di un’attività di socializzazione e di condivisione”. In ogni caso, “il fundraising 2.0 non ha niente di diverso dal fundraising faccia a faccia: a fare raccolta fondi deve essere una comunità, perché crede in un progetto, lo sente suo e se ne impossessa” (vedi intervista allegata). In quest’ottica, anche il 48,6% che reputa poco soddisfacente i risultati della raccolta fondi online avviata dalla sua organizzazione, e il 16,2% che li considera per nulla soddisfacenti potrebbe impostare diversamente una strategia di fundraising, magari in una direzione peer-to-peer, dove al centro c’è la persona e non la campagna da promuovere.

## INDAGINE – QUARTA PARTE: NEWSLETTER E BOLLETTINI

Nell’ultima parte della ricerca realizzata da VpS si sono indagate anche le modalità di comunicazione più tradizionali, come la newsletter e la pubblicazione di bollettini periodici. Al riguardo si è potuto rilevare che il 72% delle Ong invia newsletter periodiche ai propri sostenitori, con frequenza per lo più mensile (65% dei casi). Circa un’associazione su due pubblica inoltre un bollettino cartaceo, con frequenza non inferiore al trimestrale, che nel 75% dei casi è disponibile anche in formato digitale, e in un caso esce anche in edicola.

## ANALISI E COMMENTI: DOV'È LO STORYTELLING PARTECIPATIVO?

In generale, dai risultati dell’indagine emerge la volontà, da parte delle Ong rispondenti, di esplorare nuovi strumenti e di seguire le ultime tendenze dal punto di vista della comunicazione 2.0, sia in quanto ciò è ritenuto necessario e fondamentale per essere al passo con i tempi, sia perché si reputa che per raggiungere un grande numero di persone con il proprio messaggio non si possa fare a meno di considerare la ‘piazza’ di internet come luogo dove si formano opinioni e movimenti sociali. Manca, nella maggior parte delle Ong intervistate, l’esplorazione della possibilità di cambiare strutturalmente il proprio lavoro facendosi permeare dalle novità di uno spazio comunicativo che è pura conversazione come il web 2.0, dove il contenuto viene generato dagli utenti. I social network, ad esempio, sono utilizzati come vetrina delle proprie attività nel senso più tradizionale del marketing e della promozione: le Ong sostengono di usarli come “canale” per informare e lanciare eventi e campagne come farebbero con uno spazio pubblicitario in tv. Con la differenza che l’uso dei social network è considerato gratuito, senza che vengano percepite come bene economico le ore-lavoro impiegate per l’uso di questi strumenti o per l’apprendimento all’uso. Anche secondo Kanter l’errore più comune nelle Ong di tutto il mondo è: “Provare a fare troppo...con troppo poco. Le Ong sono ovunque, ma senza strategia e in questo modo perdono tempo e hanno un impatto veramente minimo. E’ giusto provare nuovi canali, ma poi bisogna passare alla fase di misurazione dei risultati e imparare da questi”.

Una prospettiva nuova potrebbe essere quella che offre lo storytelling partecipativo, ovvero la pubblicazione di contenuti sotto forma di storia: le Ong che hanno attivato blog aggiornati da un gruppo di persone interne ed esterne, con il coinvolgimento dei beneficiari o di persone vicine ai beneficiari, hanno raccolto appieno la sfida del web 2.0. E, in più, “quando le persone partecipano pubblicando dei contenuti sono più motivate a fare la propria parte”, spiega Luca Conti.

Spostando l’attenzione sui termini storytelling e narrazione ci si avvicina di più all’approccio conversazionale dei nuovi media. Quando lo storytelling è efficace produce due risultati immediati: coinvolge, creando “engagement” (impegno), e produce cambiamento.

Un esempio è quello della campagna “It gets better”, lanciata spontaneamente nel 2010 dal giornalista Dan Savage insieme al suo partner Terry Miller con un video su YouTube per incoraggiare i teenager ad affrontare le difficoltà dell’essere omosessuali durante il periodo dell’adolescenza. Savage e Miller hanno trovato il modo per raccontare che, crescendo la vita migliora, “It gets better”: dopo di loro altre 200 persone hanno caricato una testimonianza video su YouTube per aderire al progetto e in una settimana è stato raggiunto il limite di caricamento di 650 clip.

I sostenitori, i volontari - ma anche i beneficiari del lavoro delle Ong - sono insieme ricettori ed emettitori di informazioni, e come tali vanno considerati quando si vuole raccontare una storia. Nel web 2.0, il loro contributo non è facoltativo.

## THE REPRESENTATION OF THE COOPERATION NORTH-SOUTH IN THE CATALAN MEDIA

Xavier Giró\*

\*Universitat Autònoma de Barcelona, Spain - [xavier.giro@uab.cat](mailto:xavier.giro@uab.cat)

### ABSTRACT

The media of reference in Catalonia (press, radio, TV and internet) propagate an image of cooperation and solidarity that combine, in different proportions depending on each case, a neocolonialist and paternalistic framework with another framework based on emancipation and empowerment for both South and North oriented to structural changes.

This paper presents the preliminary results of a quantitative and qualitative study, still underway, carried out as a part of an initiative organised with the financial support of the European Union. The project, called "Network of Journalists and Communicators for cooperation and development" ([www.devreporternetwork.eu](http://www.devreporternetwork.eu), DCI-NSAPVD/2012/279-805), is run by the consortium formed by Catalan Federation of NGO ([www.fcong.org](http://www.fcong.org)), RESACOOOP (Réseau Rhône-Alpes d'appui à la coopération internationale [www.resacoop.org](http://www.resacoop.org)) and Consorzio ONG Piemontesi ([www.ongpiemonte.it](http://www.ongpiemonte.it)).

### METODOLOGÍA

#### Objetivos y objetos

El estudio que presentamos tiene como objetivo, en primer lugar, analizar la representación de la cooperación y la solidaridad en los medios de comunicación que se producen desde Catalunya y, en segundo lugar, contrastarla con el posicionamiento ideológico de las direcciones y los redactores. Por lo tanto, hay dos objetos de estudio:

- las piezas periodísticas emitidas o publicadas por los medios locales y regionales catalanes que tengan relación con la cooperación o la solidaridad internacionales (CSI);
- la concepción que las direcciones y los periodistas de los medios tienen sobre cooperación y solidaridad.

Para obtener los resultados deseados hemos escalado el proceso en distintos objetivos específicos:

- reconstruir la matriz ideológica del discurso de cada medio sobre CSI;
- identificar y describir los marcos ideológicos promovidos;
- reconstruir la matriz ideológica de las redacciones de los medios sobre CSI;
- identificar eventuales estereotipos sobre el Sur;
- y establecer correlaciones entre los discursos publicados y los expresados en las entrevistas con integrantes de las redacciones.

#### Hipótesis

A medida que logramos los objetivos, esperamos verificar o refutar la siguiente hipótesis general: los medios combinan dos visiones sobre la CSI, una solidaria e igualitaria con otra neocolonial marcada por estereotipos negativos sobre los 'receptores' y positivos sobre los 'donantes'.

La distinción entre las dos orientaciones está inspirada en el documento Finding Frames: New ways to engage the UK public in global poverty, elaborado por Andrew Darnton con Martin Kirk. [1]

La comprobación de la hipótesis general se realizará a través de las siguientes hipótesis específicas.

1. En el discurso periodístico hay proposiciones que explícita o implícitamente fomentan un encuadre (marco, frame) caracterizado por:
  - o la promoción de la caridad, las organizaciones de beneficencia, las donaciones, el desarrollo de tipo occidental,
  - o y estar focalizado en la efectividad a corto plazo de la ayuda, la corrupción de la sociedad receptora, la comunicación como proceso unidireccional y las campañas puntuales de solidaridad.

2. Alternativamente, en el discurso periodístico hay proposiciones que explícita o implícitamente que fomentan otro encuadre (marco, frame) caracterizado por:
  - o la promoción de la justicia y la equidad; los movimientos sociales y las ong; el apoyo mutuo norte-sur y el partenariado; el bienestar, las libertades i la responsabilidad económica, ambiental, social; el buen gobierno; el diálogo y los compromisos;
  - o la denuncia de las responsabilidades de actores del norte y no solo del sur; los fraudes; el no cumplimiento de los compromisos y las prácticas neocoloniales.
3. Hay estereotipos sobre el Sur.

### Corpus y muestra...

Para estudiar el discurso de los medios se han escogido dos televisiones (TV3 y 8TV, una pública y una privada) de ámbito catalán; dos radios (Catalunya Ràdio y RAC1, una pública y una privada) también de ámbito catalán; cinco periódicos diarios de ámbito catalán (La Vanguardia, El Periódico, El País-Cataluña, ARA y Punt-Avui); cinco periódicos de ámbito local (Diari de Girona, Diari de Tarragona, El Segre, Regió 7 y Nou9), y un portal-web informativo (Vila-Web).

La muestra se ha construido a partir de piezas escogidas por los periodistas más cercanos en cada medio a temas de cooperación, dentro del último año. Frente al inconveniente de que no son piezas escogidas sistemáticamente o al azar por el investigador, proporcionan la ventaja de disponer de piezas a las que los periodistas conceden importancia.

Hay que añadir, llegados a este punto, que esta investigación, al formar parte de un proyecto europeo que se propone como objetivo final la creación de una red de informadores sobre cooperación, el método escogido para seleccionar la muestra sirve de forma más efectiva al objetivo final de lo que hubiese rendido una selección aleatoria.

Para estudiar la concepción de los periodistas y la dominante en los medios, se realizaron entrevistas a una persona de la directiva y a un o una redactora de cada medio. Esta fase aún no se ha iniciado en el momento de la entrega de este documento. En cuanto a piezas, aún no ha terminado el proceso, pero ya se han analizado 67.

## RESULTADOS

### Visión positiva

La inmensa mayoría de la piezas presentan una visión positiva de la cooperación o de la solidaridad internacional, sea lo que sea esta y sea sobre el campo que sea. Si bien no es un resultado sorprendente porque las piezas analizadas ha sido facilitadas por los periodistas a petición de un grupo de investigación manifiestamente favorable a la cooperación, no deja de ser un indicio de que ese es el tono hegemónico de la información sobre cooperación. De todas forma el siguiente gráfico 1 ofrece el resultado numérico.

Gráf. 1 – Visión de la cooperación.

### Deriva política en tiempos de recortes

El tema más visitado por las piezas ha sido el de los recortes presupuestarios que las administraciones públicas (gobiernos catalán y estatal) ha ejecutado sobre las subvenciones a proyectos de cooperación de todo tipo, pero particularmente a los gestionados por organizaciones no gubernamentales (ONG). No son la inmensa mayoría, pero como se observa en el gráfico 2, hay más piezas sobre recortes que sobre cualquier otra temática de la cooperación.

**Gráf. 2 – Temática principal.**

**Sensibilización y divulgación tienen fuerte presencia**

Los gabinetes de prensa de las ong se preguntan a menudo cómo se puede lograr que los medios hablen de la cooperación. Pues bien, a pesar del resultado anterior que muestra que una información con capacidad de erosión política como lo es la publicación de recortes en algo percibido como positivo tiene una gran presencia, nuestros resultados muestran que la 'noticiabilidad' (news peg, valeur informative) también puede residir en el carácter divulgativo o de sensibilización que comporta aquello que se difunde. El gráfico 3 muestra 'con ocasión de qué' se han publicado las piezas de que disponemos.

**Gráf. 3 - Cantidad de piezas publicadas por diversos motivos principales.**

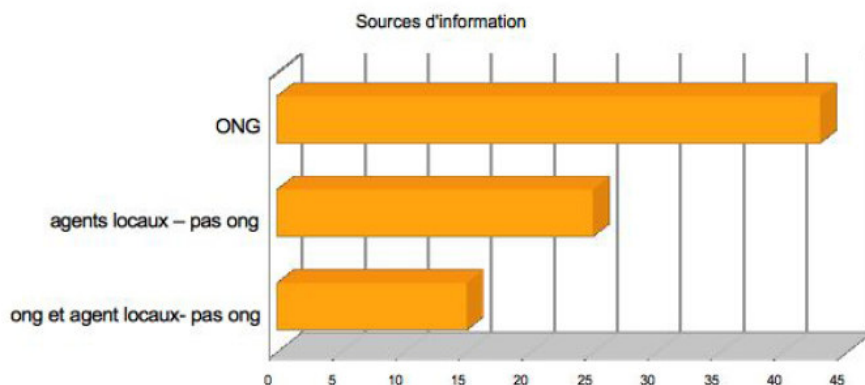

De todas formas, si pasamos de los datos globales a los particulares para cada medio observamos que en los medios en que los criterios de selección de noticias son más duros (porque son para todo el ámbito catalán y normalmente porque tienen poco espacio redaccional) las informaciones que erosionan políticamente están más presentes.

En los medios de ámbito local, tiene más cabida la divulgación de proyectos concretos, sobre todo si hay

protagonistas locales en aplicación del conocido criterio periodístico de la proximidad. Estos protagonistas tienen voz, aunque no la tengan los protagonistas de los países del sur participantes porque las informaciones han sido elaboradas en la localidad con material (información y fotos) traídos por los cooperantes.

La voz de los protagonistas del sur aparece si el o la periodista han viajado a lugar donde se desarrolla el proyecto y esto ocurre –es claramente deducible de los textos– si había una emergencia y el medio decide enviar a alguien o si una ong o una institución pública financia el viaje. El gráfico 4 muestra la presencia de testimonios.

Gráf. 4 - Fuentes de información.

### Equiparados valores caritativos y valores transformadores

El valor más fomentado es el de la 'Ayuda' en distintas variaciones: 'Ayuda al Sur', 'Ayuda al Tercer Mundo', 'Ayuda humanitaria', 'Ayuda sanitaria', 'Ayuda educativa'. Y también la versión simple de 'Donaciones' o de 'Donaciones empresariales'.

El siguiente paquete de valores en importancia cuantitativa –en lo que llevamos de estudio – corresponde a la defensa de los derechos humanos, sociales, económicos y a la solidaridad entendida como lucha por esos valores.

El tercero bloque es el que promueve la cooperación en el plano igualitario y saluda positivamente las medidas que fomentan el auto desarrollo y la sostenibilidad.

A un mismo nivel se encuentran los valores como 'comercio justo', 'efectividad de la ayuda', 'responsabilidad empresarial', por un lado, y las 'ong' como un valor en si mismas –aunque en parte como instrumento de solidaridad–.

Las piezas en que las ong aparecen como un valor en si mismas son las que tratan de los recortes presupuestarios a la cooperación y de las deudas de los gobiernos con las ong. Algunos de los artículos apuntan –siguiendo la línea de ong citadas – no sólo al valor de la ong sino también a su 'independencia' y consecuentemente sugieren nuevas formas de captación de socios y también de presión política.

Con respecto a las mujeres, en una pieza se trata del empoderamiento y en otra de la lucha contra las agresiones.

En las informaciones sobre la protesta contra los recortes y las deudas, se fomenta el valor de la responsabilidad política. En el gráfico 5, se observa como la suma de piezas que fomentan valores orientados en la línea de la solidaridad vertical de norte a sur (piezas azules) es ligeramente superior a la de piezas orientadas a los derechos, la justicia, el auto-desarrollo (anaranjadas).

Gráf. 5 - Cantidad de piezas que fomentan determinados valores.

### Marco caritativo más presente

En la medida que las piezas de que disponemos son en su mayoría de una extensión considerable (páginas enteras, dobles páginas, diversos programas de tv de 30 minutos), cada una puede contener (explícita o implícitamente) un buen número de proposiciones relevantes que sin ser contradictorias necesariamente respondan a orientaciones distintas.

Por este motivo, en la ficha de análisis que hemos usado, hemos recogido todas esas proposiciones de tal forma que hemos podido establecer si una pieza fomentaba una u otra orientación o ninguna o ambas a la vez. El resultado está recogido en el gráfico 6.

Es interesante notar que en algunas piezas (las más relacionadas con la política de erosión) no se distingue una orientación u otra.

En un número relativamente pequeño (15) se fomentan ambas a la vez.

Hay más piezas que fomentan sólo el marco 'Ayuda-Caridad' que piezas que fomenten el marco 'Cooperación-Justicia-Transformación'.

Y, globalmente, destaca que la orientación más presente es 'Ayuda-Caridad'. He aquí algunos ejemplos de proposiciones que la fomentan:

- 'Avances como los registrados en alimentos se verán truncados por culpa de los recortes en cooperación' (Punt-Avui, 06/07/2011)
- 'Hay jóvenes que aprovechan el verano para realizar trabajos solidarios' (Diari de Tarragona, 08/08/2011)
- 'Los proyectos responden a las necesidades justificadas en espacios de escasez por todo el mundo' (Diari de Tarragona, 23/04/08)
- 'Los ciudadanos comprometidos recolectan fondos para los jóvenes desfavorecidos de República Dominicana' (Nou9, 26/02/10)
- 'La aplicación efectiva del tratamiento de la enfermedad dependerá de los donantes de fondos del Norte' (Cat ràdio, 23/03/13)
- 'La incapacidad i corrupció del gobierno haitiano deja desamparada a la población de manera que las acciones de cooperación internacional son positivas, justificadas y totalmente necesarias o imprescindibles para la supervivencia de la población haitiana enferma' (TV3, 16/11/11)

Veamos ahora ejemplos de proposiciones con una orientación favorable a la 'Cooperación-Justicia-Transformación':

- 'Las empresas farmacéuticas no están interesadas en los problemas de África' (La Vanguardia, 27/01/13)
- 'Hace falta una reforma agraria para tener seguridad alimentaria' (Cat Radio, 2013)
- 'El comercio es justo si hay: precio justo, condiciones laborales dignas, es sostenible, retorna beneficio a la comunidad' (TV3, 18/06/10)
- 'Las poblaciones receptoras sufren explotación, marginación e injusticia' (Diari de Tarragona, 23/07/06)
- 'Las ONG del Sur tiene métodos e ideas concebidas para trabajar problemas específicos de su país que han demostrado que funcionan y que tienen efectos de desarrollo a largo plazo tanto a nivel individual como comunitario' (TV3, 20/6/2011)

### Escasos estereotipos, pero los hay

En un 13% de las piezas se detectan estereotipos sobre los habitantes del Sur que, si bien no son flagrantes generalizaciones, por su repetición los refuerzan. No por comprensible que sea la evocación de la 'pobreza' o 'extrema pobreza' y de la combinación entre 'pobreza y pasividad' en la información sobre actuaciones de emergencia (o la

necesidad de hacerlas), la reiteración de estas características a veces para poblaciones concretas y a veces sin precisar más que la nacionalidad de los afectados, dejan la puerta abierta a la generalización.

Ocorre lo mismo al evocar a menudo la corrupción o la incapacidad de gobernarse o gestionar lo público. Además, en ocasiones, esas incapacidades se ven relacionadas con lo que en los medios califican de 'superstición'.

## THE ICT FOR AN INCLUSIVE URBAN DEVELOPMENT

Francesca De Filippi<sup>1</sup>, Serena Pantanetti<sup>2</sup>

<sup>1</sup> Research and Documentation Centre in Technology, Architecture and City in Developing Countries (CRD-PVS), Politecnico di Torino, Italy - [francesca.defilippi@polito.it](mailto:francesca.defilippi@polito.it)

<sup>2</sup> Interuniversity Dept. of Regional and Urban Studies and Planning, Politecnico di Torino, Italy

The focus of the panel relates to the use of the Information and Communication Technologies for Development and social inclusion, a topic that has been recognized as a priority both on national and international levels, as inferred by the guidelines of European programs such as Horizon2020 (2014-2020) or from the Call 'Smart cities and Social Innovation' (MIUR, Italian Ministry of Education, University and Research).

'Social Innovation' is to be included as a part of the field of research and work of ICT4D (Information and Communication Technologies for Development) which, in fact, refers to the use of information and communication technologies in the field of international, socio-economic development and human rights. Possible implementations of ICT4D, between which it is intended to be done a comparison, concern, on one hand the methods and techniques of participation of the local community in identifying problems and resources and on the other hand the use and the integration of data collected in a relation with the database and the planning tools used by administrators and policy makers, as a basis for future interventions.

The use of ICTs technology platforms such as websites, wikis, interactive geographic maps and SMS have an important role in increasing the accountability of the public administration. Accountability is connected to the ability to respond and to clearly report the activities carried out. As an aspect of governance, this responsibility has been in the past and must be now and in the future a main topic of discussions when concerning about issues related to the public, non-profit and private sectors.

In addition to the papers hereinafter reported, other contributors to the Panel have been:

- Jean-Claude Bolay, Abigail Kern Centre Coopération & Développement, Ecole Polytechnique Fédérale de Lausanne: *“Technology and urban planning: What is appropriate for cities of the South?”*

The communication dealt with technologies, considered as catalysts for change, and their links to urban development. One of the main questions to be investigated for the next decades, in relation with the spatial and demographic growth of cities in Southern countries, is to know if we could discern appropriate technologies adapted to the specific urban contexts, affordable for users, socially acceptable, and efficient in order to improve concretely the present and future situation tackled by urban population, stakeholders and authorities. Particularly for developing and emerging countries, technological breakthroughs create wonderful opportunities but they may also convey risks that should not be overlooked. This leads to crucial questions on the nature of technological innovation and its capacity to fulfill the specific needs of these societies, characterized, in a lot of cities in Africa, Asia and Latin America, by limited financial and human resources. In a prospective approach, we shall try to identify priority sectors fostering a sustainable urban development, 4 at the initial moment of our research process: habitat; energies; water and sanitation; transport.

The aim of the contribution is: addressing the question of the existence of exclusively-urban technologies; exploring the framework conditions allowing the implementation of appropriate technologies in Southern cities; assessing the criteria allowing an access for all inhabitants to urban infrastructures and services; defining key elements we shall have to find in instruments used to translate the urban information in real applicable tools of urban planning, with a focus on “poor cities”.

- Elisabetta Demartis, Università degli Studi di Torino: *“Geographies for peace and development cooperation. Mapping and preventing violence and post-electoral disorders in Nairobi slums: an ICT4D participative project”*.

The general purpose of the paper is to reflect on how ICTs can improve the social issues of Developing Countries. The research starts from a participative project in three slums of Nairobi (Kibera, Mathare and Mukuru), where Map Kibera Trust set up a Ushahidi crowdmap platform to monitor the elections and prevent post-election violences and disorders. The methodology and approach used are a combination of semi structured questionnaire addressed to Map Kibera members, interviews of Kibera CBOs and Ngos, focus groups coupled with the author’s previous research on ICT4D.

The research aims to discover the driving forces behind the project and its impact on the community, first of all on people living in Kibera. In detail:

- What is the background of the members of the Map Kibera and how they are integrated within the territory of the slum;

- How can a participatory mapping project to prevent riots and post-election violence;
  - How many people were really involved in the project and how;
  - Can this project be considered a success which confirms the positive role of ICT in emergency cases such as elections;
  - How the project may involve slum dwellers and influence them positively.
  - The implications are significant in light of the ICT4D scenario and research, aiming at understanding how a technology can be used at its best to impact positively on a social issue. At the core of this idea is the belief that behind the crowdmap there is not just the software that allows the creation, but that set of social, spatial and human values that connect people with their own territory, in this case with one of the largest slums in Africa.

### ABSTRACT

The proposed paper aims to address the use of ICT for social inclusion. In peculiar this research study and experimentation examine both the application of participative methods and techniques, which support the community to identify problems and resources, and the possibility to integrate data and tools with the ones used by public stakeholders, as a starting point for future interventions. Participative planning is then intended as a way to think over the public action, either in the relationship with citizens or in the public space management. The proposed subject takes cue from the “Crowdmapping Mirafiori Sud” project outcomes. The project has been granted with 5x1000 funds from Politecnico di Torino for student projects and is now in the final phase. The aim of the project is to conduct a pilot experience in a participative and inclusive way in order to identify and categorize – returning information on a geographic map – the nature, the location and consistency of the obstacles/barriers which prevent vulnerable categories to access and use the public spaces of their neighbourhood. For this aim it is going to be used Ushahidi, an opensource platform which allows an easy crowdsourcing of data and the total transparency of their diffusion. One of the key aspect of using Ushahidi is the possibility to use mobile phones as a mean to send reports and receive updates, not needing an internet connection, which is often not available. Outcomes of data collection are then available and given to local and public actors, establishing a direct connection with the instrument used and the possibility to continue the project autonomously. This crowdmapping, and the transparency of the process, are useful not only to sensitize the population and to define the state of the art, but they mostly allow to interpret the results, analyzing the problem from the point of view of the community, the public actors and the scientists, hypothesizing active and participative solutions.

### BACKGROUND

Increasingly over the last decade, there has been attention and expectations on the role that ICT based technology platforms such as websites and wikis, social media, interactive geo-mapping, and SMS and voice based reporting can play in increasing *accountability*, participation and transparency in the Public Administration (R. Avila et al. 2010; W. Reyes 2006).

Concerning ICT and social innovation rich are also the literature and the scientific debate, however the practical side is still under exploration and it need to be developed through projects and initiatives which effectively foresee participation and interaction of the involved actors.

Some exceptions are worth mentioning, among others: FixMyStreet in Uk, a platform where people can send information and discuss local problems about infrastructural issues or ePart and IRIS Beta in Italy. Their common goal is to offer an online service which allows citizens to interact with the public administration and to send information. They have a transparent interface and they are easy to use, they mainly allow to see the warning list and to check the status.

This paper aims to examine both the application of participative methods and techniques, which support the community to identify problems and resources, and the possibility to integrate data and tools with the ones used by public actors, as a starting point for future interventions. Participative planning is then intended as a way to think over the public action, either in the relationship with citizens or in the public space management.

### THE CROWDMAPPING MIRAFIORI SUD PROJECT

The proposed subject takes cue from the “Crowdmapping Mirafiori Sud” project outcomes. The project has been granted with 5x1000 funds from Politecnico di Torino for student projects and is now in the final phase.

The project “Crowdmapping Mirafiori Sud” ([www.polito.it/mapmirafiorisud](http://www.polito.it/mapmirafiorisud)) has been conceived and drafted under the lead of the Research and Documentation Center in Technology, Architecture and City in Developing and

Emerging Countries (CRD-PVS) at the Politecnico di Torino.

It is set in continuity with the ongoing research of the CRD-PVS, which seek to experiment the applicability of strategies, methods and instruments successfully developed in the Global South into urban contexts of traditionally defined “developed” Countries and nowadays in deep transformation or crisis.

As a recent experience the CRD-PVS organized in collaboration with UN-Habitat the international student design competition *Tur(i)ntogreen – farms in a town* ([www.polito.it/turintogreen](http://www.polito.it/turintogreen)), with the aim of reflecting on the urban future. The Competition area was the Mirafiori Sud neighbourhood in Torino (Italy). This neighbourhood has been the emblem of the Italian motown during the economic boom, gradually decreased due to the work crisis and to the new production geographies; it will be in the next future the object of urban transformations with an high social and economic potential.

Furthermore Mirafiori Sud is an active neighbourhood, with dwellers keen to participate into the urban transformation projects, in order to overtake the actual situation of crisis and poverty. A rich and lively network of local associations support them in this sense.

Thanks to the *tur(i)ntogreen* competition, the CRD-PVS had the opportunity to get in contact and collaborate with some of the local actors and stakeholders such as the Fondazione della Comunità di Mirafiori Onlus and the City Council District.

The aim of the project Crowdmapping Mirafiori Sud is to conduct a pilot experience in a participative and inclusive way (together with the population and the local associations) in order to identify and categorize – returning information on a geographic map – the nature, the location and consistency of the obstacles/barriers which prevent vulnerable categories to access and use the public spaces of their neighbourhood.

For this aim it is going to be used Ushahidi, developed in Kenya to map in 2008 the violence in the post-electoral period, an opensource platform which allows an easy crowdsourcing of data and the total transparency of their diffusion (Hagen E. 2011). Ushahidi is nowadays used as a prototype and an example of something that could be done by matching information generated from citizens reports, media and NGOs into a geographical map.

One of the key aspect of utilizing Ushahidi is the possibility to use of mobile phones as a mean to send reports and receive updates, not needing an internet connection, which is often not available.

The project is addressed to citizens, dwellers of Mirafiori Sud neighbourhood, in particular to those who belong to the most vulnerable categories concerning accessibility and use of urban public spaces.

The problems identification, survey and mapping will be lead by the proponent group together with citizens representatives, identified thanks to the contribution of Fondazione della Comunità di Mirafiori Onlus.

Outcomes of data collection will then be available and given to local and public actors, establishing a direct connection with the instrument used and the possibility to continue the project autonomously.

This crowdmapping, and the transparency of the process, will be useful not only to sensitize the population and to define the state of the art, but they will mostly allow to interpret the results, analyzing the problem from the point of view of the community, the public actors and the scientists, hypothesizing active and participative solutions.

Because of this reasons, the project is meant to be a pilot project, relevant for other neighbourhoods and other cities, either at a national or international level.

## METODOLOGY AND TOOLS

The project has been developed from April to October 2013, through the following phases:

- **Kick off.** A necessary phase of identification, contact and meeting with the local actors and representative of the categories identified as “vulnerable”. After the launch the students group planned meetings with both civil society’s representatives and public administrators in order to better explain the projects, advertise it and gather consensus to form a group which would have then make the first signals.

Fig. 1, 2 - Kick-off Meetings.

- **Definition of Criteria.** Starting from the interaction with local actors through a series of transect walks, and ending with a reflection on criteria, categories, standard identification of the phenomena to be signaled, for a coherent achievement of a data base. The formed group took some transect-walks along the neighbourhood in order to better understand the area, let the involved people discuss and transmit their knowledge and finally start looking for obstacles. The willing to involve people since the first steps is innate in the nature of the project, which doesn't want to have fixed prejudiced but it would like to look at the real obstacles for whoever lives the neighbourhood, either them being physical, mental, intellectual or visual.
- **Set up.** Starting from inputs acquisition from the local actors. Setting of the Ushahidi platform for a better response to the project's goals.

In order to better improve the system and to create an useful instrument, the students designed a website where all information and news can be found. An email address, a telephone and an SMS numbers were also established, in this manner civil society and public administration had all the means to get in contact and to send their posts.

As long as the aim of the project is to create and to use an instrument which has to be affordable, appropriate and easy to use, the team decided to implement the use of SMS to send information, which could be done by any mobile phone, both basic ones and smartphones.

The iXem Labs, a component of the Department of Electronics and Telecommunications of the Politecnico di Torino, which field of activity is mainly related to wireless systems and networks, radioplanning, radiofrequency propagation and high frequency electromagnetic compatibility, created a system which could send SMS direct to an email address. The system is based on the Arduino, a low cost open-hardware platform with the addition of a GSM\3G shield. The platform is connected to Internet by means of Ethernet connection. It may be also possible to set up a 3G connection in case of absence of Ethernet connectivity.

Once an SMS has been received, the program performs two automatic actions, it forwards the information to the Maps platform and sends an alert via e-mail to the administrators. Afterwards the Platform takes in charge the information received from the Arduino and with an automatic procedure it publishes the reporting on the Map. The new message is not public yet waiting for the approval by the administrators. In order to improve the reliability of the system, the Arduino platform logs all the data and actions on a local SD such that even in case of failure of connectivity it is possible to recover all data locally.

Furthermore it is possible to query the SIM card, by means of special string sent via SMS, in order to retrieve information about: status of SMS storage capacity, ask to re-send a particular SMS, delete all SMS, automatic reply, etcetera (De Filippi F., Pantanetti S., Stefanelli R., 2014).

Fig. 3, 4 - The Arduino-based system set up by iXemLabs (Politecnico di Torino).

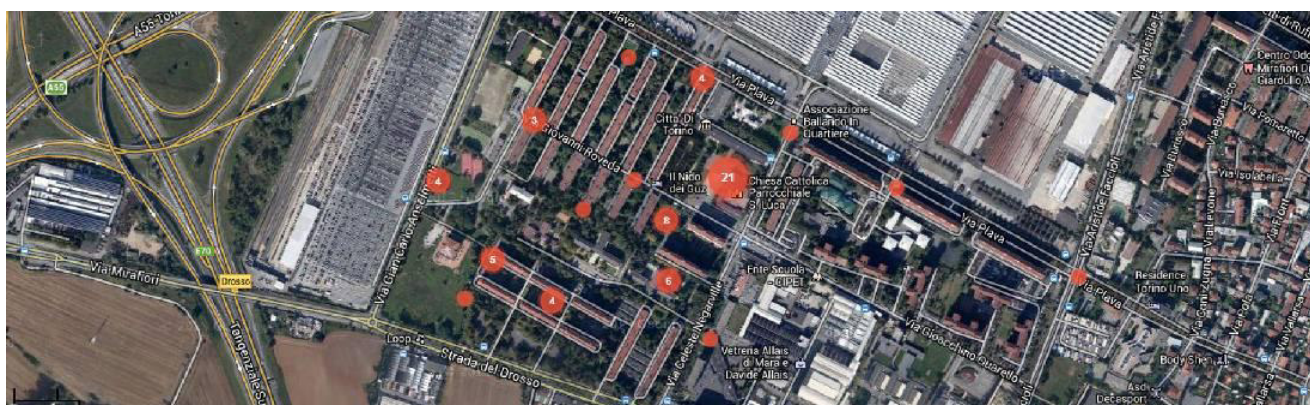

- **Training.** With the support of the Fondazione della Comunità di Mirafiori, a group of inhabitants [30] is selected for collecting data on the area, stimulating the effect of crowdmapping. A period of training is conceived in order to understand how the platform works and how to send information by the means of SMS, emails, phone calls and website.
- **On field data collection.** The data collection begins through a direct analysis, with the representatives of the interested categories, and an indirect analysis based on the received inputs on Ushahidi. During June and July 2013 the group formed by the students and the involved citizens made different data collections in the neighbourhood, sending information direct from mobile phones, app and computers to the Crowdmapping Mirafiori Sud Website, email and numbers. Once the information is received, it must be approved by a member of the student team and then it can be seen in the map.

In the meanwhile an analysis of data is needed, in order to understand the weak points and to discuss with people This analysis is made by all the involved people using more traditional ways such as meetings. From this meetings other important information are gathered which could be seen on both the map and the website. This process is important to enhance participation: people are directly involved from the first to the last steps.

**Fig. 5, 6 - Data collection.**

- **On line.** Once the data collection is completed, the elaboration and dissemination phase will take place through preparation and distribution of the material (reports, videos, photos, etc...) to all the stakeholders involved in the project. All tools and materials can be used by the local actors, to continue the project in an autonomous way, eventually supported by the team in future interventions.

**Fig. 4 - The Project Map.**

## CONCLUSIONS

The project outcomes are:

- having created a “smart” methodology and tool, based on the use of ICT (internet and mobile phones) to map the barriers and enhance the community participation and social inclusion; its use is not limited to identify and point out single interventions, but also to analyze phenomena at the urban scale;
- having built local capacities, stimulate participation and ownership;
- having enabled Local Authorities to access and use the data, to build and strengthen their "accountability";
- having set up a pilot scheme that could be replicated and expanded to other neighborhoods (or to other contexts).

## AN EFFECTIVE STRATEGY TO DEVELOP EFFICIENT SERVICES FOR A DIGITAL-DIVIDED POPULATION

Riccardo Stefanelli\*, Abel Rodriguez de la Concepcion\*, Elisa Pievanelli\*, Daniele Trincherero\*

\*iXem Labs, Politecnico di Torino, Italy - [info@iXem.polito.it](mailto:info@iXem.polito.it)

### ABSTRACT

The project consists of a medium scale Internet of Things and Internet of Services experiment, in a rural village in the Italian Countryside, where population is relatively aged and the village is almost digitally divided from the neighboring cities (and consequently from the whole World). A wide band wireless network with full coverage has been built, to provide several remote services: Internet access, intelligent house (garden) control, remote assistance to people. Internet of Things and Internet of Services activities are realized by means of low cost, open technology. A relevant application is represented by tele-assistance to elder people living alone. The results obtained during the first eighteen months of experimentation demonstrate a strong participation of the local population, a reduction of the house management costs, together with an increase of safety and security, which are particularly critical in rural scenarios, far from the accessibility levels typically found in metropolitan city.

### INTRODUCTION

The digital gap in rural (remote) regions is considered a strategic issue for Developing, but also Developed Countries, a clear limitation of living conditions, and one of the most significant causes of emigration, loss of popular heritage and traditions. The connection to the digital World represents the most significant way to provide access to information and cultural exchange, but also to basic social services like telemedicine and distance learning. Additionally, in the very last years, a digital channel is more and more requested to transport information related to Things and Services.

In rural scenarios, the possibility to acquire, share and control information associated to house and/or environment may signify not only additional comfort, but also energy saving, costs reduction, improved life quality, advanced security, health assistance. Nonetheless, transforming a rural living place into an intelligent one does not make real sense, without a network. When a network is available, Things and Services may be inserted in a virtual social network, as the Humans do. The inhabitants may share, compare, and optimize house managing. Or, even more, they could delegate management to somebody else. Security control can be assigned to an external authority. Energy consumption can be administered at a Municipality level. Health assistance can be supervised by a medical unit.

Bringing a networked intelligent platform to rural places is normally limited by bandwidth availability and end-users technological skill. Network operators have no significant advantage to operate in the Countryside, because of the restricted number of possible subscribers. Furthermore, rural citizens are typically unfamiliar with high technology and intelligent systems.

Starting from these basic concepts, we have developed an implementation scheme to facilitate adoption of intelligent systems in the Countryside. It is based on the realization of a very low cost, wideband last-mile Intranet network, on the construction of extremely low cost sensors and controllers, on a strong participation of the inhabitants, on the enrolment of University students during the design, realization and technological transfer phases. The scheme is being successfully implemented in a peculiar location in the Italian Countryside.

### THE LOCATION

The experiment has been organized and developed in the Municipality of Verrua Savoia, in the Monferrato region, a huge hilly, mainly agricultural area in North-Western Italy, not far from the city of Torino. The village covers a territory of about 16 square kilometers, where about 1400 inhabitants live, with half of the population aging more than sixty-five years old. Very few factories and commercial activities are present; the economy is mainly agricultural, for ninety percent devoted to family needs. Most of the people aging between 15 and 60 are commuters and travel far from the village, staying outside for a large part of the day. Topographically, the Municipality area is formed by more than thirty islets, some of them being connected exclusively through dirty roads.

As a business case, for ICT companies, the Municipality is a losing affair: for long times, no wideband connectivity has been provided to the inhabitants and still now, several hamlets are not provided with cabled ADSL connectivity.

The relative distance from the city, the average age of the population, the significant presence of commuters and the lack of ICT facilities and ICT know-how make the selected location a representative case of a general remote rural context.

## THE EXPERIMENT

To set-up any kind of network study, the first step is represented by bandwidth availability and end-user connectability. To bridge this initial gap, at first, a Municipality wireless network has been realized, in order to interconnect all the hamlets of the village [1] [2]. Figure 1 shows the orographic profile of Verrua Savoia and the position of the Hyperlan base stations. To lower the costs and avoid expenses, network design the construction of hardware components have been developed by a first group of University students, during their courses or internships [3] [4]. Citizens have participated to the network realization, installing autonomously client equipments for connecting to the network. Additionally, Internet connectivity has been provided for free to all subscribers, transporting bandwidth from an Internet exchange to the village by means of a high performance point-to-point radio-link.

**Fig. 1** - Orographic representation of Verrua Savoia: yellow arrows indicate the Hyperlan Access Points, red arrows show backbone links and white boxes are houses.

Once this first phase has been completed, we have started developing home automation facilities for each subscriber. Citizens have been provided with one controller that can be connected to several sensors, a large number of personal Ethernet devices, and actuators. The controller, the sensors and the actuators have been built by means of extremely-low-cost devices, developed on purpose for larger scale applications in rural environments [5]. These open hardware solutions have been designed and realized by a second group of University students (Figure 2). Among the several parameters that can be monitored are: temperature and humidity of the relevant rooms, unexpected gas/water leakages in the living environments, mechanical and vibrational state of buildings, ground humidity. The list of Ethernet devices comprises cameras, loudspeakers, light detectors, etc. As actuators, the controller is able to manage thermostats, fuel burners, stoves, automated wells, alarming units and again any kind of Ethernet based actuator.

**Fig. 2** - Examples of prototypes manufactured in our Lab, ready for installation in the house selected for the preliminary application of the experiment

In the same time, a customized network environment, together with a dedicated web platform, has been developed, to favor an easy and integrated management of the sensing and controlling components. The collected information is transferred to a general monitoring console, hosted in the Municipality building, which offers a global overview of the situation of the whole village, and allows an upper and immediate level of protection and intervention. Its functionality can be undertaken by the owner or delegated to the Municipality console, depending on the presence/absence/capability of the house holder himself.

Moreover, we are developing a dedicated infrastructure to provide remote control of the living conditions of elder people, without affecting their privacy. The system is realized thanks to an extremely low cost wireless passive tracking platform, which detects information about the activity inside the house. A dedicated algorithm processes the acquired information, thanks to statistical comparisons and cross-correlation computations originated from data acquired during certain amounts of periods. This solution does not require any action by the inhabitant, neither wearing a device, nor being confident with technology: hence it can be exploited to a very general case.

## RESULTS AND OUTCOMES

The network has been constructed between August and October 2010 and the number of subscribers has been increasing continuously, becoming approximately 240 in September 2013 (over a total of about 600 families). The participants distribution on the territory of the Municipality of Verrua Savoia is shown in Figure 3. Figure 4 shows temporal evolution of the subscribers from August 2010 to September 2013. Surprisingly (but not very much), not only young people were interested to the new technology: in fact, the Municipality was forced to change the teaching program of the local Third Age University, inserting (between a cooking lecture and a gardening one) a dedicated Introduction to ICTs. User appreciation about the network is very high. Even if network management is carried out by University students and there is not a structured “customer service”, citizens participate actively to network control, being always the first to document network problems and sometimes providing suggestions. During last winter, when a huge snowfall covered the solar panels compromising power supply of half the network backbone, 10 volunteers offered to climb up the hills and put into service the infrastructure.

**Fig. 1** - Participants distribution in the territory of Verrua Savoia.

**Fig. 2** - Temporal evolution of the number of participants from August 2010 to September 2013.

The preliminary results measured in the house that has been automated since the beginning of winter 2010-2011 are showing dramatic money savings, primarily due to the remote control of the sensing equipment. They exhibit a reduction of almost the 50% of the heating energy consumption and about 25% of garden watering. As a matter of fact, this early result could not be considered as representative of the functionality of the whole system, but it represents an interesting starting point that generates important perspectives for the continuation and implementation of the project on a larger scale. Figure 5 shows one of the temperature sensors mounted on the wall of the bedroom, while Figure 6 presents a wood stove connected to the controller.

**Fig. 3** - Temperature sensor mounted on wall bedroom.

**Fig. 4** - Wood stove connected to the controller.

Data regarding the following winter season (2011-2012) are more representative, as they are been applied to a larger number of houses. Unfortunately, they are affected by an unpredictable trigger: winter 2011-2012 has been the coldest of the last 100 years in Europe. Nevertheless, we have still measured an average reduction of the 10% of the expenditures, between early November and late February. This datum should be analyzed and disaggregated, or, even more, compared to further data acquire in the next winter periods.

On October 28, 2011, the inhabitants have been involved in a photographic competition with subject related to their own home equipment installation. The competition has gathered a large number of participants ([http://www.ixem.polito.it/research/Verrua\\_2010/Concorso\\_fotografico\\_2011\\_e.htm](http://www.ixem.polito.it/research/Verrua_2010/Concorso_fotografico_2011_e.htm)): one more demonstration of the passion generated by the project.

## PARTICIPATORY METHODOLOGIES FOR A RESPONSIBLE TOURISM: THE ZINAVE NATIONAL PARK (MOZAMBIQUE)

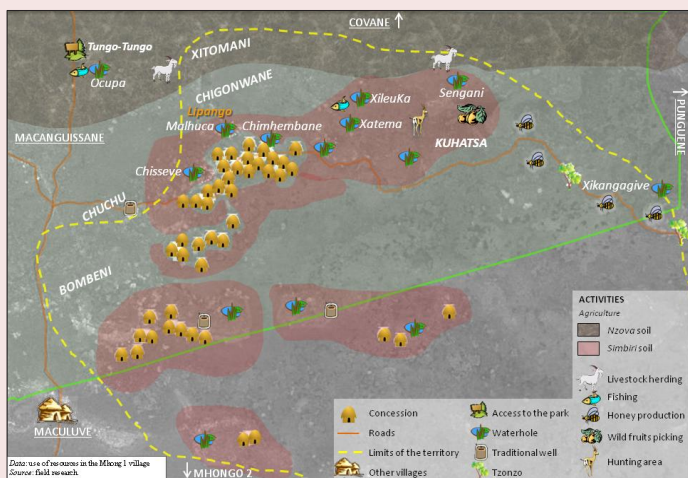

Diathesis Cartographic Laboratory  
University of Bergamo

### Abstract

The Zinave National Park (Mozambique), included in a system of protected areas as the **Great Limpopo Transfrontier Park**, is the experimental area for the application of a particular form of involvement of local communities in the conservative actions: the **community conservation**. As part of a *Ph.D. thesis*<sup>\*</sup>, it was carried out a field research in order to recover the local knowledge and the traditional values about the use of resources in the villages located within the protected area to achieve this implicative form.

The traditional status of the villages in the Zinave National Park

The system of use of resources in the village of Mhongo 1 in the PNZ

### Conclusion

The field data were used to bring out the **systems that govern the territory**, recovering local knowledge, and has allowed to highlight some conflict situations about: i. **land ownership**, for the competition between Park and local communities and for the change of the boundaries of the protected area; ii. **use of resources**, due to the incompatibility of the hunting, fishing and agriculture with the environmental management of the Park; iii. **tourism**, for the difficulty of achieving a sustainable system that will ensure the practice of tourism without causing negative impacts on the land system and the local production.

### Achieved results

Through the **observation**, the **inquiry** and the use of **participatory mapping** have been investigated the **traditional status** and the **organization of the villages** of PNZ recovering the **systems of resource use**. In particular, the research has allowed to realize:

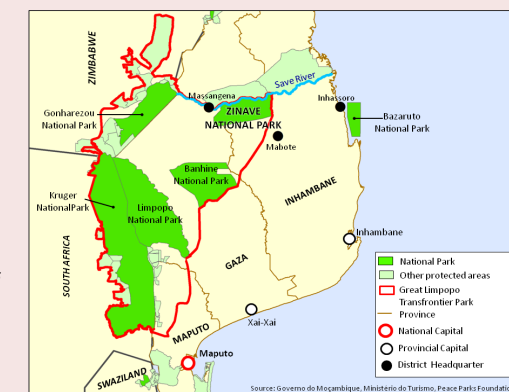

- the **census of 25 villages**, ever before cartographically represented, and the reconstruction of their traditional organizational structure;
- an in-depth analysis of **two sample villages**, Mongho 1 and Makitchile, recovering their traditional system of resource use;
- the study of the potentiality of a **sustainable tourism development** as an alternative activity to the livelihood of local communities, in view of the implementation of new regulations for the use of resources in the Park.

### Objectives

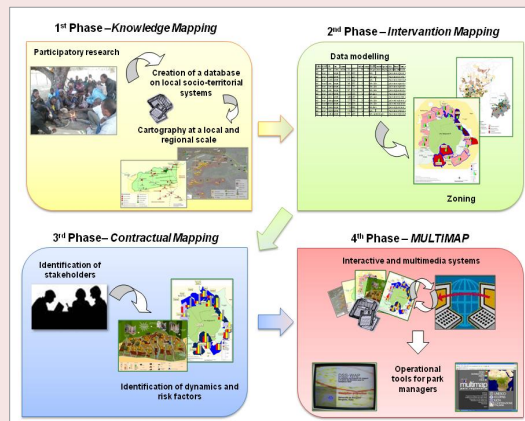

The research has highlighted the importance of the territorial organization of local communities for the recovery of **spatial capital**<sup>\*\*</sup> in order to manage and develop tourism in the African protected areas.

### Methodological approach

The **SIGAP Strategy** is a **participatory methodology of research** based on: i. **field work** for collecting data; ii. **mapping systems** for communicating results. In particular, this research presents the application of the first phase knowledge-based of that strategy, who allowed the creation of a **participatory database**, that was digitized in order to realize **GIS cartographic documents**, useful to improve the **environmental governance** and the **participation of the people** in the field of environmental conservation and promotion of tourism initiatives.

The Zinave National Park and the Great Limpopo Transfrontier Park

The SIGAP Strategy

\* The PhD thesis in Geography of Development entitled "The Transfrontier Conservation Area of Great Limpopo: participation and tourism promotion in the Zinave National Park (Mozambique)", is coordinated by Prof. Emanuela Casti, head of the Diathesis Cartographic Laboratory of the University of Bergamo ([www.unibg.it/diathesis](http://www.unibg.it/diathesis)). The defense is expected for the beginning of 2014.

\*\* The term *spatial capital* refers to the heritage of places, territories and networks built up by a social actor and the set of skills acquired over time to manage it, which can give benefits for his own survival (J. Levy, M. Lussault, Dictionnaire de la Géographie, Belin, Paris, 2003, p. 124-126.)

OLTRE LA CARTOGRAFIA PARTECIPATIVA.  
Raccolta coordinate con palmari GPS  
e condivisione di Geodati via web (2.0)

Antonio Maini  
Università di Torino  
Interfacoltà di Geografia

### Introduzione

In Mozambico, a sud del fiume Save, lungo 40km di Savana semidesertica compresa tra il 33° e il 34° meridiano, si trovano insediate sei comunità investite da un coraggioso progetto di *ecoturismo* finanziato dalla Banca Mondiale e appoggiato da altri attori tra cui l'Ong italiana LVIA.

Tra l'ottobre e il dicembre 2012, sono stato incaricato di realizzare una rappresentazione cartografica delle risorse culturali e naturali della regione.

### Approccio metodologico

Attraverso la cartografia partecipativa ho svolto la prima parte del lavoro. Successivamente, i luoghi segnalati nella carta disegnata insieme a rappresentanti del villaggio, sono stati rintracciati sul terreno e georiferiti con un comune GPS. Tornato dietro la scrivania, i dati raccolti sono stati organizzati in un geodatabase tramite semplici funzioni del software QuantumGIS.

I geodati - esportati in formato shapefile da Qgis - con pochi semplici passaggi sono poi stati pubblicati - senza alcun costo - sul rivoluzionario portale Mangomap.com.

### Obiettivi e risultati ottenuti

Oltre alla manifestazione in scala ridotta del territorio investigato, uno dei risultati più affascinanti raggiunti attraverso la cartografia partecipativa risiede nel processo di autocoscienza che talvolta coinvolge i partecipanti al disegno della carta. La fase di rilievo GPS, invece, permette di conoscere in prima persona ogni singolo luogo degno di nota delle comunità.

Infine l'esportazione sul web consente di analizzare e comunicare in modo dinamico e multiscalare le realtà sociali, culturali e ambientali conosciute sul campo.

### Conclusioni

Ogni luogo nasconde ponti e dirupi. Ecco perché l'attività diagnostica qui illustrata dovrebbe essere considerata indispensabile per aiutare (tutti) a capire, dove siamo, dove vogliamo andare e qual è la strada migliore da percorrere.

I links che seguono portano ad un blog dal quale è possibile accedere alla carta dinamica.  
Following the links you can read it in English and access to an interesting dynamic-map.

### UNDERSTANDING AND KNOWING HOW TO DESIGN HEALTHCARE BUILDINGS THROUGH INTERDISCIPLINARITY MASTER II LEVEL "ARCHITECTURE FOR HEALTH"

#### PLANNING, DESIGNING AND MANAGEMENT OF HEALTHCARE BUILDINGS IN DEVELOPING COUNTRIES

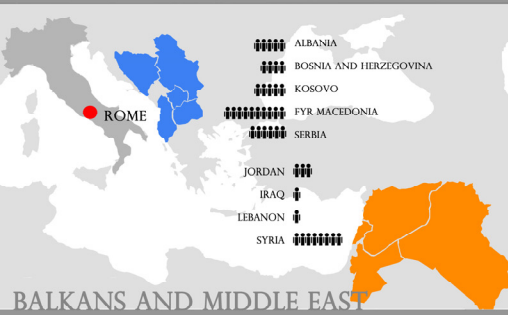

SAPIENZA UNIVERSITÀ DI ROMA  
DIPARTIMENTO PIANIFICAZIONE DESIGN TECNOLOGIA DELL'ARCHITETTURA

co-financed by the Italian  
MINISTRY OF FOREIGN AFFAIRS  
GDCC - General Direction for Development Cooperation

prof.ssa FRANCESCA GIOFRÈ, PhD  
arch. GIUSEPPE PRIMICERI, PhD - arch. IVANA MILETIC, PhD

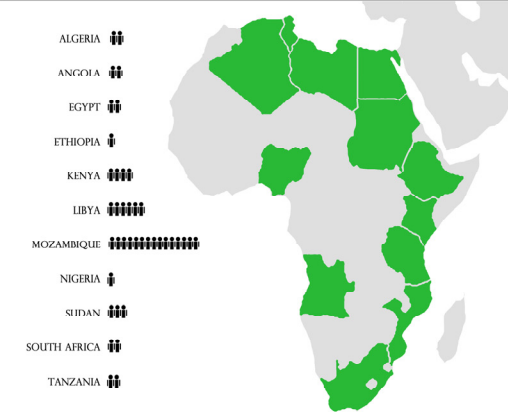

DEPARTMENT OF PLANNING, DESIGN, TECHNOLOGY OF ARCHITECTURE

BALKANS AND MIDDLE EAST

LATIN AMERICA

AFRICA PARTICIPANTS

#### ABSTRACT

THE POSTER ILLUSTRATES THE TRAINING PROGRAM AND THE RESULTS DRAWN FROM A WEALTH OF EXPERIENCE OF POST-GRADUATE SPECIALIST INTERDISCIPLINARY EDUCATION COURSES. LAUNCHED IN 2004 THE PROGRAM IS AIMED AT ARCHITECTS AND ENGINEERS WITH FIVE-YEAR DEGREE COURSES FROM COUNTRIES CONSIDERED A PRIORITY BY THE ITALIAN COOPERATION POLICIES. THE MASTER'S DEGREE IN ARCHITECTURE FOR HEALTH, WHICH IS CURRENTLY IN ITS SIXTH EDITION, IS CO-FINANCED BY THE G.D.D.C. OF THE MINISTRY OF FOREIGN AFFAIRS AND THE DEPARTMENT OF PLANNING, DESIGN AND TECHNOLOGY OF ARCHITECTURE FROM SAPIENZA UNIVERSITY OF ROME. IN THE FIVE PREVIOUS EDITIONS (FIRST EDITION 2004, II ED. 2006, III ED. 2008, IV ED. 2010, V ED. 2011) 95 FIELD EXPERTS IN TOTAL HAVE BEEN TRAINED FROM 19 DIFFERENT DEVELOPING AND EMERGING COUNTRIES. ACCORDING TO THE EX-POST MONITORING CARRIED OUT, ABOUT 45% OF THESE EXPERTS ON THE RETURN TO THEIR COUNTRIES OF ORIGIN GAINED SOME PROFESSIONAL EXPERIENCE OR FOUND EMPLOYMENT IN THEIR SPECIFIC SECTOR. CURRENTLY IN ITS SIXTH EDITION, NINETEEN ARCHITECTS AND ENGINEERS FROM EIGHT COUNTRIES IN SUB-SAHARIAN AFRICA ARE ATTENDING THE PROGRAM. IT HAS ALSO BEEN DECIDED THAT THE FUTURE EDITIONS WILL ALSO ONLY FOCUS ON SUB-SAHARIAN COUNTRIES. THE TRAINING PROGRAM HAS ALSO BEEN EXPORTED, WITH THE NECESSARY ADJUSTMENTS, AS A SINGLE EDITION TO THE UNIVERSITY OF SAN CARLOS OF GUATEMALA, FACULTY OF ARCHITECTURE (2009) WITH THE RELEASE OF THE JOINT DEGREE BETWEEN THE TWO INSTITUTIONS, AGAIN THANKS TO THE CO-FINANCING OF THE G.D.D.C.

#### ACHIEVED RESULTS

WITH THE GRADUAL DEVELOPMENT OF THESE EXPERTS, A NETWORK OF HIGHLY PROFESSIONALIZED SPECIALISTS HAS BEEN CREATED. THEY ARE ALL CONNECTED TO EACH OTHER AND ALSO WITH THE TEACHING STAFF OF THE MASTERS COURSE, WHO CONTINUE TO PLAY A SUPPORTING ROLE. THE SUPPORT IS FOCUSED PARTICULARLY ON ISSUES RELATED TO THE FACTORS OF SCIENTIFIC AND TECHNOLOGICAL INNOVATION THAT IS CONSTANTLY AFFECTING THE SECTOR. FURTHERMORE, THE MASTERS HAS BEEN AN OPPORTUNITY TO BEGIN AND ALSO TO FORMALISE COLLABORATIVE ACTIVITIES WITH FURTHER ACADEMIC INSTITUTIONS.

#### OBJECTIVE

The specific objective of the training is the acquisition on the part of the participants of the methods, knowledge and specialist competences relating to the design, planning and programming of the activities of building and plant maintenance. From a point of view that pays attention to the themes of environmental sustainability, for health buildings.

#### METHODOLOGICAL APPROACH

##### PHASE 1 - E-LEARNING

Before starting the specialist-training program which also features online educational support, participants must first carry out an Italian language course in their own country. Following on from this they must also complete a basic activity targeted towards on-site collection of documentation about the hospital case study that each student will analyse within his or her Masters.

##### PHASE 2 - INTRODUCTION TRAINING

The educational path starts in Italy with the "Introduction training." In this phase the main themes that are taught are tools for analysing and quantifying health needs through a demographic analysis, the assessment of disease load, existing and potential risk factors, expectations and values of citizens) and methods for health services planning in connection with local needs.

##### PHASE 3 - SPECIALIZED TRAINING I

This fifth section is divided into two teaching modules. The first is focused on the spatial planning and environmental sustainability of health care facilities, while the second looks at typological analysis related to the spatial and functional requirements of different types of health care facilities. Parallel to the lectures, as part of a Design Workshop I starts the systematisation and gradual processing of the collected data about the case study in order to guide the design choices in relation to the acquisition of learning content.

##### PHASE 4 - INTERNSHIP AND SEMINARS

Next students complete an internship at various hospitals in Rome and attend specialised seminars. Participants are divided into groups and supervised by a university tutor. They carry out practical training in the Technical Offices of hospitals or local health authorities in order to acquire skills and expertise in different areas such as maintenance management, plant engineering and energy saving. During the entire training cycle of the Masters the student will also complete specialised seminars, which aim to focus further on specific issues such as technical installations, interior design and cost analysis.

##### PHASE 5 - SPECIALIZED TRAINING II

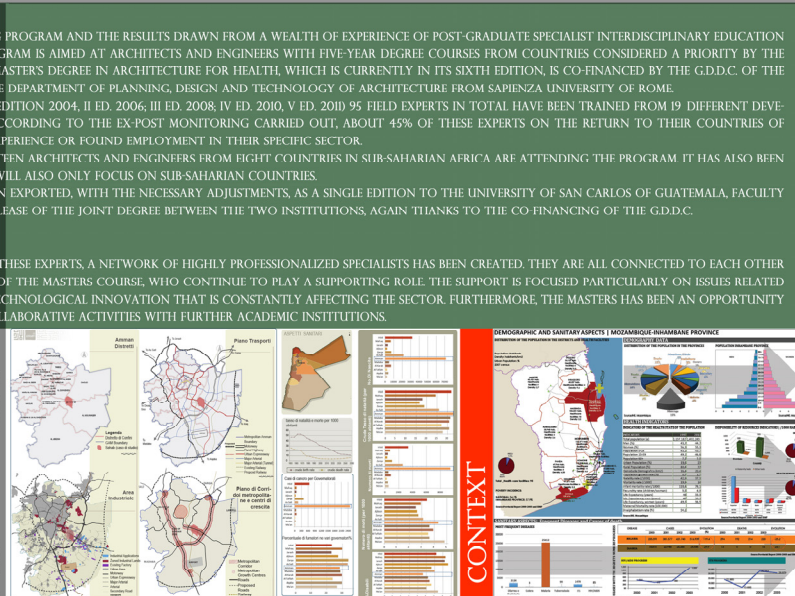

The fifth section is divided into two teaching modules aimed at analysing features and requirements of functional areas of a healthcare facility, their spatial and functional relationships and to provide tools and content of the meta-design of health facilities in order to improve the development of a design-guide during the Design Workshop II.

##### PHASE 6 - SPECIALIZED TRAINING III

Between lessons and workshops, the sixth phase presents in an integrated way the theme of the ex-novo planning of a socio-health structure, such as a health centre, starting from the initial concept right up to the executive project.

##### DESIGN COMPETITION

Throughout the training there is also another important experience which sees participants form groups on their own and then elect a project leader to work collectively within a set timeframe in response to an international tender for the construction of a new hospital structure. Students are supplied with all the bid material and are shown the contents and the winning projects. This activity is the only one of a collective nature within the course, and it simulates on a reduced scale the approach of a professional studio.

## A.P.P.A.® Project: study of pediatric formulations for using in developing Countries

Francesca Baratta<sup>1,2</sup>, Francesca Tarditi<sup>1</sup> and Paola Brusa<sup>1,2</sup>

<sup>1</sup> Aid Progress Pharmacist Agreement® onlus, via P. Giuria 9, 10125 Torino, Italy

<sup>2</sup> Department of Scienza e Tecnologia del Farmaco, University of Turin, via P. Giuria 9, 10125 Torino, Italy

### Abstract

The A.P.P.A.® Project [1] is the result of the cooperation between the Pharmacy Faculty (TO) and local Pharmacists and it is in agreement with the International Health Cooperation principles. The Project is structured in six phases, through which it is possible to obtain an effective and functional **galenic lab in hospitals located in developing Countries** (DC). Due to the different socio-economic conditions each lab is a reality different from the others, always without forgetting the goal of opening labs that produce quality medicinal products. For each lab a specific handbook has been studied: each of them reflects the different local needs. For this reason, in the last two labs carried out in Angola and Haiti, it was necessary to introduce several formulations for pediatric use. For each preparation specific tests were performed to verify the stability under different environmental conditions, in accordance with the European Medicines Agency (EMA) guidelines [2].

### Achieved Results

The **galenic medicines** studied until now for **pediatric use** have been prepared in different pharmaceutical forms:

- ✓ **Solutions:** captopril, furosemide
- ✓ **Suspension:** amoxicillin, carbocysteine, chloramphenicol, erythromycin, magnesium and aluminum hydroxide, metronidazole, vitamin B complex
- ✓ **Syrups:** ascorbic acid, carbocysteine, ibuprofen, iron sulphate, paracetamol, potassium ranrenoate, propranolol, quinine, ranitidine, salbutamol, vitamin B6
- ✓ **Drops:** nifedipine, quinine, ranitidine, salbutamol, vitamin B6
- ✓ **Suppositories:** paracetamol

For each preparation specific tests were performed to verify the **quality** and also the **stability** under different environmental conditions, in accordance with the **EMA guidelines**. Up today, all formulations have proved to be stable in "Refrigerated" conditions (T=5±3 °C) and "Standard" conditions (T=40±2 °C, UR 60±5%) for **12 months**, in "Accelerated" conditions (T=25±2 °C, UR 60±5%) for **3 months**.

### Objectives

- ✓ To realize **pediatric formulation** according to the needs of different hospitals
- ✓ To verify the **quality** [3-4] and also the **stability** [2] of the medicinal products under different environmental conditions

The study of pediatric formulation is very important considering that the **availability** of preparations designed for children is **limited**. Furthermore should not be underestimated the extremely high incidence of **counterfeit medicines** in DC [5].

For pediatric use **suppository** and **liquid preparations for oral use** should be preferred; in particular liquid preparations allow a simple modulation of the amount in function of the weight of several children afferent to the hospital.

The main goal of the stability study is that the preparations could therefore be **preserved in complete safety at homes even if these houses, as often happens in DC, are not equipped with air conditioners or refrigerators**.

### Methodological approach

- ✓ In agreement with local medical doctors the **drugs** for the pediatric therapy are **chosen** and then **formulated** [6]: liquid oral formulations are preferred and appropriate excipients are selected.
- ✓ For each formulation a **specific card** (written in local language) has been prepared. The card shows the procedure of preparation and the characteristics of each component present in the formulation.
- ✓ Each preparation have been tested to check its **quality** and its **stability** under different environmental conditions in accordance with the EMA guidelines.

Card for the preparation of the Propranolol syrup

Operator of the A.P.P.A.® lab of Haiti

Quality control and quality assurance

Considering the environmental conditions present in DC where the galenic products will be used and in order to investigate the stability of these medicinal products, A.P.P.A.® performed a survey of the stability of various galenic dosage forms using different environmental conditions in accordance with the EMA guidelines. We endeavoured to gather information on stability of galenics at extreme environmental conditions (high temperatures and relative humidity) that might prove useful in those Countries (e.g., African ones) where the tropical climate is a serious threat for the quality of drugs. Stability results of samples stored in "accelerated" (T=40±2°C, RH=50±5%) conditions supplied precious information on the expected stability of galenics in tropical Countries where extreme environmental conditions are often a limiting factor for correct storage of drugs.

TEST CONDITIONS				
STORAGE CONDITION	T (°C)	RH	PERIOD COVERED BY DATA	ANALYTICAL METHOD
<b>Standard</b>	25±2	50±5%	analysis at time zero (T0) and every 30 days (from TS-1 to TS-n)	UV-VIS spectrophotometric assay
<b>Refrigerator</b>	5±3	-	analysis at time zero (T0) and every 30 days (from TS-1 to TS-n)	UV-VIS spectrophotometric assay
<b>Accelerated</b>	40±2	50±5%	3 months, analysis at time zero (T0) and every 30 days (from TA-1 through TA-3)	UV-VIS spectrophotometric assay

### Conclusion

- ✓ About **30 galenic medicinal products** for pediatric use have been studied and then formulated.
- ✓ For all formulations **quality** and **stability** have been demonstrated in accordance with EMA guidelines.
- ✓ The studied pediatric formulations are currently in use in the A.P.P.A.® laboratories of **Haiti** and **Angola**.

## SOLID WASTE MANAGEMENT IN ARMED CONFLICTS AND UNSTABLE CONDITIONS: A CASE STUDY FROM THE GAZA STRIP

Marco Caniato, Mentore Vaccari

University of Brescia, CeTamb – Research Centre on Appropriate Technologies for Environmental Management in Developing Countries

### Abstract

Solid waste management (SWM) is one of the most challenging topics in low- and middle-income countries. Municipalities are usually not able to provide an acceptable level of collection and disposal service, despite great economical and financial efforts, with social, political, health and environmental impacts. Several actors are interested in SWM, with a different level of involvement according to needs, resources and objectives: they can be either officially recognised (e.g. NGOs, CBOs, private companies) or informal individuals/groups (e.g. scavengers, collectors, traders), interacting each other in dynamic conditions. Thus a SWM system looks particularly complex, and any intervention could affect not only the environment, but also society and public health: technicians have to identify appropriate solutions, considering not only technical aspect, but also social, economical, environmental and institutional ones, evaluating impacts at short and middle-long period. When conditions are unstable, for example in case of armed conflicts, not all the aspects can be clearly evaluated, due to lack of data, unexpected political changes, and security constraints. Donors and international NGOs have a humanitarian approach, with short term projects: sustainability is clearly not a priority, and some particularly complex sectors, like SWM, are usually not considered. In the Gaza Strip SWM is a hot topic, due to high population density, with consequent large waste generation, scarcity of land availability for disposal, few recycling opportunities, and equipment poor conditions. CeTamb has analysed the situation in order to identify appropriate solutions, robust to local instability, and supported COOPI, an Italian NGO, to design effective and sustainable humanitarian interventions. Such solutions concern the management of municipal solid waste and health-care waste, and have partially been applied. CeTamb have evaluated the impact on local conditions and sustainability.

### Objectives

- To assess solid waste management system in the Gaza Strip
- To identify main needs and challenges
- To suggest possible humanitarian responses

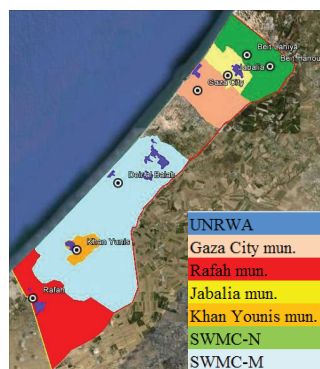

### Methodological approach

- Literature review
- Field missions: document collections, field visits, meetings and interviews
- Each service provider was analysed in details (e.g. scheme of collection, equipment, challenges, potentialities, and future plan)
- Data verification and triangulation with COOPI staff, and service providers

### Achieved Results

Land and maritime no-go zone in Gaza Strip (United Nations OCHA, 2011. *Easing the Blockade*).

MSW coverage by main service providers (authors' elaboration).

Year	Household (ton/day)	Commercial (ton/day)	Market (ton/day)	TOT MSW (ton/day)	Composting rate	MSW to landfill (m <sup>3</sup> /year)	Agricultural (ton/day)
2007	1,306	68	72	1,446	1%	435,336	1,200
2011	1,506	78	83	1,667	1%	501,825	1,200

\*\* source: Financial Statements and Independent Auditor's Report for the Year Ended December 31, 2010 - SWMC Deir al Balah-Palestine.

\*\*\* source: interview with municipality of Rafah, Environment and Health Department.

### Conclusion

- Industrial and healthcare waste are collected with MSW; **MSW production is expected to largely increase in few years**. Recycling is very limited.
- MSW management system is overloaded**, with scarce, old, and poorly maintained equipment. However **almost all the waste is collected and landfilled**.
- Several actions are required**: a more efficient waste and fee collection, **directly involving population in planning phase**; schools and commercial areas should start **separating waste**; new **technologies for material recovery** should be introduced, in particular anaerobic digestion for organic.
- Need of **future research**: **specific waste production and management** (healthcare, commercial); **service providers' operation**; **informal sector**.
- Cooperation with COOPI is still on-going, in particular about **healthcare waste management**.

## COOPERATION, DISCOURS, CHANGEMENT: *BIAS* DANS LE DISCOURS ACADEMIQUE SUR LE CONFLIT

Davide Ziveri\*, Angela Fedi°

\* Universidad Complutense de Madrid [davide.ziveri@acmos.net](mailto:davide.ziveri@acmos.net)

° Dipartimento di Psicologia, Università degli Studi di Torino, [angela.fedi@unito.it](mailto:angela.fedi@unito.it)

### ABSTRACT

L'article part du présupposé que les discours ont un pouvoir, puisqu'ils influencent l'action. Les discours définissent les limites du cadre d'explication d'une réalité. C'est ce que nous appelons le *frame*.

Tous les discours académiques ont un poids important sur la construction des *frames* ; ils les valident. Ces discours légitiment ainsi une certaine vision de la réalité.

L'article présente, en étude de cas, une analyse d'un texte académique. Il s'agit d'une description qualitative d'un projet de coopération entre Italie et Palestine visant l'empowerment des habilités des jeunes dans l'utilisation des TIC pour dénoncer les violations des Droits de l'Homme. L'analyse critique de ce texte fait émerger le *frame* du «balanced approach» comme filtre de représentation du projet. Ce *frame* biaise la description de la réalité et incite, par sa présence, à l'inaction sociale.

Cette étude de cas met en lumière tout le pouvoir des *frames* dans le discours académique.

### INTRODUCTION THÉORIQUE

#### 1. Le pouvoir du discours

Habituellement, nous entendons le pouvoir de la communication comme un contrôle sur ce que l'on peut dire ; c'est-à-dire sur la construction de l'agenda des médias : c'est d'abord une question d'accès au discours. Mais le pouvoir ne s'exerce pas seulement à travers la censure et le silence. Le pouvoir, nous enseigne Foucault, est producteur : «Le pouvoir s'exerce aussi comme construction du signifié à partir des discours, à travers lesquels les acteurs sociaux orientent leurs actions.» [1]. «Le pouvoir est l'habilité à interpréter la réalité et à faire en sorte que les autres acceptent ces interprétations.» [2].

Selon la théorie politique d'Habermas [3], ce n'est pas seulement la violence qui est à la base de la relation de pouvoir, mais plutôt la légitimation que le subordonné accorde au dominant. Cette légitimation « dépend surtout du consensus obtenu à travers la construction d'un signifié partagé » [1, p.36].

#### 2. Les frames

Selon la théorie linguistique de Lakoff [4], ce signifié partagé constitue les *frames*; c'est-à-dire, le contexte de connaissances dans lequel l'individu peut placer les informations qu'il reçoit sur un fait. L'ensemble des *frames* constitue la cosmovision, c'est-à-dire la pensée de chacun pour «reconstruire» le monde [5].

Depuis les études de Goffman [6], les *frames* ont été considérés comme importants, dans la mesure où ils définissent des séries de métaphores pour guider l'interprétation de la réalité.

#### 3. La stratégie du framing

Le pouvoir de changer la réalité est le pouvoir de contrôler les *frames*. Le *framing* est une activité stratégique visant à manipuler certaines communications afin d'imposer son point de vue à autrui. Le *framing* n'est pas une technique de manipulation coercitive, mais il limite les métaphores à disposition du sujet. En effet, l'individu n'agit pas de façon rationnelle, mais utilise ses préconstruits, ses attentes, ses perceptions sur l'identité, des mythes et stéréotypes, ses mémoires et ses croyances. Ainsi, manipuler le *frame* offre la base pour contrôler de façon indirecte le futur comportement. «Le *frame* donne du signifié aux opportunités, au réseau, au groupe et à ses membres. Il est donc une composante cruciale de l'action collective» [7, p. 9].

La conclusion de Castells [1, p.85] est que «les discours, dans nos sociétés, forment le mental à travers une technologie précise : le réseau de communication, qui organise la communication socialisée. Ainsi, la programmation des réseaux de communication est la source décisive des matériaux culturels».

#### 4. Le discours académique

Le discours académique est le plus valide des matériaux culturels à disposition des individus pour construire ses *frames* et activer ses réseaux. Le discours académique suit des règles précises et bénéficie *a priori* d'un degré très élevé de légitimité dans la description de la réalité, grâce au consensus de prestige accordé à la méthode scientifique en

général. «La vérité est située dans la forme du discours scientifique et dans les institutions qui le produisent» [8]. Deleuze [9, p.59] affirme, quant à lui, que «la représentation n'existe plus, mais n'existe que l'action ; action théorique ou action pratique». A cela Foucault ajoute que « le rôle de l'intellectuel n'est pas de dire la vérité muette ; son devoir est plutôt de lutter contre toutes les formes de pouvoir là où l'intellectuel-même est objet et outil, c'est-à-dire dans la connaissance, la vérité, la conscience et dans le discours » [8, p.60].

### 5. Le discours construit des sujets

Le discours possède aussi le pouvoir de former les sujets qui parlent et qui écoutent : le discours in-forme le sujet. Cette dimension du discours explique pourquoi les individus considèrent qu'adopter un discours est une action existentielle et identitaire.

## ETUDE DE CAS

Le titre de l'article que l'on examine ici est le suivant : «The global imaginary, new media and social political innovation in the periphery: the practical case of an Internet-based empowerment project in Palestine and Israel» de Roland Benedikter, Davide Ziveri, Revue Continuum: Journal of Media & Cultural Studies [2013, pp. 2 -15].

### 1. Le projet

L'article parle d'un projet d'échanges entre jeunes ayant reçu une formation aux usages des nouvelles technologies de l'information et de la communication (TIC) dans les media labs de Turin (Italie) et de At-Tuwani (Cisjordanie). Le projet a été financé grâce à un processus participatif dans une communauté de jeunes en province italienne de Bolzano. Le projet est un exemple de bonne pratique d'apprentissage de pair à pair et il fait partie du processus d'empowerment du comité local populaire de résistance non violente palestinienne. L'objectif du projet était de favoriser l'autoreprésentation des jeunes Palestiniens et d'observer et dénoncer les violations des Droits de l'Homme en Palestine. A partir de la description de cette expérience, l'article propose le concept de non-violence 2.0, c'est-à-dire un savoir non violent capable d'utiliser de façon tactique les TIC et d'agir sur les discours.

### 2. Les prémisses non-respectées

Les auteurs de l'article affirment que « ce qui est crucial pour un résultat positif des efforts des émancipations à l'âge de la globalisation médiatique, ce sont les faits sociopolitiques sur le terrain ». Cela vient dire que la description de l'image du contexte est très importante. Les éléments de la narration de la situation sur le terrain sont une partie des histoires qui se passent sur le terrain-même. Mais la narration influence également le contexte de ce sur quoi elle porte.

La non-violence, en tant que force sociale, peut fonctionner comme un «*reframing*» d'un problème, d'un conflit et de sa résolution (transformation), mais seulement si la narration se base sur la vérité.

En effet, la non-violence, dans son étymologie originelle («*satyagraha*», Gandhi) signifie «force de la vérité». Il ne s'agit pas d'une vérité *a priori*, mais d'une attitude parrésiasique.

### 3. Le frame du « balanced approach »

Dans l'analyse de l'article, il apparaît un *frame* spécifique qui forme le cadre d'explication de la situation israélo-palestinienne au-dessus de la réalité. Le *frame* est tellement puissant qu'on le retrouve dans le discours académique. Le *frame* explique la réalité à la manière d'un script.

On peut appeler ce *frame*, celui du « balanced approach », dont les éléments caractéristiques sont les suivants :

#### - La dynamique de la violence

Plusieurs références dans le texte dessinent un scénario différent de la situation réelle. «La région où se déroule le projet est ravagée par la violence des deux factions : les colons Israéliens qui occupent une partie du territoire et les jeunes Palestiniens qui répondent avec des protestations violentes et des actes subversifs. [...] Les observateurs internationaux ont documenté des attaques de la part de la communauté palestinienne vers les colons et, en réaction à cela, une contre-attaque des colons et, occasionnellement, des intimidations de la part de l'Armée israélienne».

Ces affirmations contredisent les rapports publics et officiels des observateurs internationaux du Corps civil de Paix pour l'Union européenne. En regard de la violence en ces régions spécifiques, les derniers actes violents de la partie palestinienne dataient de 1999. En 2001, les villageois ont créé le comité populaire de résistance nonviolente. Il s'agissait d'une décision communautaire visant à repousser la violence en tant qu'agression ou défense. Depuis lors, les observateurs internationaux ont relevé constamment les attaques des colons et ont observé qu'aucun acte violent n'y a été riposté de la part des Palestiniens.

Le *frame* du «balanced approach» qui émerge de ce texte refuse une catégorisation dichotomique, mais généralise excessivement la dynamique de la violence. Ce biais ne permet pas de mettre le focus sur ces contextes locaux qui représentent une différence significative par rapport à la tendance des autres zones géographiques. Ainsi, ce *frame* rend invisibles les expériences locales de non-violence.

- *La dénonciation de la violation des Droits de l'Homme à travers le Web*

L'article rapporte que « l'observation des violences à travers Internet permet aux citoyens de dénoncer les agressions des deux parties du front ». Cette description ne tient pas compte des différences en matière d'accès à Internet [10]. Le village des At-Tuwani n'a été que très récemment alimenté en électricité. Le retard n'a pas été causé par la situation de pauvreté et de sous-développement, mais par une décision politique de l'autorité militaire israélienne qui contrôle le territoire occupé (area C, selon les accords d'Oslo).

- *La participation ouverte*

Le *frame* du «balanced approach» ne décrit les expériences comme étant positives que si les deux communautés (israélienne et palestinienne) y participent. Cette méthodologie de transformation des conflits a été utilisée avec succès en Irlande du Nord. Malheureusement, ce n'est pas exactement ce qui se passe en ce cas. L'article dit que «le projet fait travailler les deux communautés dans une échange on line et off line. Les activités avec des groupes mixtes de jeunes leur permettent de connaître les deux narrations du conflit. Le projet essaie donc de construire des relations partenariales entre pairs». Cette affirmation est inexacte, car cette intéressante activité ne fait pas partie du projet, puisque la communauté de la colonie israélienne - proche du village palestinien d'At- Tuwani – se montre très fermée et a érigé plusieurs barrières (contrôle physique et armé, langue, idéologie), qui n'offrent aucune possibilité de rencontres. Les jeunes du village palestinien engagés dans le projet travaillent avec des associations pacifistes israéliennes. Cet aspect montre d'un côté que les rencontres sont possibles, mais également que les différences sont très marquées à l'intérieur de la société israélienne entre les colons et les citoyens Israéliens engagés pour la paix.

- *A l'origine du frame du «balanced approach» : le concept du politiquement correct*

L'origine de ce *frame* se trouve dans la culture Nord-américaine du «politically correct», c'est-à-dire une attitude visant à réduire la discrimination verbale dans la forme extérieure du discours. Cette attitude implique une équidistance, autrement dit, une relation à distances égales entre deux parties en conflit. C'est l'attitude de la prétendue «neutralité». Se placer loin des deux parties implique de ne pas reconnaître les victimes comme telles. Cela favorise la production de sensation de culpabilité chez les victimes et un véritable deuxième traumatisme. En revanche, dans la culture non-violente, il est plus fréquent de trouver le concept de proximité avec les deux parties, en reconnaissant toujours les responsabilités de chacune.

- *A l'origine du frame du «balanced approach» : la peur des valeurs sacrées*

Sur le conflit israélo-palestinien, au centre des médias de toute la planète, convergent plusieurs intérêts, mémoires et identités. Ainsi, il est considéré comme légitime d'expérimenter la peur des valeurs sacrées. La première de ces valeurs est la dignité humaine. Jamais dans l'histoire la dignité humaine n'aura autant été brisée que durant la Shoah. Le *frame* du «balanced approach» met en relation le respect pour le drame de l'holocauste avec l'impossibilité d'exprimer des opinions sur les politiques du Gouvernement israélien dans les territoires occupés.

- *Les avantages du frame du «balanced approach»*

Utiliser le filtre de ce *frame* amène des avantages grâce à l'économie cognitive. Les narrations dans ce *frame* réduisent la complexité et défendent l'individu de toute dissonance cognitive, motrice du changement.

Ce *frame* a aussi une valeur heuristique : il offre une explication de la violence selon la dynamique attaque – défense, expliquant ainsi la continuité de l'état de violence. De plus, si les rôles s'alternent, il est facile et permis de s'identifier alternativement aux deux acteurs du conflit. Cette double empathie nous amène à comprendre le conflit dans une dynamique action – réaction de majeur à mineur [11].

- *Les effets du frame du «balanced approach»*

En refusant la polarisation entre groupes et la radicalisation d'autrui, en refusant la figure de l'ennemi, du différent et du barbare, le *frame* du «balanced approach» risque quand même de déshumaniser les acteurs du conflit, qui deviennent alors esclaves de l'automatisme de la violence.

Ce *frame* du «balanced approach» est tellement basé sur les valeurs de la modération qu'il favorise une attitude passive, et donc l'inaction.

## CONCLUSIONS

L'analyse critique du discours ne pose pas de question sur le degré de véracité des interprétations de la réalité. La *question* qui émerge se pose quant à la typologie d'actions, et quant à la typologie de sujets créés par l'adoption d'un type particulier de *frame*. Quand le *frame* du «balanced approach» entre dans le discours académique, il y a un risque de ne pas pouvoir adéquatement présenter la complexité du contexte de chaque situation, d'empêcher les chercheurs de prêter attention aux cas particuliers et différents, de limiter la sérendipité.

Une action de coopération académique efficace doit tenir compte des histoires, des représentations, des discours et des *frames* sur les conflits et sur les régions qui souffrent de violence politique ou de catastrophes naturelles ou encore de sous-développement économique. La façon avec laquelle ces situations sont représentées à la Communauté internationale définit l'action de la Communauté internationale-même par rapport à la situation donnée. Autrement dit, agir sur les *frames* intentionnellement et stratégiquement change les représentations, et, par conséquent, les actions de la Communauté internationale.

Les *chercheurs* en Sciences Sociales ont le devoir d'explicitier les *frames* que l'on trouve dans les narrations qui circulent dans les réseaux. Nous, en tant qu'activistes, que chercheurs, que représentants politiques ou simples citoyens, sommes toujours consommateurs et producteurs de flux de discours. Donc, nous pouvons choisir de participer à la diffusion des *frames* qui promeuvent le changement social.

## Table of contents - Papers and posters

### SESSION: OPENING REMARKS

- iii Foreword  
*Rectors: Gianmaria Ajani, Marco Gilli*
- iv Imagining cultures of cooperation: Universities networking to face the new development challenges  
*Egidio Dansero, Francesca De Filippi, Emanuele Fantini, Irene Marocco*
- ix Italy and the post 2015 development agenda. The role of universities  
*Caterina Bertolini*
- x University networks as actors of scientific and multidisciplinary partnerships: history and development of CUCS  
*Emanuela Colombo*
- xii The development scenarios and university cooperation  
*Gianni Vaggi*
- xvii Role and social responsibility of the university in promoting international cooperation for global health  
*Edoardo Missoni*

### SESSION: EDUCATION, TRAINING AND HUMAN RESOURCES

#### Partnerships between academia and NGOs in technical studies in Italy

- 1 Partnerships between academia and NGOs in technical studies in Italy  
*Guido Zolezzi, Angela Ortigara, Marco Bezzi, Emanuela Colombo, Lorenzo Mattarolo, Carlo Collivignarelli, Sabrina Sorlini, Mentore Vaccari, Francesco Vitali, Francesco Mongera, Italo Rizzi, Giovanni Armando, Giorgio Cancelliere, Fabio Fussi*

#### Cooperation programs on education and teachers training: the role of university and effectiveness evaluation

- 8 Cooperation programs on education and teachers training: the role of university and effectiveness evaluation  
*Cristina Coggi, Paola Ricchiardi*
- 10 From a disciplinary approach to the culture of inclusion: the role of the Department of Education Studies of the University of Bologna in the project “Inclusive education for children with disabilities in Kosovo”  
*Federica Zanetti*
- 16 Implementing and evaluating teachers training and education interventions in the global south  
*Cristina Coggi, Paola Ricchiardi*
- 24 The project “Fenix” in TeofiloOtoni – Brazil – Minas Gerais. Training teachers on cognitive enhancement for children living in dilapidated containers  
*Tiziana Bonasso*
- 26 Cognitive enhancement for children in developing countries. A teacher training experience in a Kigali primary school.  
*Roberto Trincherro*

#### ICT and Capacity Building

- 33 ICT and Capacity Building: the contribution of interuniversity cooperation to the training of global and local entrepreneurship in cultural, economic and social sectors  
*Angelo Inzoli*
- 35 Possible areas and critical elements for building development cooperation initiatives in education and blended learning methodologies  
*Gerolamo Spreafico*
- 40 The intercultural perspective of e-learning programs and the use of new technologies in Africa  
*Angelo Inzoli, Lucie Zouya Mimbang*
- 47 Participatory processes and tools for improving teachers professionalism: the IUS Case  
*Piergiuseppe Ellerani, José Gil Mendoza Ma.*
- 55 Alternative media strengthening and support mechanisms in African protracted crises and conflict-affected territories: can paradigm shifts assist and relief?  
*Mohamed S.M. Yassin, Renato Sesana (Kizito)*

## HEI Cooperation for capacity building in biodiversity conservation, food security and sustainable development

- 62 HEI cooperation for capacity building in biodiversity conservation, food security and sustainable development  
*Cristina Giacomina*
- 63 Cooperation experiences with HEIs in the Indian Ocean  
*Cristina Giacomina*
- 67 Fostering “Little Green Guards” through a collaborative partnership to create an effective conservation education program for rural children in Guizhou, China  
*Chia L. Tan, Yeqin Yang, Kefeng Niu, Lei Shi, Weiyong Zhang, Isidoro Riondato, Cristina Giacomina, Emilio Balletto, Marco Gamba, John A. Phillips*
- 73 A Program in higher education for food security and environmental sustainability  
*Carlo Semita, Elena Ferrero, Gabriella Trucchi, Angela Calvo*

## Posters

- 81 Teaching Italian and Arabic: an interchange between Italy and Libya  
*Barbara Airò, Silvio Beretta, Antonio M. Morone*
- 82 «Insieme per Makamba»  
*Anael Bianucci, Chiara Ghislieri*
- 83 M.M.SC. Track In integrated environment and landscape design in the context of international cooperation. Field work internship as opportunity for engineering students to approach developing context  
*Marco Bezzi, Guido Zolezzi, Martina Ferrai, Davide Geneletti, Cordeiro A. R. Ortigara.*
- 84 Preparare i bambini all’adozione internazionale. Ideazione di nuove prassi con gli operatori burkinabè  
*Marta Casonato, Paola Molina, Gisèle Thiombiano*
- 85 Capacity building in ICT: the Experience of Maputo living lab’s Summer Schools  
*Aaron Ciaghi, Pietro Molini, Adolfo Villafiorita*
- 86 1st level Master in “Oral Health in Disadvantaged Communities and Low Income Countries”  
*Giancarlo Vecchiati, Francesco Bassi, Patrizia Di Caccamo, Jennifer Atkinson, Luca Cavallo, Giulio Preti*
- 87 Promuovere la salute orale in cooperazione internazionale: una sfida di salute globale nelle esperienze di progetti integrati in Libano e in Etiopia  
*A. Rinaldi, P. Di Caccamo, G. Benedetti, B. Giordani, C. Resti*
- 88 Establishing a new Master degree in sustainable crop protection in Egypt: a project funded by EU TEMPUS programme  
*Paola Colla, Davide Spadaro, Maria Lodovica Gullino*
- 89 Tutori di resilienza. Modello di formazione di insegnanti e social workers nell’ambito del programma MOSAIC del Ministero degli Affari Sociali Libanese con il supporto della cooperazione italiana  
*V. Hurtubia, F. Giordano, C. Castelli*
- 90 University-NGOs partnership in formal education: the experience of CIVIC.A.S.  
*Francesco Mongera, Michela Bortoli, Guido Zolezzi, Marco Bezzi*
- 91 A wood in the San Salvario neighborhood: A Photovoice project  
*Valentina Noya*
- 92 Indo-Italian International School on "Use of e-infrastructures for advanced seismic hazard assessment in Indian Subcontinent"  
*Antonella Peresan, Giuliano F. Panza, Giampiero Viezzoli*
- 93 L’osservazione: uno strumento di lavoro per gli educatori della prima infanzia.  
*Maria Nives Sala, Paola Molina*
- 861 Master in Architecture for Health  
*Addendum Francesca Giofrè, Giuseppe Primiceri, Ivana Miletic*

## SESSION: GLOBAL HEALTH

### Training abroad for residents

- 94 Training abroad for residents  
*Luisa Mondo, Giuseppe Costa*

### Global Health Governance, healthy systems and development cooperation

- 97 Global Health Governance, healthy systems and development cooperation  
*Eduardo Missoni, Angelo Stefanini, Paola Brusa*
- 100 The role of the university in the global health strategies of the Italian development cooperation  
*Angelo Stefanini, Eduardo Missoni*

- 107 Global health education and the growing need for policy-making and management training of future health-relevant professionals  
*Eduardo Missoni, Fabrizio Tediosi*
- 117 The challenge of training health personnel in resource-limited settings  
*F. Castelli, S. Caligaris, A. Matterelli, M. Bettinzoli, G. Sulis, V. Pietra*
- 123 A.P.P.A.® PROJECT: an example of international health cooperation  
*Francesca Baratta, Antonio Germano, Gaetano Di Lascio, Paola Brusa*
- 130 GHC-TUSCANY: new partnerships for the global health  
*Maria José Caldés, Nicole Mascia, Michele De Luca*

#### **Posters**

- 135 ARACNE Tessere reti per il diritto alla salute dei migranti  
*Comitato Collaborazione Medica*
- 136 Promozione della salute in una società multietnica  
*Iolanda Vigna, Christel Makoutsin, Mirela Rau, Bi Xu, Mariamel Gendi, Maria Cristina Odiard, Claudia Spezia, Maria Luisa Soranzo*
- 137 Impact of pregnancy and labour complications on neonatal outcomes: a retrospective cohort study in a rural hospital of Ethiopia  
*Elisa Bobba*
- 138 Positive and negative effects of financial and non-financial incentive mechanisms for health workers in rural and remote areas of Ethiopia. Focus on Oromiya, Somali and Tigray regions  
*Maria Alessandra Brocardo*
- 139 Professionalization of future humanitarian health workers: an innovative hybrid training course for residents in anesthesia and critical care medicine in collaboration with an Italian NGO.  
*P.L. Ingrassia, M. Foletti, L. Ragazzoni, A. Ripoll, F. Della Corte.*
- 140 Humanitarian Medic: an innovative training program for the professionalization of humanitarian health workers in anesthesia and critical care medicine during residency programs.  
*P.L. Ingrassia, M. Foletti, L. Ragazzoni, A. Ripoll, F. Della Corte*
- 141 Selezione e uso di idonei alimenti locali per la prevenzione della malnutrizione infantile  
*Bruna Santini, Emanuela Nigro, Maria Luisa Soranzo*
- 142 Bibliographic repository. Comitato di Collaborazione Medica (CCM)  
*G.P. Zara, S. Rasetti, F. Locatelli, L. Palmucci, C. Rigazzi, M. Passatore, A. Levis, M. Bertini, M. Fascendini, E. Bobba*
- 862 A.P.P.A.® Project: study of pediatric formulations for using in developing Countries  
*Addendum Francesca Baratta, Francesca Tarditi, Paola Brusa*

### **SESSION: SECURITY, RISKS, CONFLICTS AND VULNERABILITY**

#### **Geomatics for emergency management**

- 143 Foreword to the oral session “Geomatics for emergency management”  
*Piero Boccoardo*
- 146 Evaluation of TRMM Satellite data for mapping monthly precipitation in Pakistan by comparison with locally available data  
*Muhammad Adnan Shahid, Piero Boccoardo, Walther Cámaro García, Adriana Albanese, Elena Cristofori*
- 155 Flood-risk mitigation in the Soliette River Basin: an international cooperation initiative (Haiti, Dominican Rep., Italy)  
*A Domeneghetti, L. Brandimarte, M. Barbarella, A. Castellarin, L. Brandimarte, G. Di Baldassarre, A. Brath*
- 164 Unmanned Aerial Systems for data acquisitions in disaster management applications  
*Irene Aicardi, Filiberto Chiabrando, Andrea Lingua, Francesca Noardo, Marco Piras*

#### **Posters**

- 172 Realisation of a Geomatics Laboratory for the Management of Hydrogeologic and Seismic Risks  
*Giorgio Poretti, Chiara Calligaris, Michele Ferneti*
- 863 Solid waste management in armed conflicts and unstable conditions: a case study from the Gaza strip  
*Addendum Marco Caniato, Mentore Veccari*

### **SESSION: HUMAN SETTLEMENTS, TERRITORIES AND COMMUNITIES**

#### **Sustainability of appropriate environmental technologies in developing countries**

- 173 Sustainability of appropriate environmental technologies in developing countries  
*CeTAmb*

- 175 Sustainability of appropriate environmental technologies in developing countries: general framework  
*Carlo Collivignarelli, Sabrina Sorlini, Francesco Vitali*
- 179 Sustainability of water supply projects: considerations from two case studies  
*Sabrina Sorlini, Luca Rondi*
- 188 Healthcare sustainable design in the global south. A tale of two stories.  
*Marco Morandotti, Daniela Besana*
- 196 International university cooperation for valorizing crude earth as building material in Chad and Cameroon  
*Jean Pierre Temga, Angelo Mazzù, Jean Pierre Nguetnkam, Daniela Palazzini, Robert Ndjouenkeu, Francesco Vitali*
- 204 Enhancing energy access for the poor: the role of appropriate technologies in the use of traditional solid fuels  
*Francesco Vitali, Mentore Vaccari*
- 210 Study of design of a low environment and social impact landfilling in Togo, Assahoun Village  
*Alessandra Bonoli, Sara Bellavita*

#### **Emergency vs Development. The architectural project within development cooperation**

- 216 Emergency vs Development. The architectural project within development cooperation  
*Francesca De Filippi, Alessio Battistella*
- 218 Architecture quality of cooperation projects  
*Camillo Magni*
- 220 A methodological proposal for the assessment of the sustainability of post-disaster reconstruction processes  
*Elisa Salvaneschi, Marco Morandotti*
- 228 Developing emergency  
*Riccardo Vannucci*
- 237 Vernacular approach to architectural design in a development cooperation experience with Mexican indigenous communities  
*Roberto Pennacchio, Roberta Nicchia, Alessandra Basile, Andrea Tulisi.*

#### **Community development and psycho-social intervention**

- 245 Community development and psycho-social intervention  
*Alfredo Mela, Norma De Piccoli*
- 246 International cooperation in the field of higher education: the TEMPUS Programme  
*Norma De Piccoli, Silvia Gattino, Cristina Mosso*
- 249 African cinema as instrument and opportunity in inter-academic cooperation: a project in Ngozi (Burundi)  
*Emanuela Gamberoni*
- 254 Appreciative inquiry in Saint Martin: exploring the potential for change  
*Manuel Marrese*
- 261 Identidad, memoria y desarrollo de comunidad  
*Anna Maria Bastianini, Ester Chicco, Alfredo Mela*
- 864 Cooperation, discours, changement: bias dans le discours academique sur le conflit  
Addendum *Davide Ziveri, Angela Fedi*

#### **Plans and projects “beyond the boundaries”: subjects, knowledge and tools**

- 267 Plans and projects “beyond the boundaries”: subjects, knowledge and tools  
*Daniela De Leo*
- 270 Una exploración de los currículos de las escuelas europeas de planeamiento en el ámbito de la planificación descentralizada  
*Valentina Alberti, Sara Bindo, Enrica Gialanella*
- 276 Spatial planning in predominantly vernacular settlements. The case of African rural towns.  
*Roberta Nicchia*
- 284 Developing the new strategic Masterplan for Herat (Afghanistan)  
*Mirella Loda, Mario Tartaglia*
- 293 Knowledge and processes of sustainable development for the South-East Europe  
*Chiara Camaioni, Ilenia Pierantoni, Massimo Sargolini*
- 301 Beyond tourism: discovery of the historical and artistic heritage of Havana  
*Micaela Scacchi*

*Patricia Rodriguez Pulido, Francesca Lulli, Abdoulaye Fall*
- 449 Economic growth, inequality and new measures of well being. Preliminary issues and fieldwork.  
*Andrea Salustri*

**SESSION: DEVELOPMENT COOPERATION METHODS AND APPROACHES**

**Open Data and Open Access: which knowledge sharing for development cooperation?**

- 450 Open Data and Open Access: which knowledge sharing for development cooperation? Data and information organization for development cooperation and knowledge sharing  
*Susanna Sancassani*

**Beyond GDP: definition and making of new welfare indicators**

- 454 Beyond GDP: definition and making of new welfare indicators, reflecting on conceptual and methodological issues  
*Elena Camino*
- 456 From enforcement to dialogue. Listening to the voices of stakeholders: a challenge for university  
*Paola Bianca Camisani, Elena Camino*
- 465 Sustainability: from the imaginaries to the indicators... and back? The case of India  
*Simone Contu, Elena Camino*
- 474 Cultures of cooperation: strengthening the network with Gandhian economists  
*Nanni Salio*

**Rethinking international cooperation: the contribution of peace studies**

- 480 Rethinking international cooperation: the contribution of peace studies  
*Gianluca Brunori, Giorgio Gallo, Massimo Pallottino*
- 483 Development cooperation and the "Culture of peace" institutionalization  
*Pierluigi Consorti*
- 487 Development cooperation, peace studies and asymmetric conflicts  
*Valentina Bartolucci, Giorgio Gallo*
- 492 Why does international development cooperation need the contribution of peace studies? And why is peace research currently so marginal in international development cooperation?  
*Massimo Pallottino*

- 500 Donors' conditionality in conflict scenarios: the difficult relationship between grant aid agencies and beneficiaries  
*Federica De Sisto*

#### **Development cooperation and internalization of universities**

- 504 Development cooperation and internalization of universities  
*Angelo Stefanini, Alessandra Bonoli*
- 506 Initiatives to start with implementing sustainability process into University of Bologna  
*Alessandra Bonoli, Francesca Cappellaro*
- 511 International development cooperation and internationalization of the university: de-construct to re-construct with different types of knowledge  
*Angelo Stefanini*
- 517 Global partnership, participation and development cooperation: the role of public consultations launched by the United Nations in building a post-2015 Global Agenda aiming at a multi-dimensional and multi-scalar development  
*Simona Epasto*

#### **From a donors/beneficiaries relationship to mutual transformation**

- 525 From a donors/beneficiaries relationship to mutual transformation: imagining and evaluating the relational dimension in decentralized cooperation initiatives  
*Egidio Dansero, Stefano Rossi*
- 527 New social pathways: voluntary organizations for development and international solidarity in Tuscany  
*Fabio Berti, Cristina Capineri, Lorenzo Nasi*
- 534 La dimension relationnelle de l' "ici" dans les initiatives de coopération au développement. Reflexions sur les effets au Nord de la coopération décentralisée des parcs naturels du Piémont  
*Nadia Tecco*
- 540 Entre théorie et pratique: Université de Turin et coopération décentralisée piémontaise. Quinze ans de recherche dans le domaine des déchets  
*Roberta Perna*
- 548 Competences et pratique de coopération internationale en Senegal sur la route des talibés.  
*Giulia Gozzelino*
- 555 Decentralised cooperation as a policy for local change and international partnership: the experience of Trentino in the Balkans and in Mozambique  
*Jenny Capuano, Sara Franch, Massimo De Marchi, Stefano Rossi, Paolo Rosso*
- 563 Which future for a policy of Italian territorial cooperation integrated with the Western Balkan countries?  
*Andrea Stocchiero*

#### **Posters**

- 571 To look at development from a Gandhian perspective. Cultural exchanges, educational opportunities and twinships between schools  
*Elena Camino, Maria Ferrando, Maria Elena Bo*
- 572 A safe place for the victims of domestic violence: support to autonomy and development of local resources in the Balkans area (since 2006)  
*Maria Perino, Miranda Prosio*
- 573 Fund for cooperation and knowledge  
*Andrea Pichelli*
- 574 Multidisciplinary and interdisciplinary skills at the service of development cooperation: the activity of the CISAO of the University of Turin  
*Carlo Semita*

#### **SESSION: RURAL DEVELOPMENT, NATURAL RESOURCES AND ENVIRONMENT**

##### **Agriculture in developing countries between local rural development policies and international models of "land grabbing"**

- 575 Agriculture in developing countries between local rural development policies and international models of "land grabbing"  
*Francesco Costamagna*
- 577 The role of African governments in the land grabbing business  
*Hans Holmén*
- 584 The commoditization of commons: the role of civil society and academic organizations in global land grabbing  
*Davide Cirillo*

- 593 Large-scale land acquisitions and foreign direct investments: a challenge for international law  
*Stefano Montaldo*
- 602 The socio-economic impact of large-scale land investments: the case of Mali  
*Astrig Tasgian*
- 611 Land grabbing as a strategic game: a three level approach  
*Raffaele Bertini*

#### **Agro-biodiversity and diversified agri-livestock systems**

- 617 Agro-biodiversity and diversified agri-livestock systems  
*Riccardo Fortina, Cristiana Peano*
- 619 Cultural identity and conservation of indigenous and native diversity  
*Francesco Sottile, M. Beatrice Del Signore, Serena Milano, Cristiana Peano, Vincenzo Girgenti*
- 627 Local fruits and nuts as a tool for the development of Afghanistan  
*Edgardo Giordani, Gregory Cullen, Pablo Degl'Innocenti, Giuliano Masini*
- 636 Analysis of the sustainability of Slow Food Mushunu chicken presidium in Kenya  
*Daniela Fiorito, Nadia Tecco, Vincenzo Girgenti*
- 641 The role of diversity and diversification for resilient agricultural systems  
*Nadia Tecco, Vincenzo Girgenti, Cristiana Peano, Francesco Sottile*

#### **Agriculture and urban and peri-urban breeding**

- 646 Agriculture and urban and peri-urban breeding  
*Mario Mattoni, Daniele De Meneghi*
- 647 Preliminary results on the development of innovative site-specific integrated animal health packages for the rural poor  
*Mario Mattoni, Rajinder Saini, Charles Mahama, Issa Sidibe, Burkhard Bauer, Oumar Diall, Antonio Rota, Raffaele Mattioli*
- 654 La filièrelaitière in Afrique sahélienne: valorisation du produit local  
*Massimo Zecchini, Anna Cantafora*
- 660 Diffusion de l'insémination artificielle bovine dans des fermes en zone urbaine et périurbaine de Niamey, Niger: perceptions et perspectives  
*Carlo Semita, Moumouni Issa, Hamani Marichatou, Abdou Moussa Mahaman Maaouia, Abdoukadi Djibril, Tiziana Nervo*
- 668 Keeping dairy cattle in the Gaza strip: a case of study.  
*Cristiano Rossignoli, Francesco Di Iacovo, Roberta Moruzzo*

#### **Gender and rural development in cooperation programs**

- 669 Gender and rural development in cooperation programs  
*Angela Calvo*
- 671 International aid and gendered roles in agricultural value chains: some reflections from a rural development program in Northern Senegal  
*Cristiano Lanzano, Agnese Migliardi, Cecilia Navarra*
- 680 The experience of IIDA: twenty-two years of frontline engagement of empowerment of the people and especially women in Somalia  
*Mariam Yassin Hagi Yussuf, Hibo Yassin Hagi Yussuf, Davide Rigallo*
- 687 Gender mainstreaming in international development: an evaluation of strategies in health and education  
*Costanza Tognini*
- 696 Agricultural gender indicators to improve development programmes: a critical approach  
*Francesca Alice Centrone, Angela Calvo*

#### **Access to water and the nexus with food, energy and land: themes and indicators for the post 2015 global development agenda**

- 704 Access to water and the nexus with food, energy and land: themes and indicators for the post 2015 global development agenda  
*Emanuele Fantini*
- 706 Environmental mainstreaming and integrated policies in development cooperation after Rio+20: the emblematic case of water and food  
*Massimo Zorzea*

#### **Posters**

- 716 Water and sanitation access in the South-Western region of Burkina Faso  
*I. Angeluccetti, V. Coviello, S. Grimaldi, P. Vezza, A. Koussoubé*
- 717 Sustainable biomass in developing countries  
*Federico Barigazzi, Stefano Bechis, Paolo, Giglio, Thomas A. Lawand*
- 718 Application of solutions developed for DCS in Italy

- Stefano Bechis, Federico Barigazzi, Giulio Re, Thomas A. Lawand*  
719 Milk and dairy products supply to urban and periurban market in Niger by the creation of a cooperative dairy unit
- Anna F.A. Cantàfora, Filippo De Monte, Simone Stella, Massimo Zecchini, Miro C. Crimella*  
720 'Italy in Senegal': large-scale investments and support for family farming  
*Giorgio Roberto*
- 721 Ten years of cooperation on sustainable agriculture between China and Italy  
*Maria Lodovica Gullino, Angelo Garibaldi, Massimo Pugliese, Corrado Clini*
- 722 Creating and improving professionals in the management of livestock farming in the Sahelian area  
*Tiziana Nervo, Gabriella Trucchi, Moumouni Issa, Marichatou Hamani, Alhassane Yenikoye, Victorin Codjia, Carlo Semita*
- 723 Environmental resources and decay in Cape Verde. A survey in Santo Antão and São Vicente  
*Stefano Orlandi, Angela Calvo*
- 724 La riforma silenziosa. Come lo Stato ruba la terra  
*Alessandra Portis*
- 725 The H<sub>2</sub>Ortisol model. Sun and water management for a reliable and sustainable horticultural production  
*Maurizio Previati, Stefano Bechis, Davide Canone, Stefano Ferraris*
- 726 Transfer of agro-livestock technologies for biodiversity preservation in Sahelian environment  
*Carlo Semita, Riccardo Fortina, Francesco Cristofori, Ousseina Saidou Touré, Moumouni Issa, Marichatou Hamani, Alhassane Yenikoye, Tiziana Nervo*
- 727 Improvement of the dairy production chain in the rural areas of Ecuador through the use of repeatable teaching model  
*Martina Tarantola, Gianluca Pressi, Paolo Rodighero, Luca Nicolandi, Emma Della Torre, Ivan Garcia, Carlos Arce, Claudia Durando, Achille Schiavone*
- 728 A multilingual approach to preserve vineyard landscapes' agrobiodiversity.  
*Francesca Varvello*

## SESSION: CULTURAL COOPERATION

### Traditional medicines and local knowledge

- 729 Traditional medicines and local knowledge: policies, international aid and academic research  
*Elisa Bignante*
- 731 Les relations entre la médecine traditionnelle et la médecine officielle au nord du Senegal: un étude comparative  
*Laura Sinagra Brisca, Sabrina Renzi*

### Cooperating for cultural heritage conservation

- 739 Cooperating for cultural heritage conservation  
*Francesca Declich, Cecilia Pennaccini*
- 740 Cultural cooperation by way of ethnography: a Ugandan case study (Corus Project)  
*Anna Baral*
- 747 The Italian ethnological mission to Ghana and cultural cooperation: heritage-making processes in the Nzema Area (South-West Ghana)  
*Mariaclaudia Cristofano, Stefano Maltese, Elisa Vasconi*
- 754 The promotion of heritage inside the politics of tourism development of Mozambique. The role of international cooperation  
*Elisa Magnani*
- 760 Sperimentazione di modelli per il rafforzamento delle istituzioni alle quali è affidata la conservazione del patrimonio culturale: casi di studio in Cina e in El Salvador  
*Mario Micheli*

### A better knowledge for a better cooperation

- 768 A better knowledge for a better cooperation: the contribution of human sciences for an intercultural cooperation to development  
*Ilaria Micheli, Mauro Tosco*
- 769 The power of ethnic labeling: the role of international cooperation and academic community in shaping the new indigenous movement in Bolivia  
*Lorenza Belinda Fontana*
- 777 Safeguarding the past to guarantee a better future. The role of ethnolinguistics in the Necofa Project among the Mariashoni Okiek Community  
*Ilaria Micheli*
- 785 Strategies of land exploitation and management in the area of Aksum (Northern Ethiopia) Between the first millennium BC and the first millennium AD

*Luisa Sernicola*

- 791 The case of Zimbabwe Bushpump like a socio-technical network  
*Federico Silvestri*

- 798 Language uses vs. language policy: South Sudan and Juba Arabic in the post-independence era  
*Stefano Manfredi, Mauro Tosco*

**Posters**

- 803 Formazione linguistica e interculturale: I laboratori di francese per studenti non italo-foni e di lettura comparata dei miti letterari  
*Patricia Kottelat, Laura Rescia, Monica Pavesio*

**SESSION: ICT AND MEDIA FOR DEVELOPMENT**

**Blurring boundaries, reshaping technologies, merging know-hows: a reflexive approach to ICT4D in developing countries**

- 804 Blurring boundaries, reshaping technologies, merging know-hows: a reflexive approach to ICT4D in developing countries  
*Iginio Gagliardone, Daniele Trincherò*
- 805 China and the African internet: perspectives from Kenya and Ethiopia  
*Iginio Gagliardone*
- 812 Mapping map Kibera: what is behind the map?  
*Elisabetta Demartis*
- 821 M.U.S.I.C. – Mediterranean Urban Sounds Interactive Culture  
*Antonella Contin, Alessandro Frigerio, Paola Bellaviti*

**Communicating development and international cooperation**

- 827 Comunicare lo sviluppo e la cooperazione internazionale  
*Silvia Pochettino*
- 828 The communication of international cooperation and development in Piedmont  
*Sara Minucci*
- 835 Ong e social media: i risultati di un'indagine di mappatura della presenza online delle organizzazioni non governative italiane  
*Donata Columbro*
- 840 The representation of the cooperation north-south in the Catalan media  
*Xavier Giró*

**New technologies for inclusive urban development**

- 846 The ICT for an inclusive urban development  
*Francesca De Filippi, Serena Pantanetti*
- 848 The use of ICT for social inclusion and participative planning. A case study of "south-north" technology transfer  
*Francesca De Filippi, Serena Pantanetti*
- 853 An effective strategy to develop efficient services for a digital-divided population  
*Riccardo Stefanelli, Abel Rodriguez de la Concepcion, Elisa Pievanelli, Daniele Trincherò*

**Posters**

- 858 Participatory methodologies for a responsible tourism: the Zinave National Park (Mozambique)  
*Sara Belotti, Diathesis Cartographic Laboratory*
- 859 Oltre la cartografia partecipativa: raccolta coordinate con palmari GPS e condivisione di geodati via web (2.0)  
*Antonio Maini*

- 860 *Addendum*

The Italian Universities Network for Development Cooperation (CUCS) has been founded in 2007 and nowadays includes 28 Italian Universities. The III CUCS Congress (CUCSTorino2013) was held in Turin on the 19th, 20th, and 21st of September, 2013. CUCSTorino2013 was co-organised by Politecnico di Torino and University of Turin in the frame of the growing partnership between these two Universities with other relevant development cooperation actors (the UN system, the Italian Ministry of Foreign Affairs, local authorities, foundations and NGOs and their respective partners in the so called “Global South”).

The Congress, titled “Imagining cultures of cooperation: universities networking to face the new development challenges”, focused on changes occurring at different levels on current development and cooperation trends (theories, policies, practices, and the definition of the Global Development Agenda post 2015), on the role of universities as development cooperation actors and their contribution in terms of research, education & training, solutions implementation in the field, technology transfer and co-creation.
